- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **Iter**, typename **Sent**, typename **T**, typename **Reduce**, typename **Convert**>

T `hpx::transform_reduce`(*Iter* first, *Sent* last, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **Iter2**, typename **T**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> `hpx::transform_reduce`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *Iter2* first2, *T* init)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

> **Note**
>
> GENERALIZED_SUM(op, a1, …, aN) is defined as follows:
>
> - a1 when N is 1
> - op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
>   - b1, …, bN may be any permutation of a1, …, aN and
>   - 1 < K+1 = M <= N.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Iter`** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **`Sent`** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **`Iter2`** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **`T`** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first`** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **`last`** – Refers to the end of the second sorted range the algorithm will be applied to.
- **`first2`** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **`init`** – The initial value for the generalized sum.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **Iter**, typename **Sent**, typename **Iter2**, typename **T**>

T `hpx::transform_reduce`(*Iter* first, *Sent* last, *Iter2* first2, *T* init)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **Iter2**, typename **T**, typename **Reduce**, typename **Convert**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> `hpx::transform_reduce`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *Iter2* first2, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.

- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.
- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **Iter**, typename **Sent**, typename **Iter2**, typename **T**, typename **Reduce**, typename **Convert**>

T *hpx*::**transform_reduce**(*Iter* first, *Sent* last, *Iter2* first2, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **`Iter`** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **`Sent`** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **`Iter2`** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **`T`** – The type of the value to be used as initial (and intermediate) values (deduced).
- **`Reduce`** – The type of the binary function object used for the reduction operation.
- **`Convert`** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **`first`** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **`last`** – Refers to the end of the second sorted range the algorithm will be applied to.
- **`first2`** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **`init`** – The initial value for the generalized sum.
- **`red_op`** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **Rng**, typename **T**, typename **Reduce**, typename **Convert**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> `hpx::`**`transform_reduce`**(*ExPolicy* &&policy, *Rng* &&rng, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Rng`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`T`** – The type of the value to be used as initial (and intermediate) values (deduced).
- **`Reduce`** – The type of the binary function object used for the reduction operation.
- **`Convert`** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`rng`** – Refers to the sequence of elements the algorithm will be applied to.
- **`init`** – The initial value for the generalized sum.
- **`red_op`** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.
- **`conv_op`** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **Rng**, typename **T**, typename **Reduce**, typename **Convert**>

T `hpx::transform_reduce`(*Rng* &&rng, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), …, conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of transform_reduce may be non-deterministic for non-associative or non-commutative binary predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicates *red_op* and *conv_op*.

> **Note**
>
> GENERALIZED_SUM(op, a1, …, aN) is defined as follows:

>   - b1, …, bN may be any permutation of a1, …, aN and
>   - 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **Rng**, typename **Iter2**, typename **T**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> `hpx::transform_reduce`(*ExPolicy* &&policy, *Rng* &&rng, *Iter2* first2, *T* init)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns
The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

template<typename **Rng**, typename **Iter2**, typename **T**>

T hpx::**transform_reduce**(*Rng* &&rng, *Iter2* first2, *T* init)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns
The *transform_reduce* algorithm returns *T*.

template<typename **ExPolicy**, typename **Rng**, typename **Iter2**, typename **T**, typename **Reduce**, typename **Convert**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> hpx::**transform_reduce**(*ExPolicy* &&policy, *Rng* &&rng, *Iter2* first2, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

template<typename **Rng**, typename **Iter2**, typename **T**, typename **Reduce**, typename **Convert**>

T *hpx*::**transform_reduce**(*Rng* &&rng, *Iter2* first2, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns

The *transform_reduce* algorithm returns *T*.

hpx::is_heap

Defined in header hpx/algorithm.hpp[698].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::is_heap_until*

template<typename **ExPolicy**, typename **RandIter**, typename **Comp** = *hpx*::*parallel*::detail::less>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> **hpx::is_heap**(*ExPolicy* &&policy, *RandIter* first, *RandIter* last, *Comp* &&comp = *Comp*())

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()). Executed according to the policy.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.

[698] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **Comp** – The type of the function/function object to use (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

template<typename **RandIter**, typename **Comp** = *hpx*::*parallel*::detail::less>

bool *hpx*::**is_heap**(*RandIter* first, *RandIter* last, *Comp* &&comp = *Comp*())

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.

Returns

The *is_heap* a *bool*. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

hpx::is_heap_until

Defined in header hpx/algorithm.hpp[699].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::is_heap*

template<typename **ExPolicy**, typename **RandIter**, typename **Comp** = *hpx*::*parallel*::detail::less>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *RandIter*> **hpx::is_heap_until**(*ExPolicy* &&policy, *RandIter* first, *RandIter* last, *Comp* &&comp = *Comp*())

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()). Executed according to the policy.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**

> Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

[699] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.

Returns

The *is_heap_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

template<typename **RandIter**, typename **Comp** = *hpx*::*parallel*::detail::less>

RandIter `hpx::is_heap_until`(*RandIter* first, *RandIter* last, *Comp* &&comp = *Comp*())

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.

Returns

The *is_heap_until* algorithm returns a *RandIter*. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

hpx::experimental::for_loop

Defined in header hpx/algorithm.hpp[700].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::experimental::for_loop_strided*
- *hpx::experimental::for_loop_n*
- *hpx::experimental::for_loop_n_strided*

template<typename **I**, typename ...**Args**>

void *hpx*::*experimental*::**for_loop**(*std*::decay_t<*I*> first, *I* last, *Args*&&... args)

The for_loop implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of for_loop without specifying an execution policy is equivalent to specifying *hpx::execution::seq* as the execution policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

[700] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

template<typename **ExPolicy**, typename **I**, typename ...**Args**>

auto *hpx*::*experimental*::**for_loop**(*ExPolicy* &&policy, *std*::decay_t<*I*> first, *I* last, *Args*&&... args)

The for_loop implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last - first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

> **Note**
>
> As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

> **Note**
>
> The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop* algorithm returns a *hpx::future<void>* if the execution policy is of type *hpx::execution::sequenced_task_policy* or *hpx::execution::parallel_task_policy* and returns *void* otherwise.

hpx::experimental::for_loop_strided

Defined in header hpx/algorithm.hpp[701].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::experimental::for_loop*
- *hpx::experimental::for_loop_n*
- *hpx::experimental::for_loop_n_strided*

template<typename **I**, typename **S**, typename ...**Args**>

void *hpx*::*experimental*::**for_loop_strided**(*std*::decay_t<*I*> first, *I* last, *S* stride, *Args*&&... args)

The for_loop_strided implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of for_loop without specifying an execution policy is equivalent to specifying *hpx::execution::seq* as the execution policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

[701] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

> **Note**
>
> As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

> **Note**
>
> The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **`I`** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **`S`** – The type of the stride variable. This should be an integral type.
- **`Args`** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`last`** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **`stride`** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if I has integral type or meets the requirements of a bidirectional iterator.
- **`args`** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

  ```
  <ignored> pred(I const& a, ...);
  ```

  The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

template<typename **`ExPolicy`**, typename **`I`**, typename **`S`**, typename ...**`Args`**>

auto `hpx::experimental::`**`for_loop_strided`**(*ExPolicy* &&policy, *std*::decay_t<*I*> first, *I* last, *S* stride, *Args*&&... args)

The for_loop_strided implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble for_each from the

Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

> **Note**
>
> As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

> **Note**
>
> The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it’s last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if I has integral type or meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

  ```
  <ignored> pred(I const& a, ...);
  ```

  The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop_strided* algorithm returns a *hpx::future<void>* if the execution policy is of type *hpx::execution::sequenced_task_policy* or *hpx::execution::parallel_task_policy* and returns *void* otherwise.

hpx::experimental::for_loop_n

Defined in header hpx/algorithm.hpp[702].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::experimental::for_loop*
- *hpx::experimental::for_loop_strided*
- *hpx::experimental::for_loop_n_strided*

template<typename **I**, typename **Size**, typename ...**Args**>

void *hpx::experimental*::**for_loop_n**(*I* first, *Size* size, *Args*&&... args)

The for_loop_n implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of for_loop_n without specifying an execution policy is equivalent to specifying *hpx::execution::seq* as the execution policy.

[702] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

> As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

> **Note**
>
> The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **size** – Refers to the number of items the algorithm will be applied to.

- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

  ```
  <ignored> pred(I const& a, ...);
  ```

  The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

template<typename **ExPolicy**, typename **I**, typename **Size**, typename ...**Args**>

auto *hpx::experimental::***for_loop_n**(*ExPolicy* &&policy, *I* first, *Size* size, *Args*&&... args)

The for_loop_n implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

> **Note**
>
> As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

> **Note**
>
> The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **`I`** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **`Size`** – The type of a non-negative integral value specifying the number of items to iterate over.
- **`Args`** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`size`** – Refers to the number of items the algorithm will be applied to.
- **`args`** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

  The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *hpx::execution::sequenced_task_policy* or *hpx::execution::parallel_task_policy* and returns *void* otherwise.

hpx::experimental::for_loop_n_strided

Defined in header hpx/algorithm.hpp[703].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::experimental::for_loop*
- *hpx::experimental::for_loop_strided*
- *hpx::experimental::for_loop_n*

template<typename **I**, typename **Size**, typename **S**, typename ...**Args**>

void *hpx::experimental*::**for_loop_n_strided**(*I* first, *Size* size, *S* stride, *Args*&&... args)

The for_loop_n_strided implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of for_loop without specifying an execution policy is equivalent to specifying *hpx::execution::seq* as the execution policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

[703] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

> **Note**
>
> The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- `I` – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- `Size` – The type of a non-negative integral value specifying the number of items to iterate over.
- `S` – The type of the stride variable. This should be an integral type.
- `Args` – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `size` – Refers to the number of items the algorithm will be applied to.
- `stride` – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if I has integral type or meets the requirements of a bidirectional iterator.
- `args` – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

  ```
  <ignored> pred(I const& a, ...);
  ```

  The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

template<typename **ExPolicy**, typename **I**, typename **Size**, typename **S**, typename ...**Args**>

auto *hpx::experimental::***for_loop_n_strided**(*ExPolicy* &&policy, *I* first, *Size* size, *S* stride, *Args*&&... args)

The for_loop_n_strided implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

```
<ignored> pred(I const& a, ...);
```

  The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop_n_strided* algorithm returns a *hpx::future<void>* if the execution policy is of type *hpx::execution::sequenced_task_policy* or *hpx::execution::parallel_task_policy* and returns *void* otherwise.

hpx::set_symmetric_difference

Defined in header hpx/algorithm.hpp[704].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **FwdIter1**, typename **FwdIter2**, typename **FwdIter3**, typename **Pred** = *hpx*::*parallel*::detail::less>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter3*>::type **hpx::set_symmetric_difference**(*ExPolicy* &&policy, *FwdIter1* first1, *FwdIter1* last1, *FwdIter2* first2, *FwdIter2* last2, *FwdIter3* dest, *Pred* &&op = *Pred*())

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects

[704] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **`FwdIter1`** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **`FwdIter2`** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **`FwdIter3`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **`Pred`** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first1`** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **`last1`** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_symmetric_difference* algorithm returns a *hpx::future<FwdIter3>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter3* otherwise. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **FwdIter1**, typename **FwdIter2**, typename **FwdIter3**, typename **Pred** = *hpx*::*parallel*::detail::less>

FwdIter3 `hpx::set_symmetric_difference`(*FwdIter1* first1, *FwdIter1* last1, *FwdIter2* first2, *FwdIter2* last2, *FwdIter3* dest, *Pred* &&op = *Pred*())

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.

- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_symmetric_difference* algorithm returns a *FwdIter3*. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::for_each

Defined in header hpx/algorithm.hpp[705].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::for_each_n*

template<typename **InIter**, typename **F**>

F `hpx::for_each`(*InIter* first, *InIter* last, *F* &&f)

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

[705] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

> **Note**
>
> Complexity: Applies *f* exactly *last* - *first* times.

Template Parameters

- **InIter** – The type of the source begin and end iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). F must meet requirements of *MoveConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.

Returns

f.

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

util::detail::algorithm_result_t<*ExPolicy*, void> *hpx*::**for_each**(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *F* &&f)

Applies *f* to the result of dereferencing every iterator in the range [first, last). Executed according to the policy.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Applies *f* exactly *last* - *first* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin and end iterator used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

Returns

The *for_each* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns void otherwise.

hpx::for_each_n

Defined in header hpx/algorithm.hpp[706].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::for_each*

[706] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

template<typename **InIter**, typename **Size**, typename **F**>

InIter hpx::**for_each_n**(*InIter* first, *Size* count, *F* &&f)

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

> **Note**
>
> Complexity: Applies *f* exactly *count* times.

Template Parameters

- **InIter** – The type of the source begin and end iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). F must meet requirements of *MoveConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.

Returns

first + *count* for non-negative values of *count* and *first* for negative values.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**, typename **F**>

util::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> hpx::**for_each_n**(*ExPolicy* &&policy, *FwdIter* first, *Size* count, *F* &&f)

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1. Executed according to the policy.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each_n* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Applies *f* exactly *count* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each_n* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

Returns

The *for_each_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *first* + *count* for non-negative values of *count* and *first* for negative values.

hpx::experimental::reduction_max

Defined in header hpx/algorithm.hpp[707].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **T**>

constexpr *hpx*::*parallel*::detail::reduction_helper<*T*, *hpx*::*parallel*::detail::max_of<*T*>> `hpx::experimental::reduction_max`(*T* &var)

The function template *reduction_max* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses std::max_of{} as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_max* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the std::max_of{} operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

> **Note**
>
> In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

[707] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

template<typename **T**>

constexpr *hpx*::*parallel*::detail::reduction_helper<*T*, *hpx*::*parallel*::detail::max_of<*T*>> `hpx::experimental::`**`reduction_max`**`(`*T* &var, *T* const &identity`)`

hpx::all_of

Defined in header hpx/algorithm.hpp[708].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::any_of*
- *hpx::none_of*

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

util::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::`**`all_of`**`(`*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *F* &&f`)`

Checks if unary predicate *f* returns true for all elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most *last* - *first* applications of the predicate *f*

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.

[708] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *all_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

Returns

The *all_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

template<typename **ExPolicy**, typename **InIter**, typename **F**>

bool *hpx*::**all_of**(*InIter* first, *InIter* last, *F* &&f)

Checks if unary predicate *f* returns true for all elements in the range [first, last).

> **Note**
>
> Complexity: At most *last* - *first* applications of the predicate *f*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *all_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.

Returns

The *all_of* algorithm returns a *bool* . The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

hpx::any_of

Defined in header hpx/algorithm.hpp[709].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::all_of*
- *hpx::none_of*

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

util::detail::algorithm_result_t<*ExPolicy*, bool> **hpx::any_of**(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *F* &&f)

Checks if unary predicate *f* returns true for at least one element in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most *last* - *first* applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

[709] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *any_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

Returns

The *any_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

template<typename **InIter**, typename **F**>

bool *hpx*::**any_of**(*InIter* first, *InIter* last, *F* &&f)

Checks if unary predicate *f* returns true for at least one element in the range [first, last).

> **Note**
>
> Complexity: At most *last* - *first* applications of the predicate *f*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *any_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.

Returns

The *any_of* algorithm returns a *bool* . The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

hpx::none_of

Defined in header hpx/algorithm.hpp[710].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::all_of*
- *hpx::any_of*

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

util::detail::algorithm_result_t<*ExPolicy*, bool> **hpx::none_of**(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *F* &&f)

Checks if unary predicate *f* returns true for no elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most *last* - *first* applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

[710] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

Returns

The *none_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

template<typename **InIter**, typename **F**>

bool *hpx*::**none_of**(*InIter* first, *InIter* last, *F* &&f)

Checks if unary predicate *f* returns true for no elements in the range [first, last).

> **Note**
>
> Complexity: At most *last* - *first* applications of the predicate *f*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.

Returns

The *none_of* algorithm returns a *bool* . The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

hpx::transform

Defined in header hpx/algorithm.hpp[711].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **FwdIter1**, typename **FwdIter2**, typename **F**>

FwdIter2 **hpx::transform**(*FwdIter1* first, *FwdIter1* last, *FwdIter2* dest, *F* &&f)

Applies the given function *f* to the range [first, last) and stores the result in another range, beginning at dest.

> **Note**
>
> Complexity: Exactly *last* - *first* applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

[711] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

Returns

The *transform* algorithm returns a *FwdIter2*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **FwdIter2**, typename **F**>

parallel::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter2*> `hpx::transform`(*ExPolicy* &&policy, *FwdIter1* first, *FwdIter1* last, *FwdIter2* dest, *F* &&f)

Applies the given function *f* to the range [first, last) and stores the result in another range, beginning at dest. Executed according to the policy.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *last* - *first* applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type &a);
  ```

  The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

Returns

The *transform* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *parallel_task_policy* and returns *FwdIter2* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **FwdIter1**, typename **FwdIter2**, typename **FwdIter3**, typename **F**>

FwdIter3 **hpx::transform**(*FwdIter1* first1, *FwdIter1* last1, *FwdIter2* first2, *FwdIter3* dest, *F* &&f)

Applies the given function *f* to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest.

> **Note**
>
> Complexity: Exactly *last* - *first* applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators for the second range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types FwdIter1 and FwdIter2 can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

Returns

The *transform* algorithm returns a *FwdIter3*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **FwdIter2**, typename **FwdIter3**, typename **F**>

parallel::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter3*> `hpx::transform`(*ExPolicy* &&policy, *FwdIter1* first1, *FwdIter1* last1, *FwdIter2* first2, *FwdIter3* dest, *F* &&f)

Applies the given function *f* to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest. Executed according to the policy.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *last* - *first* applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators for the second range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types FwdIter1 and FwdIter2 can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

Returns

The *transform* algorithm returns a *hpx::future<FwdIter3>* if the execution policy is of type *parallel_task_policy* and returns *FwdIter3* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

hpx::ranges::shift_left

Defined in header hpx/algorithm.hpp[712].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **FwdIter**, typename **Sent**, typename **Size**>

[712] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

FwdIter `hpx::ranges::shift_left`(*FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: At most (last - first) - n assignments.

> **Note**
>
> The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns *FwdIter*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Size**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::shift_left`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most (last - first) - n assignments.

> **Note**
>
> The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`FwdIter`** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent`** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **`Size`** – The type of the argument specifying the number of positions to shift by.

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`last`** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **`n`** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

template<typename **`Rng`**, typename **`Size`**>

std::ranges::iterator_t<*Rng*> `hpx::ranges::`**`shift_left`**(*Rng* &&rng, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: At most (last - first) - n assignments.

> **Note**
>
> The type of dereferenced *std::ranges::iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **`Rng`** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **`Size`** – The type of the argument specifying the number of positions to shift by.

Parameters

- **`rng`** – Refers to the range in which the elements will be shifted.
- **`n`** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns *std::ranges::iterator_t<Rng>*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **Rng**, typename **Size**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::shift_left`(*ExPolicy* &&policy, *Rng* &&rng, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most (last - first) - n assignments.

> **Note**
>
> The type of dereferenced *std::ranges::iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns a hpx::future<*std::ranges::iterator_t<Rng>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::ranges::iterator_t<Rng>* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

hpx::ranges::exclusive_scan

Defined in header hpx/algorithm.hpp[713].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **T** = typename *std*::iterator_traits<*InIter*>::value_type, typename **Op** = *std*::plus<*T*>>

exclusive_scan_result<*InIter*, *OutIter*> `hpx::ranges::exclusive_scan`(*InIter* first, *Sent* last, *OutIter* dest, *T* init, *Op* &&op = *Op*())

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, …, *(first + (i - result) - 1)).

[713] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *op*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, . . . , aN) is defined as:
>
> - a1 when N is 1
> - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, . . . , aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, . . . , aN)) where 1 < K+1 = M <= N.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **T** = typename *std*::iterator_traits<*FwdIter1*>::value_type, typename **Op** = *std*::plus<*T*>>

parallel::*util*::detail::algorithm_result<*ExPolicy*, exclusive_scan_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::exclusive_scan`(*ExP* && icy, *Fwd* first *Sen* last, *Fwd* dest *T* init, *Op* && = *Op*(

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, …, *(first + (i - result) - 1)).

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *op*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
>
> - a1 when N is 1
> - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN)) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns a hpx::future<*util::in_out_result<FwdIter1, FwdIter2>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *util::in_out_result<FwdIter1, FwdIter2>* otherwise. The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **O**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type, typename **Op** = *std*::plus<*T*>>
exclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*> `hpx::ranges::exclusive_scan`(*Rng* &&rng, *O* dest, *T* init, *Op* &&op = *Op*())

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, …, *(first + (i - result) - 1))

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *std::plus<T>*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:
>
> - a1 when N is 1
> - GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)
> - GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type, typename **Op** = *std*::plus<*T*>>

parallel::*util*::detail::algorithm_result<*ExPolicy*, exclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*>> `hpx::ranges::exclusive_scan`

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, …, *(first + (i - result) - 1))

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *std::plus<T>*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, …, aN) is defined as:
>
> - a1 when N is 1
> - GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, …, aK)
>   - GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns a hpx::future<*util::in_out_result* <std::ranges::iterator_t<Rng>, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *util::in_out_result* <std::ranges::iterator_t<Rng>, O> otherwise. The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::swap_ranges

Defined in header hpx/algorithm.hpp[714].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InIter1**, typename **Sent1**, typename **InIter2**, typename **Sent2**>

swap_ranges_result<*InIter1*, *InIter2*> `hpx::ranges::`**`swap_ranges`**(*InIter1* first1, *Sent1* last1, *InIter2* first2, *Sent2* last2)

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

[714] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

> **Note**
>
> Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **InIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns

The *swap_ranges* algorithm returns *swap_ranges_result<InIter1, InIter2>*. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, swap_ranges_result<*FwdIter1*, *FwdIter2*>>::type hpx::ranges::**swap_ranges**(*ExPolicy* &&policy, *FwdIter1* first1, *Sent1* last1, *FwdIter2* first2, *Sent2* last2)

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter1` – The type of the first range of iterators to swap (deduced).
- `Sent1` – The type of the first sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- `FwdIter2` – The type of the second range of iterators to swap (deduced).
- `Sent2` – The type of the second sentinel (deduced). This sentinel type must be a sentinel for FwdIter2.

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first1` – Refers to the beginning of the sequence of elements for the first range.
- `last1` – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- `first2` – Refers to the beginning of the sequence of elements for the second range.
- `last2` – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns

The *swap_ranges* algorithm returns a hpx::future<*swap_ranges_result*<*FwdIter1, FwdIter2*>> if the execution policy is of type *parallel_task_policy* and returns *FwdIter2* otherwise. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

template<typename **Rng1**, typename **Rng2**>

swap_ranges_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>> `hpx::ranges::swap_ranges`(*Rng1* &&rng1, *Rng2* &&rng2)

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns

The *swap_ranges* algorithm returns *swap_ranges_result*< std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, swap_ranges_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>>> `hpx::r`

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns

The *swap_ranges* algorithm returns a hpx::future<*swap_ranges_result*< std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>> if the execution policy is of type *parallel_task_policy* and returns *swap_ranges_result*< std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>. otherwise. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

hpx::ranges::stable_sort

Defined in header hpx/algorithm.hpp[715].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

RandomIt `hpx::ranges::stable_sort`(*RandomIt* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *stable_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

[715] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Template Parameters

- `RandomIt` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- `Comp` – The type of the function/function object to use (deduced).
- `Proj` – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- `comp` – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- `proj` – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **ExPolicy**, typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *RandomIt*>::type `hpx::ranges::stable_sort`(*ExPolicy* &&policy, *RandomIt* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `RandomIt` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- `Comp` – The type of the function/function object to use (deduced).
- `Proj` – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- `comp` – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- `proj` – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **Rng**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

std::ranges::iterator_t<*Rng*> `hpx::ranges::stable_sort`(*Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i +

n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *stable_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns *std::ranges::iterator_t<Rng>*. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::stable_sort`(*ExPolicy* &&policy, *Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **`Rng`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`Comp`** – The type of the function/function object to use (deduced).
- **`Proj`** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`rng`** – Refers to the sequence of elements the algorithm will be applied to.
- **`comp`** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **`proj`** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns a hpx::future<*std::ranges::iterator_t*<*Rng*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::ranges::iterator_t*<*Rng*> otherwise. It returns *last*.

hpx::ranges::unique

Defined in header hpx/algorithm.hpp[716].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::unique_copy*

template<typename **FwdIter**, typename **Sent**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>

subrange_t<*FwdIter*, *Sent*> `hpx::ranges::unique`(*FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs not more than *last - first* assignments, exactly *last - first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

[716] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns *subrange_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*FwdIter*, *Sent*>>::type `hpx::ranges::unique`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns *subrange_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

template<typename **Rng**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>

subrange_t<*std*::ranges::iterator_t<*Rng*>, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::`**`unique`**(*Rng* &&rng, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns *subrange_t<std::ranges::iterator_t<Rng>*, std::ranges::iterator_t<Rng>>. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

template<typename **ExPolicy**, typename **Rng**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*std*::ranges::iterator_t<*Rng*>, *std*::ranges::iterator_t<*Rng*>>> `hpx::ranges::u`

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns a hpx::future <subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *subrange_t<std::ranges::iterator_t<Rng>*, std::ranges::iterator_t<Rng>> otherwise. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

hpx::ranges::unique_copy

Defined in header hpx/algorithm.hpp[717].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::unique*

template<typename **InIter**, typename **Sent**, typename **O**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>

unique_copy_result<*InIter*, *O*> `hpx::ranges::unique_copy`(*InIter* first, *Sent* last, *O* dest, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

[717] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter1* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns a returns unique_copy_result<InIter, O>. The *unique_copy* algorithm returns an in_out_result with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **O**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, unique_copy_result<*FwdIter*, *O*>>::type `hpx::ranges::`**`unique_copy`**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *O* dest, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns returns a *hpx::future*< unique_copy_result<FwdIter, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *unique_copy_result<FwdIter, O>* otherwise. The *unique_copy* algorithm returns an in_out_result with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

template<typename **Rng**, typename **O**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>

unique_copy_result<*std*::ranges::iterator_t<*Rng*>, *O*> `hpx::ranges::unique_copy`(*Rng* &&rng, *O* dest, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns *unique_copy_result*< std::ranges::iterator_t<Rng>, O>. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **Pred** = *ranges*::equal_to, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, unique_copy_result<*std*::ranges::iterator_t<*Rng*>, *O*>> `hpx::ranges::unique_copy`(*ExP* && icy, *Rng* && *O* dest *Pre* && = *Pre* *Pro* && = *Pro*

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns a hpx::future<*unique_copy_result*< std::ranges::iterator_t<Rng>, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *unique_copy_result*< std::ranges::iterator_t<Rng>, O> otherwise. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

hpx::ranges::merge

Defined in header hpx/algorithm.hpp[718].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::inplace_merge*

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Comp** = *hpx*::*ranges*::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

[718] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*ranges*::merge_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs O(std::distance(first1, last1) + std::distance(first2, last2)) applications of the comparison *comp* and the each projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.

- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first range of elements the algorithm will be applied to.
- **rng2** – Refers to the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

  ```
  bool comp(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

Returns

The *merge* algorithm returns a hpx::future<*merge_result*<*Iter1, Iter2, Iter3*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *merge_result*<*Iter1, Iter2, Iter3*> otherwise. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Comp** = *hpx*::*ranges*::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*ranges*::merge_result<*Iter1*, *Iter2*, *Iter3*>>::type `hpx::ranges::merge`(*ExPolicy* &&policy, *Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Comp* &&comp = *Comp*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs O(std::distance(first1, last1) + std::distance(first2, last2)) applications of the comparison *comp* and the each projection.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Iter1`** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an random access iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

Returns

The *merge* algorithm returns a hpx::future<*merge_result*<*Iter1, Iter2, Iter3*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *merge_result*<*Iter1, Iter2, Iter3*> otherwise. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Comp** = *hpx*::*ranges*::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*ranges*::merge_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>, *Iter3*> `hpx::ranges::merge`(*Rng1* &&rng1, *Rng2* &&rng2, *Iter3* dest, *Comp* &&comp = *Comp*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: Performs O(std::distance(first1, last1) + std::distance(first2, last2)) applications of the comparison *comp* and the each projection.

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first range of elements the algorithm will be applied to.
- **rng2** – Refers to the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

  ```
  bool comp(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

Returns

The *merge* algorithm returns *merge_result<Iter1, Iter2, Iter3>*. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Comp** = *hpx*::*ranges*::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*ranges*::merge_result<*Iter1*, *Iter2*, *Iter3*> **hpx::ranges::merge**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Comp* &&comp = *Comp*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: Performs O(std::distance(first1, last1) + std::distance(first2, last2)) applications of the comparison *comp* and the each projection.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an random access iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.

- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

  ```
  bool comp(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

Returns

The *merge* algorithm returns *merge_result<Iter1, Iter2, Iter3>*. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

hpx::ranges::inplace_merge

Defined in header hpx/algorithm.hpp[719].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::merge*

template<typename **ExPolicy**, typename **Rng**, typename **Iter**, typename **Comp** = *hpx*::*ranges*::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *Iter*> `hpx::ranges::inplace_merge`(*ExPolicy* &&policy, *Rng* &&rng, *Iter* middle, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

The assignments in the parallel *inplace_merge* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *inplace_merge* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs O(std::distance(first, last)) applications of the comparison *comp* and the each projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to std::less<>

[719] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range of elements the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

  ```
  bool comp(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *inplace_merge* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. The *inplace_merge* algorithm returns the source iterator *last*

template<typename **Rng**, typename **Iter**, typename **Comp** = *hpx*::*ranges*::less, typename **Proj** = *hpx*::identity>

Iter hpx::ranges::**inplace_merge**(*Rng* &&rng, *Iter* middle, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

> **Note**
>
> Complexity: Performs O(std::distance(first, last)) applications of the comparison *comp* and the each projection.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the range of elements the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

  ```
  bool comp(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *inplace_merge* algorithm returns *Iter*. The *inplace_merge* algorithm returns the source iterator *last*

template<typename **Iter**, typename **Sent**, typename **Comp** = *hpx*::*ranges*::less, typename **Proj** = *hpx*::identity>

Iter hpx::ranges::**inplace_merge**(*Iter* first, *Iter* middle, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

> **Note**

Complexity: Performs O(std::distance(first, last)) applications of the comparison *comp* and the each projection.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

  ```
  bool comp(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *inplace_merge* algorithm *Iter*. The *inplace_merge* algorithm returns the source iterator *last*

hpx::ranges::search

Defined in header hpx/algorithm.hpp[720].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::search_n*

template<typename **FwdIter**, typename **Sent**, typename **FwdIter2**, typename **Sent2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

[720] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

FwdIter `hpx::ranges::search`(*FwdIter* first, *Sent* last, *FwdIter2* s_first, *Sent2* s_last, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note

Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = distance(first, last).

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **FwdIter2**, typename **Sent2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type `hpx::ranges::search`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *FwdIter2* s_first, *Sent2* s_last, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

template<typename **Rng1**, typename **Rng2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

std::ranges::iterator_t<*Rng1*> `hpx::ranges::search`(*Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: at most (S*N) comparisons where S = distance(s_first, s_last) and N = distance(first, last).

Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng1*>> `hpx::ranges::search`(*ExPolicy* &&policy, *Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

hpx::ranges::search_n

Defined in header hpx/algorithm.hpp[721].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::search*

template<typename **FwdIter**, typename **FwdIter2**, typename **Sent2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

FwdIter `hpx::ranges::search_n`(*FwdIter* first, *std*::size_t count, *FwdIter2* s_first, Sent s_last, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search_n* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = count.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.

[721] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search_n* algorithm returns *FwdIter*. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [s_first, s_last) in range [first, first+count). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, first+count), *first* is returned. Additionally, if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

template<typename **ExPolicy**, typename **FwdIter**, typename **FwdIter2**, typename **Sent2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type `hpx::ranges::search_n`(*ExPolicy* &&policy, *FwdIter* first, *std*::size_t count, *FwdIter2* s_first, *Sent2* s_last, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = count.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [s_first, s_last) in range [first, first+count). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, first+count), *first* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

template<typename **Rng1**, typename **Rng2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

std::ranges::iterator_t<*Rng1*> `hpx::ranges::search_n`(*Rng1* &&rng1, *std*::size_t count, *Rng2* &&rng2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = distance(first, last).

Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.

- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Pred** = *hpx*::*ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng1*>> `hpx::ranges::search_n`(*ExPolicy* &&policy, *Rng1* &&rng1, *std*::size_t count, *Rng2* &&rng2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (S*N) comparisons where S = distance(s_first, s_last) and N = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

hpx::ranges::is_partitioned

Defined in header hpx/algorithm.hpp[722].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **FwdIter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity>

bool *hpx*::*ranges*::**is_partitioned**(*FwdIter* first, *Sent* last, *Pred* &&pred, *Proj* &&proj = *Proj*())

Determines if the range [first, last) is partitioned.

> **Note**
>
> Complexity: at most (N) predicate evaluations where *N* = distance(first, last).

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.

[722] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns *bool*. The *is_partitioned* algorithm returns true if each element in the sequence for which pred returns true precedes those for which pred returns false. Otherwise is_partitioned returns false. If the range [first, last) contains less than two elements, the function is always true.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::is_partitioned`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Pred* &&pred, *Proj* &&proj = *Proj*())

Determines if the range [first, last) is partitioned.

The predicate operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (N) predicate evaluations where *N* = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *CopyConstructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_partitioned* algorithm returns true if each element in the sequence for which pred returns true precedes those for which pred returns false. Otherwise is_partitioned returns false. If the range [first, last) contains less than two elements, the function is always true.

template<typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity>

bool *hpx::ranges::***is_partitioned**(*Rng* &&rng, *Pred* &&pred, *Proj* &&proj = *Proj*())

Determines if the range rng is partitioned.

> **Note**
>
> Complexity: at most (N) predicate evaluations where *N* = std::size(rng).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

  ```
  bool pred(const Type &a);
  ```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns *bool*. The *is_partitioned* algorithm returns true if each element in the sequence for which pred returns true precedes those for which pred returns false. Otherwise is_partitioned returns false. If the range rng contains less than two elements, the function is always true.

template<typename **ExPolicy**, typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::is_partitioned`(*ExPolicy* &&policy, *Rng* &&rng, *Pred* &&pred, *Proj* &&proj = *Proj*())

Determines if the range [first, last) is partitioned.

The predicate operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (N) predicate evaluations where *N* = std::size(rng).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *CopyConstructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_partitioned* algorithm returns true if each element in the sequence for which pred returns true precedes those for which pred returns false. Otherwise is_partitioned returns false. If the range rng contains less than two elements, the function is always true.

hpx::ranges::starts_with

Defined in header hpx/algorithm.hpp[723].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

bool *hpx*::*ranges*::**starts_with**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.

[723] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **Iter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::starts_with`(*ExPolicy* &&policy, *FwdIter1* first1, *Sent1* last1, *FwdIter2* first2, *Sent2* last2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

template<typename **Rng1**, typename **Rng2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

bool `hpx::ranges::starts_with`(*Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, bool>::type `hpx::ranges::starts_with`(*ExPolicy* &&policy, *Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

hpx::ranges::uninitialized_copy

Defined in header hpx/algorithm.hpp[724].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::uninitialized_copy_n*

template<typename **InIter**, typename **Sent1**, typename **FwdIter**, typename **Sent2**>

hpx::*parallel*::*util*::in_out_result<*InIter*, *FwdIter*> `hpx::ranges::uninitialized_copy`(*InIter* first1, *Sent1* last1, *FwdIter* first2, *Sent2* last2)

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

[724] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy* algorithm returns an *in_out_result<InIter, FwdIter>*. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *parallel*::*util*::in_out_result<*FwdIter1*, *FwdIter2*>>::type *hpx*::*ranges*::**uninitialized_**

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter1` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- `Sent1` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- `FwdIter2` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent2` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first1` – Refers to the beginning of the sequence of elements that will be copied from
- `last1` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- `first2` – Refers to the beginning of the destination range.
- `last2` – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy* algorithm returns a hpx::future<*in_out_result<InIter, FwdIter>*>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result<InIter, FwdIter>* otherwise. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**>

hpx::*parallel*::*util*::in_out_result<typename *hpx*::*traits*::range_traits<*Rng1*>::iterator_type, typename *hpx*::*traits*::range_traits<*Rng2*>::iterator

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns

The *uninitialized_copy* algorithm returns an *in_out_result<typename* hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*parallel*::*util*::in_out_result<typename *hpx*::*traits*::range_traits<*Rng1*>::iterator_type, ty

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns

The *uninitialized_copy* algorithm returns a hpx::future<*in_out_result*<*InIter, FwdIter*>>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result*< typename hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type> otherwise. The *uninitialized_copy* algorithm returns the input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::uninitialized_copy_n

Defined in header hpx/algorithm.hpp[725].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::uninitialized_copy*

template<typename **InIter**, typename **Size**, typename **FwdIter**, typename **Sent2**>

hpx::*parallel*::*util*::in_out_result<*InIter*, *FwdIter*> `hpx::ranges::`**`uninitialized_copy_n`**(*InIter* first1, *Size* count, *FwdIter* first2, *Sent2* last2)

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

[725] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Note

Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- `InIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- `Size` – The type of the argument specifying the number of elements to apply *f* to.
- `FwdIter` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent2` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- `first1` – Refers to the beginning of the sequence of elements that will be copied from
- `count` – Refers to the number of elements starting at *first* the algorithm will be applied to.
- `first2` – Refers to the beginning of the destination range.
- `last2` – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy_n* algorithm returns *in_out_result<InIter, FwdIter>*. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Size**, typename **FwdIter2**, typename **Sent2**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *parallel*::*util*::in_out_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::uninitialized_`

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter1` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- `Size` – The type of the argument specifying the number of elements to apply *f* to.
- `FwdIter2` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent2` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first1` – Refers to the beginning of the sequence of elements that will be copied from
- `count` – Refers to the number of elements starting at *first* the algorithm will be applied to.
- `first2` – Refers to the beginning of the destination range.
- `last2` – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy_n* algorithm returns a hpx::future<*in_out_result*<*FwdIter1, FwdIter2*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::partial_sort_copy

Defined in header hpx/algorithm.hpp[726].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InIter**, typename **Sent1**, typename **RandIter**, typename **Sent2**, typename **Comp** = *ranges*::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

partial_sort_copy_result<*InIter*, *RandIter*> `hpx::ranges::partial_sort_copy`(*InIter* first, *Sent1* last, *RandIter* r_first, *Sent2* r_last, *Comp* &&comp = *Comp*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r_first, r_last). At most r_last - r_first of the elements are placed sorted to the range [r_first, r_first + n) where n is the number of elements to sort (n = min(last - first, r_last - r_first)).

The assignments in the parallel *partial_sort_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: O(N log(min(D,N))), where N = std::distance(first, last) and D = std::distance(r_first, r_last) comparisons.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced).This sentinel type must be a sentinel for InIter.
- **RandIter** – The type of the destination iterators used(deduced) This iterator type must meet the requirements of an random iterator.
- **Sent2** – The type of the destination sentinel (deduced).This sentinel type must be a sentinel for RandIter.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.
- **Proj1** – The type of an optional projection function for the input range. This defaults to *hpx::identity*.
- **Proj1** – The type of an optional projection function for the output range. This defaults to *hpx::identity*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

[726] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **last** – Refers to the sentinel value denoting the end of the sequence of elements the algorithm will be applied to.
- **r_first** – Refers to the beginning of the destination range.
- **r_last** – Refers to the sentinel denoting the end of the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to detail::less.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate *comp* is invoked.

Returns

The *partial_sort_copy* algorithm returns a returns *partial_sort_copy_result<InIter, RandIter>*. The algorithm returns {last, result_first + N}.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent1**, typename **RandIter**, typename **Sent2**, typename **Comp** = *ranges*::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r_first, r_last). At most r_last - r_first of the elements are placed sorted to the range [r_first, r_first + n) where n is the number of elements to sort (n = min(last - first, r_last - r_first)).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: O(N log(min(D,N))), where N = std::distance(first, last) and D = std::distance(r_first, r_last) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source sentinel (deduced).This sentinel type must be a sentinel for FwdIter.
- **RandIter** – The type of the destination iterators used(deduced) This iterator type must meet the requirements of an random iterator.
- **Sent2** – The type of the destination sentinel (deduced).This sentinel type must be a sentinel for RandIter.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.
- **Proj1** – The type of an optional projection function for the input range. This defaults to *hpx::identity*.
- **Proj1** – The type of an optional projection function for the output range. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the sentinel value denoting the end of the sequence of elements the algorithm will be applied to.
- **r_first** – Refers to the beginning of the destination range.
- **r_last** – Refers to the sentinel denoting the end of the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to detail::less.

- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate *comp* is invoked.

Returns

The *partial_sort_copy* algorithm returns a hpx::future<*partial_sort_copy_result*<*FwdIter, RandIter*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *partial_sort_copy_result*<*FwdIter, RandIter*> otherwise. The algorithm returns {last, result_first + N}.

template<typename **Rng1**, typename **Rng2**, typename **Comp** = *ranges*::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

partial_sort_copy_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>> `hpx::ranges::partial_sort_copy`(*Rng1* &&rng1, *Rng2* &&rng2, *Comp* &&comp = *Comp*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r_first, r_last). At most r_last - r_first of the elements are placed sorted to the range [r_first, r_first + n) where n is the number of elements to sort (n = min(last - first, r_last - r_first)).

The assignments in the parallel *partial_sort_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: O(N log(min(D,N))), where N = std::distance(first, last) and D = std::distance(r_first, r_last) comparisons.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of a random iterator.

- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.
- **Proj1** – The type of an optional projection function for the input range. This defaults to *hpx::identity*.
- **Proj2** – The type of an optional projection function for the output range. This defaults to *hpx::identity*.

Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to detail::less.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate *comp* is invoked.

Returns

The *partial_sort_copy* algorithm returns *partial_sort_copy_result<range_iterator_t<Rng1>*, range_iterator_t<Rng2>>. The algorithm returns {last, result_first + N}.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Comp** = *ranges*::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

parallel::*util*::detail::algorithm_result_t<*ExPolicy*, partial_sort_copy_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>>> h

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r_first, r_last). At most r_last - r_first of the elements are placed sorted to the range [r_first, r_first + n) where n is the number of elements to sort (n = min(last - first, r_last - r_first)).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: O(N log(min(D,N))), where N = std::distance(first, last) and D = std::distance(r_first, r_last) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of a random iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.
- **Proj1** – The type of an optional projection function for the input range. This defaults to *hpx::identity*.
- **Proj2** – The type of an optional projection function for the output range. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to detail::less.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate *comp* is invoked.

Returns

The *partial_sort_copy* algorithm returns a hpx::future<*partial_sort_copy_result*< range_iterator_t<Rng1>, range_iterator_t<Rng2>>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *partial_sort_copy_result<range_iterator_t<Rng1>*, range_iterator_t<Rng2>> otherwise. The algorithm returns {last, result_first + N}.

hpx::ranges::inclusive_scan

Defined in header hpx/algorithm.hpp[727].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **Op** = *std*::plus<typename *std*::iterator_traits<*InIter*>::value_type>>
inclusive_scan_result<*InIter*, *OutIter*> `hpx::ranges::inclusive_scan`(*InIter* first, *Sent* last, *OutIter* dest, *Op* &&op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, …, *(first + (i - result))).

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum.

Note

Complexity: O(*last* - *first*) applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, …, aN) is defined as:

- a1 when N is 1
- GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, …, aK)
- GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.

[727] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *inclusive_scan* algorithm returns *util::in_out_result<InIter, OutIter>*. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **Op** = *std*::plus<typename *std*::iterator_traits<*FwdIter1*>::value_type>>

parallel::*util*::detail::algorithm_result<*ExPolicy*, inclusive_scan_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::inclusive_scan`(*ExP* && icy, *Fwd* first *Sent* last, *Fwd* dest *Op* &&

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, …, *(first + (i - result))).

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum.

Note

Complexity: O(*last* - *first*) applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, …, aN) is defined as:

- a1 when N is 1
- GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK)
- GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *inclusive_scan* algorithm returns a hpx::future<*util::in_out_result<FwdIter1,*

FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *util::in_out_result<FwdIter1, FwdIter2>* otherwise. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **O**, typename **Op** = *std*::plus<typename *hpx*::*traits*::range_traits<*Rng*>::value_type>>

inclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*> `hpx::ranges::inclusive_scan`(*Rng* &&rng, *O* dest, *Op* &&op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result))).

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *op*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, …, *(first + (i - result))).

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: O(*last* - *first*) applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN)) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *inclusive_scan* algorithm returns a hpx::future<*util::in_out_result*<*InIter, OutIter*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *util::in_out_result*<*InIter, OutIter*> otherwise. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **O**, typename **Op**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>
inclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*> `hpx::ranges::inclusive_scan`(*Rng* &&rng, *O* dest, *Op* &&op, *T* init)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, …, *(first + (i - result))).

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *op*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
>
> - a1 when N is 1
> - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN)) where 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **init** – The initial value for the generalized sum.

Returns

The *inclusive_scan* algorithm returns *util::in_out_result<std::ranges::iterator_t<Rng>*, O> The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **Op**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>

parallel::*util*::detail::algorithm_result<*ExPolicy*, inclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*>> `hpx::ranges::inclusive_scan`

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result))).

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the ith input element in the ith sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: O(*last* - *first*) applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *inclusive_scan* algorithm returns a hpx::future<*util::in_out_result* <std::ranges::iterator_t<Rng>, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *util::in_out_result* <std::ranges::iterator_t<Rng>, O> otherwise. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied

hpx::ranges::uninitialized_value_construct

Defined in header hpx/algorithm.hpp[728].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::uninitialized_value_construct_n*

template<typename **FwdIter**, typename **Sent**>

FwdIter `hpx::ranges::`**`uninitialized_value_construct`**(*FwdIter* first, *Sent* last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

[728] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- `FwdIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_value_construct* algorithm returns a returns *FwdIter*. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::uninitialized_value_construct`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_value_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **Rng**>

hpx::*traits*::range_traits<*Rng*>::iterator_type `hpx::ranges::uninitialized_value_construct`(*Rng* &&rng)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last - first* assignments.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the range to which will be value constructed.

Returns

The *uninitialized_value_construct* algorithm returns a returns *hpx::traits::range_traits<Rng>::iterator_type*. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **Rng**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type>::type `hpx::ranges::uninitiali`

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be value consutrcted

Returns

The *uninitialized_value_construct* algorithm returns a hpx::future<*typename* hpx::traits::range_traits<Rng>::iterator_type>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename* hpx::traits::range_traits<Rng>::iterator_type otherwise. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

hpx::ranges::uninitialized_value_construct_n

Defined in header hpx/algorithm.hpp[729].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::uninitialized_value_construct*

template<typename **FwdIter**, typename **Size**>

FwdIter `hpx::ranges::uninitialized_value_construct_n`(*FwdIter* first, *Size* count)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_value_construct_n* algorithm returns a returns *FwdIter*. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>

[729] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::uninitialized_value_construct_n`(*ExPolicy* &&policy, *FwdIter* first, *Size* count)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_value_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::ranges::equal

Defined in header hpx/algorithm.hpp[730].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::equal`(*ExPolicy* &&policy, *Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most min(last1 - first1, last2 - first2) applications of the predicate *f*.

Note

The two ranges are considered equal if, for every iterator i in the range [first1,last1), *i equals *(first2 + (i - first1)). This overload of equal uses operator== to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).

[730] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Pred** = equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::equal`(*ExPolicy* &&policy, *Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most *last1 - first1* applications of the predicate *f*.

> **Note**
>
> The two ranges are considered equal if, for every iterator i in the range [first1,last1), *i equals *(first2 + (i - first1)). This overload of equal uses operator== to determine if two elements are equal.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Rng1`** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **`Rng2`** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **`Pred`** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **`Proj1`** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **`Proj2`** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`rng1`** – Refers to the first sequence of elements the algorithm will be applied to.
- **`rng2`** – Refers to the second sequence of elements the algorithm will be applied to.
- **`op`** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

bool *hpx::ranges::***equal**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

Note

Complexity: At most min(last1 - first1, last2 - first2) applications of the predicate *f*.

Note

The two ranges are considered equal if, for every iterator i in the range [first1,last1), *i equals *(first2 + (i - first1)). This overload of equal uses operator== to determine if two elements are equal.

Template Parameters

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>

- **Proj1** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

template<typename **Rng1**, typename **Rng2**, typename **Pred** = equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

bool *hpx::ranges::***equal**(*Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise.

> **Note**
>
> Complexity: At most *last1* - *first1* applications of the predicate *f*.

Note

The two ranges are considered equal if, for every iterator i in the range [first1,last1), *i equals *(first2 + (i - first1)). This overload of equal uses operator== to determine if two elements are equal.

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

hpx::ranges::mismatch

Defined in header hpx/algorithm.hpp[731].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, mismatch_result<*Iter1*, *Iter2*>>::type `hpx::ranges::mismatch`(*ExPolicy* &&policy, *Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if the range [first1, last1) is mismatch to the range [first2, last2), and false otherwise.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most min(last1 - first1, last2 - first2) applications of the predicate *f*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and (last1 - first1) != (last2 - first2) then no applications of the predicate *f* are made.

[731] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

> **Note**
>
> The two ranges are considered mismatch if, for every iterator i in the range [first1,last1), *i mismatchs *(first2 + (i - first1)). This overload of mismatch uses operator== to determine if two elements are mismatch.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *mismatch* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *mismatch* algorithm returns true if the elements in the two ranges are mismatch, otherwise it returns false. If the length of the range [first1, last1) does not mismatch the length of the range [first2, last2), it returns false.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Pred** = equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, mismatch_result<typename *hpx*::*traits*::range_traits<*Rng1*>::iterator_type, typename *hp*

Returns std::pair with iterators to the first two non-equivalent elements.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most *last1* - *first1* applications of the predicate *f*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *mismatch* algorithm returns a hpx::future<*std::pair<FwdIter1, FwdIter2>* > if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::pair<FwdIter1, FwdIter2>* otherwise. The *mismatch* algorithm returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2, last2).

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

mismatch_result<*Iter1*, *Iter2*> hpx::ranges::**mismatch**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if the range [first1, last1) is mismatch to the range [first2, last2), and false otherwise.

> **Note**
>
> Complexity: At most min(last1 - first1, last2 - first2) applications of the predicate *f*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and (last1 - first1) != (last2 - first2) then no applications of the predicate *f* are made.

> **Note**
>
> The two ranges are considered mismatch if, for every iterator i in the range [first1,last1), *i mismatchs *(first2 + (i - first1)). This overload of mismatch uses operator== to determine if two elements are mismatch.

Template Parameters

- `Iter1` – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- `Sent1` – The type of the source iterators used for the end of the first range (deduced).
- `Iter2` – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- `Sent2` – The type of the source iterators used for the end of the second range (deduced).
- `Pred` – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- `Proj1` – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- `Proj2` – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

Parameters

- `first1` – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- `last1` – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- `first2` – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- `last2` – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- `op` – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *mismatch* algorithm returns *bool*. The *mismatch* algorithm returns true if the elements in the two ranges are mismatch, otherwise it returns false. If the length of the range [first1, last1) does not mismatch the length of the range [first2, last2), it returns false.

template<typename **Rng1**, typename **Rng2**, typename **Pred** = equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

mismatch_result<typename *hpx*::*traits*::range_traits<*Rng1*>::iterator_type, typename *hpx*::*traits*::range_traits<*Rng2*>::iterator_type> `hpx::ra`

Returns std::pair with iterators to the first two non-equivalent elements.

> **Note**
>
> Complexity: At most *last1 - first1* applications of the predicate *f*.

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *mismatch* algorithm returns *std::pair<FwdIter1, FwdIter2>*. The *mismatch* algorithm returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2, last2).

hpx::ranges::uninitialized_default_construct

Defined in header hpx/algorithm.hpp[732].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::uninitialized_default_construct_n*

template<typename **FwdIter**, typename **Sent**>

FwdIter `hpx::ranges::`**`uninitialized_default_construct`**(*FwdIter* first, *Sent* last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

[732] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

The assignments in the parallel *uninitialized_default_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- `FwdIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_default_construct* algorithm returns a returns *FwdIter*. The *uninitialized_default_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::uninitialized_default_construct`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_default_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_default_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **Rng**>

hpx::*traits*::range_traits<*Rng*>::iterator_type `hpx::ranges::uninitialized_default_construct`(*Rng* &&rng)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the range to which will be default constructed.

Returns

The *uninitialized_default_construct* algorithm returns a returns *hpx::traits::range_traits<Rng>::iterator_type*. The *uninitialized_default_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **Rng**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type>::type `hpx::ranges::uninitiali`

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be default constructed

Returns

The *uninitialized_default_construct* algorithm returns a hpx::future<*typename* hpx::traits::range_traits<Rng>::iterator_type>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename* hpx::traits::range_traits<Rng>::iterator_type otherwise. The *uninitialized_default_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

hpx::ranges::uninitialized_default_construct_n

Defined in header hpx/algorithm.hpp[733].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::uninitialized_default_construct*

template<typename **FwdIter**, typename **Size**>

FwdIter `hpx::ranges::uninitialized_default_construct_n`(*FwdIter* first, *Size* count)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_default_construct_n* algorithm returns a returns *FwdIter*. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>

[733] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

parallel::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type `hpx::ranges::uninitialized_default_construct_n`(*ExPolicy* &&policy, *FwdIter* first, *Size* count)

Constructs objects of type typename iterator_traits<ForwardIt>::value_type in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_default_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::ranges::ends_with

Defined in header hpx/algorithm.hpp[734].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

bool *hpx::ranges::***ends_with**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.

[734] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *ends_with* algorithm returns *bool*. The *ends_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, bool>::type `hpx::ranges::`**`ends_with`**(*ExPolicy* &&policy, *FwdIter1* first1, *Sent1* last1, *FwdIter2* first2, *Sent2* last2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.

- `FwdIter2` – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent2` – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- `Pred` – The binary predicate that compares the projected elements.
- `Proj1` – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- `Proj2` – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first1` – Refers to the beginning of the source range.
- `last1` – Sentinel value referring to the end of the source range.
- `first2` – Refers to the beginning of the destination range.
- `last2` – Sentinel value referring to the end of the destination range.
- `pred` – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- `proj1` – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- `proj2` – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *ends_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *ends_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

template<typename **Rng1**, typename **Rng2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

bool `hpx::ranges::ends_with`(*Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range *rng2* matches the suffix of the first range *rng1*.

The assignments in the parallel *ends_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *ends_with* algorithm returns *bool*. The *ends_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Pred** = *ranges*::equal_to, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, bool>::type `hpx::ranges::ends_with`(*ExPolicy* &&policy, *Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks whether the second range *rng2* matches the suffix of the first range *rng1*.

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `Rng1` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- `Rng2` – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- `Pred` – The binary predicate that compares the projected elements.
- `Proj1` – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- `Proj2` – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `rng1` – Refers to the source range.
- `rng2` – Refers to the destination range.
- `pred` – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- `proj1` – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- `proj2` – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *ends_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *ends_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

hpx::ranges::min_element

Defined in header hpx/algorithm.hpp[735].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::max_element*
- *hpx::ranges::minmax_element*

template<typename **FwdIter**, typename **Sent**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

FwdIter `hpx::ranges::min_element`(*FwdIter* first, *Sent* last, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min_element* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Exactly *max*(N-1, 0) comparisons, where N = std::distance(first, last).

Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

[735] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *min_element* algorithm returns *FwdIter*. The *min_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

template<typename **Rng**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

std::ranges::iterator_t<*Rng*> `hpx::ranges::min_element`(*Rng* &&rng, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min_element* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Exactly *max*(N-1, 0) comparisons, where N = std::distance(first, last).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *min_element* algorithm returns a *hpx::traits::range_iterator<Rng>::type* otherwise. The *min_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::min_element`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *max*(N-1, 0) comparisons, where N = std::distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *min_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *min_element* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *min_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

template<typename **ExPolicy**, typename **Rng**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::min_element`(*ExPolicy* &&policy, *Rng* &&rng, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *max*(N-1, 0) comparisons, where N = std::distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *min_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *min_element* algorithm returns a hpx::future<*hpx::traits::range_iterator*<*Rng*>*::type*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *min_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

hpx::ranges::max_element

Defined in header hpx/algorithm.hpp[736].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::min_element*
- *hpx::ranges::minmax_element*

template<typename **FwdIter**, typename **Sent**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

FwdIter `hpx::ranges::max_element`(*FwdIter* first, *Sent* last, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max_element* algorithm execute in sequential order in the calling thread.

[736] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

> **Note**
>
> Complexity: Exactly *max*(N-1, 0) comparisons, where N = std::distance(first, last).

Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to std::less. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *max_element* algorithm returns a *FwdIter*. The *max_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

template<typename **Rng**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

std::ranges::iterator_t<*Rng*> `hpx::ranges::`**`max_element`**(*Rng* &&rng, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max_element* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Exactly *max*(N-1, 0) comparisons, where N = std::distance(first, last).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to std::less. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *max_element* algorithm returns a *hpx::traits::range_iterator<Rng>::type* otherwise. The *max_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::`**`max_element`**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *max*(N-1, 0) comparisons, where N = std::distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to std::less. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *max_element* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *max_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

template<typename **ExPolicy**, typename **Rng**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::max_element`(*ExPolicy* &&policy, *Rng* &&rng, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *max*(N-1, 0) comparisons, where N = std::distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to std::less. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *max_element* algorithm returns a hpx::future<*hpx::traits::range_iterator*<*Rng*>*::type*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *max_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

hpx::ranges::minmax_element

Defined in header hpx/algorithm.hpp[737].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::min_element*
- *hpx::ranges::max_element*

template<typename **FwdIter**, typename **Sent**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

minmax_element_result<*FwdIter*> *hpx*::*ranges*::**minmax_element**(*FwdIter* first, *Sent* last, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The assignments in the parallel *minmax_element* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: At most *max*(floor(3/2*(N-1)), 0) applications of the predicate, where N = std::distance(first, last).

Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.

[737] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to std::less. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *minmax_element* algorithm returns a *minmax_element_result<FwdIter, FwdIter>* The *minmax_element* algorithm returns a min_max_result consisting of an iterator to the smallest element as the min element and an iterator to the greatest element as the max element. Returns minmax_element_result{first, first} if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

template<typename **Rng**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

minmax_element_result<*std*::ranges::iterator_t<*Rng*>> `hpx::ranges::`**`minmax_element`**(*Rng* &&rng, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The assignments in the parallel *minmax_element* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: At most *max*(floor(3/2*(N-1)), 0) applications of the predicate, where N = std::distance(first, last).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to std::less. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *minmax_element* algorithm returns a *minmax_element_result<hpx::traits::range_iterator<Rng>::type* , hpx::traits::range_iterator<Rng>::type> The *minmax_element* algorithm returns a min_max_result consisting of an range iterator to the smallest element as the min element and an range iterator to the greatest element as the max element. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, minmax_element_result<*FwdIter*>> `hpx::ranges::minmax_element`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *F* &&f = *F*(), *Proj* &&proj = *Proj*())

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most *max*(floor(3/2*(N-1)), 0) applications of the predicate, where N = std::distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to std::less. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *minmax_element* algorithm returns a *minmax_element_result<FwdIter, FwdIter>* The *minmax_element* algorithm returns a min_max_result consisting of an iterator to the smallest element as the min element and an iterator to the greatest element as the max element. Returns minmax_element_result{first, first} if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

template<typename **ExPolicy**, typename **Rng**, typename **F** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, minmax_element_result<*std*::ranges::iterator_t<*Rng*>>> `hpx::ranges::minmax_el`

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most *max*(floor(3/2*(N-1)), 0) applications of the predicate, where N = std::distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to std::less. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *minmax_element* algorithm returns a *minmax_element_result<hpx::traits::range_iterator<Rng>::type*, hpx::traits::range_iterator<Rng>::type> The *minmax_element* algorithm returns a min_max_result consisting of an range iterator to the smallest element as the min element and an range iterator to the greatest element as the max element. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

hpx::ranges::adjacent_find

Defined in header hpx/algorithm.hpp[738].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **FwdIter**, typename **Sent**, typename **Proj** = *hpx*::identity, typename **Pred** = detail::equal_to>

FwdIter `hpx::ranges::adjacent_find`(*FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Searches the range [first, last) for two consecutive identical elements.

> **Note**
>
> Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use.

Parameters

[738] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1* .
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Proj** = *hpx*::identity, typename **Pred** = detail::equal_to>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type `hpx::ranges::adjacent_find`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Searches the range [first, last) for two consecutive identical elements. This version uses the given binary predicate pred

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

> **Note**
>
> Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1* .
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *adjacent_find* algorithm returns a *hpx::future<InIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *InIter* otherwise. The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

template<typename **Rng**, typename **Proj** = *hpx*::identity, typename **Pred** = detail::equal_to>

hpx::*traits*::range_traits<*Rng*>::iterator_type **hpx::ranges::adjacent_find**(*Rng* &&rng, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Searches the range rng for two consecutive identical elements.

Note

Complexity: Exactly the smaller of (result - std::begin(rng)) + 1 and (std::begin(rng) - std::end(rng)) - 1 applications of the predicate where *result* is the value returned

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1* .
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

template<typename **ExPolicy**, typename **Rng**, typename **Proj** = *hpx*::identity, typename **Pred** = detail::equal_to>

parallel::*util*::detail::algorithm_result<*ExPolicy*, typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type>::type `hpx::ranges::adjacent_f`

Searches the range rng for two consecutive identical elements.

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

Note

Complexity: Exactly the smaller of (result - std::begin(rng)) + 1 and (std::begin(rng) - std::end(rng)) - 1 applications of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1* .
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *adjacent_find* algorithm returns a *hpx::future<InIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *InIter* otherwise. The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

hpx::ranges::shift_right

Defined in header hpx/algorithm.hpp[739].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **FwdIter**, typename **Sent**, typename **Size**>

[739] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

FwdIter `hpx::ranges::shift_right`(*FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: At most (last - first) - n assignments.

> **Note**
>
> The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns *FwdIter*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Size**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::shift_right`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most (last - first) - n assignments.

> **Note**
>
> The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

template<typename **Rng**, typename **Size**>

std::ranges::iterator_t<*Rng*> `hpx::ranges::shift_right`(*Rng* &&rng, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: At most (last - first) - n assignments.

> **Note**
>
> The type of dereferenced *std::ranges::iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns *std::ranges::iterator_t<Rng>*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **Rng**, typename **Size**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::shift_right`(*ExPolicy* &&policy, *Rng* &&rng, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most (last - first) - n assignments.

> **Note**
>
> The type of dereferenced *std::ranges::iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns a hpx::future<*std::ranges::iterator_t<Rng>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::ranges::iterator_t<Rng>* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

hpx::ranges::generate

Defined in header hpx/algorithm.hpp[740].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::generate_n*

template<typename **ExPolicy**, typename **Rng**, typename **F**>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::generate`(*ExPolicy* &&policy, *Rng* &&rng, *F* &&f)

Assign each element in range [first, last) a value generated by the given function object f

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

[740] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

  The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns
The *replace_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **F**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *Iter*> `hpx::ranges::generate`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *F* &&f)

Assign each element in range [first, last) a value generated by the given function object f

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source end iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

  The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns
The *replace_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

template<typename **Rng**, typename **F**>

std::ranges::iterator_t<*Rng*> `hpx::ranges::generate`(*Rng* &&rng, *F* &&f)

Assign each element in range [first, last) a value generated by the given function object f

> **Note**
>
> Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

  The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns
The *replace_if* algorithm returns *last*.

template<typename **Iter**, typename **Sent**, typename **F**>

Iter `hpx::ranges::generate`(*Iter* first, *Sent* last, *F* &&f)

Assign each element in range [first, last) a value generated by the given function object f

> **Note**
>
> Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **Iter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source end iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

  The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns *last*.

hpx::ranges::generate_n

Defined in header hpx/algorithm.hpp[741].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::generate*

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**, typename **F**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **hpx::ranges::generate_n**(*ExPolicy* &&policy, *FwdIter* first, *Size* count, *F* &&f)

Assigns each element in range [first, first+count) a value generated by the given function object g.

[741] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

The assignments in the parallel *generate_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *count* invocations of *f* and assignments, for count > 0.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

```
Ret fun();
```

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

template<typename **FwdIter**, typename **Size**, typename **F**>

FwdIter `hpx::ranges::`**generate_n**(*FwdIter* first, *Size* count, *F* &&f)

Assigns each element in range [first, first+count) a value generated by the given function object g.

> **Note**
>
> Complexity: Exactly *count* invocations of *f* and assignments, for count > 0.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

  ```
  Ret fun();
  ```

  The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns *last*.

hpx/parallel/container_algorithms/iota.hpp

Defined in header hpx/parallel/container_algorithms/iota.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**, typename **T**>

iota_result<*FwdIter*, *T*> **iota**(*FwdIter* first, *Sent* last, *T* value)

Fills the range [first, last) with sequentially increasing values, starting with *value* and repetitively evaluating ++`value`.

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Exactly *std::distance(first, last)* assignments and increments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input or output iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a *hpx::ranges::iota_result* containing the final iterator and the final value.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **T**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, iota_result<*FwdIter*, *T*>> **iota**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *T* value)

Fills the range [first, last) with sequentially increasing values, starting with *value* and repetitively evaluating ++`value`.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *std::distance(first, last)* assignments and increments.

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `FwdIter` – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- `T` – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to the end of the sequence of elements the algorithm will be applied to.
- `value` – The value to be stored in the first element.

Returns

The *iota* algorithm returns a *hpx::future<iota_result>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *iota_result* otherwise.

template<typename **Range**, typename **T**>

iota_result<typename *hpx*::*traits*::range_traits<*Range*>::iterator_type, *T*> **iota**(*Range* &&r, *T* value)

Fills the range *r* with sequentially increasing values, starting with *value* and repetitively evaluating `++value`.

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Exactly *std::ranges::distance(r)* assignments and increments.

Template Parameters

- `Range` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input or output iterator
- `T` – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- `r` – Refers to the sequence of elements the algorithm will be applied to.
- `value` – The value to be stored in the first element.

Returns

The *iota* algorithm returns a *hpx::ranges::iota_result* containing the final iterator and the final value.

template<typename **ExPolicy**, typename **Range**, typename **T**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, iota_result<typename *hpx*::*traits*::range_traits<*Range*>::iterator_type, *T*>> **iota**(*Ex*
&
icy
Ra
&
T
va

Fills the range *r* with sequentially increasing values, starting with *value* and repetitively evaluating `++value`.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly *std::ranges::distance(r)* assignments and increments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Range** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **r** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a *hpx::future<iota_result>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *iota_result* otherwise.

hpx::ranges::transform_inclusive_scan

Defined in header hpx/algorithm.hpp[742].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **BinOp**, typename **UnOp**>

transform_inclusive_scan_result<*InIter*, *OutIter*> `hpx::ranges::transform_inclusive_scan`(*InIter* first, *Sent* last, *OutIter* dest, *BinOp* &&binary_op, *UnOp* &&unary_op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where 1 < K+1 = M <= N.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

[742] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_inclusive_scan* algorithm returns *transform_inclusive_scan_result<InIter, OutIter>*. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **BinOp**, typename **UnOp**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_inclusive_result<*FwdIter1*, *FwdIter2*>>::type *hpx*::*ranges*::**transform_incl**

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_inclusive_scan* algorithm returns a hpx::future<*transform_inclusive_result*<*FwdIter1*, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_result*<*FwdIter1*, FwdIter2> otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**>

transform_inclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*> *hpx*::*ranges*::**transform_inclusive_scan**(*Rng* &&rng, *O* dest, *BinOp* &&binary_op, *UnOp* &&unary_op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, . . . , aN) is defined as:
>
> - a1 when N is 1
> - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, . . . , aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, . . . , aN) where 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_inclusive_scan* algorithm returns a returns *transform_inclusive_scan_result*< std::ranges::iterator_t<Rng>, O>. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_inclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*>>::type `hpx::ranges::t`

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.
- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns *transform_inclusive_scan_result<InIter, OutIter>*. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*FwdIter1*>::value_type>

parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_inclusive_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::transform_incl`

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.
- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns a hpx::future<*transform_inclusive_result*<*FwdIter1*, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_result*<*FwdIter1*, FwdIter2> otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>

transform_inclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*> *hpx*::*ranges*::**transform_inclusive_scan**(*Rng* &&rng, *O* dest, *BinOp* &&binary_op, *UnOp* &&unary_op, *T* init)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
>
> - a1 when N is 1
> - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.
- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns a returns *transform_inclusive_scan_result*< std::ranges::iterator_t<Rng>, O>. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>

parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_inclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*>>::type `hpx::ranges::t`

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_inclusive_scan may be non-deterministic for a non-associative predicate.

> - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns a hpx::future<*transform_inclusive_scan_result*< std::ranges::iterator_t<Rng>, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_scan_result*< std::ranges::iterator_t<Rng>, O> otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::includes

Defined in header hpx/algorithm.hpp[743].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::includes`(*ExPolicy* &&policy, *Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

[743] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

At most 2*(N1+N2-1) comparisons, where N1 = std::distance(first1, last1) and N2 = std::distance(first2, last2).

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `Iter1` – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- `Sent1` – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- `Iter2` – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- `Sent2` – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- `Pred` – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- `Proj1` – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- `Proj2` – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first1` – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- `last1` – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- `first2` – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- `last2` – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- `op` – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

bool *hpx*::*ranges*::**includes**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

> **Note**
>
> At most 2*(N1+N2-1) comparisons, where N1 = std::distance(first1, last1) and N2 = std::distance(first2, last2).

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*

- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::`**`includes`**(*ExPolicy* &&policy, *Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> At most 2*(N1+N2-1) comparisons, where N1 = std::distance(first1, last1) and N2 = std::distance(first2, last2).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

template<typename **Rng1**, typename **Rng2**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

bool *hpx*::*ranges*::**includes**(*Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

> **Note**
>
> At most 2*(N1+N2-1) comparisons, where N1 = std::distance(first1, last1) and N2 = std::distance(first2, last2).

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

hpx::ranges::partial_sort

Defined in header hpx/algorithm.hpp[744].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

RandomIt `hpx::ranges::partial_sort`(*RandomIt* first, *RandomIt* middle, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The assignments in the parallel *partial_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Approximately (last - first) * log(middle - first) comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

[744] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. Comp defaults to detail::less.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *partial_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **ExPolicy**, typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *RandomIt*>::type `hpx::ranges::partial_sort`(*ExPolicy* &&policy, *RandomIt* first, *RandomIt* middle, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Approximately (last - first) * log(middle - first) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.

- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. Comp defaults to detail::less.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *partial_sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **Rng**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

std::ranges::iterator_t<*Rng*> `hpx::ranges::partial_sort`(*Rng* &&rng, *std*::ranges::iterator_t<*Rng*> middle, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The assignments in the parallel *partial_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Approximately (last - first) * log(middle - first) comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. Comp defaults to detail::less.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *partial_sort* algorithm returns *std::ranges::iterator_t<Rng>*. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result_t<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::partial_sort`(*ExPolicy* &&policy, *Rng* &&rng, *std*::ranges::iterator_t<*Rn* middle, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: O(N log(N)), where N = std::distance(first, last) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less;
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. Comp defaults to detail::less.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *partial_sort* algorithm returns a hpx::future<*std::ranges::iterator_t<Rng>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::ranges::iterator_t<Rng>* otherwise. It returns *last*.

hpx::ranges::adjacent_difference

Defined in header hpx/algorithm.hpp[745].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **FwdIter1**, typename **FwdIter2**, typename **Sent**>

FwdIter2 `hpx::ranges::adjacent_difference`(*FwdIter1* first, *Sent* last, *FwdIter2* dest)

Searches the range [first, last) for two consecutive identical elements.

[745] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

template<typename **Rng**, typename **FwdIter2**>

FwdIter2 `hpx::ranges::adjacent_difference`(*Rng* &&rng, *FwdIter2* dest)

Searches the *rng* for two consecutive identical elements.

Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter2*> `hpx::ranges::adjacent_difference`(*ExPolicy* &&policy, *FwdIter1* first, *Sent* last, *FwdIter2* dest)

Searches the range [first, last) for two consecutive identical elements.

> **Note**
>
> Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter2**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter2*> `hpx::ranges::adjacent_difference`(*ExPolicy* &&policy, *Rng* &&rng, *FwdIter2* dest)

Searches the *rng* for two consecutive identical elements.

> **Note**
>
> Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

template<typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **Op**>

FwdIter2 `hpx::ranges::adjacent_difference`(*FwdIter1* first, *Sent* last, *FwdIter2* dest, *Op* &&op)

Searches the range [first, last) for two consecutive identical elements.

> **Note**
>
> Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const &. The types *Type1* and *Type2* must be such that an object of type *iterator_traits<InputIt>::value_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

template<typename **Rng**, typename **FwdIter2**, typename **Op**>

FwdIter2 `hpx::ranges::adjacent_difference`(*Rng* &&rng, *FwdIter2* dest, *Op* &&op)

Searches the *rng* for two consecutive identical elements.

Template Parameters

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const &. The types *Type1* and *Type2* must be such that an object of type *iterator_traits<InputIt>::value_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.?

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **Op**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter2*> `hpx::ranges::adjacent_difference`(*ExPolicy* &&policy, *FwdIter1* first, *Sent* last, *FwdIter2* dest, *Op* &&op)

Searches the range [first, last) for two consecutive identical elements.

Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &. The types *Type1* and *Type2* must be such that an object of type *iterator_traits<InputIt>::value_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.?

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter2**, typename **Op**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter2*> `hpx::ranges::adjacent_difference`(*ExPolicy* &&policy, *Rng* &&rng, *FwdIter2* dest, *Op* &&op)

Searches the *rng* for two consecutive identical elements.

> **Note**
>
> Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- `Op` – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &. The types *Type1* and *Type2* must be such that an object of type *iterator_traits<InputIt>::value_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

hpx::ranges::copy

Defined in header hpx/algorithm.hpp[746].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::copy_n*
- *hpx::ranges::copy_if*

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::copy_result<*FwdIter1*, *FwdIter*>>::type `hpx::ranges::copy`(*ExPolicy* &&policy, *FwdIter1* iter, *Sent1* sent, *FwdIter* dest)

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

[746] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`FwdIter1`** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent1`** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **`FwdIter`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`iter`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`sent`** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **`dest`** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a hpx::future<*ranges::copy_result<FwdIter1, FwdIter>* > if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::copy_result<FwdIter1, FwdIter>* otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **`ExPolicy`**, typename **`Rng`**, typename **`FwdIter`**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::copy_result<typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type, *FwdIter*>>::typ

Copies the elements in the range *rng* to another range beginning at *dest*.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly std::distance(begin(rng), end(rng)) assignments.

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `FwdIter` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `rng` – Refers to the sequence of elements the algorithm will be applied to.
- `dest` – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a hpx::future<*ranges::copy_result*<*iterator_t*<*Rng*>, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::copy_result*<*iterator_t*<*Rng*>, FwdIter2> otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **FwdIter1**, typename **Sent1**, typename **FwdIter**>

ranges::copy_result<*FwdIter1*, *FwdIter*> `hpx::ranges::copy`(*FwdIter1* iter, *Sent1* sent, *FwdIter* dest)

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

Note

Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- `FwdIter1` – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- `Sent1` – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.

- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **FwdIter**>

ranges::copy_result<typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type, *FwdIter*> `hpx::ranges::copy`(*Rng* &&rng, *FwdIter* dest)

Copies the elements in the range *rng* to another range beginning at *dest*.

> **Note**
>
> Complexity: Performs exactly std::distance(begin(rng), end(rng)) assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::copy_n

Defined in header hpx/algorithm.hpp[747].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::copy*
- *hpx::ranges::copy_if*

template<typename **ExPolicy**, typename **FwdIter1**, typename **Size**, typename **FwdIter2**>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::copy_n_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::copy_n`(*ExPolicy* &&policy, *FwdIter1* first, *Size* count, *FwdIter2* dest)

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

[747] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `count` – Refers to the number of elements starting at *first* the algorithm will be applied to.
- `dest` – Refers to the beginning of the destination range.

Returns

The *copy_n* algorithm returns a hpx::future<*ranges::copy_n_result<FwdIter1, FwdIter2>* > if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::copy_n_result<FwdIter1, FwdIter2>* otherwise. The *copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **FwdIter1**, typename **Size**, typename **FwdIter2**>

ranges::copy_n_result<*FwdIter1*, *FwdIter2*> `hpx::ranges::copy_n`(*FwdIter1* first, *Size* count, *FwdIter2* dest)

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest.

> **Note**
>
> Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- `FwdIter1` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- `Size` – The type of the argument specifying the number of elements to apply *f* to.
- `FwdIter2` – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `count` – Refers to the number of elements starting at *first* the algorithm will be applied to.
- `dest` – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::copy_if

Defined in header hpx/algorithm.hpp[748].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::copy*
- *hpx::ranges::copy_n*

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter**, typename **Pred**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::copy_if_result<*FwdIter1*, *FwdIter*>>::type `hpx::ranges::copy_if`(*ExPolicy* &&policy, *FwdIter1* iter, *Sent1* sent, *FwdIter* dest, *Pred* &&pred, *Proj* &&proj = *Proj*())

Copies the elements in the range, defined by [first, last) to another range beginning at *dest*. The order of the elements that are not removed is preserved.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for FwdIter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

[748] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1* .
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *copy_if* algorithm returns a hpx::future<*ranges::copy_if_result<iterator_t<Rng>*, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::copy_if_result<iterator_t<Rng>*, FwdIter2> otherwise. The *copy_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter**, typename **Pred**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::copy_if_result<typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type, *FwdIte*

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1* .
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *copy_if* algorithm returns a hpx::future<*ranges::copy_if_result<iterator_t<Rng>*, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::copy_if_result<iterator_t<Rng>*, FwdIter2> otherwise. The *copy_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **FwdIter1**, typename **Sent1**, typename **FwdIter**, typename **Pred**, typename **Proj** = *hpx*::identity>

ranges::copy_if_result<*FwdIter1*, *FwdIter*> `hpx::ranges::copy_if`(*FwdIter1* iter, *Sent1* sent, *FwdIter* dest, *Pred* &&pred, *Proj* &&proj = *Proj*())

Copies the elements in the range, defined by [first, last) to another range beginning at *dest*. The order of the elements that are not removed is preserved.

Template Parameters

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for FwdIter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1* .
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *copy_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **FwdIter**, typename **Pred**, typename **Proj** = *hpx*::identity>

ranges::copy_if_result<typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type, *FwdIter*> **hpx::ranges::copy_if**(*Rng* &&rng, *FwdIter* dest, *Pred* &&pred, *Proj* &&proj = *Proj*())

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1* .

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *copy_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::is_sorted

Defined in header hpx/algorithm.hpp[749].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::is_sorted_until*

template<typename **FwdIter**, typename **Sent**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

bool `hpx::ranges::is_sorted`(*FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Determines if the range [first, last) is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is_sorted* algorithm executes in sequential order in the calling thread.

> **Note**
>
> Complexity: at most (N+S-1) comparisons where *N* = distance(first, last). *S* = number of partitions

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.

[749] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a *bool*. The *is_sorted* algorithm returns true if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::is_sorted`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Determines if the range [first, last) is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (N+S-1) comparisons where *N* = distance(first, last). *S* = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

  ```
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_sorted* algorithm returns a bool if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

template<typename **Rng**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

bool *hpx::ranges::***is_sorted**(*Rng* &&rng, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Determines if the range rng is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is_sorted* algorithm executes in sequential order in the calling thread.

> **Note**
>
> Complexity: at most (N+S-1) comparisons where N = size(rng). S = number of partitions

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

  ```
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a *bool*. The *is_sorted* algorithm returns true if each element in the rng satisfies the predicate passed. If the range rng contains less than two elements, the function always returns true.

template<typename **ExPolicy**, typename **Rng**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::is_sorted`(*ExPolicy* &&policy, *Rng* &&rng, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Determines if the range rng is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (N+S-1) comparisons where N = size(rng). S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

  ```
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_sorted* algorithm returns a bool if each element in the range rng satisfies the predicate passed. If the range rng contains less than two elements, the function always returns true.

hpx::ranges::is_sorted_until

Defined in header hpx/algorithm.hpp[750].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::is_sorted*

[750] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

template<typename **FwdIter**, typename **Sent**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

FwdIter `hpx::ranges::is_sorted_until`(*FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm execute in sequential order in the calling thread.

Note

Complexity: at most (N+S-1) comparisons where N = distance(first, last). S = number of partitions

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* algorithm returns a *FwdIter*. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type `hpx::ranges::is_sorted_until`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most (N+S-1) comparisons where *N* = distance(first, last). *S* = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

  ```
  bool pred(const Type &a, const Type &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

template<typename **Rng**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

std::ranges::iterator_t<*Rng*> *hpx*::*ranges*::**is_sorted_until**(*Rng* &&rng, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Returns the first element in the range rng that is not sorted. Uses a predicate to compare elements or the less than operator.

> **Note**
>
> Complexity: at most (N+S-1) comparisons where *N* = size(rng). *S* = number of partitions

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* returns *FwdIter*. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

template<typename **ExPolicy**, typename **Rng**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>
hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::is_sorted_until`(*ExPolicy* &&policy, *Rng* &&rng, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Returns the first element in the range rng that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (N+S-1) comparisons where N = size(rng). S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

hpx::ranges::make_heap

Defined in header hpx/algorithm.hpp[751].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **Comp**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *Iter*> `hpx::ranges::make_heap`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *Comp* &&comp, *Proj* &&proj = *Proj*{})

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

[751] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Iter`** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent`** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **`Comp`** – The type of the function/function object to use (deduced).
- **`Proj`** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`last`** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **`comp`** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

  ```
  bool comp(const Type &a, const Type &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to Type.
- **`proj`** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **Comp**, typename **Proj** = *hpx*::identity>

hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> `hpx::ranges::make_heap`(*ExPolicy* &&policy, *Rng* &&rng, *Comp* &&comp, *Proj* &&proj = *Proj*{})

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *Iter*> `hpx::ranges::make_heap`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *Proj* &&proj = *Proj*{})

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::make_heap`(*ExPolicy* &&policy, *Rng* &&rng, *Proj* &&proj = *Proj*{})

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

template<typename **Iter**, typename **Sent**, typename **Comp**, typename **Proj** = *hpx*::identity>

Iter `hpx::ranges::make_heap`(*Iter* first, *Sent* last, *Comp* &&comp, *Proj* &&proj = *Proj*{})

Constructs a *max heap* in the range [first, last).

> **Note**
>
> Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

  ```
  bool comp(const Type &a, const Type &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns *Iter*. It returns *last*.

template<typename **Rng**, typename **Comp**, typename **Proj** = *hpx*::identity>

std::ranges::iterator_t<*Rng*> `hpx::ranges::make_heap`(*Rng* &&rng, *Comp* &&comp, *Proj* &&proj = *Proj*{})

Constructs a *max heap* in the range [first, last).

> **Note**
>
> Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns *Iter*. It returns *last*.

template<typename **Iter**, typename **Sent**, typename **Proj** = *hpx*::identity>

Iter `hpx::ranges::make_heap`(*Iter* first, *Sent* last, *Proj* &&proj = *Proj*{})

Constructs a *max heap* in the range [first, last).

> **Note**
>
> Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns *Iter*. It returns *last*.

template<typename **Rng**, typename **Proj** = *hpx*::identity>

std::ranges::iterator_t<*Rng*> `hpx::ranges::make_heap`(*Rng* &&rng, *Proj* &&proj = *Proj*{})

Constructs a *max heap* in the range [first, last).

> **Note**
>
> Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns *Iter*. It returns *last*.

hpx::ranges::set_union

Defined in header hpx/algorithm.hpp[752].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

[752] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_union_result<*Iter1*, *Iter2*, *Iter3*>>::type `hpx::ranges::set_union`(*ExPolicy* &&policy, *Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), then all *m* elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- `proj2` – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_union* algorithm returns a hpx::future<*ranges::set_union_result*<*Iter1, Iter2, Iter3*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_union_result*<*Iter1, Iter2, Iter3*> otherwise. The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_union_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>, *Iter3*>>

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), then all *m* elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_union* algorithm returns a hpx::future<*ranges::set_union_result<Iter1, Iter2, Iter3>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_union_result<Iter1, Iter2, Iter3>* otherwise. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

set_union_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>, *Iter3*> `hpx::ranges::set_union`(*Rng1* &&rng1, *Rng2* &&rng2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in one or both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), then all *m* elements will be copied from [first1, last1) to dest, preserving order, and then exactly std::max(n-m, 0) elements will be copied from [first2, last2) to dest, also preserving order.

The resulting range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_union* algorithm returns *ranges::set_union_result<Iter1, Iter2, Iter3>*. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::lexicographical_compare

Defined in header hpx/algorithm.hpp[753].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InIter1**, typename **Sent1**, typename **InIter2**, typename **Sent2**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity, typename **Pred** = *hpx*::*parallel*::detail::less>

bool `hpx::ranges::lexicographical_compare`(*InIter1* first1, *Sent1* last1, *InIter2* first2, *Sent2* last2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

[753] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Checks if the first range [first1, last1) is lexicographically less than the second range [first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: At most 2 * min(N1, N2) applications of the comparison operation, where N1 = std::distance(first1, last) and N2 = std::distance(first2, last2).

> **Note**
>
> Lexicographical comparison is an operation with the following properties
>
> - Two ranges are compared element by element
> - The first mismatching element defines which range is lexicographically *less* or *greater* than the other
> - If one range is a prefix of another, the shorter range is lexicographically *less* than the other
> - If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
> - An empty range is lexicographically *less* than any non-empty range
> - Two empty ranges are lexicographically *equal*

Template Parameters

- **`InIter1`** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **`Sent1`** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **`InIter2`** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an input iterator.
- **`Sent2`** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.
- **`Pred`** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **`Proj1`** – The type of an optional projection function for FwdIter1. This defaults to *hpx::identity*
- **`Proj2`** – The type of an optional projection function for FwdIter2. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *lexicographically_compare* algorithm returns *bool*. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity, typename **Pred** = *hpx*::*parallel*::detail::less>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::lexicographical_compare`(*ExPolicy* &&policy, *FwdIter1* first1, *Sent1* last1, *FwdIter2* first2, *Sent2* last2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks if the first range [first1, last1) is lexicographically less than the second range [first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most 2 * min(N1, N2) applications of the comparison operation, where N1 = std::distance(first1, last) and N2 = std::distance(first2, last2).

> **Note**
>
> Lexicographical comparison is an operation with the following properties
>
> - Two ranges are compared element by element
> - The first mismatching element defines which range is lexicographically *less* or *greater* than the other
> - If one range is a prefix of another, the shorter range is lexicographically *less* than the other
> - If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
> - An empty range is lexicographically *less* than any non-empty range
> - Two empty ranges are lexicographically *equal*

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`FwdIter1`** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent1`** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **`FwdIter2`** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent2`** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter2.
- **`Pred`** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>

- **Proj1** – The type of an optional projection function for FwdIter1. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for FwdIter2. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *lexicographically_compare* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

template<typename **Rng1**, typename **Rng2**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity, typename **Pred** = *hpx*::*parallel*::detail::less>

bool *hpx::ranges::***lexicographical_compare**(*Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks if the first range rng1 is lexicographically less than the second range rng2. uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: At most 2 * min(N1, N2) applications of the comparison operation, where N1 = std::distance(std::begin(rng1), std::end(rng1)) and N2 = std::distance(std::begin(rng2), std::end(rng2)).

Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function for elements of the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for elements of the second range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *lexicographically_compare* algorithm returns *bool*. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity, typename **Pred** = *hpx*::*parallel*::detail::less>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::lexicographical_compare`(*ExPolicy* &&policy, *Rng1* &&rng1, *Rng2* &&rng2, *Pred* &&pred = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Checks if the first range rng1 is lexicographically less than the second range rng2. uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most 2 * min(N1, N2) applications of the comparison operation, where N1 = std::distance(std::begin(rng1), std::end(rng1)) and N2 = std::distance(std::begin(rng2), std::end(rng2)).

Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other

- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function for elements of the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for elements of the second range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *lexicographically_compare* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

hpx::ranges::set_intersection

Defined in header hpx/algorithm.hpp[754].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_intersection_result<*Iter1*, *Iter2*, *Iter3*>>::type `hpx::ranges::set_intersection`

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

[754] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **`Iter1`** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **`Sent1`** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **`Iter2`** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **`Sent2`** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **`Iter3`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **`Pred`** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **`Proj1`** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **`Proj2`** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first1`** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **`last1`** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **`first2`** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **`last2`** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **`dest`** – Refers to the beginning of the destination range.
- **`op`** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns a hpx::future<*ranges::set_intersection_result*<*Iter1, Iter2, Iter3*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_intersection_result*<*Iter1, Iter2, Iter3*> otherwise. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_intersection_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>, *Ite*

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns a hpx::future<*ranges::set_intersection_result*<*Iter1, Iter2, Iter3*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_intersection_result*<*Iter1, Iter2, Iter3*> otherwise. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

set_intersection_result<*Iter1*, *Iter2*, *Iter3*> **hpx::ranges::set_intersection**(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.

- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns *ranges::set_intersection_result<Iter1, Iter2, Iter3>*. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

set_intersection_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>, *Iter3*> `hpx::ranges::set_intersection`(*Rng1* &&rng1, *Rng2* &&rng2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), the first std::min(m, n) elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns *ranges::set_intersection_result<Iter1, Iter2, Iter3>*. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::transform_exclusive_scan

Defined in header hpx/algorithm.hpp[755].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*InIter*>::value_type>

transform_exclusive_scan_result<*InIter*, *OutIter*> `hpx::ranges::transform_exclusive_scan`(*InIter* first, *Sent* last, *OutIter* dest, *T* init, *BinOp* &&binary_op, *UnOp* &&unary_op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

[755] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
>
> - a1 when N is 1
> - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_exclusive_scan* algorithm returns *transform_exclusive_scan_result<InIter, OutIter>*. The *transform_exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*FwdIter1*>::value_type>

parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_exclusive_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::transform_excl`

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

Note

Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_exclusive_scan* algorithm returns a hpx::future<*transform_exclusive_result*<*FwdIter1*, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_exclusive_result*<*FwdIter1*, FwdIter2> otherwise. The *transform_exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>

transform_exclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*> *hpx::ranges::***transform_exclusive_scan**(*Rng* &&rng, *O* dest, *T* init, *BinOp* &&binary_op, *UnOp* &&unary_op)

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_exclusive_scan* algorithm returns a returns *transform_exclusive_scan_result*< std::ranges::iterator_t<Rng>, O>. The *transform_exclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **O**, typename **BinOp**, typename **UnOp**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>

parallel::*util*::detail::algorithm_result<*ExPolicy*, transform_exclusive_scan_result<*std*::ranges::iterator_t<*Rng*>, *O*>>::type `hpx::ranges::t`

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), …, conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of transform_exclusive_scan may be non-deterministic for a non-associative predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicates *op* and *conv*.

> **Note**
>
> GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aN) is defined as:
>
> - a1 when N is 1
> - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, …, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, …, aN) where 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.
- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

  ```
  R fun(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_exclusive_scan* algorithm returns a hpx::future<*transform_exclusive_scan_result*< std::ranges::iterator_t<Rng>, O>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_exclusive_scan_result*< std::ranges::iterator_t<Rng>, O> otherwise. The *transform_exclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::uninitialized_fill

Defined in header hpx/algorithm.hpp[756].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::uninitialized_fill_n*

template<typename **FwdIter**, typename **Sent**, typename **T**>

FwdIter `hpx::ranges::uninitialized_fill`(*FwdIter* first, *Sent* last, *T* const &value)

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the ranges *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **T**>

[756] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::uninitialized_fill`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *T* const &value)

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **Rng**, typename **T**>

hpx::*traits*::range_traits<*Rng*>::iterator_type `hpx::ranges::`**`uninitialized_fill`**(*Rng* &&rng, *T* const &value)

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a returns *hpx::traits::range_traits<Rng>::iterator_type*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **T**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, typename *hpx*::*traits*::range_traits<Rng1>::iterator_type>::type `hpx::ranges::`**`uninitial`**

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a hpx::future<*typename* hpx::traits::range_traits<Rng>::iterator_type>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename* hpx::traits::range_traits<Rng>::iterator_type otherwise. The *uninitialized_fill* algorithm returns the iterator to one past the last element filled in the range.

hpx::ranges::uninitialized_fill_n

Defined in header hpx/algorithm.hpp[757].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::uninitialized_fill*

template<typename **FwdIter**, typename **Size**, typename **T**>

FwdIter `hpx::ranges::`**`uninitialized_fill_n`**(*FwdIter* first, *Size* count, *T* const &value)

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

[757] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill_n* algorithm returns a returns *FwdIter*. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**, typename **T**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::uninitialized_fill_n`(*ExPolicy* &&policy, *FwdIter* first, *Size* count, *T* const &value)

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill_n* algorithm returns a *hpx::future<FwdIter>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns FwdIter otherwise. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

hpx::ranges::move

Defined in header hpx/algorithm.hpp[758].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, move_result<*Iter1*, *Iter2*>>::type `hpx::ranges::move`(*ExPolicy* &&policy, *Iter1* first, *Sent1* last, *Iter2* dest)

[758] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly std::distance(begin(rng), end(rng)) assignments.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Iter1`** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent1`** – The type of the source iterators used for the end of the first range (deduced).
- **`Iter2`** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`last`** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **`dest`** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a hpx::future<*ranges::move_result*<*iterator_t*<*Rng*>, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::move_result*<*iterator_t*<*Rng*>, FwdIter2> otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

template<typename **`ExPolicy`**, typename **`Rng`**, typename **`Iter2`**>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, move_result<*std*::ranges::iterator_t<*Rng*>, *Iter2*>>::type `hpx::ranges::move`(*ExPolicy* &&policy, *Rng* &&rng, *Iter2* dest)

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly std::distance(begin(rng), end(rng)) assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a hpx::future<*ranges::move_result<iterator_t<Rng>*, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::move_result<iterator_t<Rng>*, FwdIter2> otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**>

move_result<*Iter1*, *Iter2*> `hpx::ranges::move`(*Iter1* first, *Sent1* last, *Iter2* dest)

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

> **Note**
>
> Complexity: Performs exactly std::distance(begin(rng), end(rng)) assignments.

Template Parameters

- **`Iter1`** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent1`** – The type of the source iterators used for the end of the first range (deduced).
- **`Iter2`** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`last`** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **`dest`** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns *ranges::move_result<iterator_t<Rng>*, FwdIter2>. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

template<typename **`Rng`**, typename **`Iter2`**>

move_result<*std*::ranges::iterator_t<*Rng*>, *Iter2*> `hpx::ranges::`**`move`**(*Rng* &&rng, *Iter2* dest)

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

> **Note**
>
> Complexity: Performs exactly std::distance(begin(rng), end(rng)) assignments.

Template Parameters

- **`Rng`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`Iter2`** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a *ranges::move_result<iterator_t<Rng>*, FwdIter2>. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

hpx::ranges::destroy

Defined in header hpx/algorithm.hpp[759].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::destroy_n*

template<typename **ExPolicy**, typename **Rng**>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::destroy`(*ExPolicy* &&policy, *Rng* &&rng)

Destroys objects of type typename iterator_traits<ForwardIt>::value_type in the range [first, last).

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* operations.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

[759] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *Iter*> `hpx::ranges::destroy`(*ExPolicy* &&policy, *Iter* first, *Sent* last)

Destroys objects of type typename iterator_traits<ForwardIt>::value_type in the range [first, last).

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* operations.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

template<typename **Rng**>

hpx::*traits*::range_iterator<*Rng*>::type `hpx::ranges::destroy`(*Rng* &&rng)

Destroys objects of type typename iterator_traits<ForwardIt>::value_type in the range [first, last).

> **Note**
>
> Complexity: Performs exactly *last* - *first* operations.

Template Parameters

`Rng` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

`rng` – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns *void*.

template<typename `Iter`, typename `Sent`>

Iter `hpx::ranges::destroy`(*Iter* first, *Sent* last)

Destroys objects of type typename iterator_traits<ForwardIt>::value_type in the range [first, last).

> **Note**
>
> Complexity: Performs exactly *last* - *first* operations.

Template Parameters

- `Iter` – The type of the source iterators used for the range (deduced).
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

Parameters

- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns *void*.

hpx::ranges::destroy_n

Defined in header hpx/algorithm.hpp[760].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::destroy*

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type `hpx::ranges::destroy_n`(*ExPolicy* &&policy, *FwdIter* first, *Size* count)

Destroys objects of type typename iterator_traits<ForwardIt>::value_type in the range [first, first + count).

The operations in the parallel *destroy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *count* operations, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

[760] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Returns

The *destroy_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *destroy_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **FwdIter**, typename **Size**>

FwdIter `hpx::ranges::destroy_n`(*FwdIter* first, *Size* count)

Destroys objects of type typename iterator_traits<ForwardIt>::value_type in the range [first, first + count).

Note

Complexity: Performs exactly *count* operations, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *destroy_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::ranges::rotate

Defined in header hpx/algorithm.hpp[761].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::rotate_copy*

template<typename **FwdIter**, typename **Sent**>

subrange_t<*FwdIter*, *Sent*> `hpx::ranges::rotate`(*FwdIter* first, *FwdIter* middle, *Sent* last)

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements

[761] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

in the range [first, last) in such a way that the element middle becomes the first element of the new range and middle - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*.

> **Note**
>
> The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **`FwdIter`** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent`** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`middle`** – Refers to the element that should appear at the beginning of the rotated range.
- **`last`** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a *subrange_t<FwdIter, Sent>*. The *rotate* algorithm returns the iterator equal to pair(first + (last - middle), last).

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*FwdIter*, *Sent*>>::type `hpx::ranges::rotate`(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* middle, *Sent* last)

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element middle becomes the first element of the new range and middle - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`FwdIter`** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent`** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`middle`** – Refers to the element that should appear at the beginning of the rotated range.
- **`last`** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a hpx::future<*subrange_t<FwdIter, Sent>*> if the execution policy is of type *parallel_task_policy* and returns a *subrange_t<FwdIter, Sent>* otherwise. The *rotate* algorithm returns the iterator equal to pair(first + (last - middle), last).

template<typename **Rng**>

subrange_t<*std*::ranges::iterator_t<*Rng*>, *std*::ranges::iterator_t<*Rng*>> **`hpx::ranges::rotate`**(*Rng* &&rng, *std*::ranges::iterator_t<*Rng*> middle)

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element middle becomes the first element of the new range and middle - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*.

> **Note**
>
> The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

Returns

The *rotate* algorithm returns a *subrange_t<std::ranges::iterator_t<Rng>*, std::ranges::iterator_t<Rng>>. The *rotate* algorithm returns the iterator equal to pair(first + (last - middle), last).

template<typename **ExPolicy**, typename **Rng**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*std*::ranges::iterator_t<*Rng*>, *std*::ranges::iterator_t<*Rng*>>> `hpx::ranges::ro`

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element middle becomes the first element of the new range and middle - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*.

> **Note**
>
> The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

Returns

The *rotate* algorithm returns a hpx::future <subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *subrange_t<std::ranges::iterator_t<Rng>*, std::ranges::iterator_t<Rng>>. otherwise. The *rotate* algorithm returns the iterator equal to pair(first + (last - middle), last).

hpx::ranges::rotate_copy

Defined in header hpx/algorithm.hpp[762].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::rotate*

template<typename **FwdIter**, typename **Sent**, typename **OutIter**>

rotate_copy_result<*FwdIter*, *OutIter*> `hpx::ranges::rotate_copy`(*FwdIter* first, *FwdIter* middle, *Sent* last, *OutIter* dest_first)

Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

[762] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

The assignments in the parallel *rotate_copy* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns

The *rotate_copy* algorithm returns a *rotate_copy_result<FwdIter, OutIter>*. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, rotate_copy_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::rotate_copy`(*ExPolicy* &&policy, *FwdIter1* first, *FwdIter1* middle, *Sent* last, *FwdIter2* dest_first)

Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns

The *rotate_copy* algorithm returns areturns *hpx::future*< rotate_copy_result<FwdIter1, FwdIter2>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *rotate_copy_result<FwdIter1, FwdIter2>* otherwise. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

template<typename **Rng**, typename **OutIter**>

rotate_copy_result<*std*::ranges::iterator_t<*Rng*>, *OutIter*> `hpx::ranges::rotate_copy`(*Rng* &&rng, *std*::ranges::iterator_t<*Rng*> middle, *OutIter* dest_first)

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns

The *rotate* algorithm returns a *rotate_copy_result<std::ranges::iterator_t<Rng>*, OutIter>. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **OutIter**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, rotate_copy_result<*std*::ranges::iterator_t<*Rng*>, *OutIter*>> `hpx::ranges::rotate_copy(`

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *new_first* becomes the first element of the new range and *new_first* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Rng`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **`OutIter`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`rng`** – Refers to the sequence of elements the algorithm will be applied to.
- **`middle`** – Refers to the element that should appear at the beginning of the rotated range.
- **`dest_first`** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns

The *rotate_copy* algorithm returns a hpx::future<*otate_copy_result*< std::ranges::iterator_t<Rng>, OutIter>> if the execution policy is of type *parallel_task_policy* and returns *rotate_copy_result*< std::ranges::iterator_t<Rng>, OutIter> otherwise. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

hpx::ranges::uninitialized_move

Defined in header hpx/algorithm.hpp[763].

template<typename **InIter**, typename **Sent1**, typename **FwdIter**, typename **Sent2**>

hpx::*parallel*::*util*::in_out_result<*InIter*, *FwdIter*> `hpx::ranges::`**`uninitialized_move`**(*InIter* first1, *Sent1* last1, *FwdIter* first2, *Sent2* last2)

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move* algorithm returns an *in_out_result<InIter, FwdIter>*. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *parallel*::*util*::in_out_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::uninitialized_`

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.

- `last2` – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move* algorithm returns a hpx::future<*in_out_result<InIter, FwdIter>*>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result<InIter, FwdIter>* otherwise. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **Rng1**, typename **Rng2**>

hpx::*parallel*::*util*::in_out_result<typename *hpx*::*traits*::range_traits<*Rng1*>::iterator_type, typename *hpx*::*traits*::range_traits<*Rng2*>::iterator_

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- `Rng1` – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- `Rng2` – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- `rng1` – Refers to the range from which the elements will be moved from
- `rng2` – Refers to the range to which the elements will be moved to

Returns

The *uninitialized_move* algorithm returns an *in_out_result<typename* hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *hpx*::*parallel*::*util*::in_out_result<typename *hpx*::*traits*::range_traits<*Rng1*>::iterator_type, ty

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

Returns

The *uninitialized_move* algorithm returns a hpx::future<*in_out_result<InIter, FwdIter>*>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result<* typename hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type> otherwise. The *uninitialized_move* algorithm returns the input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

hpx::ranges::uninitialized_move_n

Defined in header hpx/algorithm.hpp[764].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::uninitialized_move*

template<typename **InIter**, typename **Size**, typename **FwdIter**, typename **Sent2**>

hpx::*parallel*::*util*::in_out_result<*InIter*, *FwdIter*> `hpx::ranges::uninitialized_move_n`(*InIter* first1, *Size* count, *FwdIter* first2, *Sent2* last2)

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *count* movements, if count > 0, no move operations otherwise.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

[764] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Returns

The *uninitialized_move_n* algorithm returns *in_out_result<InIter, FwdIter>*. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Size**, typename **FwdIter2**, typename **Sent2**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *parallel*::*util*::in_out_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::uninitialized_`

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *count* movements, if count > 0, no move operations otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first1` – Refers to the beginning of the sequence of elements that will be moved from
- `count` – Refers to the number of elements starting at *first* the algorithm will be applied to.
- `first2` – Refers to the beginning of the destination range.
- `last2` – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move_n* algorithm returns a hpx::future<*in_out_result*<*FwdIter1, FwdIter2*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

hpx::ranges::fill

Defined in header hpx/algorithm.hpp[765].

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *void*.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **T** = typename *std*::iterator_traits<*Iter*>::value_type>
hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *Iter*>::type `hpx::ranges::fill`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *T* const &value)

Assigns the given value to the elements in the range [first, last).

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *void*.

template<typename **Rng**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>

std::ranges::iterator_t<*Rng*> `hpx::ranges::fill`(*Rng* &&rng, *T* const &value)

Assigns the given value to the elements in the range [first, last).

> **Note**
>
> Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill* algorithm returns *void*.

template<typename **Iter**, typename **Sent**, typename **T** = typename *std*::iterator_traits<*Iter*>::value_type>

Iter `hpx::ranges::fill`(*Iter* first, *Sent* last, *T* const &value)

Assigns the given value to the elements in the range [first, last).

> **Note**
>
> Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **value** – The value to be assigned.

Returns
The *fill* algorithm returns *void*.

hpx::ranges::fill_n

Defined in header hpx/algorithm.hpp[766].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type `hpx::ranges::fill_n`(*ExPolicy* &&policy, *FwdIter* first, *Size* count, *T* const &value)

Assigns the given value value to the first count elements in the range beginning at first if count > 0. Does nothing otherwise.

The comparisons in the parallel *fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *count* assignments, for count > 0.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *void*.

template<typename **Rng**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>

hpx::*traits*::range_traits<*Rng*>::iterator_type `hpx::ranges::fill_n`(*Rng* &&rng, *T* const &value)

Assigns the given value value to the first count elements in the range beginning at first if count > 0. Does nothing otherwise.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill_n* algorithm returns an output iterator that compares equal to last.

template<typename **FwdIter**, typename **Size**, typename **T** = typename *std*::iterator_traits<*FwdIter*>::value_type>

FwdIter `hpx::ranges::fill_n`(Iterator first, *Size* count, *T* const &value)

Assigns the given value value to the first count elements in the range beginning at first if count > 0. Does nothing otherwise.

> **Note**
>
> Complexity: Performs exactly *count* assignments, for count > 0.

Template Parameters

- **Iterator** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill_n* algorithm returns an output iterator that compares equal to last.

hpx::ranges::count

Defined in header hpx/algorithm.hpp[767].

> The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- `Iter` – The type of the source iterators used for the range (deduced).
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- `T` – The type of the value to search for (deduced).
- `Proj` – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to the end of the sequence of elements the algorithm will be applied to.
- `value` – The value to search for.
- `proj` – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns a *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*. The *count* algorithm returns the number of elements satisfying the given criteria.

template<typename **Rng**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*std*::ranges::iterator_t<*Rng*>, *Proj*>::value_type>

std::iterator_traits<typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type>::difference_type `hpx::ranges::count`(*Rng* &&rng, *T* const &value, *Proj* &&proj = *Proj*())

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

> **Note**
>
> Complexity: Performs exactly *last* - *first* comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

template<typename **Iter**, typename **Sent**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*Iter*, *Proj*>::value_type>

std::iterator_traits<*Iter*>::difference_type `hpx::ranges::count`(*Iter* first, *Sent* last, *T* const &value, *Proj* &&proj = *Proj*())

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

> **Note**
>
> Complexity: Performs exactly *last* - *first* comparisons.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

hpx::ranges::count_if

Defined in header hpx/algorithm.hpp[768].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::count*

template<typename **ExPolicy**, typename **Rng**, typename **F**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, typename *std*::iterator_traits<typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type>::

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

> **Note**
>
> Complexity: Performs exactly *last* - *first* applications of the predicate.

[768] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count_if* algorithm returns *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*. The *count* algorithm returns the number of elements satisfying the given criteria.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **F**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, typename *std*::iterator_traits<*Iter*>::difference_type>::type `hpx::ranges::count_if`

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

Note

Complexity: Performs exactly *last* - *first* applications of the predicate.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count_if* algorithm returns *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*. The *count* algorithm returns the number of elements satisfying the given criteria.

template<typename **Rng**, typename **F**, typename **Proj** = *hpx*::identity>

std::iterator_traits<typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type>::difference_type `hpx::ranges::count_if`(*Rng* &&rng, *F* &&f, *Proj* &&proj = *Proj*())

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

> **Note**
>
> Complexity: Performs exactly *last* - *first* applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

template<typename **Iter**, typename **Sent**, typename **F**, typename **Proj** = *hpx*::identity>

std::iterator_traits<*Iter*>::difference_type *hpx*::*ranges*::**count_if**(*Iter* first, *Sent* last, *F* &&f, *Proj* &&proj = *Proj*())

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

> **Note**
>
> Complexity: Performs exactly *last* - *first* applications of the predicate.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns
The *count* algorithm returns the number of elements satisfying the given criteria.

hpx::ranges::reduce

Defined in header hpx/algorithm.hpp[769].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **F**, typename **T** = typename *std*::iterator_traits<*FwdIter*>::value_type>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> `hpx::ranges::reduce`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *T* init, *F* &&f)

Returns GENERALIZED_SUM(f, init, *first, ..., *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *f*.

> **Note**
>
> GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:
>
> - a1 when N is 1
> - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
>   - b1, ..., bN may be any permutation of a1, ..., aN and

[769] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

```
1 < K+1 = M <= N.
```

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const&. The types *Type1 Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **Rng**, typename **F**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> hpx::ranges::**reduce**(*ExPolicy* &&policy, *Rng* &&rng, *T* init, *F* &&f)

Returns GENERALIZED_SUM(f, init, *first, …, *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *f*.

> **Note**
>
> GENERALIZED_SUM(op, a1, …, aN) is defined as follows:
>
> - a1 when N is 1
> - op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
>   - b1, …, bN may be any permutation of a1, …, aN and
>   - 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const&. The types *Type1 Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **T** = typename *std*::iterator_traits<*FwdIter*>::value_type>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> `hpx::ranges::reduce`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *T* init)

Returns GENERALIZED_SUM(+, init, *first, …, *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: O(*last* - *first*) applications of the operator+().

Note

GENERALIZED_SUM(+, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, …, bK), GENERALIZED_SUM(+, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.

- `Sent` – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- `T` – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to the end of the sequence of elements the algorithm will be applied to.
- `init` – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

template<typename **ExPolicy**, typename **Rng**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>
hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *T*> `hpx::ranges::reduce`(*ExPolicy* &&policy, *Rng* &&rng, *T* init)

Returns GENERALIZED_SUM(+, init, *first, …, *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the operator+().

> **Note**
>
> GENERALIZED_SUM(+, a1, …, aN) is defined as follows:
>
> - a1 when N is 1

> - op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
>   - b1, …, bN may be any permutation of a1, …, aN and
>   - 1 < K+1 = M <= N.

Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&. The types *Type1 Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

template<typename **Rng**, typename **F**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>

T `hpx::ranges::reduce`(*Rng* &&rng, *T* init, *F* &&f)

Returns GENERALIZED_SUM(f, init, *first, …, *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the predicate *f*.

> **Note**
>
> GENERALIZED_SUM(op, a1, …, aN) is defined as follows:
>
> - a1 when N is 1
> - op(GENERALIZED_SUM(op, b1, …, bK), GENERALIZED_SUM(op, bM, …, bN)), where:
>   - b1, …, bN may be any permutation of a1, …, aN and
>   - 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&. The types *Type1 Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

template<typename **FwdIter**, typename **Sent**, typename **T** = typename *std*::iterator_traits<*FwdIter*>::value_type>

T *hpx*::*ranges*::**reduce**(*FwdIter* first, *Sent* last, *T* init)

Returns GENERALIZED_SUM(+, init, *first, …, *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the operator+().

> **Note**
>
> GENERALIZED_SUM(+, a1, …, aN) is defined as follows:
>
> - a1 when N is 1
> - op(GENERALIZED_SUM(+, b1, …, bK), GENERALIZED_SUM(+, bM, …, bN)), where:
>   - b1, …, bN may be any permutation of a1, …, aN and
>   - 1 < K+1 = M <= N.

Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

template<typename **Rng**, typename **T** = typename *std*::iterator_traits<*std*::ranges::iterator_t<*Rng*>>::value_type>

T *hpx*::*ranges*::**reduce**(*Rng* &&rng, *T* init)

Returns GENERALIZED_SUM(+, init, *first, …, *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: O(*last* - *first*) applications of the operator+().

Note

GENERALIZED_SUM(+, a1, …, aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, …, bK), GENERALIZED_SUM(+, bM, …, bN)), where:
  - b1, …, bN may be any permutation of a1, …, aN and
  - 1 < K+1 = M <= N.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

template<typename **FwdIter**, typename **Sent**>

std::iterator_traits<*FwdIter*>::value_type `hpx::ranges::reduce`(*FwdIter* first, *Sent* last)

Returns GENERALIZED_SUM(+, T(), *first, …, *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the operator+().

> **Note**
>
> The type of the initial value (and the result type) *T* is determined from the value_type of the used *FwdIterB*.

> **Note**
>
> GENERALIZED_SUM(+, a1, …, aN) is defined as follows:
>
> - a1 when N is 1
> - op(GENERALIZED_SUM(+, b1, …, bK), GENERALIZED_SUM(+, bM, …, bN)), where:
>   - b1, …, bN may be any permutation of a1, …, aN and
>   - 1 < K+1 = M <= N.

Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns *T* (where T is the value_type of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

template<typename **Rng**>

std::iterator_traits<typename *hpx*::*traits*::range_traits<*Rng*>::iterator_type>::value_type `hpx::ranges::reduce`(*Rng* &&rng)

Returns GENERALIZED_SUM(+, T(), *first, …, *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

> **Note**
>
> Complexity: O(*last* - *first*) applications of the operator+().

> **Note**
>
> The type of the initial value (and the result type) *T* is determined from the value_type of the used *FwdIterB*.

> **Note**
>
> GENERALIZED_SUM(+, a1, …, aN) is defined as follows:
>
> - a1 when N is 1
> - op(GENERALIZED_SUM(+, b1, …, bK), GENERALIZED_SUM(+, bM, …, bN)), where:
>   - b1, …, bN may be any permutation of a1, …, aN and
>   - 1 < K+1 = M <= N.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns *T* (where T is the value_type of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

template<typename **InIter**, typename **Sent**, typename **T**, typename **F**>

auto `hpx::ranges::fold_left`(*InIter* first, *Sent* last, *T* init, *F* f)

Left-folds a range of elements using a binary operator.

> **Note**
>
> Complexity: Exactly N applications of the binary operator, where N = std::distance(first, last).

Template Parameters

- **InIter** – The type of the source begin iterator (deduced). This iterator must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **T** – The type of the initial value.

[779] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp
[780] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns
The result of left-folding the range.

template<typename **Rng**, typename **T**, typename **F**>

auto *hpx*::*ranges*::**fold_left**(*Rng* &&rng, *T* init, *F* f)

Left-folds a range of elements using a binary operator.

> **Note**
>
> Complexity: Exactly N applications of the binary operator, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns
The result of left-folding the range.

hpx::ranges::fold_left_first

Defined in header hpx/algorithm.hpp[781].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::fold_left*

[781] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- *hpx::ranges::fold_right*
- *hpx::ranges::fold_right_last*
- *hpx::ranges::fold_left_with_iter*
- *hpx::ranges::fold_left_first_with_iter*

template<typename **InIter**, typename **Sent**, typename **F**>

auto *hpx*::*ranges*::**fold_left_first**(*InIter* first, *Sent* last, *F* f)

Left-folds a range using the first element as the initial value.

> **Note**
>
> Complexity: Exactly N-1 applications of the binary operator, where N = std::distance(first, last).

Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

Returns

An optional containing the fold result, or std::nullopt if the range is empty.

template<typename **Rng**, typename **F**>

auto *hpx*::*ranges*::**fold_left_first**(*Rng* &&rng, *F* f)

Left-folds a range using the first element as the initial value.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

Returns

An optional containing the fold result, or std::nullopt if the range is empty.

hpx::ranges::fold_right

Defined in header hpx/algorithm.hpp[782].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::fold_left*
- *hpx::ranges::fold_left_first*
- *hpx::ranges::fold_right_last*
- *hpx::ranges::fold_left_with_iter*
- *hpx::ranges::fold_left_first_with_iter*

template<typename **BidIter**, typename **Sent**, typename **T**, typename **F**>

auto *hpx*::*ranges*::**fold_right**(*BidIter* first, *Sent* last, *T* init, *F* f)

Right-folds a range of elements using a binary operator.

> **Note**
>
> Complexity: Exactly N applications of the binary operator.

Template Parameters

- **BidIter** – The type of the source begin iterator (deduced). This iterator must meet the requirements of a bidirectional iterator.
- **Sent** – The type of the source sentinel (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns

The result of right-folding the range.

template<typename **Rng**, typename **T**, typename **F**>

auto *hpx*::*ranges*::**fold_right**(*Rng* &&rng, *T* init, *F* f)

Right-folds a range of elements using a binary operator.

[782] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns

The result of right-folding the range.

hpx::ranges::fold_right_last

Defined in header hpx/algorithm.hpp[783].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::fold_left*
- *hpx::ranges::fold_left_first*
- *hpx::ranges::fold_right*
- *hpx::ranges::fold_left_with_iter*
- *hpx::ranges::fold_left_first_with_iter*

template<typename **BidIter**, typename **Sent**, typename **F**>

auto *hpx::ranges::***fold_right_last**(*BidIter* first, *Sent* last, *F* f)

Right-folds a range using the last element as the initial value.

Template Parameters

- **BidIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

[783] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Returns

An optional containing the fold result, or std::nullopt if the range is empty.

template<typename **Rng**, typename **F**>

auto *hpx*::*ranges*::**fold_right_last**(*Rng* &&rng, *F* f)

Right-folds a range using the last element as the initial value.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

Returns

An optional containing the fold result, or std::nullopt if the range is empty.

hpx::ranges::fold_left_with_iter

Defined in header hpx/algorithm.hpp[784].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::fold_left*
- *hpx::ranges::fold_left_first*
- *hpx::ranges::fold_right*
- *hpx::ranges::fold_right_last*
- *hpx::ranges::fold_left_first_with_iter*

template<typename **InIter**, typename **Sent**, typename **T**, typename **F**>

auto *hpx*::*ranges*::**fold_left_with_iter**(*InIter* first, *Sent* last, *T* init, *F* f) -> fold_left_with_iter_result<*InIter*, *std*::decay_t<*hpx*::*util*::invoke_result_t<*F*&, *T*, *hpx*::*traits*::iter_reference_t<*InIter*>>>>

Left-folds a range and returns both the result and the end iterator.

Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **T** – The type of the initial value.

784 http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns
A fold_left_with_iter_result containing the end iterator and the fold result.

template<typename **Rng**, typename **T**, typename **F**>

auto *hpx*::*ranges*::**fold_left_with_iter**(*Rng* &&rng, *T* init, *F* f) -> fold_left_with_iter_result<*std*::ranges::iterator_t<*Rng*>, *std*::decay_t<*hpx*::*util*::invoke_result_t<*F*&, *T*, *hpx*::*traits*::range_reference_t<*Rng*>>>>

Left-folds a range and returns both the result and the end iterator.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns
A fold_left_with_iter_result containing the end iterator and the fold result.

hpx::ranges::fold_left_first_with_iter

Defined in header hpx/algorithm.hpp[785].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

[785] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

template<typename **InIter**, typename **Sent**, typename **F**>

auto *hpx*::*ranges*::**fold_left_first_with_iter**(*InIter* first, *Sent* last, *F* f) -> fold_left_first_with_iter_result<*InIter*, *hpx*::optional<*std*::decay_t<*hpx*::*util*::invoke_result_t<*F*&, *hpx*::*traits*::iter_reference_t<*InIter*>, *hpx*::*traits*::iter_reference_t<*InIter*>>>>>

Left-folds a range using the first element and returns both an optional result and the end iterator.

Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

Returns

A fold_left_first_with_iter_result containing the end iterator and an optional with the fold result.

template<typename **Rng**, typename **F**>

auto *hpx*::*ranges*::**fold_left_first_with_iter**(*Rng* &&rng, *F* f) -> fold_left_first_with_iter_result<*std*::ranges::iterator_t<*Rng*>, *hpx*::optional<*std*::decay_t<*hpx*::*util*::invoke_result_t<*F*&, *hpx*::*traits*::range_reference_t<*Rng*>, *hpx*::*traits*::range_reference_t<*Rng*>>>>>

Left-folds a range using the first element and returns both an optional result and the end iterator.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

Returns

A fold_left_first_with_iter_result containing the end iterator and an optional with the fold result.

hpx::ranges::set_difference

Defined in header hpx/algorithm.hpp[786].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_difference_result<*Iter1*, *Iter3*>>::type `hpx::ranges::set_difference`(*ExPolicy* &&policy, *Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

[786] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns a hpx::future<*ranges::set_difference_result<Iter1, Iter3>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_difference_result<Iter1, Iter3>* otherwise. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_difference_result<*std*::ranges::iterator_t<*Rng1*>, *Iter3*>> **hpx::ranges::set_dif**

Constructs a sorted range beginning at dest consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **`Rng1`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`Rng2`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`Iter3`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **`Pred`** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **`Proj1`** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **`Proj2`** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`rng1`** – Refers to the first sequence of elements the algorithm will be applied to.
- **`rng2`** – Refers to the second sequence of elements the algorithm will be applied to.
- **`dest`** – Refers to the beginning of the destination range.
- **`op`** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns a hpx::future<*ranges::set_difference_result<Iter1, Iter3>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_difference_result<Iter1, Iter3>* otherwise. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

set_difference_result<*Iter1*, *Iter3*> `hpx::ranges::set_difference`(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns *ranges::set_difference_result<Iter1, Iter3>*. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

set_difference_result<*std*::ranges::iterator_t<*Rng1*>, *Iter3*> **hpx::ranges::set_difference**(*Rng1* &&rng1, *Rng2* &&rng2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in the range [first1, last1) and not present in the range [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::max(m-n, 0) times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns *ranges::set_difference_result<Iter1, Iter3>*. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::nth_element

Defined in header hpx/algorithm.hpp[787].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **RandomIt**, typename **Sent**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

RandomIt `hpx::ranges::nth_element`(*RandomIt* first, *RandomIt* nth, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

nth_element is a partial sorting algorithm that rearranges elements in [first, last) such that the element pointed at by nth is changed to whatever element would occur in that position if [first, last) were sorted and all of the elements before this new nth element are less than or equal to the elements after the new nth element.

The comparison operations in the parallel *nth_element* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear in std::distance(first, last) on average. O(N) applications of the predicate, and O(N log N) swaps, where N = last - first.

Template Parameters

- **RandomIt** – The type of the source begin, nth, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

[787] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

  ```
  bool cmp(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to Type. This defaults to std::less<>.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to hpx::identity.

Returns

The *nth_element* algorithm returns returns *RandomIt*. The *nth_element* algorithm returns an iterator equal to last.

template<typename **ExPolicy**, typename **RandomIt**, typename **Sent**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result_t<*ExPolicy*, *RandomIt*> `hpx::ranges::nth_element`(*ExPolicy* &&policy, *RandomIt* first, *RandomIt* nth, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

nth_element is a partial sorting algorithm that rearranges elements in [first, last) such that the element pointed at by nth is changed to whatever element would occur in that position if [first, last) were sorted and all of the elements before this new nth element are less than or equal to the elements after the new nth element.

The comparison operations in the parallel *nth_element* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *nth_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Linear in std::distance(first, last) on average. O(N) applications of the predicate, and O(N log N) swaps, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **RandomIt** – The type of the source begin, nth, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to Type. This defaults to std::less<>.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to hpx::identity.

Returns

The *partition* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *parallel_task_policy* and returns *RandomIt* otherwise. The *nth_element* algorithm returns an iterator equal to last.

template<typename **Rng**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

std::ranges::iterator_t<*Rng*> `hpx::ranges::nth_element`(*Rng* &&rng, *std*::ranges::iterator_t<*Rng*> nth, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

nth_element is a partial sorting algorithm that rearranges elements in [first, last) such that the element pointed at by nth is changed to whatever element would occur in that position if [first, last) were sorted and all of the elements before this new nth element are less than or equal to the elements after the new nth element.

The comparison operations in the parallel *nth_element* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear in std::distance(first, last) on average. O(N) applications of the predicate, and O(N log N) swaps, where N = last - first.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

  ```
  bool cmp(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to Type. This defaults to std::less<>.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to hpx::identity.

Returns

The *nth_element* algorithm returns returns *std::ranges::iterator_t<Rng>*. The *nth_element* algorithm returns an iterator equal to last.

template<typename **ExPolicy**, typename **Rng**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result_t<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::nth_element`(*ExPolicy* &&policy, *Rng* &&rng, *std*::ranges::iterator_t<*Rng*> nth, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

nth_element is a partial sorting algorithm that rearranges elements in [first, last) such that the element pointed at by nth is changed to whatever element would occur in that position if [first, last) were sorted and all of the elements before this new nth element are less than or equal to the elements after the new nth element.

The comparison operations in the parallel *nth_element* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *nth_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in std::distance(first, last) on average. O(N) applications of the predicate, and O(N log N) swaps, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point

- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

  ```
  bool cmp(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to Type. This defaults to std::less<>.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to hpx::identity.

Returns

The *partition* algorithm returns a hpx::future<*std::ranges::iterator_t*<*Rng*>> if the execution policy is of type *parallel_task_policy* and returns *std::ranges::iterator_t*<*Rng*> otherwise. The *nth_element* algorithm returns an iterator equal to last.

hpx::ranges::remove

Defined in header hpx/algorithm.hpp[788].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::remove_if*

template<typename **Iter**, typename **Sent**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*Iter*, *Proj*>::value_type>

subrange_t<*Iter*, *Sent*> `hpx::ranges::remove`(*Iter* first, *Sent* last, *T* const &value, *Proj* &&proj = *Proj*())

Removes all elements that are equal to *value* from the range [first, last) and and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* applications of the operator==() and the projection *proj*.

Template Parameters

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.

[788] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a *subrange_t<FwdIter, Sent>*. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

template<typename **Rng**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*std*::ranges::iterator_t<*Rng*>, *Proj*>::value_type>

subrange_t<*std*::ranges::iterator_t<*Rng*>> `hpx::ranges::remove`(*Rng* &&rng, *T* const &value, *Proj* &&proj = *Proj*())

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs not more than *util::end(rng)*
>
> - *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator==() and the projection *proj*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a *subrange_t<std::ranges::iterator_t<Rng>>*. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*FwdIter*, *Proj*>::value_type>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*FwdIter*, *Sent*>>::type `hpx::ranges::remove`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *T* const &value, *Proj* &&proj = *Proj*())

Removes all elements that are equal to *value* from the range [first, last) and and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator==() and the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a hpx::future<*subrange_t<FwdIter, Sent*>>. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

template<typename **ExPolicy**, typename **Rng**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*std*::ranges::iterator_t<*Rng*>, *Proj*>::value_type>
parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*std*::ranges::iterator_t<*Rng*>>> `hpx::ranges::remove`(*ExPolicy* &&policy, *Rng* &&rng, *T* const &value, *Proj* &&proj = *Proj*())

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs not more than *util::end(rng)*
>
> - *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator==() and the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a hpx::future< subrange_t<std::ranges::iterator_t<Rng>>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove* algorithm returns the iterator to the new end of the range.

hpx::ranges::remove_if

Defined in header hpx/algorithm.hpp[789].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::remove*

template<typename **Iter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity>

subrange_t<*Iter*, *Sent*> `hpx::ranges::remove_if`(*Iter* first, *Sent* sent, *Pred* &&pred, *Proj* &&proj = *Proj*())

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm execute in sequential order in the calling thread.

[789] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Note

Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* applications of the predicate *pred* and the projection *proj*.

Template Parameters

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*..
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a *subrange_t<FwdIter, Sent>*. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

template<typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity>

subrange_t<*std*::ranges::iterator_t<*Rng*>> *hpx*::*ranges*::**remove_if**(*Rng* &&rng, *Pred* &&pred, *Proj* &&proj = *Proj*())

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator==() and the projection *proj*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a *subrange_t<std::ranges::iterator_t<Rng>>*. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*FwdIter*, *Sent*>>::type **hpx::ranges::remove_if**(*ExPolicy* &&policy, *FwdIter* first, *Sent* sent, *Pred* &&pred, *Proj* &&proj = *Proj*())

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* applications of the predicate *pred* and the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a hpx::future<*subrange_t*<*FwdIter, Sent*>>. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

template<typename **ExPolicy**, typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*std*::ranges::iterator_t<*Rng*>>> `hpx::ranges::`**`remove_if`**(*ExPolicy* &&policy, *Rng* &&rng, *Pred* &&pred, *Proj* &&proj = *Proj*())

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs not more than *util::end(rng)*
>
> - *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator==() and the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a hpx::future<*subrange_t*< std::ranges::iterator_t<Rng>>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

hpx::ranges::reverse

Defined in header hpx/algorithm.hpp[790].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::reverse_copy*

template<typename **Iter**, typename **Sent**>

Iter `hpx::ranges::reverse`(*Iter* first, *Sent* sent)

Reverses the order of the elements in the range [first, last). Behaves as if applying std::iter_swap to every pair of iterators first+i, (last-i) - 1 for each non-negative i < (last-first)/2.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*.

Template Parameters

[790] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a *Iter*. It returns *last*.

template<typename **Rng**>

std::ranges::iterator_t<*Rng*> `hpx::ranges::`**`reverse`**(*Rng* &&rng)

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Reverses the order of the elements in the range [first, last). Behaves as if applying std::iter_swap to every pair of iterators first+i, (last-i) - 1 for each non-negative i < (last-first)/2.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

Parameters

rng – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a *hpx::traits::range_iterator<Rng>::type*. It returns *last*.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *Iter*> `hpx::ranges::`**`reverse`**(*ExPolicy* &&policy, *Iter* first, *Sent* sent)

Reverses the order of the elements in the range [first, last). Behaves as if applying std::iter_swap to every pair of iterators first+i, (last-i) - 1 for each non-negative i < (last-first)/2.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Iter`** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **`Sent`** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`sent`** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Rng**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::`**`reverse`**(*ExPolicy* &&policy, *Rng* &&rng)

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Reverses the order of the elements in the range [first, last). Behaves as if applying std::iter_swap to every pair of iterators first+i, (last-i) - 1 for each non-negative i < (last-first)/2.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a hpx::future<*std::ranges::iterator_t<Rng>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns hpx::future< std::ranges::iterator_t<Rng>> otherwise. It returns *last*.

hpx::ranges::reverse_copy

Defined in header hpx/algorithm.hpp[791].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::reverse*

template<typename **Iter**, typename **Sent**, typename **OutIter**>

reverse_copy_result<*Iter*, *OutIter*> `hpx::ranges::reverse_copy`(*Iter* first, *Sent* last, *OutIter* result)

Copies the elements from the range [first, last) to another range beginning at result in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment *(result + (last - first) - 1 - i) = *(first + i) once for each non-negative i < (last - first) If the source and destination ranges (that is, [first, last) and [result, result+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last* - *first* assignments.

[791] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a *reverse_copy_result<Iter, OutIter>*. The *reverse_copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **OutIter**>

reverse_copy_result<*std*::ranges::iterator_t<*Rng*>, *OutIter*> `hpx::ranges::reverse_copy`(*Rng* &&rng, *OutIter* result)

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last) to another range beginning at result in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment *(result + (last - first) - 1 - i) = *(first + i) once for each non-negative i < (last - first) If the source and destination ranges (that is, [first, last) and [result, result+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a *ranges::reverse_copy_result*< std::ranges::iterator_t<Rng>, OutIter>. The *reverse_copy* algorithm returns an object equal to {last, result + N} where N = last - first

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **FwdIter**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, reverse_copy_result<*Iter*, *FwdIter*>>::type `hpx::ranges::reverse_copy`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *FwdIter* result)

Copies the elements from the range [first, last) to another range beginning at result in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment *(result + (last - first) - 1 - i) = *(first + i) once for each non-negative i < (last - first) If the source and destination ranges (that is, [first, last) and [result, result+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a hpx::future<*reverse_copy_result<Iter, FwdIter>* > if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *reverse_copy_result<Iter, FwdIter>* otherwise. The *reverse_copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **OutIter**>

parallel::*util*::detail::algorithm_result<*ExPolicy*, reverse_copy_result<*std*::ranges::iterator_t<*Rng*>, *OutIter*>>::type `hpx::ranges::revers`

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last) to another range beginning at result in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment *(result + (last - first) - 1 - i) = *(first + i) once for each non-negative i < (last - first) If the source and destination ranges (that is, [first, last) and [result, result+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a hpx::future<*ranges::reverse_copy_result*< std::ranges::iterator_t<Rng>, OutIter>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::reverse_copy_result*< std::ranges::iterator_t<Rng>, OutIter> otherwise. The *reverse_copy* algorithm returns an object equal to {last, result + N} where N = last - first

hpx::ranges::replace

Defined in header hpx/algorithm.hpp[792].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::replace_if*
- *hpx::ranges::replace_copy*
- *hpx::ranges::replace_copy_if*

template<typename **Iter**, typename **Sent**, typename **Proj** = *hpx*::identity, typename **T1** = typename *hpx*::*parallel*::traits::projected<*Iter*, *Proj*>::value_type, typename **T2** = *T1*>

Iter `hpx::ranges::replace`(*Iter* first, *Sent* sent, *T1* const &old_value, *T2* const &new_value, *Proj* &&proj = *Proj*())

Replaces all elements satisfying specific criteria with *new_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator it in the range [first,last) with new_value, when the following corresponding conditions hold: INVOKE(proj, *i) == old_value

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

[792] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace* algorithm returns an *Iter*.

```
template<typename Rng, typename Proj = hpx::identity, typename T1 = typename hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
std::ranges::iterator_t<Rng> hpx::ranges::replace(Rng &&rng, T1 const &old_value, T2 const &new_value, Proj &&proj = Proj())
```

Replaces all elements satisfying specific criteria with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator it in the range rng with new_value, when the following corresponding conditions hold: INVOKE(proj, *i) == old_value

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *util::end(rng)* - *util::begin(rng)* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace* algorithm returns an *hpx::traits::range_iterator<Rng>::type*.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **Proj** = *hpx*::identity, typename **T1** = typename *hpx*::*parallel*::traits::projected<*Iter*, *Proj*>::value_type, typename **T2** = *T1*>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *Iter*> `hpx::ranges::replace`(*ExPolicy* &&policy, *Iter* first, *Sent* sent, *T1* const &old_value, *T2* const &new_value, *Proj* &&proj = *Proj*())

Replaces all elements satisfying specific criteria with *new_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator it in the range [first,last) with new_value, when the following corresponding conditions hold: INVOKE(proj, *i) == old_value

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise.

template<typename **ExPolicy**, typename **Rng**, typename **Proj** = *hpx*::identity, typename **T1** = typename *hpx*::*parallel*::traits::projected<*std*::ranges::iterator_t<*Rng*>, *Proj*>::value_type, typename **T2** = *T1*>
parallel::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::replace`(*ExPolicy* &&policy, *Rng* &&rng, *T1* const &old_value, *T2* const &new_value, *Proj* &&proj = *Proj*())

Replaces all elements satisfying specific criteria with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator it in the range rng with new_value, when the following corresponding conditions hold: INVOKE(proj, *i) == old_value

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *util::end(rng) - util::begin(rng)* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Returns

The *replace* algorithm returns an hpx::future<*hpx::traits::range_iterator*<*Rng*>*::type*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *hpx::traits::range_iterator*<*Rng*>*::type* otherwise.

hpx::ranges::replace_if

Defined in header hpx/algorithm.hpp[793].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::replace*
- *hpx::ranges::replace_copy*
- *hpx::ranges::replace_copy_if*

[793] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

template<typename **Iter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*Iter*, *Proj*>::value_type>

Iter **hpx::ranges::replace_if**(*Iter* first, *Sent* sent, *Pred* &&pred, *T* const &new_value, *Proj* &&proj = *Proj*())

Replaces all elements satisfying specific criteria (for which predicate *f* returns true) with *new_value* in the range [first, sent).

Effects: Substitutes elements referred by the iterator it in the range [first, sent) with new_value, when the following corresponding conditions hold: INVOKE(f, INVOKE(proj, *it)) != false

The assignments in the parallel *replace_if* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the elements which need to replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns *Iter*. It returns *last*.

template<typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*std*::ranges::iterator_t<*Rng*>, *Proj*>::value_type>
std::ranges::iterator_t<*Rng*> `hpx::ranges::replace_if`(*Rng* &&rng, *Pred* &&pred, *T* const &new_value, *Proj* &&proj = *Proj*())

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range rng.

Effects: Substitutes elements referred by the iterator it in the range rng with new_value, when the following corresponding conditions hold: INVOKE(f, INVOKE(proj, *it)) != false

> **Note**
>
> Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by rng.This is an unary predicate which returns *true* for the elements which need to replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns an *hpx::traits::range_iterator<Rng>::type*. It returns *last*.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*Iter*, *Proj*>::value_type>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *Iter*> `hpx::ranges::replace_if`(*ExPolicy* &&policy, *Iter* first, *Sent* sent, *Pred* &&pred, *T* const &new_value, *Proj* &&proj = *Proj*())

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range rng.

Effects: Substitutes elements referred by the iterator it in the range rng with new_value, when the following corresponding conditions hold: INVOKE(f, INVOKE(proj, *it)) != false

The assignments in the parallel *replace_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the elements which need to replaced. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy*. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity, typename **T** = typename *hpx*::*parallel*::traits::projected<*std*::ranges::iterator_t<*Rng*>, *Proj*>::value_type>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::replace_if`(*ExPolicy* &&policy, *Rng* &&rng, *Pred* &&pred, *T* const &new_value, *Proj* &&proj = *Proj*())

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range rng.

Effects: Substitutes elements referred by the iterator it in the range rng with new_value, when the following corresponding conditions hold: INVOKE(f, INVOKE(proj, *it)) != false

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by rng.This is an unary predicate which returns *true* for the elements which need to replaced. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns a hpx::future<*std::ranges::iterator_t*<*Rng*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy*. It returns *last*.

hpx::ranges::replace_copy

Defined in header hpx/algorithm.hpp[794].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::replace*
- *hpx::ranges::replace_if*
- *hpx::ranges::replace_copy_if*

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **Proj** = *hpx*::identity, typename **T1** = typename *hpx*::*parallel*::traits::projected<*InIter*, *Proj*>::value_type, typename **T2** = *T1*>

replace_copy_result<*InIter*, *OutIter*> `hpx::ranges::replace_copy`(*InIter* first, *Sent* sent, *OutIter* dest, *T1* const &old_value, *T2* const &new_value, *Proj* &&proj = *Proj*())

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either new_value or *(first + (it - result)) depending on whether the following corresponding condition holds: INVOKE(proj, *(first + (i - result))) == old_value

The assignments in the parallel *replace_copy* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *sent* - *first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

[794] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns an *in_out_result<InIter, OutIter>*. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **OutIter**, typename **Proj** = *hpx*::identity, typename **T1** = typename *hpx*::*parallel*::traits::projected<*std*::ranges::iterator_t<*Rng*>, *Proj*>::value_type, typename **T2** = *T1*>

replace_copy_result<*std*::ranges::iterator_t<*Rng*>, *OutIter*> `hpx::ranges::replace_copy`(*Rng* &&rng, *OutIter* dest, *T1* const &old_value, *T2* const &new_value, *Proj* &&proj = *Proj*())

Copies the all elements from the range rbg to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (util::end(rng) - util::begin(rng))) either new_value or *(first + (it - result)) depending on whether the following corresponding condition holds: INVOKE(proj, *(first + (i - result))) == old_value

The assignments in the parallel *replace_copy* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns an *in_out_result<std::ranges::iterator_t<Rng>*, OutIter>. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **Proj** = *hpx*::identity, typename **T1** = typename *hpx*::*parallel*::traits::projected<*FwdIter1*, *Proj*>::value_type, typename **T2** = *T1*>

parallel::*util*::detail::algorithm_result<*ExPolicy*, replace_copy_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::replace_copy`(*ExPolic* &&pol- icy, *FwdIter* first, *Sent* sent, *FwdIter* dest, *T1* const &old_v *T2* const &new_v *Proj* &&proj = *Proj*())

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either new_value or *(first + (it - result)) depending on whether the following corresponding condition holds: INVOKE(proj, *(first + (i - result))) == old_value

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *sent* - *first* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns a hpx::future<*in_out_result*<*FwdIter1, FwdIter2*>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result*<*FwdIter1, FwdIter2*> otherwise. The *copy* algorithm returns the pair of the forward iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter**, typename **Proj** = *hpx*::identity, typename **T1** = typename *hpx*::*parallel*::traits::projected<*std*::ranges::iterator_t<*Rng*>, *Proj*>::value_type, typename **T2** = *T1*>

parallel::*util*::detail::algorithm_result<*ExPolicy*, replace_copy_result<*std*::ranges::iterator_t<*Rng*>, *FwdIter*>>::type `hpx::ranges::replac`

Copies the all elements from the range rbg to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (util::end(rng) - util::begin(rng))) either new_value or *(first + (it - result)) depending on whether the following corresponding condition holds: INVOKE(proj, *(first + (i - result))) == old_value

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns a hpx::future<*in_out_result*< std::ranges::iterator_t<Rng>, FwdIter>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result*< std::ranges::iterator_t<Rng>, FwdIter>> The *copy* algorithm returns the pair of the input iterator *last* and the forward iterator to the element in the destination range, one past the last element copied.

hpx::ranges::replace_copy_if

Defined in header hpx/algorithm.hpp[795].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **Pred**, typename **T** = typename *std*::iterator_traits<*OutIter*>::value_type, typename **Proj** = *hpx*::identity>

replace_copy_if_result<*InIter*, *OutIter*> `hpx::ranges::replace_copy_if`(*InIter* first, *Sent* sent, *OutIter* dest, *Pred* &&pred, *T* const &new_value, *Proj* &&proj = *Proj*())

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either new_value or *(first + (it - result)) depending on whether the following corresponding condition holds: INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false

The assignments in the parallel *replace_copy_if* algorithm execute in sequential order in the calling thread.

[795] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Note

Complexity: Performs exactly *sent* - *first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the elements which need to replaced. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns a *in_out_result<InIter, OutIter>*. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **OutIter**, typename **Pred**, typename **T** = typename *std*::iterator_traits<*OutIter*>::value_type, typename **Proj** = *hpx*::identity>

replace_copy_if_result<*std*::ranges::iterator_t<*Rng*>, *OutIter*> `hpx::ranges::replace_copy_if`(*Rng* &&rng, *OutIter* dest, *Pred* &&pred, *T* const &new_value, *Proj* &&proj = *Proj*())

Copies the all elements from the range rng to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (util::end(rng) - util::begin(rng))) either new_value or *(first + (it - result)) depending on whether the following corresponding condition holds: INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false

The assignments in the parallel *replace_copy_if* algorithm execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the elements which need to replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns an *in_out_result<std::ranges::iterator_t<Rng>*, OutIter>. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **Pred**, typename **T** = typename *std*::iterator_traits<*FwdIter2*>::value_type, typename **Proj** = *hpx*::identity>

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns an *hpx::future<FwdIter1, FwdIter2>*. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter**, typename **Pred**, typename **T** = typename *std*::iterator_traits<*FwdIter*>::value_type, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, replace_copy_if_result<*std*::ranges::iterator_t<*Rng*>, *FwdIter*>>::type `hpx::ranges::rep`

Copies the all elements from the range rng to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (util::end(rng) - util::begin(rng))) either new_value or *(first + (it - result)) depending on whether the following corresponding condition holds: INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false

The assignments in the parallel *replace_copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Rng`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`FwdIter`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Pred`** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **`T`** – The type of the new values to replace (deduced).

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate which returns *true* for the elements which need to replaced. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns an hpx::future<*in_out_result*<*std::ranges::iterator_t*<*Rng*>, OutIter>>. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::sort

Defined in header hpx/algorithm.hpp[796].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

RandomIt `hpx::ranges::sort`(*RandomIt* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

[796] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Note

Complexity: O(N log(N)), where N = detail::distance(first, last) comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **ExPolicy**, typename **RandomIt**, typename **Sent**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *RandomIt*>::type `hpx::ranges::sort`(*ExPolicy* &&policy, *RandomIt* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: O(N log(N)), where N = detail::distance(first, last) comparisons.

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- `RandomIt` – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- `Comp` – The type of the function/function object to use (deduced).
- `Proj` – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- `last` – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- `comp` – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- `proj` – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

template<typename **Rng**, typename **Comp**, typename **Proj**>

std::ranges::iterator_t<*Rng*> `hpx::ranges::sort`(*Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: O(N log(N)), where N = std::distance(begin(rng), end(rng)) comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns *std::ranges::iterator_t<Rng>*. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **Comp** = *ranges*::less, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::sort`(*ExPolicy* &&policy, *Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: O(N log(N)), where N = std::distance(begin(rng), end(rng)) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns a hpx::future<*std::ranges::iterator_t<Rng>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::ranges::iterator_t<Rng>* otherwise. It returns *last*.

hpx::ranges::partition

Defined in header hpx/algorithm.hpp[797].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::stable_partition*

[797] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- *hpx::ranges::partition_copy*

template<typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity>

subrange_t<*std*::ranges::iterator_t<*Rng*>> `hpx::ranges::partition`(*Rng* &&rng, *Pred* &&pred, *Proj* &&proj = *Proj*())

Reorders the elements in the range *rng* in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs at most 2 * N swaps, exactly N applications of the predicate and projection, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns *subrange_t<std::ranges::iterator_t<Rng>>* The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

template<typename **ExPolicy**, typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*std*::ranges::iterator_t<*Rng*>>> `hpx::ranges::partition`(*ExPolicy* &&policy, *Rng* &&rng, *Pred* &&pred, *Proj* &&proj = *Proj*())

Reorders the elements in the range *rng* in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs at most 2 * N swaps, exactly N applications of the predicate and projection, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **`proj`** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns a hpx::future<*subrange_t<std::ranges::iterator_t<Rng>>*> if the execution policy is of type *parallel_task_policy* and returns *subrange_t<std::ranges::iterator_t<Rng>>* The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

template<typename **FwdIter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity>

subrange_t<*FwdIter*> `hpx::ranges::partition`(*FwdIter* first, *Sent* last, *Pred* &&pred, *Proj* &&proj = *Proj*())

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: At most 2 * (last - first) swaps. Exactly *last* - *first* applications of the predicate and projection.

Template Parameters

- **`FwdIter`** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Sent`** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **`Pred`** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **`Proj`** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`last`** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns returns *subrange_t<FwdIter>*. The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity>
parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*FwdIter*>>::type `hpx::ranges::partition`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Pred* &&pred, *Proj* &&proj = *Proj*())

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most 2 * (last - first) swaps. Exactly *last* - *first* applications of the predicate and projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns a hpx::future<*subrange_t*<*FwdIter*>> if the execution policy is of type *parallel_task_policy* and returns *subrange_t*<*FwdIter*> otherwise. The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

hpx::ranges::stable_partition

Defined in header hpx/algorithm.hpp[798].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::partition*
- *hpx::ranges::partition_copy*

template<typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity>

[798] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

subrange_t<*std*::ranges::iterator_t<*Rng*>> `hpx::ranges::stable_partition`(*Rng* &&rng, *Pred* &&pred, *Proj* &&proj = *Proj*())

Permutes the elements in the range [first, last) such that there exists an iterator i such that for every iterator j in the range [first, i) INVOKE(f, INVOKE (proj, *j)) != false, and for every iterator k in the range [i, last), INVOKE(f, INVOKE (proj, *k)) == false

The invocations of *f* in the parallel *stable_partition* algorithm invoked without an execution policy object executes in sequential order in the calling thread.

> **Note**
>
> Complexity: At most (last - first) * log(last - first) swaps, but only linear number of swaps if there is enough extra memory Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an birdirectional iterator
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  bool fun(const Type &a);
  ```

  The signature does not need to have const&. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *stable_partition* algorithm returns an iterator i such that for every iterator j in the range [first, i), f(*j) != false INVOKE(f, INVOKE(proj, *j)) != false, and for every iterator k in the range [i, last), f(*k) == false INVOKE(f, INVOKE (proj, *k)) == false. The relative order of the elements in both groups is preserved.

template<typename **ExPolicy**, typename **Rng**, typename **Pred**, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*std*::ranges::iterator_t<*Rng*>>> `hpx::ranges::stable_partition`(*ExPolicy* &&policy, *Rng* &&rng, *Pred* &&pred, *Proj* &&proj = *Proj*())

Permutes the elements in the range [first, last) such that there exists an iterator i such that for every iterator j in the range [first, i) INVOKE(f, INVOKE (proj, *j)) != false, and for every iterator k in the range [i, last), INVOKE(f, INVOKE (proj, *k)) == false

The invocations of *f* in the parallel *stable_partition* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The invocations of *f* in the parallel *stable_partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most (last - first) * log(last - first) swaps, but only linear number of swaps if there is enough extra memory. Exactly *last* - *first* applications of the predicate and projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an birdirectional iterator
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *stable_partition* algorithm returns an iterator i such that for every iterator j in the range [first, i), f(*j) != false INVOKE(f, INVOKE(proj, *j)) != false, and for every iterator k in the range [i, last), f(*k) == false INVOKE(f, INVOKE (proj, *k)) == false. The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel_task_policy* the algorithm returns a future<> referring to this iterator.

template<typename **BidirIter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity>

subrange_t<*BidirIter*> *hpx*::*ranges*::**stable_partition**(*BidirIter* first, *Sent* last, *Pred* &&pred, *Proj* &&proj = *Proj*())

Permutes the elements in the range [first, last) such that there exists an iterator i such that for every iterator j in the range [first, i) INVOKE(f, INVOKE (proj, *j)) != false, and for every iterator k in the range [i, last), INVOKE(f, INVOKE (proj, *k)) == false

The invocations of *f* in the parallel *stable_partition* algorithm invoked without an execution policy object executes in sequential order in the calling thread.

> **Note**
>
> Complexity: At most (last - first) * log(last - first) swaps, but only linear number of swaps if there is enough extra memory Exactly *last* - *first* applications of the predicate and projection.

Template Parameters

- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for BidirIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *stable_partition* algorithm returns an iterator i such that for every iterator j in the range [first, i), f(*j) != false INVOKE(f, INVOKE(proj, *j)) != false, and for every iterator k in the range [i, last), f(*k) == false INVOKE(f, INVOKE (proj, *k)) == false. The relative order of the elements in both groups is preserved.

template<typename **ExPolicy**, typename **BidirIter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, subrange_t<*BidirIter*>>::type `hpx::ranges::stable_partition`(*ExPolicy* &&policy, *BidirIter* first, *Sent* last, *Pred* &&pred, *Proj* &&proj = *Proj*())

Permutes the elements in the range [first, last) such that there exists an iterator i such that for every iterator j in the range [first, i) INVOKE(f, INVOKE (proj, *j)) != false, and for every iterator k in the range [i, last), INVOKE(f, INVOKE (proj, *k)) == false

The invocations of *f* in the parallel *stable_partition* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The invocations of *f* in the parallel *stable_partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most (last - first) * log(last - first) swaps, but only linear number of swaps if there is enough extra memory Exactly *last* - *first* applications of the predicate and projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for BidirIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  bool fun(const Type &a);
  ```

  The signature does not need to have const&. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *stable_partition* algorithm returns an iterator i such that for every iterator j in the range [first, i), f(*j) != false INVOKE(f, INVOKE(proj, *j)) != false, and for every iterator k in the range [i, last), f(*k) == false INVOKE(f, INVOKE (proj, *k)) == false. The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel_task_policy* the algorithm returns a future<> referring to this iterator.

hpx::ranges::partition_copy

Defined in header hpx/algorithm.hpp[799].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::partition*
- *hpx::ranges::stable_partition*

template<typename **Rng**, typename **OutIter2**, typename **OutIter3**, typename **Pred**, typename **Proj** = *hpx*::identity>

partition_copy_result<*std*::ranges::iterator_t<*Rng*>, *OutIter2*, *OutIter3*> `hpx::ranges::partition_copy`(*Rng* &&rng, *OutIter2* dest_true, *OutIter3* dest_false, *Pred* &&pred, *Proj* &&proj = *Proj*())

Copies the elements in the range *rng*, to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

> **Note**
>
> Complexity: Performs not more than N assignments, exactly N applications of the predicate *pred*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.

[799] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns a partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>>. The *partition_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter2**, typename **FwdIter3**, typename **Pred**, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, partition_copy_result<*std*::ranges::iterator_t<*Rng*>, *FwdIter2*, *FwdIter3*>>::type `hpx::rang`

Copies the elements in the range *rng*, to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs not more than N assignments, exactly N applications of the predicate *pred*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **`Rng`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **`FwdIter2`** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **`FwdIter3`** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **`Pred`** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **`Proj`** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`rng`** – Refers to the sequence of elements the algorithm will be applied to.
- **`dest_true`** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **`dest_false`** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **`pred`** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns a hpx::future<*partition_copy_result* <std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>> if the execution policy is of type *parallel_task_policy* and returns partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3> otherwise. The *partition_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

template<typename **InIter**, typename **Sent**, typename **OutIter2**, typename **OutIter3**, typename **Pred**, typename **Proj** = *hpx*::identity>

partition_copy_result<*InIter*, *OutIter2*, *OutIter3*> `hpx::ranges::`**`partition_copy`**(*InIter* first, *Sent* last, *OutIter2* dest_true, *OutIter3* dest_false, *Pred* &&pred, *Proj* &&proj = *Proj*())

Copies the elements in the range, defined by [first, last), to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* applications of the predicate *f*.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns a *partition_copy_result<FwdIter, OutIter2, OutIter3>*. The *partition_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **OutIter2**, typename **OutIter3**, typename **Pred**, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, partition_copy_result<*FwdIter*, *OutIter2*, *OutIter3*>>::type `hpx::ranges::partition_co`

Copies the elements in the range, defined by [first, last), to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* applications of the predicate *f*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.

- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns a *hpx::future*<partition_copy_result<FwdIter, OutIter2, OutIter3>> if the execution policy is of type *parallel_task_policy* and returns *partition_copy_result<FwdIter, OutIter2, OutIter3>* otherwise. The *partition_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

hpx::ranges::transform_reduce

Defined in header hpx/algorithm.hpp[800].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

> **Warning**
>
> doxygenfunction: Cannot find function "hpx::ranges::transform_reduce" in doxygen xml output for project "hpx" from directory: ../hpx_autodoc

[800] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

hpx::ranges::is_heap

Defined in header hpx/algorithm.hpp[801].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::is_heap_until*

template<typename **ExPolicy**, typename **Rng**, typename **Comp** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::is_heap`(*ExPolicy* &&policy, *Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

801 http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **Comp** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::is_heap`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

template<typename **Rng**, typename **Comp** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

bool *hpx::ranges::***is_heap**(*Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

> **Note**
>
> Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

template<typename **Rng**, typename **Comp** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

std::ranges::iterator_t<*Rng*> `hpx::ranges::is_heap_until`(*Rng* &&rng, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

> **Note**
>
> Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap_until* algorithm returns *RandIter*. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

template<typename **Iter**, typename **Sent**, typename **Comp** = *hpx*::*parallel*::detail::less, typename **Proj** = *hpx*::identity>

Iter `hpx::ranges::is_heap_until`(*Iter* first, *Sent* last, *Comp* &&comp = *Comp*(), *Proj* &&proj = *Proj*())

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap_until* algorithm returns *RandIter*. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

hpx::ranges::experimental::for_loop

Defined in header hpx/algorithm.hpp[803].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::experimental::for_loop_strided*
- *hpx::ranges::experimental::for_loop_n*
- *hpx::ranges::experimental::for_loop_n_strided*

```
template<typename ExPolicy, typename Iter, typename Sent, typename ...Args>
hpx::parallel::util::detail::algorithm_result<ExPolicy>::type hpx::ranges::experimental::for_loop(ExPolicy &&policy, Iter first, Sent last, Args&&... args)
```

The for_loop implements loop functionality over a range specified by iterator bounds. These algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Iter* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of MoveConstructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the

[803] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

> **Note**
>
> As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

> **Note**
>
> The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the iteration variable (forward iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

  ```
  <ignored> pred(Iter const& a, ...);
  ```

  The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop* algorithm returns a *hpx::future<void>* if the execution policy is of type *hpx::execution::sequenced_task_policy* or *hpx::execution::parallel_task_policy* and returns *void* otherwise.

template<typename **Iter**, typename **Sent**, typename ...**Args**>

void *hpx*::*ranges*::experimental::**for_loop**(*Iter* first, *Sent* last, *Args*&&... args)

The for_loop implements loop functionality over a range specified by iterator bounds. These algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of for_loop without specifying an execution policy is equivalent to specifying *hpx::execution::seq* as the execution policy.

Requires: *Iter* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of MoveConstructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

> **Note**
>
> As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

> **Note**

> As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

> **Note**
>
> The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **`Iter`** – The type of the iteration variable (forward iterator).
- **`Sent`** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **`S`** – The type of the stride variable. This should be an integral type.
- **`Args`** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first`** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **`last`** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if Iter meets the requirements a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Iter const& a, ...);
```

  The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop_strided* algorithm returns a *hpx::future<void>* if the execution policy is of type *hpx::execution::sequenced_task_policy* or *hpx::execution::parallel_task_policy* and returns *void* otherwise.

template<typename **Iter**, typename **Sent**, typename **S**, typename ...**Args**>

void *hpx*::*ranges*::experimental::**for_loop_strided**(*Iter* first, *Sent* last, *S* stride, *Args*&&... args)

The for_loop_strided implements loop functionality over a range specified by iterator bounds. These algorithms resemble for_each from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of for_loop_strided without specifying an execution policy is equivalent to specifying *hpx::execution::seq* as the execution policy.

Requires: *Iter* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of MoveConstructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **Iter** – The type of the iteration variable (input iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_symmetric_difference_result<*Iter1*, *Iter2*, *Iter3*>>::type `hpx::ranges::set_symm`

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- `proj2` – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns a hpx::future<*ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>* otherwise. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, set_symmetric_difference_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns a hpx::future<*ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>*> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>* otherwise. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

set_symmetric_difference_result<*Iter1*, *Iter2*, *Iter3*> `hpx::ranges::set_symmetric_difference`(*Iter1* first1, *Sent1* last1, *Iter2* first2, *Sent2* last2, *Iter3* dest, *Pred* &&op = *Pred*(), *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.

- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

  ```
  bool pred(const Type1 &a, const Type1 &b);
  ```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns *ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>*. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **Iter3**, typename **Pred** = *hpx*::*parallel*::detail::less, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

set_symmetric_difference_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>, *Iter3*> `hpx::ranges::set_symmetric_dif`

Constructs a sorted range beginning at dest consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly std::abs(m-n) times. If m>n, then the last m-n of those elements are copied from [first1,last1), otherwise the last n-m elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

> **Note**
>
> Complexity: At most 2*(N1 + N2 - 1) comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **`Rng1`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`Rng2`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`Iter3`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **`Pred`** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::less<>
- **`Proj1`** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*

- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

  The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns *ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>*. where Iter1 is range_iterator_t<Rng1> and Iter2 is range_iterator_t<Rng2> The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::for_each

Defined in header hpx/algorithm.hpp[808].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::for_each_n*

template<typename **InIter**, typename **Sent**, typename **F**, typename **Proj** = *hpx*::identity>

for_each_result<*InIter*, *F*> `hpx::ranges::for_each`(*InIter* first, *Sent* last, *F* &&f, *Proj* &&proj = *Proj*())

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

[808] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Note

Complexity: Applies *f* exactly *last* - *first* times.

Template Parameters

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

{last, HPX_MOVE(f)} where last is the iterator corresponding to the input sentinel last.

template<typename **Rng**, typename **F**, typename **Proj** = *hpx*::identity>

for_each_result<*std*::ranges::iterator_t<*Rng*>, *F*> `hpx::ranges::for_each`(*Rng* &&rng, *F* &&f, *Proj* &&proj = *Proj*())

Applies *f* to the result of dereferencing every iterator in the given range *rng*.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Note

Complexity: Applies *f* exactly *size(rng)* times.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

{std::end(rng), HPX_MOVE(f)}

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **F**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> `hpx::ranges::for_each`(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *F* &&f, *Proj* &&proj = *Proj*())

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Applies *f* exactly *last* - *first* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  <ignored> pred(const Type &a);
  ```

  The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *for_each* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **F**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *std*::ranges::iterator_t<*Rng*>> `hpx::ranges::for_each`(*ExPolicy* &&policy, *Rng* &&rng, *F* &&f, *Proj* &&proj = *Proj*())

Applies *f* to the result of dereferencing every iterator in the given range *rng*.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Applies *f* exactly *size(rng)* times.

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **`Rng`** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`F`** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **`Proj`** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`rng`** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *for_each* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

hpx::ranges::for_each_n

Defined in header hpx/algorithm.hpp[809].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::for_each*

template<typename **InIter**, typename **Size**, typename **F**, typename **Proj** = *hpx*::identity>

for_each_n_result<*InIter*, *F*> **hpx::ranges::for_each_n**(*InIter* first, *Size* count, *F* &&f, *Proj* &&proj = *Proj*())

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

> **Note**
>
> Complexity: Applies *f* exactly *count* times.

Template Parameters

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

[809] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

It returns *last*.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**, typename **F**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result<*ExPolicy*, *FwdIter*>::type `hpx::ranges::for_each_n`(*ExPolicy* &&policy, *FwdIter* first, *Size* count, *F* &&f, *Proj* &&proj = *Proj*())

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Applies *f* exactly *count* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  <ignored> pred(const Type &a);
  ```

  The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *for_each* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

hpx::ranges::all_of

Defined in header hpx/algorithm.hpp[810].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::any_of*
- *hpx::ranges::none_of*

template<typename **ExPolicy**, typename **Rng**, typename **F**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::all_of`(*ExPolicy* &&policy, *Rng* &&rng, *F* &&f, *Proj* &&proj = *Proj*())

Checks if unary predicate *f* returns true for all elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most std::distance(begin(rng), end(rng)) applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

[810] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **F**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::all_of`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *F* &&f, *Proj* &&proj = *Proj*())

Checks if unary predicate *f* returns true for all elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most std::distance(begin(rng), end(rng)) applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

template<typename **Rng**, typename **F**, typename **Proj** = *hpx*::identity>

bool *hpx*::*ranges*::**all_of**(*Rng* &&rng, *F* &&f, *Proj* &&proj = *Proj*())

Checks if unary predicate *f* returns true for all elements in the range *rng*.

> **Note**
>
> Complexity: At most std::distance(begin(rng), end(rng)) applications of the predicate *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

template<typename **Iter**, typename **Sent**, typename **F**, typename **Proj** = *hpx*::identity>

bool *hpx*::*ranges*::**all_of**(*Iter* first, *Sent* last, *F* &&f, *Proj* &&proj = *Proj*())

Checks if unary predicate *f* returns true for all elements in the range *rng*.

> **Note**
>
> Complexity: At most std::distance(begin(rng), end(rng)) applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

hpx::ranges::any_of

Defined in header hpx/algorithm.hpp[811].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::all_of*
- *hpx::ranges::none_of*

template<typename **ExPolicy**, typename **Rng**, typename **F**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::`**`any_of`**(*ExPolicy* &&policy, *Rng* &&rng, *F* &&f, *Proj* &&proj = *Proj*())

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: At most std::distance(begin(rng), end(rng)) applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **F**, typename **Proj** = *hpx*::identity>

hpx::*parallel*::*util*::detail::algorithm_result_t<*ExPolicy*, bool> `hpx::ranges::none_of`(*ExPolicy* &&policy, *Iter* first, *Sent* last, *F* &&f, *Proj* &&proj = *Proj*())

Checks if unary predicate *f* returns true for no elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- `ExPolicy` – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- `Iter` – The type of the source iterators used for the range (deduced).
- `Sent` – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- `F` – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- `Proj` – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- `policy` – The execution policy to use for the scheduling of the iterations.
- `first` – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- `last` – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- `f` – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.
- `proj` – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

template<typename **Rng**, typename **F**, typename **Proj** = *hpx*::identity>

bool *hpx::ranges::***none_of**(*Rng* &&rng, *F* &&f, *Proj* &&proj = *Proj*())

Checks if unary predicate *f* returns true for no elements in the range *rng*.

> **Note**
>
> Complexity: At most std::distance(begin(rng), end(rng)) applications of the predicate *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

  ```
  bool pred(const Type &a);
  ```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

template<typename **Iter**, typename **Sent**, typename **F**, typename **Proj** = *hpx*::identity>

bool `hpx::ranges::none_of`(*Iter* first, *Sent* last, *F* &&f, *Proj* &&proj = *Proj*())

Checks if unary predicate *f* returns true for no elements in the range [first, last).

> **Note**
>
> Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

  The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to Type.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

hpx::ranges::transform

Defined in header hpx/algorithm.hpp[813].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **F**, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::unary_transform_result<*FwdIter1*, *FwdIter2*>>::type `hpx::ranges::transform(`

[813] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/algorithm.hpp

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at dest.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **`ExPolicy`** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **`FwdIter1`** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **`Sent1`** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **`FwdIter2`** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **`F`** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **`Proj`** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **`policy`** – The execution policy to use for the scheduling of the iterations.
- **`first`** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **`last`** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **`dest`** – Refers to the beginning of the destination range.
- **`f`** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type &a);
  ```

  The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type

Ret must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns a hpx::future<*ranges::unary_transform_result<FwdIter1, FwdIter2>* > if the execution policy is of type *parallel_task_policy* and returns *ranges::unary_transform_result<FwdIter1, FwdIter2>* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter**, typename **F**, typename **Proj** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::unary_transform_result<*std*::ranges::iterator_t<*Rng*>, *FwdIter*>> `hpx::ranges::t`

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at dest.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

  The signature does not need to have const&. The type *Type* must be such that an object of type *range_iterator<Rng>::type* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns a hpx::future<*ranges::unary_transform_result<range_iterator<Rng>::type*, FwdIter>> if the execution policy is of type *parallel_task_policy* and returns *ranges::unary_transform_result<range_iterator<Rng>::type*, FwdIter> otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**, typename **FwdIter3**, typename **F**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

parallel::*util*::detail::algorithm_result<*ExPolicy*, *ranges*::binary_transform_result<*FwdIter1*, *FwdIter2*, *FwdIter3*>>::type `hpx::ranges::tr`

Applies the given function *f* to pairs of elements from two ranges: one defined by *rng* and the other beginning at first2, and stores the result in another range, beginning at dest.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

> **Note**
>
> Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

  The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types FwdIter1 and FwdIter2 can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns A hpx::future<*ranges::binary_transform_result*<*FwdIter1, FwdIter2, FwdIter3*>> if the execution policy is of type *parallel_task_policy* and returns *ranges::binary_transform_result*<*FwdIter1, FwdIter2, FwdIter3*> otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

template<typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **F**, typename **Proj** = *hpx*::identity>

ranges::unary_transform_result<*FwdIter1*, *FwdIter2*> **hpx::ranges::transform**(*FwdIter1* first, *Sent1* last, *FwdIter2* dest, *F* &&f, *Proj* &&proj = *Proj*())

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at dest.

> **Note**
>
> Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type &a);
  ```

  The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns *ranges::unary_transform_result<FwdIter1, FwdIter2>*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng**, typename **FwdIter**, typename **F**, typename **Proj** = *hpx*::identity>

ranges::unary_transform_result<*std*::ranges::iterator_t<*Rng*>, *FwdIter*> **hpx::ranges::transform**(*Rng* &&rng, *FwdIter* dest, *F* &&f, *Proj* &&proj = *Proj*())

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at dest.

> **Note**
>
> Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is an unary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type &a);
  ```

  The signature does not need to have const&. The type *Type* must be such that an object of type *range_iterator<Rng>::type* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns *ranges::unary_transform_result<range_iterator<Rng>::type*, FwdIter>. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

template<typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **Sent2**, typename **FwdIter3**, typename **F**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

ranges::binary_transform_result<*FwdIter1*, *FwdIter2*, *FwdIter3*> `hpx::ranges::transform`(*FwdIter1* first1, *Sent1* last1, *FwdIter2* first2, *Sent2* last2, *FwdIter3* dest, *F* &&f, *Proj1* &&proj1 = *Proj1*(), *Proj2* &&proj2 = *Proj2*())

Applies the given function *f* to pairs of elements from two ranges: one defined by *rng* and the other beginning at first2, and stores the result in another range, beginning at dest.

> **Note**
>
> Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.

- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types FwdIter1 and FwdIter2 can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns *ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**, typename **FwdIter**, typename **F**, typename **Proj1** = *hpx*::identity, typename **Proj2** = *hpx*::identity>

ranges::binary_transform_result<*std*::ranges::iterator_t<*Rng1*>, *std*::ranges::iterator_t<*Rng2*>, *FwdIter*> **hpx::ranges::transform**(*Rng1* &&rn *Rng2* &&rn *FwdIt* dest, *F* &&f, *Proj1* &&pr = *Proj1*(*Proj2* &&pr = *Proj2*(

Applies the given function *f* to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest.

> **Note**
>
> Complexity: Exactly min(last2-first2, last1-first1) applications of *f*

> **Note**
>
> The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

Template Parameters

- **`Rng1`** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`Rng2`** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **`FwdIter`** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **`F`** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **`Proj1`** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **`Proj2`** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **`rng1`** – Refers to the first sequence of elements the algorithm will be applied to.
- **`rng2`** – Refers to the second sequence of elements the algorithm will be applied to.
- **`dest`** – Refers to the beginning of the destination range.
- **`f`** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last).This is a binary predicate. The signature of this predicate should be equivalent to:

  ```
  Ret fun(const Type1 &a, const Type2 &b);
  ```

  The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types range_iterator<Rng1>::type and range_iterator<Rng2>::type can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.
- **`proj1`** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns *ranges::binary_transform_result*< std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, FwdIter>. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

Defined in header hpx/future.hpp[818].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

> **See also**
>
> *hpx::post (distributed)*

template<typename **F**, typename ...**Ts**>

bool *hpx*::**post**(*F* &&f, *Ts*&&... ts)

Runs the function `f` asynchronously (potentially in a separate thread which might be a part of a thread pool). This is done in a fire-and-forget manner, meaning there is no return value or way to synchronize with the function execution (it does not return an *`hpx::future`* that would hold the result of that function call).

`hpx::post` is particularly useful when synchronization mechanisms as heavyweight as futures are not desired, and instead, more lightweight mechanisms like latches or atomic variables are preferred. Essentially, the post function enables the launch of a new thread without the overhead of creating a future.

> **Note**
>
> *`hpx::post`* is similar to `hpx::async` but does not return a future. This is why there is no way of finding out the result/failure of the execution of this function.

template<typename **Action**, typename ...**Ts**>

template<typename **Action**, typename **Target**, typename ...**Ts**>

bool *hpx*::**post**(*Action* &&action, *Target* &&target, *Ts*&&... ts)

The distributed implementation of `hpx::post` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID.

Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

Returns

`true` if the action was successfully posted, `false` otherwise.

hpx::dataflow

Defined in header hpx/future.hpp[819].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::async

Defined in header hpx/future.hpp[820].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also

hpx::async (distributed)

template<typename **Action**, typename **F**, typename ...**Ts**>

[819] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp
[820] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

auto **hpx::async**(*F* &&f, *Ts*&&... ts) -> decltype(detail::async_action_dispatch<*Action*, *std*::decay_t<*F*>>::call(*std*::forward<*F*>(*f*), *std*::forward<*Ts*>(*ts*)...))

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a hpx::future that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being *hpx::launch::async* | hpx::launch::deferred. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the async flag is set (i.e. (policy & hpx::launch::async) != 0), then async executes the callable object f on a new thread of execution (with all thread-locals initialized) as if spawned by *hpx::thread*(std::forward<F>(f), std::forward<Ts>(ts)…), except that if the function f returns a value or throws an exception, it is stored in the shared state accessible through the *hpx::future* that async returns to the caller.
- If the deferred flag is set (i.e. (policy & hpx::launch::deferred) != 0), then async converts f and ts… the same way as by *hpx::thread* constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the *hpx::future* that async returned to the caller will cause the copy of f to be invoked (as a rvalue) with the copies of ts… (also passed as rvalues) in the current thread (which does not have to be the thread that originally called hpx::async). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same *hpx::future* will return the result immediately.
- If neither hpx::launch::async nor hpx::launch::deferred, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

  If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the hpx::launch::async and hpx::launch::deferred flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

  In any case, the call to hpx::async synchronizes-with (as defined in std::memory_order) the call to f, and the completion of f is sequenced-before making the shared state ready. If the async policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If std::decay<Function>::type or each type in std::decay<Ts>::type is not constructible from its corresponding argument, the program is ill-formed.

Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to f

Returns

hpx::future referring to the shared state created by this call to *hpx::async*.

template<typename **Action**, typename **F**, typename ...**Ts**>

auto **hpx::async**(*F* &&f, *Ts*&&... ts) -> decltype(detail::async_action_dispatch<*Action*, *std*::decay_t<*F*>>::call(*std*::forward<*F*>(*f*), *std*::forward<*Ts*>(*ts*)...))

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a hpx::future that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being *hpx::launch::async* | hpx::launch::deferred. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the async flag is set (i.e. (policy & hpx::launch::async) != 0), then async executes the callable object f on a new thread of execution (with all thread-locals initialized) as if spawned by *hpx::thread*(std::forward<F>(f), std::forward<Ts>(ts)…), except that if the function f returns a value or throws an exception, it is stored in the shared state accessible through the *hpx::future* that async returns to the caller.
- If the deferred flag is set (i.e. (policy & hpx::launch::deferred) != 0), then async converts f and ts… the same way as by *hpx::thread* constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the *hpx::future* that async returned to the caller will cause the copy of f to be invoked (as a rvalue) with the copies of ts… (also passed as rvalues) in the current thread (which does not have to be the thread that originally called hpx::async). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same *hpx::future* will return the result immediately.
- If neither hpx::launch::async nor hpx::launch::deferred, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

  If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the hpx::launch::async and hpx::launch::deferred flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

  In any case, the call to hpx::async synchronizes-with (as defined in std::memory_order) the call to f, and the completion of f is sequenced-before making the shared state ready. If the async policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If std::decay<Function>::type or each type in std::decay<Ts>::type is not constructible from its corresponding argument, the program is ill-formed.

Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to f

Returns

hpx::future referring to the shared state created by this call to *hpx::async*.

Warning

doxygenfunction: Unable to resolve function "hpx::async" with arguments (Executor&&, hpx::sycl::experimental::sycl_executor::queue_function_ptr_t<Ts…>&&, Ts&&…) in doxygen xml output for project "hpx" from directory: ../hpx_autodoc. Potential matches:

```
- template<typename Action,
↪ typename F, typename ...Ts> auto async(F &&f, Ts&&... ts)␣
↪-> decltype(detail::async_action_dispatch<Action, std::decay_
↪t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
- template<typename Action, typename Target, typename␣
↪...Ts> auto async(Action &&action, Target &&target, Ts&&... ts)
- template<typename Executor, typename ...Ts> decltype(auto)␣
↪async(Executor &&exec, hpx::sycl::experimental::sycl_
↪executor::queue_function_ptr_t<Ts...> &&f, Ts&&... ts)
- template<typename␣
↪F, typename ...Ts> decltype(auto) async(F &&f, Ts&&... ts)
```

template<typename **Action**, typename **Target**, typename ...**Ts**>

auto *hpx*::**async**(*Action* &&action, *Target* &&target, *Ts*&&... ts)

The distributed implementation of `hpx::async` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID. The action executes asynchronously.

Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

Returns

hpx::future referring to the shared state created by this call to `hpx::async`

async_combinators

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::wait_some

Defined in header hpx/future.hpp[821].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait_some_nothrow*
- *hpx::wait_some_n*
- *hpx::wait_some_n_nothrow*

template<typename **InputIter**>

void *hpx*::**wait_some**(*std*::size_t n, *InputIter* first, *InputIter* last)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

[821] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

> **Note**
>
> The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

> **Note**
>
> The function wait_some will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the function to return.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or shared_future objects for which *when_all* should wait.

template<typename **R**>

void *hpx*::**wait_some**(*std*::size_t n, *std*::vector<*future*<*R*>> &&futures)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

> **Note**
>
> The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

> **Note**
>
> The function wait_some will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A vector holding an arbitrary amount of *future* or shared_future objects for which *wait_some* should wait.

template<typename **R**, *std*::size_t **N**>

void *hpx*::**wait_some**(*std*::size_t n, *std*::array<*future*<*R*>, *N*> &&futures)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

> **Note**
>
> The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

> **Note**
>
> The function wait_some will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An array holding an arbitrary amount of *future* or shared_future objects for which *wait_some* should wait.

template<typename ...**T**>

void *hpx*::**wait_some**(*std*::size_t n, *T*&&... futures)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

> **Note**
>
> The function *wait_all* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

> **Note**
>
> The function wait_some will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or shared_future objects, possibly holding different types for which *wait_some* should wait.

hpx::wait_some_nothrow

Defined in header hpx/future.hpp[822].

> The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

> **Note**
>
> The function wait_all will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

> **Note**
>
> The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until wait_all returns and all inspection of the futures is complete.

Parameters

- **first** – The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_all* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or shared_future objects for which *wait_all* should wait.

template<typename **R**>

void *hpx*::**wait_all**(*std*::vector<*future*<*R*>> &&futures)

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

> **Note**
>
> The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

> **Note**
>
> The function wait_all will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

> **Note**
>
> The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until wait_all returns and all inspection of the futures is complete.

Parameters

futures – A vector or array holding an arbitrary amount of *future* or shared_future objects for which *wait_all* should wait.

template<typename **R**, *std*::size_t **N**>

void *hpx*::**wait_all**(*std*::array<*future*<*R*>, *N*> &&futures)

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

> **Note**
>
> The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

> **Note**
>
> The function wait_all will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

> **Note**
>
> The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until wait_all returns and all inspection of the futures is complete.

Parameters

futures – A vector or array holding an arbitrary amount of *future* or shared_future objects for which *wait_all* should wait.

template<typename **T**>

void *hpx*::**wait_all**(*hpx*::*future*<*T*> const &f)

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

> **Note**
>
> The function *wait_all* returns after the future has become ready. The input future is still valid after *wait_all* returns.

> **Note**
>
> The function wait_all will rethrow any exceptions captured by the future while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters

f – A *future* or shared_future for which *wait_all* should wait.

template<typename ...**T**>

void *hpx*::**wait_all**(*T*&&... futures)

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

> **Note**
>
> The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

> **Note**
>
> The function wait_all will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters

futures – An arbitrary number of *future* or shared_future objects, possibly holding different types for which *wait_all* should wait.

hpx::wait_all_nothrow

Defined in header hpx/future.hpp[826].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait_all*
- *hpx::wait_all_n*
- *hpx::wait_all_n_nothrow*

template<typename **InputIter**>

bool *hpx*::**wait_all_nothrow**(*InputIter* first, *InputIter* last)

The function *wait_all_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all*. It differs from *wait_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

> **Note**
>
> The function *wait_all_nothrow* returns after all futures have become ready. All input futures are still valid after *wait_all_nothrow* returns.

[826] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

> **Note**
>
> Unlike *wait_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

> **Note**
>
> The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until wait_all returns and all inspection of the futures is complete.

Parameters

- **`first`** – The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_all_nothrow* should wait.
- **`last`** – The iterator pointing to the element after the last one of a sequence of *future* or shared_future objects for which *wait_all_nothrow* should wait.

Returns

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

template<typename **R**>

bool *hpx*::**`wait_all_nothrow`**(*std*::vector<*future*<*R*>> &&futures)

The function *wait_all_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all*. It differs from *wait_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

> **Note**
>
> The function *wait_all_nothrow* returns after all futures have become ready. All input futures are still valid after *wait_all_nothrow* returns.

> **Note**
>
> Unlike *wait_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

Parameters

`futures` – A vector or array holding an arbitrary amount of *future* or shared_future objects for which *wait_all_nothrow* should wait.

Returns

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

template<typename **R**, *std*::size_t **N**>

bool *hpx*::**wait_all_nothrow**(*std*::array<*future*<*R*>, *N*> &&futures)

The function *wait_all_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all*. It differs from *wait_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

> **Note**
>
> The function *wait_all_nothrow* returns after all futures have become ready. All input futures are still valid after *wait_all_nothrow* returns.

> **Note**
>
> Unlike *wait_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

Parameters

`futures` – A vector or array holding an arbitrary amount of *future* or shared_future objects for which *wait_all_nothrow* should wait.

Returns

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

template<typename **T**>

bool *hpx*::**wait_all_nothrow**(*hpx*::*future*<*T*> const &f)

The function *wait_all_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all*. It differs from *wait_all* in that it will not rethrow any exceptions captured by the given future while it became ready.

> **Note**
>
> The function *wait_all_nothrow* returns after the future has become ready. The input future is still valid after *wait_all_nothrow* returns.

> **Note**
>
> Unlike *wait_all*, this function will not rethrow any exception captured by the future while becoming ready. Any such exception is silently discarded; the caller can use the returned *bool* to detect its presence.

Parameters

`f` – A *future* or shared_future for which *wait_all_nothrow* should wait.

Returns

Returns *true* if the given future held an exception once it became ready, and *false* otherwise.

template<typename ...T>

bool *hpx*::**wait_all_nothrow**(*T*&&... futures)

The function *wait_all_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all*. It differs from *wait_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

> **Note**
>
> The function *wait_all_nothrow* returns after all futures have become ready. All input futures are still valid after *wait_all_nothrow* returns.

> **Note**
>
> Unlike *wait_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

Parameters

`futures` – An arbitrary number of *future* or shared_future objects, possibly holding different types for which *wait_all_nothrow* should wait.

Returns

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

hpx::wait_all_n

Defined in header hpx/future.hpp[827].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

template<typename **InputIter**>

[827] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

void *hpx*::**wait_all_n**(*InputIter* begin, *std*::size_t count)

The function *wait_all_n* is an operator allowing to join on the result of all given futures.
It AND-composes all future objects given and returns after they finished executing.

> **Note**
>
> The function *wait_all_n* returns after all futures have become ready. All input futures are still valid after *wait_all_n* returns.

> **Note**
>
> The function wait_all_n will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_n_nothrow* instead.

> **Note**
>
> The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until wait_all returns and all inspection of the futures is complete.

Parameters

- **begin** – The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_all_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

Returns

The function *wait_all_n* will return an iterator referring to the first element in the input sequence after the last processed element.

hpx::wait_all_n_nothrow

Defined in header hpx/future.hpp[828].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait_all*
- *hpx::wait_all_nothrow*
- *hpx::wait_all_n*

template<typename **InputIter**>

std::pair<*InputIter*, bool> *hpx*::**wait_all_n_nothrow**(*InputIter* begin, *std*::size_t count)

The function *wait_all_n_nothrow* is an operator allowing to join on the result of all

[828] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all_n*. It differs from *wait_all_n* in that it will not rethrow any exceptions captured by the given futures while they became ready.

Note

The function *wait_all_n_nothrow* returns after all futures have become ready. All input futures are still valid after *wait_all_n_nothrow* returns.

Note

Unlike *wait_all_n*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

Note

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until wait_all returns and all inspection of the futures is complete.

Parameters

- **`begin`** – The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_all_n_nothrow* should wait.
- **`count`** – The number of elements in the sequence starting at *first*.

Returns

The function *wait_all_n_nothrow* returns a pair consisting of an iterator referring to the first element in the input sequence after the last processed element, and a *bool* that is *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

hpx::when_any

Defined in header hpx/future.hpp[829].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std*::iterator_traits<*InputIter*>::value_type>>>

future<when_any_result<*Container*>> `hpx::`**`when_any`**(*InputIter* first, *InputIter* last)

function *when_any* creates a future object that becomes when at least one element in a set of *future* and shared_future objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

[829] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *when_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or shared_future objects for which *when_any* should wait.

Returns

Returns a when_any_result holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

- future<when_any_result<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename **Range**>

future<when_any_result<*Range*>> `hpx::`**`when_any`**(*Range* &values)

function *when_any* creates a future object that becomes when at least one element in a set of *future* and shared_future objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

values – [in] A range holding an arbitrary amount of *futures* or shared_future objects for which *when_any* should wait.

Returns

Returns a when_any_result holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

- future<when_any_result<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename ...**T**>

future<when_any_result<*tuple*<*future*<*T*>...>>> `hpx::`**`when_any`**(*T*&&... futures)

function *when_any* creates a future object that becomes when at least one element in a set of *future* and shared_future objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

futures – [in] An arbitrary number of *future* or shared_future objects, possibly holding different types for which *when_any* should wait.

Returns

Returns a when_any_result holding the same list of futures as has been passed to when_any and an index pointing to a ready future.

- future<when_any_result<tuple<future<T0>, future<T1>…>>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.

- future<when_any_result<tuple<>>> if *when_any* is called with zero arguments. The returned future will be initially ready.

hpx/async_combinators/split_future.hpp

Defined in header hpx/async_combinators/split_future.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename ...**Ts**>

inline *tuple<future<Ts>...>* **split_future**(*future<tuple<Ts...>>* &&f)

The function *split_future* is an operator allowing to split a given future of a sequence of values (any tuple, std::pair, or std::array) into an equivalent container of futures where each future represents one of the values from the original future. In some sense this function provides the inverse operation of *when_all*.

Note

The following cases are special:

```
tuple<future<void> > split_future(future<tuple<> > && f);
array<future<void>, 1> split_future(future<array<T, 0> > && f);
```

here the returned futures are directly representing the futures which were passed to the function.

Parameters

f – [in] A future holding an arbitrary sequence of values stored in a tuple-like container. This facility supports *hpx::tuple<>*, *std::pair<T1, T2>*, and *std::array<T, N>*

Returns

Returns an equivalent container (same container type as passed as the argument) of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

template<typename **T**>

inline *std*::vector<*future*<*T*>> **split_future**(*future*<*std*::vector<*T*>> &&f, *std*::size_t size)

The function *split_future* is an operator allowing to split a given future of a sequence of values (any std::vector) into a std::vector of futures where each future represents one of the values from the original std::vector. In some sense this function provides the inverse operation of *when_all*.

Parameters

- **f** – [in] A future holding an arbitrary sequence of values stored in a std::vector.
- **size** – [in] The number of elements the vector will hold once the input future has become ready

Returns
Returns a std::vector of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

hpx::when_all

Defined in header hpx/future.hpp[830].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std*::iterator_traits<*InputIter*>::value_type>>>

hpx::*future*<*Container*> **hpx::when_all**(*InputIter* first, *InputIter* last)

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and shared_future objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

> **Note**
>
> Calling this version of *when_all* where first == last, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or shared_future objects for which *when_all* should wait.

Returns
Returns a future holding the same list of futures as has been passed to *when_all*.

- future<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

[830] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

template<typename **Range**>

hpx::future<Range> `hpx::when_all`(*Range* &&values)

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and shared_future objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

> **Note**
>
> Calling this version of *when_all* where the input container is empty, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

`values` – [in] A range holding an arbitrary amount of *future* or shared_future objects for which *when_all* should wait.

Returns

Returns a future holding the same list of futures as has been passed to when_all.

- future<Container<future<R>>>: If the input cardinality is unknown at compile time and the futures are all have the same type.

template<typename ...**T**>

hpx::future<hpx::tuple<hpx::future<T>...>> `hpx::when_all`(*T*&&... futures)

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and shared_future objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

> **Note**
>
> Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

`futures` – [in] An arbitrary number of *future* or shared_future objects, possibly holding different types for which *when_all* should wait.

Returns

Returns a future holding the same list of futures as has been passed to *when_all*.

- future<tuple<future<T0>, future<T1>, future<T2>…>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.

- future<tuple<>> if *when_all* is called with zero arguments. The returned future will be initially ready.

hpx::when_some

Defined in header hpx/future.hpp[831].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std*::iterator_traits<*InputIter*>::value_type>>>

future<when_some_result<*Container*>> `hpx::when_some`(*std*::size_t n, Iterator first, Iterator last)

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

> **Note**
>
> The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

> **Note**
>
> Calling this version of *when_some* where first == last, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or shared_future objects for which *when_all* should wait.

Returns

Returns a when_some_result holding the same list of futures as has been passed to when_some and indices pointing to ready futures.

- future<when_some_result<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename **Range**>

[831] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

future<when_some_result<*Range*>> `hpx::when_some`(*std*::size_t n, *Range* &&futures)

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note

The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note

Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A container holding an arbitrary amount of *future* or shared_future objects for which *when_some* should wait.

Returns

Returns a when_some_result holding the same list of futures as has been passed to when_some and indices pointing to ready futures.

- future<when_some_result<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename ...**Ts**>

future<when_some_result<*tuple*<*future*<T>...>>> `hpx::when_some`(*std*::size_t n, *Ts*&&... futures)

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note

The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note

Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or shared_future objects, possibly holding different types for which *when_some* should wait.

Returns

Returns a when_some_result holding the same list of futures as has been passed to when_some and an index pointing to a ready future..

- future<when_some_result<tuple<future<T0>, future<T1>…>>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- future<when_some_result<tuple<>>> if *when_some* is called with zero arguments. The returned future will be initially ready.

hpx::when_each

Defined in header hpx/future.hpp[832].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **F**, typename **Future**>

future<void> *hpx*::**when_each**(*F* &&f, *std*::vector<*Future*> &&futures)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.

[832] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

- **futures** – A vector holding an arbitrary amount of *future* or shared_future objects for which *wait_each* should wait.

Returns
Returns a future representing the event of all input futures being ready.

template<typename **F**, typename **Iterator**>

future<*Iterator*> *hpx*::**when_each**(*F* &&f, *Iterator* begin, *Iterator* end)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

> **Note**
>
> This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or shared_future objects for which *wait_each* should wait.

Returns
Returns a future representing the event of all input futures being ready.

template<typename **F**, typename ...**Ts**>

future<void> *hpx*::**when_each**(*F* &&f, *Ts*&&... futures)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

> **Note**
>
> This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or shared_future objects, possibly holding different types for which *wait_each* should wait.

Returns

Returns a future representing the event of all input futures being ready.

hpx::wait_all_for

Defined in header hpx/future.hpp[833].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait_all_for_nothrow*
- *hpx::wait_all_for_n*
- *hpx::wait_all_for_n_nothrow*

template<typename **InputIter**>

hpx::future_status **hpx::wait_all_for**(*hpx*::chrono::steady_duration const &timeout, *InputIter* first, *InputIter* last)

The function *wait_all_for* is an operator allowing to join on the result of all given futures, similar to *wait_all*. It differs from *wait_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

> **Note**
>
> The function *wait_all_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

> **Note**
>
> The function wait_all_for will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait_all_for_nothrow* instead.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.

[833] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

- **first** – The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_all_for* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or shared_future objects for which *wait_all_for* should wait.

Returns

Returns *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

template<typename **R**>

hpx::future_status **hpx::wait_all_for**(*hpx*::chrono::steady_duration const &timeout, *std*::vector<*future*<*R*>> const &futures)

The function *wait_all_for* is an operator allowing to join on the result of all given futures, similar to *wait_all*. It differs from *wait_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

Note

The function wait_all_for will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait_all_for_nothrow* instead.

Note

The function wait_all_for returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after wait_all_for returns, independently of the returned status, and can be inspected (e.g. using is_ready()) to determine which of the given futures have become ready.

Note

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, wait_all_for may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or shared_future objects for which *wait_all_for* should wait.

Returns

Returns *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

template<typename **R**, *std*::size_t **N**>

hpx::future_status **hpx::wait_all_for**(*hpx*::chrono::steady_duration const &timeout, *std*::array<*future*<*R*>, *N*> const &futures)

The function *wait_all_for* is an operator allowing to join on the result of all given futures, similar to *wait_all*. It differs from *wait_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

> **Note**
>
> The function *wait_all_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

> **Note**
>
> The function wait_all_for will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait_all_for_nothrow* instead.

> **Note**
>
> The function wait_all_for returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after wait_all_for returns, independently of the returned status, and can be inspected (e.g. using is_ready()) to determine which of the given futures have become ready.

> **Note**
>
> The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, wait_all_for may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

Parameters

- **`timeout`** – The maximum duration to wait for all the given futures to become ready.
- **`futures`** – A vector or array holding an arbitrary amount of *future* or shared_future objects for which *wait_all_for* should wait.

Returns

Returns *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

template<typename **T**>

hpx::future_status **`hpx::wait_all_for`**(*hpx*::chrono::steady_duration const &timeout, *hpx*::*future*<*T*> const &f)

The function *wait_all_for* is an operator allowing to join on the result of the given future, similar to *wait_all*. It differs from *wait_all* in that it will not suspend indefinitely if the given future never becomes ready; instead it returns as soon as either the future has become ready, or the given timeout has elapsed, whichever happens first.

> **Note**
>
> The function *wait_all_for* returns after the future has become ready, or after the given timeout has expired, whichever comes first. The input future is still valid after *wait_all_for* returns, independently of the returned status.

> **Note**
>
> The function wait_all_for will rethrow any exceptions captured by the future while becoming ready, as long as the given future became ready before the timeout elapsed. If this behavior is undesirable, use *wait_all_for_nothrow* instead.

Parameters

- **`timeout`** – The maximum duration to wait for the given future to become ready.
- **`f`** – A *future* or shared_future for which *wait_all_for* should wait.

Returns

Returns *hpx::future_status::ready* if the given future has become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

template<typename ...**T**>

hpx::future_status **hpx::wait_all_for**(*hpx*::chrono::steady_duration const &timeout, *T* const&... futures)

The function *wait_all_for* is an operator allowing to join on the result of all given futures, similar to *wait_all*. It differs from *wait_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

Note

The function wait_all_for will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait_all_for_nothrow* instead.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – An arbitrary number of *future* or shared_future objects, possibly holding different types for which *wait_all_for* should wait.

Returns

Returns *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

hpx::wait_all_for_nothrow

Defined in header hpx/future.hpp[834].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

template<typename **InputIter**>

[834] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

hpx::wait_all_for_nothrow_result **hpx::wait_all_for_nothrow**(*hpx*::chrono::steady_duration const &timeout, *InputIter* first, *InputIter* last)

The function *wait_all_for_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait_all_for*. It differs from *wait_all_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

> **Note**
>
> The function *wait_all_for_nothrow* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for_nothrow* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

> **Note**
>
> Unlike *wait_all_for_nothrow*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **first** – The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_all_for_nothrow* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or shared_future objects for which *wait_all_for_nothrow* should wait.

Returns

Returns a *wait_all_for_nothrow_result* object whose *status* member is *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise; and whose *has_exceptional_results* member indicates whether any of the futures that became ready had captured an exception.

template<typename **R**>

hpx::wait_all_for_nothrow_result **hpx::wait_all_for_nothrow**(*hpx*::chrono::steady_duration const &timeout, *std*::vector<*future*<*R*>> const &futures)

The function *wait_all_for_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait_all_for*. It differs from *wait_all_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

> **Note**
>
> The function *wait_all_for_nothrow* returns after all futures have become ready, or after

the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for_nothrow* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

Note

Unlike *wait_all_for*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

Note

The function wait_all_for_nothrow returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after wait_all_for returns, independently of the returned status, and can be inspected (e.g. using is_ready()) to determine which of the given futures have become ready.

Note

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, wait_all_for may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

Parameters

- **`timeout`** – The maximum duration to wait for all the given futures to become ready.
- **`futures`** – A vector or array holding an arbitrary amount of *future* or shared_future objects for which *wait_all_for_nothrow* should wait.

Returns

Returns a *wait_all_for_nothrow_result* object whose *status* member is *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise; and whose *has_exceptional_results* member indicates whether any of the futures that became ready had captured an exception.

template<typename **R**, *std*::size_t **N**>

hpx::wait_all_for_nothrow_result **`hpx::wait_all_for_nothrow`**(*hpx*::chrono::steady_duration const &timeout, *std*::array<*future*<*R*>, *N*> const &futures)

The function *wait_all_for_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait_all_for*. It differs from *wait_all_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

> **Note**
>
> The function *wait_all_for_nothrow* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for_nothrow* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

> **Note**
>
> Unlike *wait_all_for*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

> **Note**
>
> The function wait_all_for_nothrow returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after wait_all_for returns, independently of the returned status, and can be inspected (e.g. using is_ready()) to determine which of the given futures have become ready.

> **Note**
>
> The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, wait_all_for may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

Parameters

- **`timeout`** – The maximum duration to wait for all the given futures to become ready.
- **`futures`** – A vector or array holding an arbitrary amount of *future* or shared_future objects for which *wait_all_for_nothrow* should wait.

Returns

Returns a *wait_all_for_nothrow_result* object whose *status* member is *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise; and whose *has_exceptional_results* member indicates whether any of the futures that became ready had captured an exception.

template<typename **T**>

hpx::wait_all_for_nothrow_result **`hpx::wait_all_for_nothrow`**(*hpx*::chrono::steady_duration const &timeout, *hpx*::*future*<*T*> const &f)

The function *wait_all_for_nothrow* is an operator allowing to join on the result of the given future, similar to *wait_all_for*. It differs from *wait_all_for* in that it will not rethrow any exceptions captured by the given future while it became ready; instead it returns as soon as either the future has become ready, or the given timeout has elapsed, whichever happens first.

> **Note**
>
> The function *wait_all_for_nothrow* returns after the future has become ready, or after the given timeout has expired, whichever comes first. The input future is still valid after *wait_all_for_nothrow* returns, independently of the returned status.

> **Note**
>
> Unlike *wait_all_for*, this function will not rethrow any exceptions captured by the future while becoming ready. Any such exception is silently discarded.

Parameters

- **timeout** – The maximum duration to wait for the given future to become ready.
- **f** – A *future* or shared_future for which *wait_all_for_nothrow* should wait.

Returns

Returns a *wait_all_for_nothrow_result* object whose *status* member is *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise; and whose *has_exceptional_results* member indicates whether any of the futures that became ready had captured an exception.

template<typename ...**T**>

hpx::wait_all_for_nothrow_result **hpx::wait_all_for_nothrow**(*hpx*::chrono::steady_duration const &timeout, *T* const&... futures)

The function *wait_all_for_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait_all_for*. It differs from *wait_all_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

> **Note**
>
> The function *wait_all_for_nothrow* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for_nothrow* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

> **Note**
>
> Unlike *wait_all_for*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – An arbitrary number of *future* or shared_future objects, possibly holding different types for which *wait_all_for_nothrow* should wait.

Returns

Returns a *wait_all_for_nothrow_result* object whose *status* member is *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise; and whose *has_exceptional_results* member indicates whether any of the futures that became ready had captured an exception.

- *hpx::wait_each_n_nothrow*

template<typename **F**, typename **Future**>

void *hpx*::**wait_each**(*F* &&f, *std*::vector<*Future*> &&futures)

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

> **Note**
>
> This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or shared_future objects for which *wait_each* should wait.

template<typename **F**, typename **Iterator**>

[837] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

void *hpx*::**wait_each**(*F* &&f, *Iterator* begin, *Iterator* end)

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

> **Note**
>
> This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or shared_future objects for which *wait_each* should wait.

template<typename **F**, typename ...**T**>

void *hpx*::**wait_each**(*F* &&f, *T*&&... futures)

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

> **Note**
>
> This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or shared_future objects, possibly holding different types for which *wait_each* should wait.

```
template<typename InputIter>
void hpx::wait_any(InputIter first, InputIter last)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note

The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

[840] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

> **Note**
>
> The function wait_any will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or shared_future objects for which *wait_any* should wait.

template<typename **R**>

void *hpx*::**wait_any**(*std*::vector<*future*<*R*>> &futures)

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

> **Note**
>
> The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

> **Note**
>
> The function wait_any will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

futures – [in] A vector holding an arbitrary amount of *future* or shared_future objects for which *wait_any* should wait.

template<typename **R**, *std*::size_t **N**>

void *hpx*::**wait_any**(*std*::array<*future*<*R*>, *N*> &futures)

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

> **Note**
>
> The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

> **Note**
>
> The function wait_any will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

futures – [in] Amn array holding an arbitrary amount of *future* or shared_future objects for which *wait_any* should wait.

template<typename ...**T**>

void *hpx*::**wait_any**(*T*&&... futures)

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

> **Note**
>
> The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

> **Note**
>
> The function wait_any will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

futures – [in] An arbitrary number of *future* or shared_future objects, possibly holding different types for which *wait_any* should wait.

hpx::wait_any_nothrow

Defined in header hpx/future.hpp[842].

template<typename **InputIter**>

void hpx::**wait_any_n**(*InputIter* first, *std*::size_t count)

The function *wait_any_n* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

> **Note**
>
> The function *wait_any_n* returns after at least one future has become ready. All input futures are still valid after *wait_any_n* returns.

> **Note**
>
> The function wait_any_n will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_n_nothrow* instead.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or shared_future objects for which *wait_any_n* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

hpx::wait_any_n_nothrow

Defined in header hpx/future.hpp[844].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait_any*

struct **sycl_executor**

Public Types

using **future_type** = *hpx*::*future*<void>

template<typename ...**Params**>

using **queue_function_ptr_t** = ::sycl::event (::sycl::queue::*)(*std*::conditional_t<*std*::is_trivial_v<*std*::remove_reference_t<*Params*>>, *std*::decay_t<*Params*>, *Params*>...)

Default Implementation without the extra intel code_location parameter. Removes the reference for trivial types to make the function matching easier (see sycl_stream.cpp test)

Public Functions

template<typename **sycl_device_selector**>

inline explicit **sycl_executor**(*sycl_device_selector* const &selector)

Create a SYCL executor (based on a sycl queue)

~sycl_executor() = default

inline *future_type* **get_future**()

Get future for this command_queue (NOTE will be more efficient if an event is provided — otherwise a dummy kernel must be submitted to get an event) inline *future_type* **get_future**(::sycl::event event)

Get future for that becomes ready when the given event completes.

template<typename ...**Params**>

inline void **post**(*queue_function_ptr_t<Params...>* &&queue_member_function, *Params*&&... args)

Invoke queue member function given queue and parameters — do not use event to return a hpx::future (One way)

template<typename ...**Params**>

inline *hpx*::*future*<void> **async_execute**(*queue_function_ptr_t<Params...>* &&queue_member_function, *Params*&&... args)

Invoke queue member function given queue and parameters — hpx::future tied to the sycl event / (two way)

inline ::sycl::device **get_device**() const

Return the device used by the underlying SYCL queue.

inline ::sycl::context **get_context**() const

Return the context used by the underlying SYCL queue.

inline ::sycl::queue &**get_queue**()

Return the underlying queue for direct access.

Protected Attributes

::sycl::queue **command_queue**

cache

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/cache/local_cache.hpp

Defined in header hpx/cache/local_cache.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

template<typename **Key**, typename **Entry**, typename **UpdatePolicy** = *std*::less<*Entry*>, typename **InsertPolicy** = policies::always<*Entry*>, typename **CacheStorage** = *std*::map<*Key*, *Entry*>, typename **Statistics** = *statistics*::*no_statistics*>

class **local_cache**

#include <hpx/cache/local_cache.hpp> The local_cache implements the basic functionality needed for a local (non-distributed) cache.

Template Parameters

- `Key` – The type of the keys to use to identify the entries stored in the cache
- `Entry` – The type of the items to be held in the cache, must model the CacheEntry concept
- `UpdatePolicy` – A (optional) type specifying a (binary) function object used to sort the cache entries based on their 'age'. The 'oldest' entries (according to this sorting criteria) will be discarded first if the maximum capacity of the cache is reached. The default is std::less<Entry>. The function object will be invoked using 2 entry instances of the type *Entry*. This type must model the UpdatePolicy model.
- `InsertPolicy` – A (optional) type specifying a (unary) function object used to allow global decisions whether a particular entry should be added to the cache or not. The default is *policies::always*, imposing no global insert related criteria on the cache. The function object will be invoked using the entry instance to be inserted into the cache. This type must model the InsertPolicy model.
- `CacheStorage` – A (optional) container type used to store the cache items. The container must be an associative and STL compatible container.The default is a std::map<Key, Entry>.
- `Statistics` – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type statistics::no_statistics which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using **key_type** = *Key*

using **entry_type** = *Entry*

using **update_policy_type** = *UpdatePolicy*

using **insert_policy_type** = *InsertPolicy*

using **storage_type** = *CacheStorage*

using **statistics_type** = *Statistics*

using **value_type** = typename *entry_type*::value_type

using **size_type** = typename *storage_type*::size_type

using **storage_value_type** = typename *storage_type*::value_type

Public Functions

inline explicit **local_cache**(*size_type* max_size = 0, *update_policy_type* const &up = *update_policy_type*(), *insert_policy_type* const &ip = *insert_policy_type*())

Construct an instance of a *local_cache*.

Parameters

- **max_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.
- **up** – [in] An instance of the *UpdatePolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *UpdatePolicy* template parameter.
- **ip** – [in] An instance of the *InsertPolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *InsertPolicy* template parameter.

local_cache(*local_cache* const &other) = default

local_cache(*local_cache* &&other) = default

local_cache &**operator=**(*local_cache* const &other) = default

local_cache &**operator=**(*local_cache* &&other) = default

~local_cache() = default

inline constexpr *size_type* **size**() const noexcept

Return current size of the cache.

Returns

The current size of this cache instance.

inline constexpr *size_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

> **Note**
>
> The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get_size*.

Returns

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline bool **reserve**(*size_type* max_size)

Change the maximum size this cache can grow to.

Parameters

max_size – [in] The new maximum size this cache will be allowed to grow to.

Returns

This function returns *true* if successful. It returns *false* if the new *max_size* is smaller than the current limit and the cache could not be shrunk to the new maximum size.

inline bool **holds_key**(*key_type* const &k) const

Check whether the cache currently holds an entry identified by the given key.

> **Note**
>
> This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

Parameters

k – [in] The key for the entry which should be looked up in the cache.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &k, *key_type* &realkey, *entry_type* &val)

Get a specific entry identified by the given key.

> **Note**
>
> The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns
This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &k, *entry_type* &val)

Get a specific entry identified by the given key.

> **Note**
>
> The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

Parameters
- **k** – [in] The key for the entry which should be retrieved from the cache.
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns
This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &k, *value_type* &val)

Get a specific entry identified by the given key.

> **Note**
>
> The function will call the entry's *entry::touch* function if the value corresponding to the provided is found in the cache.

Parameters
- **k** – [in] The key for the entry which should be retrieved from the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding value.

Returns
This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **insert**(*key_type* const &k, *value_type* const &val)

Insert a new element into this cache.

> **Note**
>
> This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the newly constructed entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value

pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **val** – [in] The value which should be added to the cache.

Returns

This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

inline bool **insert**(*key_type* const &k, *value_type* &&val)

template<typename **Entry_**, *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>, int> = 0>

inline bool **insert**(*key_type* const &k, *Entry_* &&e)

Insert a new entry into this cache.

> **Note**
>
> This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the provided entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **e** – [in] The entry which should be added to the cache.

Returns

This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

template<typename **Value**, *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Value*>, *value_type*>, int> = 0>

inline bool **update**(*key_type* const &k, *Value* &&val)

Update an existing element in this cache.

> **Note**
>
> The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

> **Note**
>
> The difference to the other overload of the *insert* function is that this overload replaces

the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename **F**, typename **Value**, typename = *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Value*>, *value_type*>>>

inline bool **update_if**(*key_type* const &k, *Value* &&val, *F* &&f)

Update an existing element in this cache.

> **Note**
>
> The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

> **Note**
>
> The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename **Entry_**, *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>, int> = 0>

inline bool **update**(*key_type* const &k, *Entry_* &&e)

Update an existing entry in this cache.

> **Note**
>
> The function will call the entry's *entry::touch* function if the indexed value is found in

the cache.

> **Note**
>
> The difference to the other overload of the *insert* function is that this overload replaces the whole cache entry, while the other overload replaces the cached value only, leaving the cache entry properties untouched.

Parameters

- **k** – [in] The key for the entry which should be updated in the cache.
- **e** – [in] The entry which should be used as a replacement for the existing entry in the cache. Any existing entry is first removed and then this entry is added.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename **Func** = policies::always<*storage_value_type*>>

inline *size_type* **erase**(*Func* &&ep = *Func*())

Remove stored entries from the cache for which the supplied function object returns true.

Parameters

ep – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*. Even then the entry might not be removed from the cache as its *entry::remove* function might return false.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

inline *size_type* **erase**()

Remove all stored entries from the cache.

> **Note**
>
> All entries are considered for removal, but in the end an entry might not be removed from the cache as its *entry::remove* function might return false. This function is very useful for instance in conjunction with an entry's *entry::remove* function enforcing additional criteria like entry expiration, etc.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

inline void **clear**()

Clear the cache.

Unconditionally removes all stored entries from the cache.

inline constexpr *statistics_type* const &**get_statistics**() const noexcept

Allow to access the embedded statistics instance.

Returns

This function returns a reference to the statistics instance embedded inside this cache

inline *statistics_type* &**get_statistics**() noexcept

hpx/cache/lru_cache.hpp

Defined in header hpx/cache/lru_cache.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

template<typename **Key**, typename **Entry**, typename **Statistics** = *statistics*::*no_statistics*>

class **lru_cache**

#include <hpx/cache/lru_cache.hpp> The lru_cache implements the basic functionality needed for a local (non-distributed) LRU cache.

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type statistics::no_statistics which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using **key_type** = *Key*

using **entry_type** = *Entry*

using **statistics_type** = *Statistics*

using **entry_pair** = *std*::pair<*key_type*, *entry_type*>

using **storage_type** = *std*::list<*entry_pair*>

using **map_type** = *std*::map<*Key*, typename *storage_type*::iterator>

using **size_type** = *std*::size_t

Public Functions

inline explicit `lru_cache`(*size_type* max_size = 0)

Construct an instance of a *lru_cache*.

Parameters

`max_size` – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.

`lru_cache`(*lru_cache* const &other) = default

`lru_cache`(*lru_cache* &&other) = default

lru_cache &`operator=`(*lru_cache* const &other) = default

lru_cache &`operator=`(*lru_cache* &&other) = default

`~lru_cache`() = default

inline constexpr *size_type* `size`() const noexcept

Return current size of the cache.

Returns

The current size of this cache instance.

inline constexpr *size_type* `capacity`() const noexcept

Access the maximum size the cache is allowed to grow to.

> **Note**
>
> The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get_size*.

Returns

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline void **`reserve`**(*size_type* max_size)

Change the maximum size this cache can grow to.

Parameters

`max_size` – [in] The new maximum size this cache will be allowed to grow to.

inline bool **`holds_key`**(*key_type* const &key) const

Check whether the cache currently holds an entry identified by the given key.

> **Note**
>
> This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

Parameters

`key` – [in] The key for the entry which should be looked up in the cache.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **`get_entry`**(*key_type* const &key, *key_type* &realkey, *entry_type* &entry)

Get a specific entry identified by the given key.

> **Note**
>
> The function will "touch" the entry and mark it as recently used if the key was found in the cache.

Parameters

- **`key`** – [in] The key for the entry which should be retrieved from the cache.
- **`realkey[out]`** – Return the full real key found in the cache
- **`entry`** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **`get_entry`**(*key_type* const &key, *entry_type* const &entry)

Get a specific entry identified by the given key.

> **Note**
>
> The function will "touch" the entry and mark it as recently used if the key was found in the cache.

Parameters

- **`key`** – [in] The key for the entry which should be retrieved from the cache.

- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

template<typename **Entry_**, typename = *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>>>

inline bool **insert**(*key_type* const &key, *Entry_* &&entry)

Insert a new entry into this cache.

> **Note**
>
> This function assumes that the entry is not in the cache already. Inserting an already existing entry is considered undefined behavior

Parameters

- **key** – [in] The key for the entry which should be added to the cache.
- **entry** – [in] The entry which should be added to the cache.

template<typename **Entry_**, typename = *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>>>

inline void **update**(*key_type* const &key, *Entry_* &&entry)

Update an existing element in this cache.

> **Note**
>
> The function will "touch" the entry and mark it as recently used if the key was found in the cache.

> **Note**
>
> The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The entry which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

template<typename **F**, typename **Entry_**, *std*::enable_if_t<*std*::is_convertible_v<*std*::decay_t<*Entry_*>, *entry_type*>, int> = 0>

inline bool **update_if**(*key_type* const &key, *Entry_* &&entry, *F* &&f)

Update an existing element in this cache.

> **Note**
>
> The function will "touch" the entry and mark it as recently used if the key was found in the cache.

> **Note**
>
> The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

template<typename **Func**>

inline *size_type* **erase**(*Func* const &ep)

Remove stored entries from the cache for which the supplied function object returns true.

Parameters

ep – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

inline *size_type* **erase**()

Remove all stored entries from the cache.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

inline *size_type* **clear**()

Clear the cache.

Unconditionally removes all stored entries from the cache.

inline constexpr *statistics_type* const &**get_statistics**() const noexcept

Allow to access the embedded statistics instance.

Returns

This function returns a reference to the statistics instance embedded inside this cache

inline *statistics_type* &**get_statistics**() noexcept

hpx/cache/entries/size_entry.hpp

Defined in header hpx/cache/entries/size_entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **size_entry** : public *hpx*::*util*::*cache*::*entries*::*entry*<*Value*>

#include <hpx/cache/entries/size_entry.hpp> The size_entry type can be used to store values in a cache which have a size associated (such as files, etc.). Using this type as the cache's entry type makes sure that the entries with the biggest size are discarded from the cache first.

> **Note**
>
> The size_entry conforms to the CacheEntry concept.

> **Note**
>
> This type can be used to model a 'discard smallest first' cache policy if it is used with a std::greater as the caches' UpdatePolicy (instead of the default std::less).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

size_entry() = default

Any cache entry has to be default constructible.

inline explicit **size_entry**(*Value* const &val, *std*::size_t size = 0) noexcept(*std*::is_nothrow_constructible_v<*base_type*, *Value* const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **size_entry**(*Value* &&val, *std*::size_t size = 0) noexcept

Construct a new instance of a cache entry holding the given value.

inline constexpr *std*::size_t **get_size**() const noexcept

Return the 'size' of this entry.

Private Types

using **base_type** = *entry*<*Value*>

Private Members

std::size_t **size_** = 0

Friends

inline friend auto **operator<**(*size_entry* const &lhs, *size_entry* const &rhs) noexcept

Compare the 'age' of two entries. An entry is 'older' than another entry if it has a bigger size.

inline friend auto **operator>**(*size_entry* const &lhs, *size_entry* const &rhs) noexcept

inline friend auto **operator<=**(*size_entry* const &lhs, *size_entry* const &rhs) noexcept

inline friend auto **operator>=**(*size_entry* const &lhs, *size_entry* const &rhs) noexcept inline friend auto **operator==**(*size_entry* const &lhs, *size_entry* const &rhs) noexcept

inline friend auto **operator!=**(*size_entry* const &lhs, *size_entry* const &rhs) noexcept

hpx/cache/entries/lru_entry.hpp

Defined in header hpx/cache/entries/lru_entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **lru_entry** : public *hpx*::*util*::*cache*::*entries*::*entry*<*Value*>

#include <hpx/cache/entries/lru_entry.hpp> The lru_entry type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently used entries are discarded from the cache first.

> **Note**
>
> The lru_entry conforms to the CacheEntry concept.

> **Note**
>
> This type can be used to model a 'most recently used' cache policy if it is used with a std::greater as the caches' UpdatePolicy (instead of the default std::less).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

inline **lru_entry**()

Any cache entry has to be default constructible.

inline explicit **lru_entry**(*Value* const &val) noexcept(*std*::is_nothrow_constructible_v<*base_type*, *Value* const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **lru_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline bool **touch**()

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LRU entry we store the time of the last access which will be used to compare the age of an entry during the invocation of the *operator<()*.

Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

inline constexpr *time_point* const &**get_access_time**() const noexcept

Returns the last access time of the entry.

Private Types

using **base_type** = *entry*<*Value*>

using **time_point** = *std*::chrono::steady_clock::time_point

Private Members

time_point **access_time_**

Friends

inline friend auto **operator<**(*lru_entry* const &lhs, *lru_entry* const &rhs)

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been accessed less recently (LRU).

inline friend auto **operator>**(*lru_entry* const &lhs, *lru_entry* const &rhs)

inline friend auto **operator<=**(*lru_entry* const &lhs, *lru_entry* const &rhs)

inline friend auto **operator==**(*lru_entry* const &lhs, *lru_entry* const &rhs)

inline friend auto **operator!=**(*lru_entry* const &lhs, *lru_entry* const &rhs)

hpx/cache/entries/fifo_entry.hpp

Defined in header hpx/cache/entries/fifo_entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **fifo_entry** : public *hpx*::*util*::*cache*::*entries*::*entry*<*Value*>

#include <hpx/cache/entries/fifo_entry.hpp> The fifo_entry type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently inserted entries are discarded from the cache first.

Note

The fifo_entry conforms to the CacheEntry concept.

Note

This type can be used to model a 'last in first out' cache policy if it is used with a std::greater as the caches' UpdatePolicy (instead of the default std::less).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

fifo_entry() = default

Any cache entry has to be default constructible.

inline explicit **fifo_entry**(*Value* const &val) noexcept(*std*::is_nothrow_constructible_v<*base_type*, *Value* const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **fifo_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline constexpr bool **insert**()

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

Note

This function is part of the CacheEntry concept

Returns

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

inline constexpr *time_point* const &**get_creation_time**() const noexcept

Private Types

using **base_type** = *entry*<*Value*>

using **time_point** = *std*::chrono::steady_clock::time_point

Private Members

time_point **insertion_time_**

Friends

inline friend auto **operator<**(*fifo_entry* const &lhs, *fifo_entry* const &rhs)

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been created earlier (FIFO).

inline friend auto **operator>**(*fifo_entry* const &lhs, *fifo_entry* const &rhs)

inline friend auto **operator<=**(*fifo_entry* const &lhs, *fifo_entry* const &rhs)

inline friend auto **operator>=**(*fifo_entry* const &lhs, *fifo_entry* const &rhs)

hpx/cache/entries/lfu_entry.hpp

Defined in header hpx/cache/entries/lfu_entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **lfu_entry** : public *hpx*::*util*::*cache*::*entries*::*entry*<*Value*>

#include <hpx/cache/entries/lfu_entry.hpp> The lfu_entry type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least frequently used entries are discarded from the cache first.

> **Note**
>
> The lfu_entry conforms to the CacheEntry concept.

> **Note**
>
> This type can be used to model a 'most frequently used' cache policy if it is used with a std::greater as the caches' UpdatePolicy (instead of the default std::less).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Public Functions

lfu_entry() = default

Any cache entry has to be default constructible.

inline explicit **lfu_entry**(*Value* const &val) noexcept(*std*::is_nothrow_constructible_v<*base_type*, *Value* const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **lfu_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline bool **touch**() noexcept

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LFU entry we store the reference count tracking the number of times this entry has been requested. This which will be used to compare the age of an entry during the invocation of the *operator<()*.

Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

inline constexpr unsigned long const &**`get_access_count`**`()` const noexcept

using **`base_type`** = *entry*<*Value*>

Private Members

unsigned long **`ref_count_`** = 0

Friends

inline friend auto **`operator<`**`(`*lfu_entry* const &lhs, *lfu_entry* const &rhs`)`

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been accessed less frequently (LFU).

inline friend auto **`operator>`**`(`*lfu_entry* const &lhs, *lfu_entry* const &rhs`)`

inline friend auto **`operator<=`**`(`*lfu_entry* const &lhs, *lfu_entry* const &rhs`)`

inline friend auto **`operator>=`**`(`*lfu_entry* const &lhs, *lfu_entry* const &rhs`)`

inline friend auto **`operator==`**`(`*lfu_entry* const &lhs, *lfu_entry* const &rhs`)`

inline friend auto **`operator!=`**`(`*lfu_entry* const &lhs, *lfu_entry* const &rhs`)`

hpx/cache/entries/entry.hpp

Defined in header hpx/cache/entries/entry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **entry**

#include <hpx/cache/entries/entry.hpp>

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Subclassed by *hpx::util::cache::entries::fifo_entry< Value >*, *hpx::util::cache::entries::lfu_entry< Value >*, *hpx::util::cache::entries::lru_entry< Value >*, *hpx::util::cache::entries::size_entry< Value >*

Public Types

using **value_type** = *Value*

Public Functions

entry() = default

Any cache entry has to be default constructible.

inline explicit **entry**(*value_type* const &val) noexcept(*std*::is_nothrow_copy_constructible_v<*value_type*>)

Construct a new instance of a cache entry holding the given value.

inline explicit **entry**(*value_type* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline *value_type* &**get**() noexcept

Get a reference to the stored data value.

> **Note**
>
> This function is part of the CacheEntry concept

inline constexpr *value_type* const &**get**() const noexcept

Public Static Functions

static inline constexpr bool **touch**() noexcept

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

> **Note**
>
> It is possible to change the entry in a way influencing the sort criteria mandated by the UpdatePolicy. In this case the function should return *true* to indicate this to the cache, forcing to reorder the cache entries.

> **Note**
>
> This function is part of the CacheEntry concept

Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

static inline constexpr bool **insert**() noexcept

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

> **Note**
>
> This function is part of the CacheEntry concept

Returns

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

static inline constexpr bool **remove**() noexcept

The function *remove* is called by a cache holding this instance whenever it is about to be removed from the cache.

> **Note**
>
> This function is part of the CacheEntry concept

Returns

The return value can be used to avoid removing this instance from the cache. If the value is *true* it is ok to remove the entry, otherwise it will stay in the cache.

static inline constexpr *std*::size_t **get_size**() noexcept

Return the 'size' of this entry. By default, the size of each entry is just one (1), which is sensible if the cache has a limit (capacity) measured in number of entries.

Private Members

value_type **value_**

Friends

friend auto **operator<=>**(*entry* const&, *entry* const&) = default

Forwarding operator<=> allowing to compare entries instead of the values.

hpx/cache/statistics/no_statistics.hpp

Defined in header hpx/cache/statistics/no_statistics.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **cache**

namespace **statistics**

Enums

enum class **method**

Values:

enumerator **get_entry**

enumerator **insert_entry**

enumerator **update_entry**

enumerator **erase_entry**

class **no_statistics**

Subclassed by *hpx::util::cache::statistics::local_statistics*

Public Static Functions

static inline constexpr void **got_hit**() noexcept

The function *got_hit* will be called by a cache instance whenever an entry got touched.

static inline constexpr void **got_miss**() noexcept

The function *got_miss* will be called by a cache instance whenever a requested entry has not been found in the cache.

static inline constexpr void **got_insertion**() noexcept

The function *got_insertion* will be called by a cache instance whenever a new entry has been inserted.

static inline constexpr void **got_eviction**() noexcept

The function *got_eviction* will be called by a cache instance whenever an entry has been removed from the cache because a new inserted entry let the cache grow beyond its capacity.

static inline constexpr void **clear**() noexcept

Reset all statistics.

static inline constexpr *std*::int64_t **get_get_entry_count**(bool) noexcept

The function *get_get_entry_count* returns the number of invocations of the get_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_insert_entry_count**(bool) noexcept

The function *get_insert_entry_count* returns the number of invocations of the insert_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_update_entry_count**(bool) noexcept

The function *get_update_entry_count* returns the number of invocations of the update_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_erase_entry_count**(bool) noexcept

The function *get_erase_entry_count* returns the number of invocations of the erase() API function of the cache.

static inline constexpr *std*::int64_t **get_get_entry_time**(bool) noexcept

The function *get_get_entry_time* returns the overall time spent executing of the get_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_insert_entry_time**(bool) noexcept

The function *get_insert_entry_time* returns the overall time spent executing of the insert_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_update_entry_time**(bool) noexcept

The function *get_update_entry_time* returns the overall time spent executing of the update_entry() API function of the cache.

static inline constexpr *std*::int64_t **get_erase_entry_time**(bool) noexcept

The function *get_erase_entry_time* returns the overall time spent executing of the erase() API function of the cache.

namespace **hpx**

namespace **util**

Functions

template<typename **Container**, typename ...**Ts**>

void **save_checkpoint_data**(*Container* &data, *Ts*&&... ts)

save_checkpoint_data

Save_checkpoint_data takes any number of objects which a user may wish to store in the given container.

Template Parameters

- **Container** – Container used to store the check-pointed data.
- **Ts** – Types of variables to checkpoint

Parameters

- **data** – Container instance used to store the checkpoint data
- **ts** – Variable instances to be inserted into the checkpoint.

template<typename ...**Ts**>

std::size_t **prepare_checkpoint_data**(*Ts* const&... ts)

prepare_checkpoint_data

prepare_checkpoint_data takes any number of objects which a user may wish to store in a subsequent save_checkpoint_data operation. The function will return the number of bytes necessary to store the data that will be produced.

Template Parameters

`Ts` – Types of variables to checkpoint

Parameters

`ts` – Variable instances to be inserted into the checkpoint.

template<typename **Container**, typename ...**Ts**>

void **restore_checkpoint_data**(*Container* const &cont, *Ts*&... ts)

restore_checkpoint_data

restore_checkpoint_data takes any number of objects which a user may wish to restore from the given container. The sequence of objects has to correspond to the sequence of objects for the corresponding call to save_checkpoint_data that had used the given container instance.

Template Parameters

- `Container` – Container used to restore the check-pointed data.
- `Ts` – Types of variables to restore

Parameters

- `cont` – Container instance used to restore the checkpoint data
- `ts` – Variable instances to be restored from the container

inline *const_reference* **front**() const

Returns a reference to the first element in the container. Calling front on an empty container is undefined.

inline *reference* **back**()

Returns a reference to the last element in the container. Calling back on an empty container is undefined.

inline *const_reference* **back**() const

Returns a reference to the last element in the container. Calling back on an empty container is undefined.

inline *pointer* **data**() noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data()*; *data()* + size()) is always a valid range, even if the container is empty (*data()* is not dereference-able in that case).

inline *const_pointer* **data**() const noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data()*; *data()* + size()) is always a valid range, even if the container is empty (*data()* is not dereference-able in that case).

inline *T* ***device_data**() const noexcept

Returns a raw pointer corresponding to the address of the data allocated on the device.

inline *std*::size_t **size**() const noexcept

inline *std*::size_t **capacity**() const noexcept

inline bool **empty**() const noexcept

Returns: size() == 0.

inline void **resize**(*size_type*)

Effects: If size <= size(), equivalent to calling pop_back() size()

- size times. If size() < size, appends size - size() default-inserted elements to the sequence.

Requires: T shall be MoveInsertable and DefaultInsertable into *this.

Remarks: If an exception is thrown other than by the move constructor of a non-CopyInsertable T there are no effects.

inline void **resize**(*size_type*, *T* const&)

Effects: If size <= size(), equivalent to calling pop_back() size() - size times. If size() < size, appends size - size() copies of val to the sequence.

Requires: T shall be CopyInsertable into *this.

Remarks: If an exception is thrown there are no effects.

inline *iterator* **begin**() noexcept

inline *iterator* **end**() noexcept

inline *const_iterator* **cbegin**() const noexcept

inline *const_iterator* **cend**() const noexcept

inline *const_iterator* **begin**() const noexcept

inline *const_iterator* **end**() const noexcept

inline *reverse_iterator* **rbegin**() noexcept inline *reverse_iterator* **rend**() noexcept

inline *const_reverse_iterator* **crbegin**() const noexcept

inline *const_reverse_iterator* **crend**() const noexcept

inline *const_reverse_iterator* **rbegin**() const noexcept

inline *const_reverse_iterator* **rend**() const noexcept

inline void **swap**(*vector* &other) noexcept

Effects: Exchanges the contents and capacity() of *this with that of x.

Complexity: Constant time.

inline void **clear**() noexcept

Effects: Erases all elements in the range [begin(),end()). Destroys all elements in ‘a’. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.

Post: a.empty() returns true.

Complexity: Linear.

hpx/compute_local/host/block_fork_join_executor.hpp

Defined in header hpx/compute_local/host/block_fork_join_executor.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

class **block_fork_join_executor**

#include <block_fork_join_executor.hpp> An executor with fork-join (blocking) semantics.

The *block_fork_join_executor* creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a fork_join_executor hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of bulk_(a)sync_execute.

This behaviour is similar to the plain *fork_join_executor* except that the *block_fork_join_executor* creates a hierarchy of fork_join_executors, one for each target used to initialize it.

Public Functions

inline explicit **block_fork_join_executor**(*threads*::*thread_priority* const priority = *threads*::*thread_priority*::*bound*, *threads*::*thread_stacksize* const stacksize = *threads*::*thread_stacksize*::*small_*, fork_join_executor::loop_schedule const schedule = fork_join_executor::loop_schedule::static_, *std*::chrono::nanoseconds const yield_delay = *std*::chrono::milliseconds(1))

Construct a *block_fork_join_executor*.

> **Note**
>
> This constructor will create one fork_join_executor for each numa domain

Parameters

- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be nostack.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

inline explicit **block_fork_join_executor**(*std*::vector<*compute*::*host*::target> const &targets, *threads*::*thread_priority* const priority = *threads*::*thread_priority*::*bound*, *threads*::*thread_stacksize* const stacksize = *threads*::*thread_stacksize*::*small_*, fork_join_executor::loop_schedule const schedule = fork_join_executor::loop_schedule::static_, *std*::chrono::nanoseconds const yield_delay = *std*::chrono::milliseconds(1))

Construct a *block_fork_join_executor*.

> **Note**
>
> This constructor will create one fork_join_executor for each given target

Parameters

- **targets** – The list of targets to use for thread placement
- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be nostack.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

Enums

enum class **thread_schedule_state** : *std*::int8_t

The *thread_schedule_state* enumerator encodes the current state of a *thread* instance

Task Lifecycle State Transitions:

```
stateDiagram-v2
    %% Creation Phase
    [*] --> Staged : task_staged
    [*] --> Pending : task_created
    [*] --> Suspended : task_created
    Staged --> Pending : task_created

    %% Execution Loop
    Pending --> Active : task_executing
    Active --> Pending : task_yielded

    %% Sleep / Wake Cycle
    Active --> Suspended : task_suspended
    Suspended --> Pending : task_resumed

    %% Termination Paths
    Active --> Terminated : task_completed
    Active --> Deleted : task_completed (Inline fast-path)
    Pending --> Terminated : task_completed (Aborted)
    Suspended --> Terminated : task_completed (Aborted)

    %% Cleanup (Destruction / Recycling)
    Terminated --> Deleted : task_deleted
    Deleted --> [*]
```

Values:

enumerator **unknown**

enumerator **active**

thread is currently active (running, has resources)

enumerator **pending**

thread is pending (ready to run, but no hardware resource available)

enumerator **suspended**

thread has been suspended (waiting for synchronization event, but still known and under control of the thread-manager)

enumerator **depleted**

thread has been depleted (deeply suspended, it is not known to the thread-manager)

enumerator **terminated**

thread has been stopped and may be garbage collected

enumerator **staged**

this is not a real thread state, but allows to reference staged task descriptions, which eventually will be converted into thread objects

enumerator **pending_do_not_schedule**

this is not a real thread state, but allows to create a thread in pending state without scheduling it (internal, do not use)

enumerator **pending_boost**

this is not a real thread state, but allows to suspend a thread in pending state without high priority rescheduling

enumerator **deleted**

thread has been stopped and was deleted

enum class **thread_priority** : *std*::int8_t

This enumeration lists all possible thread-priorities for HPX threads.

Values:

enumerator **unknown**

enumerator **default_**

Will assign the priority of the task to the default (normal) priority.

enumerator **low**

Task goes onto a special low priority queue and will not be executed until all high/normal priority tasks are done, even if they are added after the low priority task.

enumerator **normal**

Task will be executed when it is taken from the normal priority queue, this is usually a first in-first-out ordering of tasks (depending on scheduler choice). This is the default priority.

enumerator **high_recursive**

The task is a high priority task and any child tasks spawned by this task will be made high priority as well - unless they are specifically flagged as non default priority.

enumerator **boost**

Same as *thread_priority_high* except that the thread will fall back to *thread_priority_normal* if resumed after being suspended.

enumerator **high**

Task goes onto a special high priority queue and will be executed before normal/low priority tasks are taken (some schedulers modify the behavior slightly and the documentation for those should be consulted).

enumerator **bound**

Task goes onto a special high priority queue and will never be stolen by another thread after initial assignment. This should be used for thread placement tasks such as OpenMP type for loops.

enumerator **initially_bound**

Task initially goes onto a special high priority queue and will never be stolen by another thread after initial assignment. If the thread is rescheduled later, it will use normal priority.

enum class **thread_restart_state** : *std*::int8_t

The *thread_restart_state* enumerator encodes the reason why a thread is being restarted

Values:

enumerator **unknown**

enumerator **signaled**

The thread has been signaled.

enumerator **timeout**

The thread has been reactivated after a timeout.

enumerator **terminate**

The thread needs to be terminated.

enumerator **abort**

The thread needs to be aborted.

enum class **thread_stacksize** : *std*::int8_t

A *thread_stacksize* references any of the possible stack-sizes for HPX threads.

Values:

enumerator **unknown**

enumerator **small_**

use small stack size (the underscore is to work around 'small' being defined to char on Windows)

enumerator **medium**

use medium sized stack size

enumerator **large**

use large stack size

enumerator **huge**

use very large stack size

enumerator **nostack**

this thread does not suspend (does not need a stack)

enumerator **current**

use size of current thread's stack

enumerator **default_**

use default stack size

enumerator **minimal**

use minimally stack size

enumerator **maximal**

use maximally stack size

enum class **thread_schedule_hint_mode** : *std*::int8_t

The type of hint given when creating new tasks.

Values:

enumerator **none**

A hint that leaves the choice of scheduling entirely up to the scheduler.

enumerator **thread**

A hint that tells the scheduler to prefer scheduling a task on the local thread number associated with this hint. Local thread numbers are indexed from zero. It is up to the scheduler to decide how to interpret thread numbers that are larger than the number of threads available to the scheduler. Typically, thread numbers will wrap around when too large.

enumerator **numa**

A hint that tells the scheduler to prefer scheduling a task on the NUMA domain associated with this hint. NUMA domains are indexed from zero. It is up to the scheduler to decide how to interpret NUMA domain indices that are larger than the number of available NUMA domains to the scheduler. Typically, indices will wrap around when too large.

enum class **thread_placement_hint** : *std*::int8_t

The type of hint given to the scheduler related to thread placement

The type of hint given to the scheduler related running a thread as a child directly in the context of the parent thread

Values:

enumerator **none**

No hint is specified. The implementation is free to chose what placement methods to use.

enumerator **depth_first**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core).

enumerator **breadth_first**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores).

enumerator **depth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core). Threads are being scheduled in reverse order.

enumerator **breadth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores). Threads are being scheduled in reverse order.

enum class **thread_sharing_hint** : *std*::int8_t

The type of hint given to the scheduler related to whether it is ok to share the invoked function object between threads

Values:

enumerator **none**

No hint is specified. The implementation is free to chose what sharing methods to use.

enumerator **do_not_share_function**

A hint that tells the scheduler to avoid sharing the given function (object) between threads.

enumerator **do_not_combine_tasks**

A hint that tells the scheduler to avoid combining tasks on the same thread. This is important for tasks that may synchronize between each other, which could lead to deadlocks if those tasks are combined running by the same thread.

enum class **thread_execution_hint** : *std*::int8_t

Values:

enumerator **none**

No hint is specified. Always run the thread in its own execution environment.

enumerator **run_as_child**

Attempt to run the thread in the execution context of the parent thread.

Functions

std::ostream &**operator<<**(*std*::ostream &os, *thread_schedule_state* t)

char const ***get_thread_state_name**(*thread_schedule_state* state) noexcept

Returns the name of the given state.

Get the readable string representing the name of the given thread_state constant.

Parameters

state – this represents the thread state.

std::ostream &**operator<<**(*std*::ostream &os, *thread_priority* t)

char const ***get_thread_priority_name**(*thread_priority* priority) noexcept

Return the thread priority name.

Get the readable string representing the name of the given thread_priority constant.

Parameters

`priority` – this represents the thread priority.

std::ostream &**operator<<**(*std*::ostream &os, *thread_restart_state* t)

char const ***get_thread_state_ex_name**(*thread_restart_state* state) noexcept

Get the readable string representing the name of the given thread_restart_state constant.

char const ***get_thread_state_name**(thread_state state) noexcept

Get the readable string representing the name of the given thread_state constant.

std::ostream &**operator<<**(*std*::ostream &os, *thread_stacksize* t)

char const ***get_stack_size_enum_name**(*thread_stacksize* size) noexcept

Returns the stack size name.

Get the readable string representing the given stack size constant.

Parameters

`size` – this represents the stack size

constexpr bool **do_not_share_function**(*thread_sharing_hint* hint) noexcept

constexpr bool **do_not_combine_tasks**(*thread_sharing_hint* hint) noexcept

constexpr *thread_sharing_hint* **operator|**(*thread_sharing_hint* lhs, *thread_sharing_hint* rhs) noexcept

constexpr bool **run_as_child**(*thread_execution_hint* hint) noexcept

Variables

constexpr *thread_execution_hint* **default_runs_as_child_hint** = *thread_execution_hint*::*none*

Default value to use for runs-as-child mode (if *true*, then futures will attempt to execute associated threads directly if they have not started running).

struct **thread_schedule_hint**

#include <thread_enums.hpp> A hint given to a scheduler to guide where a task should be scheduled.

A scheduler is free to ignore the hint, or modify the hint to suit the resources available to the scheduler.

Public Functions

inline constexpr **thread_schedule_hint**() noexcept

Construct a default hint with mode *thread_schedule_hint_mode::none*.

inline explicit constexpr **thread_schedule_hint**(*std*::int16_t const thread_hint, *thread_placement_hint* placement = *thread_placement_hint*::*none*, *thread_execution_hint* runs_as_child = *default_runs_as_child_hint*, *thread_sharing_hint* sharing = *thread_sharing_hint*::*none*) noexcept

Construct a hint with mode *thread_schedule_hint_mode::thread* and the given hint as the local thread number.

inline constexpr **thread_schedule_hint**(*thread_schedule_hint_mode* const mode, *std*::int16_t const hint, *thread_placement_hint* placement = *thread_placement_hint*::*none*, *thread_execution_hint* runs_as_child = *default_runs_as_child_hint*, *thread_sharing_hint* sharing = *thread_sharing_hint*::*none*) noexcept

Construct a hint with the given mode and hint. The numerical hint is unused when the mode is *thread_schedule_hint_mode::none*.

inline explicit constexpr **thread_schedule_hint**(*thread_placement_hint* placement) noexcept

Construct a hint with the given placement hint.

inline explicit constexpr **thread_schedule_hint**(*thread_execution_hint* runs_as_child) noexcept

Construct a hint with the given execution hint.

inline explicit constexpr **thread_schedule_hint**(*thread_sharing_hint* sharing) noexcept

Construct a hint with the given sharing hint.

inline constexpr *thread_placement_hint* **placement_mode**() const noexcept inline constexpr void **placement_mode**(*thread_placement_hint* bits) noexcept

inline constexpr *thread_sharing_hint* **sharing_mode**() const noexcept

inline constexpr void **sharing_mode**(*thread_sharing_hint* bits) noexcept

inline constexpr *thread_execution_hint* **runs_as_child_mode**() const noexcept

inline constexpr void **runs_as_child_mode**(*thread_execution_hint* bits) noexcept

inline constexpr void **schedule_hint**(*std*::int16_t core) noexcept

Public Members

std::int16_t **hint** = -1

The hint associated with the mode. The interpretation of this hint depends on the given mode.

thread_schedule_hint_mode **mode** = *thread_schedule_hint_mode*::*none*

The mode of the scheduling hint.

std::uint8_t **placement_mode_bits**

The mode of the desired thread placement.

std::uint8_t **sharing_mode_bits**

The mode of the desired sharing hint.

std::uint8_t **runs_as_child_mode_bits**

The thread will run as a child directly in the context of the current thread

datastructures

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::ignore

Defined in header hpx/tuple.hpp[845].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::tuple*
- *hpx::tuple_size*
- *hpx::tuple_element*
- *hpx::make_tuple*
- *hpx::tie*
- *hpx::forward_as_tuple*
- *hpx::tuple_cat*
- *hpx::get*

constexpr *hpx*::detail::ignore_type `hpx::ignore` = {}

An object of unspecified type such that any value can be assigned to it with no effect. Intended for use with *hpx::tie* when unpacking a *hpx::tuple*, as a placeholder for the arguments that are not used. While the behavior of *hpx::ignore* outside of *hpx::tie* is not formally specified, some code guides recommend using *hpx::ignore* to avoid warnings from unused return values of [[nodiscard]] functions.

hpx::tuple

Defined in header hpx/tuple.hpp[846].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

[845] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/tuple.hpp
[846] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/tuple.hpp

template<typename ...**Ts**>

class **tuple**

Class template *hpx::tuple* is a fixed-size collection of heterogeneous values. It is a generalization of *hpx::pair*. If *std::is_trivially_destructible<Ti>::value* is true for every *Ti* in *Ts*, the destructor of tuple is trivial.

Param Ts...
the types of the elements that the tuple stores.

hpx::tuple_size

Defined in header hpx/tuple.hpp[847].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::get*

template<typename ...**Ts**>

constexpr *tuple*<*Ts*&...> `hpx::tie`(*Ts*&... ts)

Creates a tuple of lvalue references to its arguments or instances of *hpx::ignore*.

Parameters
`ts` – zero or more lvalue arguments to construct the tuple from.

Returns
hpx::tuple object containing lvalue references.

hpx::forward_as_tuple

Defined in header hpx/tuple.hpp[851].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ignore*
- *hpx::tuple*
- *hpx::tuple_size*
- *hpx::tuple_element*
- *hpx::make_tuple*

- *hpx::tuple_cat*
- *hpx::get*

template<typename ...**Ts**>

constexpr *tuple*<*Ts*&&...> `hpx::forward_as_tuple`(*Ts*&&... ts)

Constructs a tuple of references to the arguments in args suitable for forwarding as an argument to a function. The tuple has rvalue reference data members when rvalues are used as arguments, and otherwise has lvalue reference data members.

Parameters
`ts` – zero or more arguments to construct the tuple from

Returns
hpx::tuple object created as if by

[851] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/tuple.hpp

```
hpx::tuple<Ts&&...>(HPX_FORWARD(Ts, ts)...)
```

hpx::tuple_cat

Defined in header hpx/tuple.hpp[852].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ignore*
- *hpx::tuple*

- *hpx::tie*
- *hpx::forward_as_tuple*
- *hpx::get*

template<typename ...**Tuples**>

constexpr auto *hpx*::**tuple_cat**(*Tuples*&&... tuples)

Constructs a tuple that is a concatenation of all tuples in `tuples`. The behavior is undefined if any type in `std::decay_t<Tuples>...` is not a specialization of *`hpx::tuple`*. However, an implementation may choose to support types (such as `std::array` and `std::pair`) that follow the tuple-like protocol.

Parameters

`tuples` – - zero or more tuples to concatenate

Returns

hpx::tuple object composed of all elements of all argument tuples constructed from *`hpx::get<Is>`*(HPX_FORWARD(UTuple,t) for each individual element.

hpx::get

Defined in header hpx/tuple.hpp[853].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **T**, typename **IArch**, typename **OArch**, typename **Char**, typename **Copyable**>

T **hpx*::**any_cast**(*util*::basic_any<*IArch*, *OArch*, *Char*, *Copyable*> *operand) noexcept

Performs type-safe access to the contained object.

Parameters
operand – target any object

Returns
If operand is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

template<typename **T**, typename **IArch**, typename **OArch**, typename **Char**, typename **Copyable**>

T const **hpx*::**any_cast**(*util*::basic_any<*IArch*, *OArch*, *Char*, *Copyable*> const *operand) noexcept

Performs type-safe access to the contained object.

Parameters
operand – target any object

Returns
If operand is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

template<typename **T**, typename **IArch**, typename **OArch**, typename **Char**, typename **Copyable**>

T *hpx*::**any_cast**(*util*::basic_any<*IArch*, *OArch*, *Char*, *Copyable*> &operand)

Performs type-safe access to the contained object. Let *U* be *std::remove_cv_t<std::remove_reference_t<T>>* The program is ill-formed if *std::is_constructible_v<T, U&>* is false.

Parameters
operand – target any object

[856] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/any.hpp

Returns

static_cast<T>(*std::any_cast<U>(&operand))

template<typename **T**, typename **IArch**, typename **OArch**, typename **Char**, typename **Copyable**>

T const &*hpx*::**any_cast**(*util*::basic_any<*IArch*, *OArch*, *Char*, *Copyable*> const &operand)

Performs type-safe access to the contained object. Let *U* be *std::remove_cv_t<std::remove_reference_t<T>>* The program is ill-formed if *std::is_constructible_v<T, const U&>* is false.

Parameters

operand – target any object

Returns

static_cast<T>(*std::any_cast<U>(&operand))

hpx::make_any_nonser

Defined in header hpx/any.hpp[857].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defined in header hpx/any.hpp[860].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::any*

template<typename **T**, typename **Char**>

util::basic_any<*serialization*::input_archive, *serialization*::output_archive, *Char*> `hpx::make_any`(*T* &&t)

Constructs an any object containing an object of type *T*, passing the provided arguments to T's constructor. Equivalent to:

```
return std::any(std::in_place_type<T>, std::forward<Args>(args)...);
```

debugging

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/debugging/print.hpp

Defined in header hpx/debugging/print.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

errors

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::error_code

Defined in header hpx/system_error.hpp[861].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **error_code** : public *std*::error_code

A *hpx::error_code* represents an arbitrary error condition.

The class *hpx::error_code* describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.

[860] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/any.hpp
[861] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/system_error.hpp

> **Note**
>
> Class *hpx::error_code* is an adjunct to error reporting by exception

hpx::exception

Defined in header hpx/exception.hpp[862].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **exception** : public *std*::system_error

A *hpx::exception* is the main exception type used by HPX to report errors.

The *hpx::exception* type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by hpx::bad_alloc_exception, hpx::cuda::experimental::cuda_exception, *hpx::exception_list*, *hpx::experimental::task_canceled_exception*, hpx::mpi::experimental::mpi_exception

hpx/errors/define_error_info.hpp

Defined in header hpx/errors/define_error_info.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/errors/macros.hpp

Defined in header hpx/errors/macros.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_THROW_EXCEPTION(errcode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX_THROW_EXCEPTION* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the hpx::error code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

[862] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/exception.hpp

```
void raise_exception()
{
    ↪// Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_EXCEPTION(hpx::error::no_success, "raise_exception",
        "simulated error");
}
```

Example:

HPX_THROW_EXCEPTION_MODE(errcode, mode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX_THROW_EXCEPTION_MODE* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the hpx::error code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate. The `throwmode` parameter allows to specify the type of the thrown exception.

```
void raise_exception() {
    ↪// Throw a hpx::exception initialized from the given parameters.
    HPX_THROW_EXCEPTION_MODE(hpx::error::no_success,
        hpx::throwmode::lighweight, "raise_exception",
        "simulated error");
}
```

Example:

HPX_THROW_BAD_ALLOC(f)

Throw a hpx::bad_alloc_exception initialized from the given parameters.

The macro *HPX_THROW_BAD_ALLOC* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the hpx::error code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    ␣
↪// Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_BAD_ALLOC("raise_exception", "simulated error");
}
```

Example:

`HPX_THROWS_IF`(ec, errcode, f, ...)

Either throw a *hpx::exception* or initialize hpx::error_code from the given parameters.

The macro *HPX_THROWS_IF* can be used to either throw a hpx::exception or to initialize a hpx::error_code from the given parameters. If &ec == &hpx::throws, the semantics of this macro are equivalent to *HPX_THROW_EXCEPTION*. If &ec != &hpx::throws, the hpx::error_code instance `ec` is initialized instead.

The parameter `errcode` holds the hpx::error code from which the new exception should be initialized. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

`HPX_THROWS_BAD_ALLOC_IF`(ec, f)

Either throw a hpx::bad_alloc_exception or hpx::error_code to out_of_memory.

The macro *HPX_THROWS_BAD_ALLOC_IF* can be used to either throw a *hpx::bad_alloc_exception* or to initialize a hpx::error_code to hpx::error::out_of_memory. If &ec == &hpx::throws, the semantics of this macro are equivalent to *HPX_THROW_BAD_ALLOC*. If &ec != &hpx::throws, the hpx::error_code instance `ec` is initialized instead.

`HPX_DEFINE_ERROR_INFO`(NAME, TYPE)

hpx/errors/try_catch_exception_ptr.hpp

Defined in header hpx/errors/try_catch_exception_ptr.hpp.

hpx/errors/exception_list.hpp

Defined in header hpx/errors/exception_list.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **exception_list** : public *hpx::exception*

#include <exception_list.hpp> The class *exception_list* is a container of exception_ptr objects parallel algorithms may use to communicate uncaught exceptions encountered during parallel execution to the caller of the algorithm

The type exception_list::const_iterator fulfills the requirements of a forward iterator.

Public Types

using **iterator** = exception_list_type::const_iterator

bidirectional iterator

Public Functions

inline *std*::size_t **size**() const noexcept

The number of exception_ptr objects contained within the *exception_list*.

> **Note**
>
> Complexity: Constant time.

[865] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/exception.hpp

inline exception_list_type::const_iterator **begin()** const noexcept

An iterator referring to the first exception_ptr object contained within the *exception_list*.

inline exception_list_type::const_iterator **end()** const noexcept

An iterator which is the past-the-end value for the *exception_list*.

hpx/errors/error.hpp

Defined in header hpx/errors/error.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_ERROR_UNSCOPED_ENUM_DEPRECATION_MSG

namespace **hpx**

Enums

enum class **error** : *std*::int16_t

Possible error conditions.

This enumeration lists all possible error conditions which can be reported from any of the API functions.

Values:

enumerator **success**

The operation was successful.

enumerator **no_success**

The operation did failed, but not in an unexpected manner.

enumerator **not_implemented**

The operation is not implemented.

enumerator **out_of_memory**

The operation caused an out of memory condition.

enumerator **bad_action_code**

enumerator **bad_component_type**

The specified component type is not known or otherwise invalid.

enumerator **network_error**

A generic network error occurred.

enumerator **version_too_new**

The version of the network representation for this object is too new.

enumerator **version_too_old**

The version of the network representation for this object is too old.

enumerator **version_unknown**

The version of the network representation for this object is unknown.

enumerator **unknown_component_address**

enumerator **duplicate_component_address**

The given global id has already been registered.

enumerator **invalid_status**

The operation was executed in an invalid status.

enumerator **bad_parameter**

One of the supplied parameters is invalid.

enumerator **internal_server_error**

enumerator **service_unavailable**

enumerator **bad_request**

enumerator **repeated_request**

enumerator **lock_error**

enumerator **duplicate_console**

There is more than one console locality.

enumerator **no_registered_console**

There is no registered console locality available.

enumerator **startup_timed_out**

enumerator **uninitialized_value**

enumerator **bad_response_type**

enumerator **deadlock**

enumerator **assertion_failure**

enumerator **null_thread_id**

Attempt to invoke an API function from a non-HPX thread.

enumerator **invalid_data**

enumerator **yield_aborted**

The yield operation was aborted.

enumerator **dynamic_link_failure**

enumerator **commandline_option_error**

One of the options given on the command line is erroneous.

enumerator **serialization_error**

There was an error during serialization of this object.

enumerator **unhandled_exception**

An unhandled exception has been caught.

enumerator **kernel_error**

The OS kernel reported an error.

enumerator **broken_task**

The task associated with this future object is not available anymore.

enumerator **task_moved**

The task associated with this future object has been moved.

enumerator **task_already_started**

The task associated with this future object has already been started.

enumerator **future_already_retrieved**

The future object has already been retrieved.

enumerator **promise_already_satisfied**

The value for this future object has already been set.

enumerator **future_does_not_support_cancellation**

The future object does not support cancellation.

enumerator **future_can_not_be_cancelled**

The future can't be canceled at this time.

enumerator **no_state**

The future object has no valid shared state.

enumerator **broken_promise**

The promise has been deleted.

enumerator **thread_resource_error**

enumerator **future_cancelled**

enumerator **thread_cancelled**

enumerator **thread_not_interruptable**

enumerator **duplicate_component_id**

The component type has already been registered.

enumerator **unknown_error**

An unknown error occurred.

enumerator **bad_plugin_type**

The specified plugin type is not known or otherwise invalid.

enumerator **filesystem_error**

The specified file does not exist or other filesystem related error.

enumerator **bad_function_call**

equivalent of std::bad_function_call

enumerator **task_canceled_exception**

parallel::task_canceled_exception

enumerator **task_block_not_active**

task_region is not active

enumerator **out_of_range**

Equivalent to std::out_of_range.

enumerator **length_error**

Equivalent to std::length_error.

enumerator **migration_needs_retry**

migration failed because of global race, retry

enumerator **stale_state**

The queried state may be stale, e.g. because no state has been recorded yet or a preceding notification has not yet been delivered

enumerator **target_fenced**

A dispatch was deliberately and correctly refused because the target had already latched a terminal lifecycle event; this is a final rejection, not a staleness signal, and should not be retried

enumerator **future_wait_timed_out**

future wait timed out

enumerator **locality_was_disconnected**

the requested target locality was disconnected

enumerator **future_uncompleted**

future was resumed while being empty

hpx/errors/exception_fwd.hpp

Defined in header hpx/errors/exception_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Enums

enum class **throwmode** : *std*::uint8_t

Encode error category for new *error_code*.

Values:

enumerator **plain**

enumerator **rethrow**

enumerator **lightweight**

Functions

constexpr bool **operator&**(*throwmode* lhs, *throwmode* rhs) noexcept

Variables

error_code **throws**

Predefined *error_code* object used as "throw on error" tag.

The predefined *hpx::error_code* object *hpx::throws* is supplied for use as a "throw on error" tag.

Functions that specify an argument in the form '*error_code*& ec=throws' (with appropriate namespace qualifiers), have the following error handling semantics:

If &ec != &throws and an error occurred: ec.value() returns the implementation specific error number for the particular error that occurred and ec.category() returns the error_category for ec.value().

If &ec != &throws and an error did not occur, ec.clear().

If an error occurs and &ec == &throws, the function throws an exception of type hpx::exception or of a type derived from it. The exception's *get_errorcode()* member function returns a reference to a hpx::error_code object with the behavior as specified above.

execution

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/execution/algorithms/future_sender.hpp

Defined in header hpx/execution/algorithms/future_sender.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Implementation details for adapting HPX futures as P2300 senders.

Usage:

```
hpx::future<int> f = hpx::async([]{ return 42; });
auto
  result = hpx::execution::experimental::as_sender(std::move(f))

  | hpx::execution::experimental::then([](int x){ return x * 2; })
    | hpx::execution::experimental::sync_wait();
```

namespace **hpx**

namespace **execution**

namespace **experimental**

hpx/execution/algorithms/sender_future.hpp

Defined in header hpx/execution/algorithms/sender_future.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Converts any P2300 stdexec sender into an hpx::future<T>.

Usage:

```
// Explicit T:
auto sender␣
↪= stdexec::just(42) | stdexec::then([](int x){ return x; });
hpx::future<int> f =
   ␣
↪hpx::execution::experimental::as_future<int>(std::move(sender));
int val = f.get();   // == 42
```

namespace **hpx**

namespace **execution**

namespace **experimental**

iii. The behavior of a program that adds specializations for *is_async_execution_policy* is undefined.

hpx::execution::experimental::static_chunk_size

Defined in header hpx/execution.hpp[866].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **static_chunk_size**

Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

> **Note**
>
> This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

hpx/execution/executors/adaptive_static_chunk_size.hpp

Defined in header hpx/execution/executors/adaptive_static_chunk_size.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **adaptive_static_chunk_size**

#include <adaptive_static_chunk_size.hpp> Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

> **Note**
>
> This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

[866] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/execution.hpp

Public Functions

adaptive_static_chunk_size() = default

Construct a adaptive_static_chunk_size executor parameters object

> **Note**
>
> By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

inline explicit constexpr **adaptive_static_chunk_size**(*std*::size_t const chunk_size) noexcept

Construct a adaptive_static_chunk_size executor parameters object

Parameters

chunk_size – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

hpx/execution/executors/execution_information.hpp

Defined in header hpx/execution/executors/execution_information.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

Variables

constexpr struct *hpx*::*execution*::*experimental*::*has_pending_closures_t* **has_pending_closures**

constexpr struct *hpx*::*execution*::*experimental*::*get_pu_mask_t* **get_pu_mask**

constexpr struct *hpx*::*execution*::*experimental*::*set_scheduler_mode_t* **set_scheduler_mode** struct **has_pending_closures_t**

#include <execution_information.hpp> Retrieve whether this executor has operations pending or not.

> **Note**
>
> If the executor does not expose this information, this call will always return *false*

Param exec
[in] The executor object to use to extract the requested information for.

Public Functions

template<typename **Executor**>

inline decltype(auto) **operator()**(*Executor* &&exec) const

template<typename **Executor**>

inline decltype(auto) **operator()**(*Executor*&&) const

struct **get_pu_mask_t**

#include <execution_information.hpp> Retrieve the bitmask describing the processing units the given thread is allowed to run on

All threads::executors invoke sched.get_pu_mask().

> **Note**
>
> If the executor does not support this operation, this call will always invoke hpx::threads::get_pu_mask()

Param exec
[in] The executor object to use for querying the number of pending tasks.
Param topo
[in] The topology object to use to extract the requested information.
Param thream_num
[in] The sequence number of the thread to retrieve information for.

Public Functions

template<typename **Executor**>

inline decltype(auto) **operator()**(*Executor* &&exec, *threads*::*topology* &topo, *std*::size_t thread_num) const

#include <execution_information.hpp> Set various modes of operation on the scheduler underneath the given executor.

> **Note**
>
> This calls exec.set_scheduler_mode(mode) if it exists; otherwise it does nothing.

Param exec
[in] The executor object to use.

Param mode
[in] The new mode for the scheduler to pick up

Public Functions

template<typename **Executor**, typename **Mode**>

inline void **operator()**(*Executor* &&exec, *Mode* const &mode) const

template<typename **Executor**, typename **Mode**>

inline void **operator()**(*Executor*&&, *Mode* const&) const

hpx::execution::experimental::guided_chunk_size

Defined in header hpx/execution.hpp[867].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

[867] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/execution.hpp

struct **guided_chunk_size**

Iterations are dynamically assigned to threads in blocks as threads request those until no blocks remain to be assigned. Similar to dynamic_chunk_size except that the block size decreases each time a number of loop iterations is given to a thread. The size of the initial block is proportional to *number_of_iterations* / *number_of_cores*. Subsequent blocks are proportional to *number_of_iterations_remaining* / *number_of_cores*. The optional chunk size parameter defines the minimum block size. The default chunk size is 1.

> **Note**
>
> This executor parameters type is equivalent to OpenMP's GUIDED scheduling directive.

hpx::execution::experimental::auto_chunk_size

Defined in header hpx/execution.hpp[868].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **auto_chunk_size**

Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

hpx/execution/executors/execution_parameters.hpp

Defined in header hpx/execution/executors/execution_parameters.hpp.

hpx::execution::experimental::max_num_chunks

Defined in header hpx/execution.hpp[869].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **max_num_chunks**

Loop iterations are divided into not more than *num_chunks* partitions that are assigned to threads. If *num_chunks* is not specified, the number of chunks is determined based on the number of available cores.

hpx::execution::experimental::persistent_auto_chunk_size

Defined in header hpx/execution.hpp[870].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **persistent_auto_chunk_size**

Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

hpx/execution/executors/default_parameters.hpp

Defined in header hpx/execution/executors/default_parameters.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

[870] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/execution.hpp

struct **default_parameters**

#include <default_parameters.hpp> Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note

This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

default_parameters() = default

Construct a default_parameters executor parameters object

Note

By default, the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

hpx/execution/executors/polymorphic_executor.hpp

Defined in header hpx/execution/executors/polymorphic_executor.hpp.

struct `null_parameters_t`

struct `get_chunk_size_t`

#include <execution_parameters_fwd.hpp> Return the number of invocations of the given function *f* which should be combined into a single task

Param params

[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num_tasks*.

Param exec
[in] The executor object which will be used for scheduling of the loop iterations.
Param iteration_duration
[in] The time one of the tasks require to be executed.
Param cores
[in] The number of cores the number of chunks should be determined for.
Param num_tasks
[in] The number of tasks the chunk size should be determined for
Return
The size of the chunks (number of iterations per chunk) that should be used for parallel execution.

Public Functions

template<typename **Parameters**, typename **Executor**>

inline decltype(auto) **operator()**(*Parameters* &&params, *Executor* &&exec, *hpx*::chrono::steady_duration const &iteration_duration, *std*::size_t cores, *std*::size_t num_tasks) const

template<typename **Parameters**, typename **Executor**>

inline decltype(auto) **operator()**(*Parameters* &&params, *Executor* &&exec, *std*::size_t cores, *std*::size_t num_tasks) const

struct **measure_iteration_t**

#include <execution_parameters_fwd.hpp> Return the measured execution time for one iteration based on running the given function.

> **Note**
>
> The parameter *f* is expected to be a nullary function returning a `std::size_t` representing the number of iteration the function has already executed (i.e. which don't have to be scheduled anymore).

Param params
[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num_tasks*.
Param exec
[in] The executor object which will be used for scheduling of the loop iterations.
Param f
[in] The function which will be optionally scheduled using the given executor.
Param num_tasks
[in] The number of tasks the chunk size should be determined for
Return
The execution time for one of the tasks.

Public Functions

template<typename **Parameters**, typename **Executor**, typename **F**>

inline decltype(auto) **operator()**(*Parameters* &&params, *Executor* &&exec, *F* &&f, *std*::size_t num_tasks) const

struct **maximal_number_of_chunks_t**

#include <execution_parameters_fwd.hpp> Return the largest reasonable number of chunks to create for a single algorithm invocation.

Param params
[in] The executor parameters object to use for determining the number of chunks for the given number of *cores*.

Param exec
[in] The executor object which will be used for scheduling of the loop iterations.

Param cores
[in] The number of cores the number of chunks should be determined for.

Param num_tasks
[in] The number of tasks the chunk size should be determined for

Public Functions

template<typename **Parameters**, typename **Executor**>

struct **reset_thread_distribution_t**

#include <execution_parameters_fwd.hpp> Reset the internal round robin thread distribution scheme for the given executor.

> **Note**
>
> This calls params.reset_thread_distribution(exec) if it exists; otherwise it does nothing.

Param params
[in] The executor parameters object to use for resetting the thread distribution scheme.

Param exec
[in] The executor object to use.

Public Functions

template<typename **Parameters**, typename **Executor**>

inline decltype(auto) **operator()**(*Parameters* &&params, *Executor* &&exec) const

struct **processing_units_count_t**

#include <execution_parameters_fwd.hpp> Retrieve the number of (kernel-)threads used by the associated executor.

> **Note**
>
> This calls params.processing_units_count(Executor&&) if it exists; otherwise it forwards the request to the executor parameters object.

Param params
[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec
[in] The executor object which will be used for scheduling of the loop iterations.

Param iteration_duration
[in] The time one of the tasks require to be executed.

Param num_tasks
[in] The number of tasks the number of cores should be determined for

Return
The number of cores to use

Public Functions

```

struct **bulk_sync_execute_t**

#include <execution.hpp> Bulk form of synchronous execution agent creation.

This synchronously creates a group of function invocations f(i) whose ordering is given by the execution_category associated with the executor. The function synchronizes the execution of all scheduled functions with the caller.

Here *i* takes on all values in the index space implied by shape. All exceptions thrown by invocations of f(i) are reported in a manner consistent with parallel algorithm execution through the returned future.

> **Note**
>
> This is deliberately different from the bulk_sync_execute customization points specified in P0443.The bulk_sync_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

> **Note**
>
> This calls exec.bulk_sync_execute(f, shape, ts...) if it exists; otherwise it executes sync_execute(f, shape, ts...) as often as needed.

Param exec
[in] The executor object to use for scheduling of the function *f*.

Param f
[in] The function which will be scheduled using the given executor.

Param shape
[in] The shape objects which defines the iteration boundaries for the arguments to be passed to *f*.

Param ts
[in] Additional arguments to use to invoke *f*.

Return
The return type of *executor_type::bulk_sync_execute* if defined by *executor_type*. Otherwise, a vector holding the returned values of each invocation of *f* except when *f* returns void, which case void is returned.

Public Functions

template<typename **Executor**, typename **F**, typename **Shape**, typename ...**Ts**>

```

struct **bulk_async_execute_t**

#include <execution.hpp> Bulk form of asynchronous execution agent creation.

This asynchronously creates a group of function invocations f(i) whose ordering is given by the execution_category associated with the executor.

Here *i* takes on all values in the index space implied by shape. All exceptions thrown by invocations of f(i) are reported in a manner consistent with parallel algorithm execution through the returned future.

> **Note**
>
> This is deliberately different from the bulk_async_execute customization points specified in P0443.The bulk_async_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

> **Note**
>
> This calls exec.bulk_async_execute(f, shape, ts…) if it exists; otherwise it executes async_execute(f, shape, ts…) as often as needed.

Param exec
[in] The executor object to use for scheduling of the function *f*.

Param f
[in] The function which will be scheduled using the given executor.

Param shape
[in] The shape objects which defines the iteration boundaries for the arguments to be passed to *f*.

Param ts
[in] Additional arguments to use to invoke *f*.

Return
The return type of *executor_type::bulk_async_execute* if defined by *executor_type*. Otherwise, a vector of futures holding the returned values of each invocation of *f*.

Defined in header hpx/executors/thread_pool_continues_on_sender.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Domain-optimized continues_on sender for HPX thread pool schedulers.

When stdexec::continues_on is applied with an HPX thread_pool_scheduler, the generic stdexec implementation creates two operation states: one for the source sender and one for the scheduler hop (schedule_from). This double-state overhead adds ~1 us per task in microbenchmarks.

This header provides a custom sender that replaces the generic path by:

1. Connecting the source sender to a lightweight receiver that captures the downstream receiver and the scheduler.
2. On set_value: if we are already on the same HPX thread pool, forwarding inline; otherwise, posting a single HPX task to forward the values.

   This eliminates the intermediate __storage_for_t, the second operation state, and the run_loop overhead.

using *hpx*::*execution*::**parallel_task_policy** = detail::parallel_task_policy_shim<*parallel_executor*, *hpx*::*traits*::executor_parameters_type_t<*parallel_executor*>>

Extension: The class parallel_task_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the parallel_policy.

hpx/executors/execution_policy_parameters.hpp

Typedefs

typedef *hpx*::*execution*::*parallel_executor* **instead**

namespace **this_thread**

Functions

hpx::*execution*::*parallel_executor* **get_executor**(*error_code* &ec = *throws*)

Returns a reference to the executor that was used to create the current thread.

Throws

`If – &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw a *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

namespace **threads**

Functions

hpx::*execution*::*parallel_executor* **get_executor**(thread_id_type const &id, *error_code* &ec = *throws*)

Returns a reference to the executor that was used to create the given thread.

Throws

If – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. hpx::bind_back

Defined in header hpx/functional.hpp[887].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Warning

doxygenfunction: Unable to resolve function "hpx::bind_back" with arguments (F&&, Ts&&...) in doxygen xml output for project "hpx" from directory: ../hpx_autodoc. Potential matches:

```
- template
↪<typename F, typename ...Ts> constexpr hpx::detail::bound_
↪back<std::decay_t<F>, util::make_index_pack_t<sizeof...
↪(Ts)>, util::decay_unwrap_t<Ts>...> bind_back(F &&f, Ts&&... vs)
- template<typename F> constexpr std::decay_t<F> bind_back(F &&f)
```

template<typename **F**>

[886] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

[887] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

constexpr *std*::decay_t<*F*> `hpx::bind_back`(*F* &&f)

hpx::invoke_fused

Defined in header hpx/functional.hpp[888].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::invoke_fused_r*

template<typename **F**, typename **Tuple**>

constexpr detail::invoke_fused_result_t<*F*, *Tuple*> `hpx::invoke_fused`(*F* &&f, *Tuple* &&t) noexcept(noexcept(detail::invoke_fused_impl(detail::fused_index_pack_
std::forward<*F*>(*f*),
std::forward<*Tuple*>(*t*))))

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

> **Note**
>
> This function is similar to `std::apply` (C++17). The difference between *`hpx::invoke`* and *`hpx::invoke_fused`* is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes *`hpx::invoke_fused`* rather useful.

Parameters

- `f` – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- `t` – A type whose contents are accessible through a call to *hpx::get*.

Throws

`std::exception` – like objects thrown by call to object f with the arguments contained in the sequenceable type t.

Returns

The result of the callable object when it's called with the content of the given sequenced type.

[888] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

hpx::invoke_fused_r

Defined in header hpx/functional.hpp[889].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::invoke_fused*

template<typename **R**, typename **F**, typename **Tuple**>

constexpr *R* hpx::**invoke_fused_r**(*F* &&f, *Tuple* &&t) noexcept(noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<*Tuple*>{}, *std*::forward<*F*>(*f*), *std*::forward<*Tuple*>(*t*))))

Invokes the given callable object f with the content of the sequenced type t (tuples, pairs).

> **Note**
>
> This function is similar to `std::apply` (C++17). The difference between *hpx::invoke* and *hpx::invoke_fused* is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes *hpx::invoke_fused* rather useful.

> **Note**
>
> The difference between *hpx::invoke_fused* and *hpx::invoke_fused_r* is that the later allows to specify the return type as well.

Parameters

- **f** – Must be a callable object. If f is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to *hpx::get*.

Throws

`std::exception` – like objects thrown by call to object f with the arguments contained in the sequenceable type t.

Template Parameters

R – The result type of the function when it's called with the content of the given sequenced type.

Returns

The result of the callable object when it's called with the content of the given sequenced type.

889 http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

hpx::move_only_function

Defined in header hpx/functional.hpp[890].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **Sig**, bool **Serializable** = false>

class **move_only_function**

Class template *hpx::move_only_function* is a general-purpose polymorphic function wrapper. *hpx::move_only_function* objects can store and invoke any constructible (not required to be move constructible) Callable target — functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to member objects.

The stored callable object is called the target of *hpx::move_only_function*. If an *hpx::move_only_function* contains no target, it is called empty. Unlike *hpx::function*, invoking an empty *hpx::move_only_function* results in undefined behavior.

hpx::move_only_functions supports every possible combination of cv-qualifiers, ref-qualifiers, and noexcept-specifiers not including volatile provided in its template parameter. These qualifiers and specifier (if any) are added to its operator(). *hpx::move_only_function* satisfies the requirements of MoveConstructible and MoveAssignable, but does not satisfy CopyConstructible or CopyAssignable.

hpx::bind

Defined in header hpx/functional.hpp[891].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

constexpr detail::placeholder<9> *hpx*::placeholders::**_9** = {}

hpx::function_ref

Defined in header hpx/functional.hpp[896].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **Sig**>

class **function_ref**

function_ref class is a vocabulary type with reference semantics for passing entities to call.

An example use case that benefits from higher-order functions is `retry(n,f)` which attempts to call `f` up to `n` times synchronously until success. This example might model the real-world scenario of repeatedly querying a flaky web service.

```
using payload = std::optional< /* ... */ >;
// Repeatedly invokes `action` up to `times` repetitions.
// Immediately returns if `action` returns a valid `payload`.
// Returns `std::nullopt` otherwise.
payload retry(size_t times, /* ????? */ action);
```

[895] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

[896] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

The passed-in action should be a callable entity that takes no arguments and returns a payload. This can be done with function pointers, *hpx::function* or a template but it is much simpler with *function_ref* as seen below:

```
payload retry(size_t times, function_ref<payload()> action);
```

hpx::function

Defined in header hpx/functional.hpp[897].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **Sig**, bool **Serializable** = false>

class **function**

Class template *hpx::function* is a general-purpose polymorphic function wrapper. Instances of *hpx::function* can store, copy, and invoke any CopyConstructible Callable target — functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to data members. The stored callable object is called the target of *hpx::function*. If an *hpx::function* contains no target, it is called empty. Invoking the target of an empty *hpx::function* results in *hpx::error::bad_function_call* exception being thrown. *hpx::function* satisfies the requirements of CopyConstructible and CopyAssignable.

hpx::bind_front

Defined in header hpx/functional.hpp[898].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Warning

doxygenfunction: Unable to resolve function "hpx::bind_front" with arguments (F&&, Ts&&…) in doxygen xml output for project "hpx" from directory: ../hpx_autodoc. Potential matches:

```
- template<typename F, typename ...Ts> constexpr detail::bound_
↪front<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>
↪, util::decay_unwrap_t<Ts>...> bind_front(F &&f, Ts&&... vs)
- template<typename F> constexpr std::decay_t<F> bind_front(F &&f)
```

template<typename **F**>

constexpr *std*::decay_t<*F*> *hpx*::**bind_front**(*F* &&f)

[897] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

[898] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

hpx::experimental::scope_success

Defined in header hpx/experimental/scope.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **F**>

auto *hpx*::*experimental*::**scope_success**(*F* &&f)

The class template scope_success is a general-purpose scope guard intended to call its exit function when a scope is normally exited.

Template Parameters
F – type of stored exit function

Parameters
f – stored exit function

hpx::experimental::scope_fail

Defined in header hpx/experimental/scope.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **F**>

auto *hpx*::*experimental*::**scope_fail**(*F* &&f)

The class template scope_fail is a general-purpose scope guard intended to call its exit function when a scope is exited via an exception.

Template Parameters
F – type of stored exit function

Parameters
f – stored exit function

hpx::experimental::scope_exit

Defined in header hpx/experimental/scope.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **F**>

auto *hpx*::*experimental*::**scope_exit**(*F* &&f)

The class template scope_exit is a general-purpose scope guard intended to call its exit function when a scope is exited.

Template Parameters
F – type of stored exit function

Parameters
f – stored exit function

hpx::is_bind_expression

Defined in header hpx/functional.hpp[899].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **T**>

struct **is_bind_expression** : public *std*::is_bind_expression<*T*>

If `T` is the type produced by a call to `hpx::bind`, this template is derived from `std::true_type`. For any other type, this template is derived from `std::false_type`.

This template may be specialized for a user-defined type `T` to implement *UnaryTypeTrait* with base characteristic of `std::true_type` to indicate that `T` should be treated by `hpx::bind` as if it were the type of a bind subexpression: when a bind-generated function object is invoked, a bound argument of this type will be invoked as a function object and will be given all the unbound arguments passed to the bind-generated object.

Subclassed by hpx::is_bind_expression< T const >

hpx::is_placeholder

Defined in header hpx/functional.hpp[900].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **T**>

struct **is_placeholder**

If `T` is a standard, Boost, or HPX placeholder (_1, _2, _3, …) then this template is derived from `std::integral_constant<int,1>`, `std::integral_constant<int, 2>`, `std::integral_constant<int,3>`, respectively. Otherwise, it is derived from `std::integral_constant<int,0>`.

The template may be specialized for any user-defined `T` type: the specialization must satisfy *UnaryTypeTrait* with base characteristic of `std::integral_constant<int, N>` with N>0 to indicate that `T` should be treated as N'th placeholder type. `hpx::bind` uses *`hpx::is_placeholder`* to detect placeholders for unbound arguments.

[899] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

[900] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

futures

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::packaged_task

Defined in header hpx/future.hpp[901].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **Sig**>

class **packaged_task**

The class template *hpx::packaged_task* wraps any Callable` target (function, lambda expression, bind expression, or another function object) so that it can be invoked asynchronously. Its return value or exception thrown is stored in a shared state which can be accessed through *hpx::future* objects. Just like *hpx::function*, *hpx::packaged_task* is a polymorphic, allocator-aware container: the stored callable target may be allocated on heap or with a provided allocator.

hpx::promise

Defined in header hpx/future.hpp[902].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **R**>

class **promise** : public *hpx*::detail::promise_base<*R*>

The class template *hpx::promise* provides a facility to store a value or an exception that is later acquired asynchronously via a *hpx::future* object created by the *hpx::promise* object. Note that the *hpx::promise* object is meant to be used only once. Each promise is associated with a shared state, which contains some state information and a result which may be not yet evaluated, evaluated to a value (possibly void) or evaluated to an exception. A promise may do three things with the shared state:

- make ready: the promise stores the result or the exception in the shared state. Marks the state ready and unblocks any thread waiting on a future associated with the shared state.
- release: the promise gives up its reference to the shared state. If this was the last such reference, the shared state is destroyed. Unless this was a shared state created by hpx::async which is not yet ready, this operation does not block.
- abandon: the promise stores the exception of type hpx::future_error with error code hpx::error::broken_promise, makes the shared state ready, and then releases it. The promise is the "push" end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in hpx::memory_order) the successful return from any function that is waiting on the shared state (such as hpx::future::get). Concurrent access to the same shared state may conflict otherwise: for example multiple callers of hpx::shared_future::get must either all be read-only or provide external synchronization.

[901] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp
[902] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

hpx::future

Defined in header hpx/future.hpp[903].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::shared_future*
- *hpx::make_future*
- *hpx::make_shared_future*
- *hpx::make_ready_future*
- *hpx::make_ready_future_alloc*
- *hpx::make_ready_future_at*
- *hpx::make_ready_future_after*
- *hpx::make_exceptional_future*

template<typename **R**>

class **future** : public *hpx*::*lcos*::detail::future_base<*future*<*R*>, *R*>

The class template *hpx::future* provides a mechanism to access the result of asynchronous operations:

- An asynchronous operation (created via hpx::async, *hpx::packaged_task*, or *hpx::promise*) can provide a *hpx::future* object to the creator of that asynchronous operation.
- The creator of the asynchronous operation can then use a variety of methods to query, wait for, or extract a value from the *hpx::future*. These methods may block if the asynchronous operation has not yet provided a value.
- When the asynchronous operation is ready to send a result to the creator, it can do so by modifying shared state (e.g. hpx::promise::set_value) that is linked to the creator's *hpx::future*. Note that *hpx::future* references shared state that is not shared with any other asynchronous return objects (as opposed to *hpx::shared_future*).

hpx::shared_future

Defined in header hpx/future.hpp[904].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::future*
- *hpx::make_future*
- *hpx::make_shared_future*
- *hpx::make_ready_future*
- *hpx::make_ready_future_alloc*

[903] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp
[904] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

- *hpx::make_ready_future_at*
- *hpx::make_ready_future_after*
- *hpx::make_exceptional_future*

template<typename **R**>

class **shared_future** : public *hpx*::*lcos*::detail::future_base<*shared_future*<*R*>, *R*>

The class template *hpx::shared_future* provides a mechanism to access the result of asynchronous operations, similar to *hpx::future*, except that multiple threads are allowed to wait for the same shared state. Unlike *hpx::future*, which is only moveable (so only one instance can refer to any particular asynchronous result), *hpx::shared_future* is copyable and multiple shared future objects may refer to the same shared state. Access to the same shared state from multiple threads is safe if each thread does it through its own copy of a *shared_future* object.

hpx::make_future

Defined in header hpx/future.hpp[905].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::future*
- *hpx::shared_future*

- *hpx::make_ready_future_alloc*
- *hpx::make_ready_future_at*
- *hpx::make_ready_future_after*
- *hpx::make_exceptional_future*

template<typename **R**, typename **U**>

hpx::*future*<*R*> `hpx::make_future`(*hpx*::*future*<*U*> &&f)

Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

template<typename **R**, typename **U**, typename **Conv**>

hpx::*future*<*R*> `hpx::make_future`(*hpx*::*future*<*U*> &&f, *Conv* &&conv)

Converts any future of type U to any other future of type R based on a given conversion function: R conv(U).

template<typename **R**, typename **U**>

[905] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

hpx::*future*<*R*> **hpx::make_future**(*hpx*::*shared_future*<*U*> f)

Converts any *shared_future* of type U to any other future of type R based on an existing conversion path from U to R.

template<typename **R**, typename **U**, typename **Conv**>

hpx::*future*<*R*> **hpx::make_future**(*hpx*::*shared_future*<*U*> f, *Conv* &&conv)

Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

hpx::make_shared_future

Defined in header hpx/future.hpp[906].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::make_ready_future_after*
- *hpx::make_exceptional_future*

template<typename **R**>

hpx::*shared_future*<*R*> **hpx::make_shared_future**(*hpx*::*future*<*R*> &&f) noexcept

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

template<typename **R**>

hpx::*shared_future*<*R*> &**hpx::make_shared_future**(*hpx*::*shared_future*<*R*> &f) noexcept

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

template<typename **R**>

hpx::*shared_future*<*R*> &&**hpx::make_shared_future**(*hpx*::*shared_future*<*R*> &&f) noexcept

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

[906] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

template<typename **R**>

hpx::*shared_future*<*R*> const &*hpx*::**make_shared_future**(*hpx*::*shared_future*<*R*> const &f) noexcept

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

hpx::make_ready_future

Defined in header hpx/future.hpp[907].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::future*
- *hpx::shared_future*
- *hpx::make_future*
- *hpx::make_shared_future*
- *hpx::make_ready_future_alloc*

template<typename **T**>

future<*T*> `hpx::`**`make_exceptional_future`**(*std*::exception_ptr const &e)

Creates a pre-initialized future object which holds the given error (extension)

template<typename **T**, typename **E**>

future<*T*> `hpx::`**`make_exceptional_future`**(*E* e)

Creates a pre-initialized future object which holds the given error (extension)

hpx/futures/future_fwd.hpp

Defined in header hpx/futures/future_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **lcos**

namespace **lcos**

[911] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/future.hpp

io_service

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/io_service/io_service_pool.hpp

Defined in header hpx/io_service/io_service_pool.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

class **io_service_pool**

#include <io_service_pool.hpp> A pool of io_service objects.

Public Functions

explicit **io_service_pool**(*std*::size_t pool_size = 2, *threads*::*policies*::callback_notifier const &notifier = *threads*::*policies*::callback_notifier(), char const *pool_name = "", char const *name_postfix = "")

Construct the io_service pool.

Parameters

- **pool_size** – [in] The number of threads to run to serve incoming requests
- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

explicit **io_service_pool**(*threads*::*policies*::callback_notifier const &notifier, char const *pool_name = "", char const *name_postfix = "")

Construct the io_service pool.

Parameters

- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

io_service_pool(*io_service_pool* const&) = delete

io_service_pool(*io_service_pool*&&) = delete *io_service_pool* &**operator=**(*io_service_pool* const&) = delete

io_service_pool &**operator=**(*io_service_pool*&&) = delete

~io_service_pool()

bool **run**(bool join_threads = true, *std*::shared_ptr<*barrier*> startup = {}) const

Run all io_service objects in the pool. If join_threads is true this will also wait for all threads to complete.

Parameters

- **join_threads** – [in] If true, wait for all pool threads to join before returning.
- **startup** – [in] Optional startup barrier used to synchronize pool worker thread startup with the caller. Its participant count must equal the number of pool worker threads plus one for the caller. The caller must call startup->*wait()* after invoking *run()*.

bool **run**(*std*::size_t num_threads, bool join_threads = true, *std*::shared_ptr<*barrier*> startup = {}) const

Run num_threads io_service objects in the pool. If join_threads is true this will also wait for all threads to complete.

Parameters

- **num_threads** – [in] The number of worker threads to start.
- **join_threads** – [in] If true, wait for all pool threads to join before returning.
- **startup** – [in] Optional startup barrier used to synchronize pool worker thread startup with the caller. Its participant count must equal num_threads plus one for the caller. The caller must call startup->*wait()* after invoking *run()*.

void **stop**() const

Stop all io_service objects in the pool.

void **join**() const

Join all io_service threads in the pool.

void **clear**() const

Clear all internal data structures.

void **wait**() const

Wait for all work to be done.

bool **stopped**() const

::asio::io_context &**get_io_service**(int index = -1) const

Get an io_service to use.

std::thread &**get_os_thread_handle**(*std*::size_t thread_num) const

access underlying thread handle

std::size_t **size**() const noexcept

Get number of threads associated with this I/O service.

void **thread_run**(*std*::size_t index, *std*::shared_ptr<*barrier*> startup = {}) const

Activate the thread *index* for this thread pool.

char const ***get_name**() const noexcept

Return name of this pool.

void **init**(*std*::size_t pool_size) const

Private Members

detail::io_service_pool_base ***pool_**

lcos_local

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/lcos_local/trigger.hpp

Defined in header hpx/lcos_local/trigger.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **lcos**

namespace **local**

template<typename **Mutex** = *hpx*::*spinlock*>

hpx::lcos::local::and_gate

Defined in header hpx/modules/lcos_local.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **and_gate** : public *hpx*::*lcos*::*local*::base_and_gate<*hpx*::*no_mutex*>

An AND-gate synchronization primitive that fires once all of its expected inputs have been received.

> **Note**
>
> This type is not thread-safe. It has to be protected from concurrent access by different threads by the code using instances of this type.

pack_traversal

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/pack_traversal/pack_traversal.hpp

Defined in header hpx/pack_traversal/pack_traversal.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

template<typename Mapper, typename... T> < unspecified > map_pack (Mapper &&mapper, T &&... pack)

Maps the pack with the given mapper.

This function tries to visit all plain elements which may be wrapped in:

- homogeneous containers (`std::vector`, `std::list`)
- heterogeneous containers (`hpx::tuple`, `std::pair`, `std::array`) and re-assembles the pack with the result of the mapper. Mapping from one type to a different one is supported.

Elements that aren't accepted by the mapper are routed through and preserved through the hierarchy.

```
// Maps all integers to floats
map_pack([](int value) {
    return float(value);
},
1, hpx::make_tuple(2, std::vector<int>{3, 4}), 5);
```

Throws

`std::exception` – like objects which are thrown by an invocation to the mapper.

Parameters

- **mapper** – A callable object, which accept an arbitrary type and maps it to another type or the same one.
- **pack** – An arbitrary variadic pack which may contain any type.

Returns

The mapped element or in case the pack contains multiple elements, the pack is wrapped into a `hpx::tuple`.

hpx::functional::unwrap

Defined in header hpx/unwrap.hpp[912].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::unwrapping_n*
- *hpx::unwrapping_all*

template<typename ...**Args**>

auto `hpx::unwrap`(*Args*&&... args) -> decltype(*util*::detail::unwrap_depth_impl<1U>(*std*::forward<*Args*>(*args*)...))

A helper function for retrieving the actual result of any *hpx::future* like type which is wrapped in an arbitrary way.

914 http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/unwrap.hpp
915 http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/unwrap.hpp

Unwraps the given pack of arguments, so that any *hpx::future* object is replaced by its future result type in the argument pack:

- `hpx::future<int>` -> `int`
- `hpx::future<std::vector<float>>` -> `std::vector<float>`
- `std::vector<future<float>>` -> `std::vector<float>`

The function is capable of unwrapping *hpx::future* like objects that are wrapped inside any container or tuple like type, see hpx::util::map_pack() for a detailed description about which surrounding types are supported. Non *hpx::future* like types are permitted as arguments and passed through.

```
hpx:unwrap(hpx::make_ready_future(0));

// Multiple arguments hpx::tuple<int, int> i2 =
    hpx:unwrap(hpx::make_ready_future(1),
               hpx::make_ready_future(2));
```

> **Note**
>
> This function unwraps the given arguments until the first traversed nested *hpx::future* which corresponds to an unwrapping depth of one. See *hpx::unwrap_n()* for a function which unwraps the given arguments to a particular depth or *hpx::unwrap_all()* that unwraps all future like objects recursively which are contained in the arguments.

Parameters

args – the arguments that are unwrapped which may contain any arbitrary future or non-future type.

Throws

`std::exception` – like objects in case any of the given wrapped *hpx::future* objects were resolved through an exception. See hpx::future::get() for details.

Returns

Depending on the count of arguments this function returns a *hpx::tuple* containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

hpx::unwrap_n

Defined in header hpx/unwrap.hpp[916].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::functional::unwrap*
- *hpx::functional::unwrap_n*
- *hpx::functional::unwrap_all*
- *hpx::unwrap*
- *hpx::unwrap_all*

[916] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/unwrap.hpp

- *hpx::unwrapping*
- *hpx::unwrapping_n*
- *hpx::unwrapping_all*

template<*std*::size_t **Depth**, typename ...**Args**>

auto *hpx*::**unwrap_n**(*Args*&&... args) -> decltype(*util*::detail::unwrap_depth_impl<*Depth*>(*std*::forward<*Args*>(*args*)...))

An alternative version of *hpx::unwrap()*, which unwraps the given arguments to a certain depth of *hpx::future* like objects.

See unwrap for a detailed description.

Template Parameters

Depth – The count of *hpx::future* like objects which are unwrapped maximally.

hpx::unwrap_all

Defined in header hpx/unwrap.hpp[917].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::functional::unwrap*
- *hpx::functional::unwrap_n*
- *hpx::functional::unwrap_all*
- *hpx::unwrap*
- *hpx::unwrap_n*
- *hpx::unwrapping*
- *hpx::unwrapping_n*
- *hpx::unwrapping_all*

template<typename ...**Args**>

auto *hpx*::**unwrap_all**(*Args*&&... args) -> decltype(*util*::detail::unwrap_depth_impl<0U>(*std*::forward<*Args*>(*args*)...))

An alternative version of *hpx::unwrap()*, which unwraps the given arguments recursively so that all contained *hpx::future* like objects are replaced by their actual value.

See *hpx::unwrap()* for a detailed description.

[917] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/unwrap.hpp

hpx::unwrapping

Defined in header hpx/unwrap.hpp[918].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::functional::unwrap*
- *hpx::functional::unwrap_n*
- *hpx::functional::unwrap_all*
- *hpx::unwrap*
- *hpx::unwrap_n*
- *hpx::unwrap_all*
- *hpx::unwrapping_n*
- *hpx::unwrapping_all*

template<typename **T**>

auto *hpx*::**unwrapping**(*T* &&callable) -> decltype(*util*::detail::functional_unwrap_depth_impl<1U>(*std*::forward<*T*>(*callable*)))

Returns a callable object which unwraps its arguments upon invocation using the *hpx::unwrap()* function and then passes the result to the given callable object.

```
    return left + right;
});

int i1 = callable(hpx::make_ready_future(1),
                  hpx::make_ready_future(2));
```

See *hpx::unwrap()* for a detailed description.

Parameters

callable – the callable object which is called with the result of the corresponding unwrap function.

hpx::unwrapping_n

Defined in header hpx/unwrap.hpp[919].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::functional::unwrap*
- *hpx::functional::unwrap_n*

template<*std*::size_t **Depth**, typename **T**>

auto *hpx*::**unwrapping_n**(*T* &&callable) -> decltype(*util*::detail::functional_unwrap_depth_impl<*Depth*>(*std*::forward<*T*>(*callable*)))

Returns a callable object which unwraps its arguments upon invocation using the *hpx::unwrap_n()* function and then passes the result to the given callable object.

See *hpx::unwrapping()* for a detailed description.

hpx::unwrapping_all

Defined in header hpx/unwrap.hpp[920].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

template<typename **T**>

auto *hpx*::**unwrapping_all**(*T* &&callable) -> decltype(*util*::detail::functional_unwrap_depth_impl<0U>(*std*::forward<*T*>(*callable*)))

Returns a callable object which unwraps its arguments upon invocation using the *hpx::unwrap_all()* function and then passes the result to the given callable object.

See *hpx::unwrapping()* for a detailed description.

[920] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/unwrap.hpp

hpx/pack_traversal/pack_traversal_async.hpp

Defined in header hpx/pack_traversal/pack_traversal_async.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

template<typename **Visitor**, typename ...**T**>

auto **traverse_pack_async**(*Visitor* &&visitor, *T*&&... pack) -> decltype(detail::apply_pack_transform_async(*std*::forward<*Visitor*>(*visitor*), *std*::forward<*T*>(*pack*)...))

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus, we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
struct my_async_visitor {
    // The synchronous overload is called for each object. It may
    // return false to suspend the current control. In that case the
    // overload below is called.
    template <typename T>
    bool operator()(async_traverse_visit_tag, T&& element)
    {
        return true;
    }

    // The asynchronous overload is called when the synchronous
    // overload returned false. In addition to the current visited
    // element, the overload is called with a continuation callable
    // object which resumes the traversal when called later.
    template <typename T, typename N>
    void operator()(async_traverse_detach_tag, T&& element, N&& next)
    {
    }

    // The overload is called when the traversal was finished. The
    // whole pack which was traversed asynchronously is passed.
    template <typename T>
    void operator()(async_traverse_complete_tag, T&& pack)
```

(continues on next page)

(continued from previous page)

```
    {
    }
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

Parameters

- **`visitor`** – A visitor object which provides the three `operator()` overloads that were described above. Additionally, the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **`pack`** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.

Returns

A hpx::intrusive_ptr that references an instance of the given visitor object.

template<typename **Allocator**, typename **Visitor**, typename ...**T**>

auto **`traverse_pack_async_allocator`**(*Allocator* const &alloc, *Visitor* &&visitor, *T*&&... pack) -> decltype(detail::apply_pack_transform_async_allocator(*alloc*, *std*::forward<*Visitor*>(*visitor*), *std*::forward<*T*>(*pack*)...))

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus, we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
struct my_async_visitor {
    // The synchronous overload is called for each object. It may
    // return false to suspend the current control. In that case the
    // overload below is called.
    template <typename T>
    bool operator()(async_traverse_visit_tag, T&& element)
    {
        return true;
    }

    // The asynchronous overload is called when the synchronous
    // overload returned false. In addition to the current visited
    // element, this overload receives a continuation callable object
    // which resumes the traversal when called later. The continuation
    // may be stored and called later or dropped completely to abort
    // the traversal early.
    template <typename T, typename N>
    void operator()(async_traverse_detach_tag, T&& element, N&& next)
```

(continues on next page)

(continued from previous page)

```
    {
    }

    // This overload is called when the traversal is finished. The
    // complete pack that was traversed asynchronously is passed.
    template <typename T>
    void operator()(async_traverse_complete_tag, T&& pack)
    {
    }
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally, the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.
- **alloc** – Allocator instance to use to create the traversal frame.

Returns

A hpx::intrusive_ptr that references an instance of the given visitor object.

preprocessor

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/preprocessor/strip_parens.hpp

Defined in header hpx/preprocessor/strip_parens.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_STRIP_PARENS(X)

For any symbol `X`, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to `X` itself without error.

The original implementation of this macro is from Steven Watanbe as shown in http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-td2591973.html#a2591976

```
HPX_PP_STRIP_PARENS(no_parens)
HPX_PP_STRIP_PARENS((with_parens))
```

Example Usage:

This produces the following output

```
no_parens
with_parens
```

Parameters

- **X** – Symbol to strip parens from

hpx/preprocessor/cat.hpp

Defined in header hpx/preprocessor/cat.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_CAT(A, B)

Concatenates the tokens `A` and `B` into a single token. Evaluates to `AB`

Parameters

- **A** – First token
- **B** – Second token

hpx/preprocessor/nargs.hpp

Defined in header hpx/preprocessor/nargs.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_NARGS(...)

Expands to the number of arguments passed in

Example Usage:

```
HPX_PP_NARGS(hpx, pp, nargs)
HPX_PP_NARGS(hpx, pp)
HPX_PP_NARGS(hpx)
```

Expands to:

```
3
2
1
```

Parameters

- **...** – The variadic number of arguments

hpx/preprocessor/stringize.hpp

Defined in header hpx/preprocessor/stringize.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_STRINGIZE(X)

The *HPX_PP_STRINGIZE* macro stringizes its argument after it has been expanded.

The passed argument `X` will expand to `"X"`. Note that the stringizing operator (#) prevents arguments from expanding. This macro circumvents this shortcoming.

Parameters

- **X** – The text to be converted to a string literal

hpx/preprocessor/expand.hpp

Defined in header hpx/preprocessor/expand.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_EXPAND(X)

The HPX_PP_EXPAND macro performs a double macro-expansion on its argument.

This macro can be used to produce a delayed preprocessor expansion.

Example:

```
#define MACRO(a, b, c) (a)(b)(c)
#define ARGS() (1, 2, 3)

HPX_PP_EXPAND(MACRO ARGS()) // expands to (1)(2)(3)
```

Parameters

- **X** – Token to be expanded twice

resiliency

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/resiliency/replay_executor.hpp

Defined in header hpx/resiliency/replay_executor.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Functions

template<typename **Executor**, typename **Vote**, typename **Pred**, typename **F**, typename ...**Ts**>

decltype(auto) **hpx_invoke**(*async_replicate_vote_validate_t*, *Executor* &&exec, *std*::size_t n, *Vote* &&vote, *Pred* &&pred, *F* &&f, *Ts*&&... ts)

ADL hook for async_replicate_vote_validate CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, validates results with *pred*, then runs valid results through *vote*.

Parameters

- **tag** – CPO tag (*async_replicate_vote_validate_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the voted-upon result.

template<typename **Executor**, typename **Vote**, typename **F**, typename ...**Ts**>

decltype(auto) **hpx_invoke**(*async_replicate_vote_t*, *Executor* &&exec, *std*::size_t n, *Vote* &&vote, *F* &&f, *Ts*&&... ts)

ADL hook for async_replicate_vote CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, runs valid results through *vote*. Validation uses the default exception check.

Parameters

- **tag** – CPO tag (*async_replicate_vote_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the voted-upon result.

template<typename **Executor**, typename **Pred**, typename **F**, typename ...**Ts**>

decltype(auto) **hpx_invoke**(*async_replicate_validate_t*, *Executor* &&exec, *std*::size_t n, *Pred* &&pred, *F* &&f, *Ts*&&... ts)

ADL hook for async_replicate_validate CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, validates results with *pred*. Returns the first valid result.

Parameters

- **tag** – CPO tag (*async_replicate_validate_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first valid result.

template<typename **Executor**, typename **F**, typename ...**Ts**>

decltype(auto) **hpx_invoke**(*async_replicate_t*, *Executor* &&exec, *std*::size_t n, *F* &&f, *Ts*&&... ts)

ADL hook for async_replicate CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*. Validates by checking for exceptions. Returns the first valid result.

Parameters

- **tag** – CPO tag (*async_replicate_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first non-throwing result.

hpx/resiliency/async_replicate.hpp

Defined in header hpx/resiliency/async_replicate.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

bool **tolerate_node_faults**()

Check whether fault tolerance for node/locality faults is enabled via the "enable_fault_tolerance" configuration entry in the "hpx" section.

Returns

true if fault tolerance is enabled, false otherwise.

inline void **tolerate_node_faults**(bool const value) const

Set whether this runtime instance should tolerate node faults.

This controls whether the runtime is configured to continue operating in the presence of locality failures (e.g. forced or unexpected disconnection of remote localities) rather than treating such failures as fatal errors.

Parameters

value – Set to `true` to enable fault tolerance for node failures, or `false` to require all localities to remain connected for normal operation.

hpx::runtime_mode

Defined in header hpx/init.hpp[921].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

enum class *hpx*::**runtime_mode** : *std*::int8_t

A HPX runtime can be executed in two different modes: console mode and worker mode.

Values:

enumerator **invalid**

enumerator **console**

The runtime is the console locality.

enumerator **worker**

The runtime is a worker locality.

enumerator **connect**

The runtime is a worker locality connecting late

enumerator **local**

The runtime is fully local.

enumerator **default_**

The runtime mode will be determined based on the command line arguments

enumerator **last**

[921] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/init_runtime/include/hpx/init.hpp

hpx::components::component_commandline_base

Defined in header hpx/components.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **component_commandline_base**

The component_commandline_base has to be used as a base class for all component command-line line handling registries.

Subclassed by hpx::components::component_commandline

HPX_REGISTER_COMPONENT_MODULE

Defined in header hpx/components.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Warning

doxygenfunction: Cannot find function "HPX_REGISTER_COMPONENT_MODULE" in doxygen xml output for project "hpx" from directory: ../hpx_autodoc

hpx/runtime_configuration/plugin_registry_base.hpp

Defined in header hpx/runtime_configuration/plugin_registry_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **plugins**

struct **plugin_registry_base**

#include <plugin_registry_base.hpp> The plugin_registry_base has to be used as a base class for all plugin registries.

Public Functions

virtual **~plugin_registry_base**() = default

virtual bool **get_plugin_info**(*std*::vector<*std*::string> &fillini) = 0

Return the configuration information for any plugin implemented by this module

Parameters

fillini – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all plugins implemented in this module.

Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

inline virtual void **init**(int*, char***, *util*::*runtime_configuration*&)

hpx/runtime_configuration/component_registry_base.hpp

Defined in header hpx/runtime_configuration/component_registry_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

struct **component_registry_base**

#include <component_registry_base.hpp> The component_registry_base has to be used as a base class for all component registries.

Public Functions

virtual **~component_registry_base**() = default

virtual bool **get_component_info**(*std*::vector<*std*::string> &fillini, *std*::string const &filepath, bool is_static = false) = 0

Return the ini-information for all contained components.

Parameters

- **fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** – [in]
- **is_static** – [in]

Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

virtual void **register_component_type**() = 0

Register the component type represented by this component.

runtime_local

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::get_locality_id

Defined in header hpx/runtime.hpp[922].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

std::uint32_t **hpx::get_locality_id**(*error_code* &ec = *throws*)

Return the number of the locality this function is being called from.

This function returns the id of the current locality.

> **Note**
>
> The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by get_num_localities()).

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

> **Note**
>
> This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx/runtime_local/get_os_thread_count.hpp

Defined in header hpx/runtime_local/get_os_thread_count.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

[922] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

Functions

std::size_t **get_os_thread_count**()

Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

std::size_t **get_os_thread_count**(*threads*::executor const &exec)

Return the number of worker OS- threads used by the given executor to execute HPX threads.

This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

Parameters

exec – [in] The executor to be used.

namespace **threads**

hpx::get_locality_name

Defined in header hpx/runtime.hpp[923].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

std::string *hpx*::**get_locality_name**()

Return the name of the locality this function is called on.

This function returns the name for the locality on which this function is called.

> **See also**
>
> *future<std::string> get_locality_name(hpx::id_type const& id)*

Returns

This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcelports.

future<*std*::string> *hpx*::**get_locality_name**(*hpx*::id_type const &id)

Return the name of the referenced locality.

This function returns a future referring to the name for the locality of the given id.

[923] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

See also

std::string get_locality_name()

Parameters
: **id** – [in] The global id of the locality for which the name should be retrieved

Returns
: This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

hpx/runtime_local/thread_mapper.hpp

Defined in header hpx/runtime_local/thread_mapper.hpp.

hpx/runtime_local/custom_exception_info.hpp

Defined in header hpx/runtime_local/custom_exception_info.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::string **diagnostic_information**(exception_info const &xi)

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function *hpx::diagnostic_information* can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

> **See also**
>
> *hpx::get_error_locality_id()*, *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters

`xi` – The parameter `e` will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`std::bad_alloc` – (if any of the required allocation operations fail)

Returns

The formatted string holding all the available diagnostic information stored in the given exception instance.

std::string **default_diagnostic_information**(*std*::exception_ptr const &e)

std::uint32_t **get_error_locality_id**(*hpx*::exception_info const &xi) noexcept

Return the locality id where the exception was thrown.

The function *hpx::get_error_locality_id* can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

> **See also**

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters

`xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`nothing` –

Returns

The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return *hpx::naming::invalid_locality_id*.

std::string **`get_error_host_name`**(*hpx*::exception_info const &xi)

Return the hostname of the locality where the exception was thrown.

The function *hpx::get_error_host_name* can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

See also

hpx::diagnostic_information() *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()* *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters

`xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return and empty string.

std::int64_t **get_error_process_id**(*hpx*::exception_info const &xi) noexcept

Return the (operating system) process id of the locality where the exception was thrown.

The function *hpx::get_error_process_id* can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.

See also

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters

`xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`nothing` –

Returns

The process id of the OS-process which threw the exception If the exception instance does not hold this information, the function will return 0.

std::string **get_error_env**(*hpx*::exception_info const &xi)

Return the environment of the OS-process at the point the exception was thrown.

The function *hpx::get_error_env* can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

See also

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters

`xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::string **`get_error_backtrace`**(*hpx*::exception_info const &xi)

Return the stack backtrace from the point the exception was thrown.

The function *hpx::get_error_backtrace* can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

> **See also**
>
> *hpx::diagnostic_information()*, *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters

`xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The stack back trace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::size_t **`get_error_os_thread`**(*hpx*::exception_info const &xi) noexcept

Return the sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

The function *hpx::get_error_os_thread* can be used to extract the diagnostic information element representing the sequence number of the OS-thread as stored in the given exception instance.

> **See also**
>
> *hpx::diagnostic_information()*, *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*,

hpx::get_error_file_name(), *hpx::get_error_line_number()*, *hpx::get_error_thread_id()*, *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters

xi – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

nothing –

Returns

The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return std::size(-1).

std::size_t **get_error_thread_id**(*hpx*::exception_info const &xi) noexcept

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function *hpx::get_error_thread_id* can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

See also

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()* *hpx::get_error_thread_description()*, *hpx::get_error()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*, *hpx::get_error_state()*

Parameters

xi – The parameter e will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

nothing –

Returns

The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return std::size_t(0).

std::string **get_error_thread_description**(*hpx*::exception_info const &xi)

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function *hpx::get_error_thread_description* can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.

> **See also**
>
> *hpx::diagnostic_information()*, *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error()*, *hpx::get_error_state()*, *hpx::get_error_what()*, *hpx::get_error_config()*

Parameters
: `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws
: `std::bad_alloc` – (if one of the required allocations fails)

Returns
: Any additionally available thread description of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::string **`get_error_config`**(*hpx*::exception_info const &xi)

Return the HPX configuration information point from which the exception was thrown.

The function *hpx::get_error_config* can be used to extract the HPX configuration information element representing the full HPX configuration information as stored in the given exception instance.

> **See also**
>
> *hpx::diagnostic_information()*, *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error()*, *hpx::get_error_state()* *hpx::get_error_what()*, *hpx::get_error_thread_description()*

Parameters
: `xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

Any additionally available HPX configuration information the point from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::string **`get_error_state`**(*hpx*::exception_info const &xi)

Return the HPX runtime state information at which the exception was thrown.

The function *hpx::get_error_state* can be used to extract the HPX runtime state information element representing the state the runtime system is currently in as stored in the given exception instance.

See also

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*, *hpx::get_error_function_name()*, *hpx::get_error_file_name()*, *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*, *hpx::get_error_thread_id()*, *hpx::get_error_backtrace()*, *hpx::get_error_env()*, *hpx::get_error()*, *hpx::get_error_what()*, *hpx::get_error_thread_description()*

Parameters

`xi` – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The point runtime state at the point at which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

hpx/runtime_local/runtime_local.hpp

Defined in header hpx/runtime_local/runtime_local.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **`hpx`**

Functions

void **set_error_handlers**(*hpx*::*util*::*runtime_configuration* const &cfg)

class **runtime**

Public Types

using **notification_policy_type** = *threads*::*policies*::callback_notifier

Generate a new notification policy instance for the given thread name prefix

using **hpx_main_function_type** = int()

The *hpx_main_function_type* is the default function type usable as the main HPX thread function.

using **hpx_errorsink_function_type** = void(*std*::uint32_t, *std*::string const&)

Public Functions

virtual *notification_policy_type* **get_notification_policy**(char const *prefix, runtime_local::os_thread_type type)

state **get_state**() const

void **set_state**(state s)

explicit **runtime**(*hpx*::*util*::*runtime_configuration* rtcfg, bool initialize)

Construct a new HPX runtime instance.

virtual **~runtime**()

The destructor makes sure all HPX runtime services are properly shut down before exiting.

void **on_exit**(*hpx*::*function*<void()> const &f)

Manage list of functions to call on exit.

void **starting**()

Manage runtime 'stopped' state.

void **stopping**()

Call all registered on_exit functions.

bool **stopped**() const

This accessor returns whether the runtime instance has been stopped.

hpx::*util*::*runtime_configuration* &**get_config**()

access configuration information

hpx::*util*::*runtime_configuration* const &**get_config**() const

std::size_t **get_instance_number**() const

util::*thread_mapper* &**get_thread_mapper**() const

Return a reference to the internal PAPI thread manager.

threads::*topology* const &**get_topology**() const

virtual int **run**(*hpx*::*function*<*hpx_main_function_type*> const &func)

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

> **Note**
>
> The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

Parameters

`func` – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

Returns

This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

virtual int **run**()

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

Returns

This function will always return 0 (zero).

virtual void **rethrow_exception**()

Rethrow any stored exception (to be called after *stop()*)

virtual int **start**(*hpx*::*function*<*hpx_main_function_type*> const &func, bool blocking = false)

Start the runtime system.

Parameters

- **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*.
- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function runtime::start will call runtime::wait internally.

Returns

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise, it will return zero.

virtual int **start**(bool blocking = false)

Start the runtime system.

Parameters

blocking – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function runtime::start will call runtime::wait internally .

Returns

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter `func`. Otherwise, it will return zero.

virtual int **wait**()

Wait for the shutdown action to be executed.

Returns

This function will return the value as returned as the result of the invocation of the function object given by the parameter `func`.

virtual void **stop**(bool blocking = true)

Initiate termination of the runtime system.

Parameters

blocking – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

virtual int **suspend**()

Suspend the runtime system.

virtual int **resume**()

Resume the runtime system.

virtual int **finalize**(double)

virtual bool **is_networking_enabled**()

Return true if networking is enabled.

virtual *hpx*::*threads*::*threadmanager* &**get_thread_manager**()

Allow access to the thread manager instance used by the HPX runtime.

virtual *std*::string **here**() const

Returns a string of the locality endpoints (usable in debug output)

virtual bool **report_error**(*std*::size_t num_thread, *std*::exception_ptr const &e, bool terminate_all = true)

Report a non-recoverable error to the runtime system.

Parameters

- **num_thread** – [in] The number of the operating system thread the error has been detected in.
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] signal whether all localities should be terminated

virtual bool **report_error**(*std*::exception_ptr const &e, bool terminate_all = true)

Report a non-recoverable error to the runtime system.

> **Note**
>
> This function will retrieve the number of the current shepherd thread and forward to the report_error function above.

Parameters

- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] signal whether all localities should be terminated

virtual void **add_pre_startup_function**(*startup_function_type* f)

Add a function to be executed inside a HPX thread before hpx_main but guaranteed to be executed before any startup function registered with *add_startup_function*.

> **Note**
>
> The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

Parameters

f – The function 'f' will be called from inside a HPX thread before hpx_main is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add_startup_function**(*startup_function_type* f)

Add a function to be executed inside a HPX thread before hpx_main

Parameters

f – The function 'f' will be called from inside a HPX thread before hpx_main is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add_pre_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed inside a HPX thread during hpx::finalize, but guaranteed before any of the shutdown functions is executed.

> **Note**
>
> The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

Parameters

f – The function 'f' will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual void **add_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed inside a HPX thread during hpx::finalize

Parameters

f – The function 'f' will be called from inside a HPX thread while hpx::finalize is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual *hpx*::*util*::*io_service_pool* ***get_thread_pool**(char const *name)

Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument `name` are "main_pool", "io_pool", "parcel_pool", and "timer_pool". For any other argument value the function will return zero.

virtual bool **register_thread**(char const *name, *std*::size_t num = 0, bool service_thread = true, *error_code* &ec = *throws*)

Register an external OS-thread with HPX.

This function should be called from any OS-thread which is external to HPX (not created by HPX), but which needs to access HPX functionality, such as setting a value on a promise or similar.

'main', 'io', 'timer', 'parcel', 'worker'

> **Note**
>
> The function will compose a thread name of the form '<name>-thread#<num>' which is used to register the thread. It is the user's responsibility to ensure that each (composed) thread name is unique. HPX internally uses the following names for the threads it creates, do not reuse those:

> **Note**
>
> This function should be called for each thread exactly once. It will fail if it is called more than once.

Parameters

- **name** – [in] The name to use for thread registration.
- **num** – [in] The sequence number to use for thread registration. The default for this parameter is zero.
- **service_thread** – [in] The thread should be registered as a service thread. The default for this parameter is 'true'. Any service threads will be pinned to cores not currently used by any of the HPX worker threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function will return whether the requested operation succeeded or not.

virtual bool **unregister_thread**()

Unregister an external OS-thread with HPX.

This function will unregister any external OS-thread from HPX.

> **Note**
>
> This function should be called for each thread exactly once. It will fail if it is called more than once. It will fail as well if the thread has not been registered before (see *register_thread*).

Returns

This function will return whether the requested operation succeeded or not.

virtual runtime_local::os_thread_data **get_os_thread_data**(*std*::string const &label) const

Access data for a given OS thread that was previously registered by *register_thread*.

virtual bool **enumerate_os_threads**(*hpx*::*function*<bool(runtime_local::os_thread_data const&)> const &f) const

Enumerate all OS threads that have registered with the runtime.

notification_policy_type::on_startstop_type **on_start_func**() const

notification_policy_type::on_startstop_type **on_stop_func**() const *notification_policy_type*::on_error_type **on_error_func**() const

Functions

char const ***get_stack_size_name**(*std*::ptrdiff_t size)

Returns the stack size name.

Get the readable string representing the given stack size constant.

Parameters

size – this represents the stack size

std::ptrdiff_t **get_default_stack_size**()

Returns the default stack size.

Get the default stack size in bytes.

std::ptrdiff_t **get_stack_size**(*thread_stacksize* size)

Returns the stack size corresponding to the given stack size enumeration.

Get the stack size corresponding to the given stack size enumeration.

Parameters

size – this represents the stack size

namespace **util**

Functions

bool **retrieve_commandline_arguments**(*hpx*::program_options::options_description const &app_options, *hpx*::program_options::variables_map &vm)

bool **retrieve_commandline_arguments**(*std*::string const &app_name, *hpx*::program_options::variables_map &vm)

hpx::get_initial_num_localities

Defined in header hpx/runtime.hpp[924].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::get_num_localities*

std::uint32_t *hpx*::**get_initial_num_localities**()

Return the number of localities which were registered at startup for the running application.

The function *get_initial_num_localities* returns the number of localities which were connected to the console at application startup.

See also

hpx::find_all_localities, hpx::get_num_localities

Note

[924] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

hpx::get_num_localities

Defined in header hpx/runtime.hpp[925].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::get_initial_num_localities*

hpx::*future*<*std*::uint32_t> `hpx::get_num_localities()`

Asynchronously return the number of localities which are currently registered for the running application.

The function *get_num_localities* asynchronously returns the number of localities currently connected to the console. The returned future represents the actual result.

See also

hpx::find_all_localities, hpx::get_num_localities

Note

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

std::uint32_t `hpx::get_num_localities`(*launch*::sync_policy, *error_code* &ec = *throws*)

Return the number of localities which are currently registered for the running application.

The function *get_num_localities* returns the number of localities currently connected to the console.

See also

hpx::find_all_localities, hpx::get_num_localities

[925] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

Note

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

`ec` – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::uint32_t `hpx::get_num_localities`(*hpx*::*launch*::sync_policy, *error_code* &ec)

Return the number of localities which are currently registered for the running application.

hpx::*future*<*std*::uint32_t> `hpx::get_num_localities`(*components*::component_type t)

Asynchronously return the number of localities which are currently registered for the running application.

The function *get_num_localities* asynchronously returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also

hpx::find_all_localities, hpx::get_num_localities

Note

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Parameters

`t` – The component type for which the number of connected localities should be retrieved.

std::uint32_t `hpx::get_num_localities`(*launch*::sync_policy, *components*::component_type t, *error_code* &ec = *throws*)

Synchronously return the number of localities which are currently registered for the running application.

The function *get_num_localities* returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also

hpx::find_all_localities, hpx::get_num_localities

Note

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Parameters

- **t** – The component type for which the number of connected localities should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::uint32_t *hpx*::**get_num_localities**(*hpx*::*launch*::sync_policy, *components*::component_type type, *error_code* &ec)

hpx/runtime_local/report_error.hpp

Defined in header hpx/runtime_local/report_error.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

void **report_error**(*std*::size_t num_thread, *std*::exception_ptr const &e)

The function report_error reports the given exception to the console.

void **report_error**(*std*::exception_ptr const &e)

The function report_error reports the given exception to the console.

hpx::get_thread_name

Defined in header hpx/runtime.hpp[926].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

std::string *hpx*::**get_thread_name**()

Return the name of the calling thread.

This function returns the name of the calling thread. This name uniquely identifies the thread in the context of HPX. If the function is called while no HPX runtime system is active, the result will be "<unknown>".

hpx::startup_function_type

Defined in header hpx/runtime.hpp[927].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_pre_startup_function*
- *hpx::register_startup_function*

using *hpx*::**startup_function_type** = *hpx*::*move_only_function*<void()>

The type of the function which is registered to be executed as a startup or pre-startup function.

hpx::register_pre_startup_function

Defined in header hpx/runtime.hpp[928].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::startup_function_type*
- *hpx::register_startup_function*

void *hpx*::**register_pre_startup_function**(*startup_function_type* f)

Add a function to be executed by a HPX thread before hpx_main but guaranteed before any startup function is executed (system-wide).

Any of the functions registered with *register_pre_startup_function* are guaranteed to be executed by an HPX thread before any of the registered startup functions are executed (see hpx::register_startup_function()).

[926] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp
[927] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp
[928] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also

hpx::register_startup_function()

Note

If this function is called while the pre-startup functions are being executed or after that point, it will raise aninvalid_status exception.

Parameters

`f` – [in] The function to be registered to run by an HPX thread as a pre-startup function.

hpx::register_startup_function

Defined in header hpx/runtime.hpp[929].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::startup_function_type*
- *hpx::register_pre_startup_function*

void `hpx::register_startup_function`(*startup_function_type* f)

Add a function to be executed by a HPX thread before hpx_main but guaranteed after any pre-startup function is executed (system-wide).

Any of the functions registered with *register_startup_function* are guaranteed to be executed by an HPX thread after any of the registered pre-startup functions are executed (see: hpx::register_pre_startup_function()), but before *hpx_main* is being called.

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also

hpx::register_pre_startup_function()

[929] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

> **Note**
>
> If this function is called while the startup functions are being executed or after that point, it will raise an invalid_status exception.

Parameters

`f` – [in] The function to be registered to run by an HPX thread as a startup function.

hpx::shutdown_function_type

Defined in header hpx/runtime.hpp[930].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_pre_shutdown_function*
- *hpx::register_shutdown_function*

using *hpx*::**shutdown_function_type** = *hpx*::*move_only_function*<void()>

The type of the function which is registered to be executed as a shutdown or pre-shutdown function.

hpx::register_pre_shutdown_function

Defined in header hpx/runtime.hpp[931].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::shutdown_function_type*
- *hpx::register_shutdown_function*

void *hpx*::**register_pre_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during hpx::finalize() but guaranteed before any shutdown function is executed (system-wide)

Any of the functions registered with *register_pre_shutdown_function* are guaranteed to be executed by an HPX thread during the execution of hpx::finalize() before any of the registered shutdown functions are executed (see: hpx::register_shutdown_function()).

> **See also**

[931] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

Note

If this function is called while the pre-shutdown functions are being executed, or after that point, it will raise an invalid_status exception.

Parameters

`f` – [in] The function to be registered to run by an HPX thread as a pre-shutdown function.

hpx::register_shutdown_function

Defined in header hpx/runtime.hpp[932].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::shutdown_function_type*
- *hpx::register_pre_shutdown_function*

void *hpx*::**register_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during hpx::finalize() but guaranteed after any pre-shutdown function is executed (system-wide)

Any of the functions registered with *register_shutdown_function* are guaranteed to be executed by an HPX thread during the execution of hpx::finalize() after any of the registered pre-shutdown functions are executed (see: hpx::register_pre_shutdown_function()).

See also

hpx::register_pre_shutdown_function()

Note

If this function is called while the shutdown functions are being executed, or after that point, it will raise an invalid_status exception.

Parameters

`f` – [in] The function to be registered to run by an HPX thread as a shutdown function.

[932] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

hpx::register_thread

Defined in header hpx/runtime.hpp[933].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::unregister_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*
- *hpx::register_on_exit*

- *hpx::is_stopped*
- *hpx::is_stopped_or_shutting_down*
- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

bool *hpx*::**register_thread**(*runtime* *rt, char const *name, *error_code* &ec = *throws*)

Register the current kernel thread with HPX, this should be done once for each external OS-thread intended to invoke HPX functionality. Calling this function more than once will return false.

hpx::unregister_thread

Defined in header hpx/runtime.hpp[934].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*
- *hpx::register_on_exit*
- *hpx::is_starting*
- *hpx::tolerate_node_faults*
- *hpx::is_running*

[933] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp
[934] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

- *hpx::is_stopped_or_shutting_down*
- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

void `hpx::unregister_thread`(*runtime* *rt)

Unregister the thread from HPX, this should be done once in the end before the external thread exists.

hpx::get_os_thread_data

Defined in header hpx/runtime.hpp[935].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*
- *hpx::register_on_exit*

- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

runtime_local::os_thread_data `hpx::get_os_thread_data`(*std*::string const &label)

Access data for a given OS thread that was previously registered by *register_thread*. This function must be called from a thread that was previously registered with the runtime.

hpx::enumerate_os_threads

Defined in header hpx/runtime.hpp[936].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*

- *hpx::is_stopped*
- *hpx::is_stopped_or_shutting_down*
- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

bool `hpx::enumerate_os_threads`(*hpx*::*function*<bool(os_thread_data const&)> const &f)

Enumerate all OS threads that have registered with the runtime.

hpx::get_runtime_instance_number

Defined in header hpx/runtime.hpp[937].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::get_os_thread_data*

- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

std::size_t `hpx::get_runtime_instance_number`()

Return the runtime instance number associated with the runtime instance the current thread is running in.

[937] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

hpx::register_on_exit

Defined in header hpx/runtime.hpp[938].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*

- *hpx::is_stopped*
- *hpx::is_stopped_or_shutting_down*
- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

bool `hpx::register_on_exit`(*hpx*::*function*<void()> const&)

Register a function to be called during system shutdown.

hpx::is_starting

Defined in header hpx/runtime.hpp[939].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*
- *hpx::register_on_exit*
- *hpx::tolerate_node_faults*
- *hpx::is_running*
- *hpx::is_stopped*
- *hpx::is_stopped_or_shutting_down*

[938] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp
[939] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

bool *hpx*::**is_starting**()

Test whether the runtime system is currently being started.

This function returns whether the runtime system is currently being started or not, e.g. whether the current state of the runtime system is *hpx::state::startup*

> **Note**
>
> This function needs to be executed on a HPX-thread. It will return false otherwise.

hpx::tolerate_node_faults

Defined in header hpx/runtime.hpp[940].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*
- *hpx::register_on_exit*
- *hpx::is_starting*
- *hpx::is_running*
- *hpx::is_stopped*
- *hpx::is_stopped_or_shutting_down*
- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

bool *hpx*::**tolerate_node_faults**()

Test if HPX runs in fault-tolerant mode.

This function returns whether the runtime system is running in fault-tolerant mode

[940] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

hpx::is_running

Defined in header hpx/runtime.hpp[941].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*
- *hpx::register_on_exit*
- *hpx::is_starting*
- *hpx::tolerate_node_faults*
- *hpx::is_stopped*
- *hpx::is_stopped_or_shutting_down*
- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

bool `hpx::is_running()`

Test whether the runtime system is currently running.

This function returns whether the runtime system is currently running or not, e.g. whether the current state of the runtime system is *hpx::state::running*

> **Note**
>
> This function needs to be executed on a HPX-thread. It will return false otherwise.

hpx::is_stopped

Defined in header hpx/runtime.hpp[942].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*

- *hpx::is_running*
- *hpx::is_stopped_or_shutting_down*
- *hpx::get_num_worker_threads*
- *hpx::get_system_uptime*

bool *hpx*::**is_stopped**()

Test whether the runtime system is currently stopped.

This function returns whether the runtime system is currently stopped or not, e.g. whether the current state of the runtime system is *hpx::state::stopped*

> **Note**
>
> This function needs to be executed on a HPX-thread. It will return false otherwise.

hpx::is_stopped_or_shutting_down

Defined in header hpx/runtime.hpp[943].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*
- *hpx::register_on_exit*
- *hpx::is_starting*
- *hpx::tolerate_node_faults*
- *hpx::is_running*
- *hpx::is_stopped*

- *hpx::get_system_uptime*

[943] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

bool *hpx*::**is_stopped_or_shutting_down**()

Test whether the runtime system is currently being shut down.

This function returns whether the runtime system is currently being shut down or not, e.g. whether the current state of the runtime system is *hpx::state::stopped* or *hpx::state::shutdown*

Note

This function needs to be executed on a HPX-thread. It will return false otherwise.

hpx::get_num_worker_threads

Defined in header hpx/runtime.hpp[944].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*

- *hpx::is_starting*
- *hpx::tolerate_node_faults*
- *hpx::is_running*
- *hpx::is_stopped*
- *hpx::is_stopped_or_shutting_down*
- *hpx::get_system_uptime*

std::size_t *hpx*::**get_num_worker_threads**()

Return the number of worker OS- threads used to execute HPX threads.

This function returns the number of OS-threads used to execute HPX threads. If the function is called while no HPX runtime system is active, it will return zero.

[944] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

hpx::get_system_uptime

Defined in header hpx/runtime.hpp[945].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*
- *hpx::get_os_thread_data*
- *hpx::enumerate_os_threads*
- *hpx::get_runtime_instance_number*
- *hpx::register_on_exit*

- *hpx::tolerate_node_faults*
- *hpx::is_running*
- *hpx::is_stopped*
- *hpx::is_stopped_or_shutting_down*
- *hpx::get_num_worker_threads*

std::uint64_t *hpx*::**get_system_uptime**()

Return the system uptime measure on the thread executing this call.

This function returns the system uptime measured in nanoseconds for the thread executing this call. If the function is called while no HPX runtime system is active, it will return zero.

hpx/runtime_local/thread_pool_helpers.hpp

Defined in header hpx/runtime_local/thread_pool_helpers.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resource**

[945] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

Functions

std::size_t **get_num_thread_pools**()

Return the number of thread pools currently managed by the *resource_partitioner*

std::size_t **get_num_threads**()

Return the number of threads in all thread pools currently managed by the *resource_partitioner*

std::size_t **get_num_threads**(*std*::string const &pool_name)

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

std::size_t **get_num_threads**(*std*::size_t pool_index)

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

std::size_t **get_pool_index**(*std*::string const &pool_name)

Return the internal index of the pool given its name.

std::string const &**get_pool_name**(*std*::size_t pool_index)

Return the name of the pool given its internal index.

threads::*thread_pool_base* &**get_thread_pool**(*std*::string const &pool_name)

Return the name of the pool given its name.

threads::*thread_pool_base* &**get_thread_pool**(*std*::size_t pool_index)

Return the thread pool given its internal index.

bool **pool_exists**(*std*::string const &pool_name)

Return true if the pool with the given name exists.

bool **pool_exists**(*std*::size_t pool_index)

Return true if the pool with the given index exists.

namespace **threads**

Functions

std::int64_t **get_thread_count**(*thread_schedule_state* state = *thread_schedule_state*::*unknown*)

The function *get_thread_count* returns the number of currently known threads.

> **Note**
>
> If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters

state – [in] This specifies the thread-state for which the number of threads should be retrieved.

std::int64_t **get_thread_count**(*thread_priority* priority, *thread_schedule_state* state = *thread_schedule_state*::*unknown*)

The function *get_thread_count* returns the number of currently known threads.

> **Note**
>
> If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters

- **priority** – [in] This specifies the thread-priority for which the number of threads should be retrieved.
- **state** – [in] This specifies the thread-state for which the number of threads should be retrieved.

std::int64_t **get_idle_core_count**()

The function *get_idle_core_count* returns the number of currently idling threads (cores).

mask_type **get_idle_core_mask**()

The function *get_idle_core_mask* returns a bit-mask representing the currently idling threads (cores).

bool **enumerate_threads**(*hpx*::*function*<bool(thread_id_type)> const &f, *thread_schedule_state* state = *thread_schedule_state*::*unknown*)

The function *enumerate_threads* will invoke the given function *f* for each thread with a matching thread state.

Parameters

- **f** – [in] The function which should be called for each matching thread. Returning 'false' from this function will stop the enumeration process.
- **state** – [in] This specifies the thread-state for which the threads should be enumerated.

hpx/runtime_local/termination_detection.hpp

Defined in header hpx/runtime_local/termination_detection.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **local**

Functions

void **termination_detection**()

Wait for all local HPX threads to complete execution.

This function blocks the calling thread until all HPX worker threads on the current locality have completed their work and become idle. It performs local termination detection by waiting for the thread manager to drain all pending tasks.

Example:

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>

int hpx_main()
{
    // Launch some asynchronous work
    for (int i = 0; i < 100; ++i)
    {
        hpx::post([]{ /* do work */ });
    }

    // Wait for all local threads to complete
    hpx::local::termination_detection();

    return hpx::finalize();
}
```

> **Note**
>
> This function should be called from an HPX thread or after the HPX runtime has been initialized.

Throws

hpx::exception – if called when the runtime is not in a valid state (e.g., before initialization or after shutdown).

bool **termination_detection**(*hpx*::chrono::steady_duration const &timeout)

Wait for all local HPX threads to complete with a timeout.

This function blocks the calling thread until either all HPX worker threads have completed their work, or the specified timeout duration has elapsed.

> **See also**
>
> termination_detection()

Example:

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <chrono>

int hpx_main()
{
    // Launch some work
    hpx::post([]{ /* long running task */ });

    // Wait up to 5 seconds
    if (!hpx::local::termination_detection(std::chrono::seconds(5)))
    {
        std::cerr << "Warning: Work did not complete within timeout\n";
        // Implement fallback strategy
    }

    return hpx::finalize();
}
```

Parameters
: **timeout** – Maximum duration to wait for termination. The function will return false if this duration elapses before all threads complete.

Throws
: *hpx::exception* – if called when the runtime is not in a valid state.

Returns
: true if all threads completed before the timeout, false if the timeout elapsed.

bool **termination_detection**(*hpx*::chrono::steady_time_point const &deadline)

Wait for all local HPX threads to complete until a deadline.

This function blocks the calling thread until either all HPX worker threads have completed their work, or the specified deadline time point is reached.

See also

termination_detection(std::chrono::duration<double>)

Example:

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <chrono>

int hpx_main()
{
    auto deadline = std::chrono::steady_clock::now() +
                    std::chrono::seconds(10);

    hpx::post([]{ /* work */ });

    if (!hpx::local::termination_detection(deadline))
    {
        std::cerr << "Deadline reached\n";
    }

    return hpx::finalize();
}
```

Parameters

deadline – Absolute time point when waiting should stop. The function will return false if this time is reached before all threads complete.

Throws

hpx::exception – if called when the runtime is not in a valid state.

Returns

true if all threads completed before the deadline, false if the deadline was reached.

bool **termination_detection**(*hpx*::*stop_token* stop_token, *hpx*::chrono::steady_duration const &timeout = *hpx*::chrono::steady_duration((*hpx*::chrono::steady_clock::duration::max)()))

Wait for all local HPX threads with cancellation support.

This function blocks the calling thread until all HPX worker threads have completed, the timeout elapses, or a stop is requested via the stop_token. This enables cooperative cancellation of the wait operation.

See also

termination_detection(std::chrono::duration<double>)

Example:

```cpp
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <hpx/stop_token.hpp>
#include <chrono>

int hpx_main()
{
    hpx::stop_source stop_src;

    // In shutdown handler
    hpx::thread shutdown_thread([&stop_src]() {
        hpx::this_thread::sleep_for(std::chrono::seconds(30));
        stop_src.request_stop();
    });

    hpx::post([]{ /* work */ });

    // Wait with cancellation support
    bool completed = hpx::local::termination_detection(
        stop_src.get_token(),
        std::chrono::minutes(1)
    );

    if (!completed)
    {
        std::cerr << "Cancelled or timed out\n";
    }

    shutdown_thread.join();
    return hpx::finalize();
}
```

Parameters

- **`stop_token`** – Token that can be used to request cancellation of the wait operation.
- **`timeout`** – Maximum duration to wait. Defaults to maximum duration (effectively infinite).

Throws

`hpx::exception` – if called when the runtime is not in a valid state.

Returns

true if all threads completed, false if timeout elapsed or stop was requested.

hpx/runtime_local/thread_hooks.hpp

Defined in header hpx/runtime_local/thread_hooks.hpp.

namespace **hpx**

Functions

threads::*policies*::callback_notifier::on_startstop_type **get_thread_on_start_func**()

Retrieve the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *register_thread_on_start_func*).

> **Note**
>
> This function can be called before the HPX runtime is initialized.

Returns
The currently installed error handler function.

threads::*policies*::callback_notifier::on_startstop_type **get_thread_on_stop_func**()

Retrieve the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *register_thread_on_stop_func*).

> **Note**
>
> This function can be called before the HPX runtime is initialized.

Returns
The currently installed error handler function.

threads::*policies*::callback_notifier::on_error_type **get_thread_on_error_func**()

Retrieve the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *register_thread_on_error_func*).

> **Note**
>
> This function can be called before the HPX runtime is initialized.

Returns
The currently installed error handler function.

threads::*policies*::callback_notifier::on_startstop_type **register_thread_on_start_func**(*threads*::*policies*::callback_notifier::on_startsto
&&f)

Set the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *get_thread_on_start_func*).

> **Note**
>
> This function can be called before the HPX runtime is initialized.

Parameters
`f` – The function to install as the new start handler.

Returns
The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

threads::*policies*::callback_notifier::on_startstop_type **`register_thread_on_stop_func`**(*threads*::*policies*::callback_notifier::on_startstop_type &&f)

Set the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *get_thread_on_stop_func*).

> **Note**
>
> This function can be called before the HPX runtime is initialized.

Parameters
`f` – The function to install as the new stop handler.

Returns
The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

threads::*policies*::callback_notifier::on_error_type **`register_thread_on_error_func`**(*threads*::*policies*::callback_notifier::on_error_type &&f)

Set the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *get_thread_on_error_func*).

> **Note**
>
> This function can be called before the HPX runtime is initialized.

Parameters
`f` – The function to install as the new error handler.

Returns
The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

hpx/runtime_local/get_worker_thread_num.hpp

Defined in header hpx/runtime_local/get_worker_thread_num.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_local/component_startup_shutdown_base.hpp

Defined in header hpx/runtime_local/component_startup_shutdown_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

struct **component_startup_shutdown_base**

#include <component_startup_shutdown_base.hpp> The component_startup_shutdown_base has to be used as a base class for all component startup/shutdown registries.

Public Functions

virtual **~component_startup_shutdown_base**() = default

virtual bool **get_startup_function**(*startup_function_type* &startup, bool &pre_startup) = 0

Return any startup function for this component.

Parameters

- **startup** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_startup** – [in, out] Will be set to true if the returned startup function is executed during the first round of calls.

Returns

Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

virtual bool **get_shutdown_function**(*shutdown_function_type* &shutdown, bool &pre_shutdown) = 0

Return any startup function for this component.

Parameters

- **shutdown** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.

- **pre_shutdown** – [in, out] Will be set to true if the returned shutdown function is executed during the first round of calls.

Returns

Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

hpx/runtime_local/service_executors.hpp

synchronization

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::mutex

Defined in header hpx/mutex.hpp[946].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::timed_mutex*

class **mutex**

mutex class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. *mutex* offers exclusive, non-recursive ownership semantics:

- A calling thread owns a mutex from the time that it successfully calls either *lock* or *try_lock* until it calls *unlock*.
- When a thread owns a *mutex*, all other threads will block (for calls to *lock*) or receive a *false* return value (for *try_lock*) if they attempt to claim ownership of the *mutex*.
- A calling thread must not own the *mutex* prior to calling *lock* or *try_lock*.

The behavior of a program is undefined if a *mutex* is destroyed while still owned by any threads, or a thread terminates while owning a *mutex*. The mutex class satisfies all requirements of and hpx::mutex is neither copyable nor movable.

Subclassed by *hpx::timed_mutex*

hpx::timed_mutex

Defined in header hpx/mutex.hpp[947].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

[947] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/mutex.hpp

class **timed_mutex** : private *hpx*::*mutex*

The timed_mutex class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In a manner similar to *mutex*, timed_mutex offers exclusive, non-recursive ownership semantics. In addition, timed_mutex provides the ability to attempt to claim ownership of a timed_mutex with a timeout via the member functions *try_lock_for()* and *try_lock_until()*. The timed_mutex class satisfies all requirements of and

hpx::timed_mutex is neither copyable nor movable.

hpx::latch

Defined in header hpx/latch.hpp[948].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **latch**

Latches are a thread coordination mechanism that allow one or more threads to block until an operation is completed. An individual latch is a single-use object; once the operation has been completed, the latch cannot be reused.

Subclassed by hpx::lcos::local::latch

hpx::no_mutex

Defined in header hpx/mutex.hpp[949].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **no_mutex**

`no_mutex` class can be used in cases where the shared data between multiple threads can be accessed simultaneously without causing inconsistencies.

hpx::nostopstate

Defined in header hpx/stop_token.hpp[950].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

950 http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/stop_token.hpp

constexpr *nostopstate_t* `hpx::nostopstate` = {}

This is a constant object instance of *hpx::nostopstate_t* for use in constructing an empty *hpx::stop_source*, as a placeholder value in the non-default constructor.

hpx::stop_callback

Defined in header hpx/stop_token.hpp[951].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::nostopstate*
- *hpx::stop_source*
- *hpx::stop_token*
- *hpx::nostopstate_t*

template<typename **Callback**>

`hpx::stop_callback`(*stop_token*, *Callback*) -> *stop_callback*<*Callback*>

The *stop_callback* class template provides an RAII object type that registers a callback function for an associated hpx::stop_token object, such that the callback function will be invoked when the hpx::stop_token*'s* associated hpx::stop_source is requested to stop. Callback functions registered via *stop_callback's* constructor are invoked either in the same thread that successfully invokes *request_stop()* for a hpx::stop_source of the *stop_callback's* associated hpx::stop_token; or if stop has already been requested prior to the constructor's registration, then the callback is invoked in the thread constructing the *stop_callback*. More than one *stop_callback* can be created for the same hpx::stop_token, from the same or different threads concurrently. No guarantee is provided for the order in which they will be executed, but they will be invoked synchronously; except for *stop_callback(s)* constructed after stop has already been requested for the hpx::stop_token, as described previously. If an invocation of a callback exits via an exception then hpx::terminate is called. *hpx::stop_callback* is not *CopyConstructible*, *CopyAssignable*, *MoveConstructible*, nor *MoveAssignable*. The template param Callback type must be both *invocable* and *destructible*. Any return value is ignored.

hpx::stop_source

Defined in header hpx/stop_token.hpp[952].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::nostopstate*
- *hpx::stop_callback*
- *hpx::stop_token*

[951] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/stop_token.hpp

[952] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/stop_token.hpp

- *hpx::nostopstate_t*

class **stop_source**

The stop_source class provides the means to issue a stop request, such as for hpx::jthread cancellation. A stop request made for one stop_source object is visible to all *stop_sources* and *hpx::stop_tokens* of the same associated stop-state; any *hpx::stop_callback(s)* registered for associated hpx::stop_token(s) will be invoked, and any *hpx::condition_variable_any* objects waiting on associated hpx::stop_token(s) will be awoken. Once a stop is requested, it cannot be withdrawn. Additional stop requests have no effect.

> **Note**
>
> For the purposes of hpx::jthread cancellation the stop_source object should be retrieved from the *hpx::jthread* object using *get_stop_source()*; or stop should be requested directly from the hpx::jthread object using *request_stop()*. This will then use the same associated stop-state as that passed into the hpx::jthread*'s* invoked function argument (i.e., the function being executed on its thread). For other uses, however, a stop_source can be constructed separately using the default constructor, which creates new stop-state.

hpx::stop_token

Defined in header hpx/stop_token.hpp[953].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::nostopstate*
- *hpx::stop_callback*
- *hpx::stop_source*
- *hpx::nostopstate_t*

class **stop_token**

The stop_token class provides the means to check if a stop request has been made or can be made, for its associated hpx::stop_source object. It is essentially a thread-safe "view" of the associated stop-state. The *stop_token* can also be passed to the constructor of *hpx::stop_callback*, such that the callback will be invoked if the stop_token*'s* associated hpx::stop_source is requested to stop. And stop_token can be passed to the interruptible waiting functions of hpx::condition_variable_any, to interrupt the condition variable's wait if stop is requested.

> **Note**
>
> A stop_token object is not generally constructed independently, but rather retrieved from a hpx::jthread or hpx::stop_source. This makes it share the same associated stop-state as the hpx::jthread or hpx::stop_source.

[953] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/stop_token.hpp

hpx::nostopstate_t

Defined in header hpx/stop_token.hpp[954].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::nostopstate*
- *hpx::stop_callback*
- *hpx::stop_source*
- *hpx::stop_token*

struct **nostopstate_t**

Unit type intended for use as a placeholder in *hpx::stop_source* non-default constructor, that makes the constructed *hpx::stop_source* empty with no associated stop-state.

hpx::shared_mutex

Defined in header hpx/shared_mutex.hpp[955].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

using *hpx*::**shared_mutex** = detail::shared_mutex<>

The *shared_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In contrast to other mutex types which facilitate exclusive access, a *shared_mutex* has two levels of access:

- *shared* - several threads can share ownership of the same mutex.
- *exclusive* - only one thread can own the mutex.

If one thread has acquired the exclusive lock (through *lock*, *try_lock*), no other threads can acquire the lock (including the shared). If one thread has acquired the shared lock (through *lock_shared*, *try_lock_shared*), no other thread can acquire the exclusive lock, but can acquire the shared lock. Only when the exclusive lock has not been acquired by any thread, the shared lock can be acquired by multiple threads. Within one thread, only one lock (shared or exclusive) can be acquired at the same time. Shared mutexes are especially useful when shared data can be safely read by any number of threads simultaneously, but a thread may only write the same data when no other thread is reading or writing at the same time. The *shared_mutex* class satisfies all requirements of *SharedMutex* and *StandardLayoutType*.

[954] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/stop_token.hpp

[955] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/shared_mutex.hpp

hpx::binary_semaphore

Defined in header hpx/semaphore.hpp[956].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **binary_semaphore**

A binary semaphore is a semaphore object that has only two states. binary_semaphore is an alias for specialization of hpx::counting_semaphore with *LeastMaxValue* being 1. HPX's implementation of binary_semaphore is more efficient than the default implementation of a counting semaphore with a unit resource count (hpx::counting_semaphore).

hpx::condition_variable

Defined in header hpx/condition_variable.hpp[957].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::condition_variable_any*
- *hpx::cv_status*

class **condition_variable**

The condition_variable class is a synchronization primitive that can be used to block a thread, or multiple threads at the same time, until another thread both modifies a shared variable (the condition), and notifies the condition_variable.

The thread that intends to modify the shared variable has to

a. acquire a hpx::mutex (typically via *std::lock_guard*)
b. perform the modification while the lock is held
c. execute *notify_one* or *notify_all* on the *condition_variable* (the lock does not need to be held for notification)

Even if the shared variable is atomic, it must be modified under the mutex in order to correctly publish the modification to the waiting thread. Any thread that intends to wait on condition_variable has to

a. acquire a *std::unique_lock<hpx::mutex>*, on the same mutex as used to protect the shared variable
b. either

i. check the condition, in case it was already updated and notified
ii. execute *wait*, *await_for*, or *wait_until*. The wait operations atomically release the mutex and suspend the execution of the thread.

[956] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/semaphore.hpp

[957] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/condition_variable.hpp

iii. When the condition variable is notified, a timeout expires, or a spurious wakeup occurs, the thread is awakened, and the mutex is atomically reacquired. The thread should then check the condition and resume waiting if the wake-up was spurious. or

i. use the predicated overload of *wait*, *wait_for*, and *wait_until*, which takes care of the three steps above.

hpx::condition_variable works only with *std::unique_lock<hpx::mutex>*. This restriction allows for maximal efficiency on some platforms. hpx::condition_variable_any provides a condition variable that works with any object, such as *std::shared_lock*.

Condition variables permit concurrent invocation of the *wait*, *wait_for*, *wait_until*, *notify_one* and *notify_all* member functions.

The class hpx::condition_variable is aIt is not , , , or

hpx::condition_variable_any

Defined in header hpx/condition_variable.hpp[958].

- *hpx::condition_variable*
- *hpx::cv_status*

class **condition_variable_any**

The condition_variable_any class is a generalization of hpx::condition_variable. Whereas hpx::condition_variable works only on *std::unique_lock<std::mutex>*, *a condition_variable_any* can operate on any lock that meets the requirements.

See hpx::condition_variable for the description of the semantics of condition variables. It is not , , , or

hpx::cv_status

Defined in header hpx/condition_variable.hpp[959].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::condition_variable*
- *hpx::condition_variable_any*

enum class *hpx*::**cv_status**

The scoped enumeration hpx::cv_status describes whether a timed wait returned because of timeout or not. hpx::cv_status is used by the *wait_for* and *wait_until* member functions of hpx::condition_variable and hpx::condition_variable_any.

[958] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/condition_variable.hpp

[959] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/condition_variable.hpp

Values:

enumerator **no_timeout**

The condition variable was awakened with *notify_all*, *notify_one*, or spuriously

enumerator **timeout**

the condition variable was awakened by timeout expiration

enumerator **error**

there was an error

hpx::recursive_mutex

Defined in header hpx/mutex.hpp[960].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

using *hpx*::**recursive_mutex** = detail::recursive_mutex_impl<>

hpx::counting_semaphore

Defined in header hpx/semaphore.hpp[961].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<*std*::ptrdiff_t **LeastMaxValue** = PTRDIFF_MAX>

class **counting_semaphore**

A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike hpx::mutex a counting_semaphore is not tied to threads of execution — acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on counting_semaphore can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

[960] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/mutex.hpp
[961] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/semaphore.hpp

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template counting_semaphore maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of hpx::counting_semaphore are not , , , , or .

> **Note**
>
> counting_semaphore*'s try_acquire()* can spuriously fail.

Template Parameters

LeastMaxValue – counting_semaphore allows more than one concurrent access to the same resource, for at least *LeastMaxValue* concurrent accessors. As its name indicates, the *LeastMaxValue* is the minimum max value, not the actual max value. Thus *max()* can yield a number larger than *LeastMaxValue*.

hpx::once_flag

Defined in header hpx/mutex.hpp[962].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::call_once*

struct **once_flag**

The class *hpx::once_flag* is a helper structure for *hpx::call_once*. An object of type *hpx::once_flag* that is passed to multiple calls to *hpx::call_once* allows those calls to coordinate with each other such that only one of the calls will actually run to completion. *hpx::once_flag* is neither copyable nor movable.

hpx::call_once

Defined in header hpx/mutex.hpp[963].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::once_flag*

template<typename **F**, typename ...**Args**>

[962] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/mutex.hpp
[963] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/mutex.hpp

void *hpx*::**call_once**(*once_flag* &flag, *F* &&f, *Args*&&... args)

Executes the Callable object *f* exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time *call_once* is called, flag indicates that *f* was already called, *call_once* returns right away (such a call to *call_once* is known as passive).
- Otherwise, *call_once* invokes `std::forward<Callable>(f)` with the arguments `std::forward<Args>(args)...` (as if by `hpx::invoke`). Unlike the `hpx::thread` constructor or `hpx::async`, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. (such a call to *call_once* is known as active).

– If that invocation throws an exception, it is propagated to the caller of *call_once*, and the flag is not flipped so that another call will be attempted (such a call to *call_once* is known as exceptional).

– If that invocation returns normally (such a call to *call_once* is known as returning), the flag is flipped, and all other calls to *call_once* with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to *call_once* are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

Note

If concurrent calls to *call_once* pass different functions *f*, it is unspecified which f will be called. The selected function runs in the same thread as the *call_once* invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using `hpx::call_once`. The POSIX equivalent of this function is *pthread_once*.

Parameters

- **flag** – an object, for which exactly one function gets executed
- **f** – Callable object to invoke
- **args** – arguments to pass to the function

Throws

`std::system_error` – if any condition prevents calls to *call_once* from executing as specified or any exception thrown by *f*

hpx/synchronization/sliding_semaphore.hpp

Defined in header hpx/synchronization/sliding_semaphore.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Typedefs

using **sliding_semaphore** = *sliding_semaphore_var*<>

template<typename **Mutex** = *hpx*::*spinlock*>

class **sliding_semaphore_var**

#include <sliding_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Sliding semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. The difference to a counting semaphore is that a sliding semaphore will not limit the number of threads which are allowed to proceed, but will make sure that the difference between the (arbitrary) number passed to set and wait does not exceed a given threshold.

Public Functions

sliding_semaphore_var(*sliding_semaphore_var* const&) = delete

sliding_semaphore_var &**operator=**(*sliding_semaphore_var* const&) = delete

sliding_semaphore_var(*sliding_semaphore_var*&&) = delete *sliding_semaphore_var* &**operator=**(*sliding_semaphore_var*&&) = delete

inline explicit **sliding_semaphore_var**(*std*::int64_t max_difference, *std*::int64_t lower_limit = 0) noexcept

Construct a new sliding semaphore.

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

inline void **set_max_difference**(*std*::int64_t max_difference, *std*::int64_t lower_limit = 0) noexcept

Set/Change the difference that will cause the semaphore to trigger

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

inline void **wait**(*std*::int64_t upper_limit)

Wait for the semaphore to be signaled.

Parameters

upper_limit – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

inline bool **try_wait**(*std*::int64_t upper_limit = 1)

Try to wait for the semaphore to be signaled.

Parameters

upper_limit – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

Returns

The function returns true if the calling thread would not block if it was calling *wait()*.

inline void **signal**(*std*::int64_t lower_limit)

Signal the semaphore.

Parameters

lower_limit – [in] The new lower limit. This will update the current lower limit of this semaphore. It will also re-schedule all suspended threads for which their associated upper limit is not larger than the lower limit plus the max_difference.

inline *std*::int64_t **signal_all**()

Private Types

using **mutex_type** = *Mutex*

using **data_type** = *lcos*::*local*::detail::sliding_semaphore_data<*mutex_type*>

Private Members

hpx::intrusive_ptr<*data_type*> **data_**

hpx::barrier

Defined in header hpx/barrier.hpp[964].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **OnCompletion** = detail::empty_oncompletion>

class **barrier**

A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier. [Note: A barrier is useful for managing repeated tasks that are handled by multiple threads. - end note] Each barrier phase consists of the following steps:

- The expected count is decremented by each call to arrive or arrive_and_drop.
- When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the CompletionFunction template parameter, the completion step is run as part of the call to arrive or arrive_and_drop that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.
- When the completion step finishes, the expected count is reset to what was specified by the expected argument to the constructor, possibly adjusted by calls to arrive_and_drop, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling wait, and will remain blocked until the phase completion step is run. The phase completion step that is executed at the end of each phase has the following effects:

- Invokes the completion function, equivalent to completion().

[964] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/barrier.hpp

- Unblocks all threads that are blocked on the phase synchronization point.

  The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the CompletionFunction template parameter, the behavior is undefined if any of the barrier object's member functions other than wait are called while the completion step is in progress.

  Concurrent invocations of the member functions of barrier, other than its destructor, do not introduce data races. The member functions arrive and arrive_and_drop execute atomically.

  CompletionFunction shall meet the Cpp17MoveConstructible (Table 28) and Cpp17Destructible (Table 32) requirements. std::is_nothrow_invocable_v<CompletionFunction&> shall be true.

  The default value of the CompletionFunction template parameter is an unspecified type, such that, in addition to satisfying the requirements of CompletionFunction, it meets the Cpp17DefaultConstructible requirements (Table 27) and completion() has no effects.

  barrier::arrival_token is an unspecified type, such that it meets the Cpp17MoveConstructible (Table 28), Cpp17MoveAssignable (Table 30), and Cpp17Destructible (Table 32) requirements.

hpx/synchronization/event.hpp

Defined in header hpx/synchronization/event.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **lcos**

namespace **local**

class **event**

#include <event.hpp> Event semaphores can be used for synchronizing multiple threads that need to wait for an event to occur. When the event occurs, all threads waiting for the event are woken up.

Public Functions

inline **event**() noexcept

Construct a new event semaphore.

inline bool **occurred**() const noexcept

Check if the event has occurred.

inline void **wait**()

Wait for the event to occur.

inline void **set**()

Release all threads waiting on this semaphore.

inline void **reset**() noexcept

Reset the event.

Private Types

using **mutex_type** = *hpx*::*spinlock*

Private Functions

inline void **wait_locked**(*std*::unique_lock<*mutex_type*> &l)

inline void **set_locked**(*std*::unique_lock<*mutex_type*> l)

Private Members

mutex_type **mtx_**

This mutex protects the queue.

local::detail::condition_variable **cond_**

std::atomic<bool> **event_**

hpx::spinlock

Defined in header hpx/mutex.hpp[965].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

using *hpx*::**spinlock** = detail::spinlock<true>

`spinlock` is a type of lock that causes a thread attempting to obtain it to check for its availability while waiting in a loop continuously.

tag_invoke

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::invoke

Defined in header hpx/functional.hpp[966].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **F**, typename ...**Ts**>

constexpr *util*::invoke_result_t<*F*, *Ts*&&...> *hpx*::**invoke**(*F* &&f, *Ts*&&... vs) noexcept(noexcept(HPX_INVOKE(*std*::forward<*F*>(*f*), *std*::forward<*Ts*>(*vs*)...)))

Invokes the given callable object f with the content of the argument pack vs

> **Note**
>
> This function is similar to `std::invoke` (C++17)

Parameters

- **f** – Requires to be a callable object. If f is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- **vs** – An arbitrary pack of arguments

Throws

`std::exception` – like objects thrown by call to object f with the argument types vs.

Returns

The result of the callable object when it's called with the given argument types.

[965] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/mutex.hpp

[966] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

hpx::is_invocable

Defined in header hpx/type_traits.hpp[967].

namespace **hpx**

namespace **threads**

Functions

hpx::*future*<void> **resume_processing_unit**(*thread_pool_base* &pool, *std*::size_t virt_core)

Resumes the given processing unit. When the processing unit has been resumed the returned future will be ready.

> **Note**
>
> Can only be called from an HPX thread. Use resume_processing_unit_cb or to resume the processing unit from outside HPX. Requires that the pool has threads::policies::enable_elasticity set.

Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **virt_core** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.

Returns

A future<void> which is ready when the given processing unit has been resumed.

void **resume_processing_unit_cb**(*thread_pool_base* &pool, *hpx*::*function*<void()> callback, *std*::size_t virt_core, *error_code* &ec = *throws*)

Resumes the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been resumed.

> **Note**
>
> Requires that the pool has threads::policies::enable_elasticity set.

Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to resume.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx::*future*<void> **suspend_processing_unit**(*thread_pool_base* &pool, *std*::size_t virt_core)

Suspends the given processing unit. When the processing unit has been suspended the returned future will be ready.

> **Note**
>
> Can only be called from an HPX thread. Use suspend_processing_unit_cb or to suspend the processing unit from outside HPX. Requires that the pool has threads::policies::enable_elasticity set.

Parameters

- **pool** – [in] The thread pool to suspend a processing unit from.
- **virt_core** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.

Throws

hpx::exception – if called from outside the HPX runtime.

Returns

A `future<void>` which is ready when the given processing unit has been suspended.

void **suspend_processing_unit_cb**(*hpx*::*function*<void()> callback, *thread_pool_base* &pool, *std*::size_t virt_core, *error_code* &ec = *throws*)

Suspends the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been suspended.

> **Note**
>
> Requires that the pool has threads::policies::enable_elasticity set.

Parameters

- **pool** – [in] The thread pool to suspend a processing unit from.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to suspend.

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx::*future*<void> **resume_pool**(*thread_pool_base* &pool)

Resumes the thread pool. When the all OS threads on the thread pool have been resumed the returned future will be ready.

> **Note**
>
> Can only be called from an HPX thread. Use resume_cb or resume_direct to suspend the pool from outside HPX.

Parameters
pool – [in] The thread pool to resume.

Throws
hpx::exception – if called from outside the HPX runtime.

Returns
A `future<void>` which is ready when the thread pool has been resumed.

void **resume_pool_cb**(*thread_pool_base* &pool, *hpx*::*function*<void()> callback, *error_code* &ec = *throws*)

Resumes the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been resumed.

Parameters

- **pool** – [in] The thread pool to resume.
- **callback** – [in] called when the thread pool has been resumed.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx::*future*<void> **suspend_pool**(*thread_pool_base* &pool)

Suspends the thread pool. When the all OS threads on the thread pool have been suspended the returned future will be ready.

> **Note**
>
> Can only be called from an HPX thread. Use suspend_cb or suspend_direct to suspend the pool from outside HPX. A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters
pool – [in] The thread pool to suspend.

Throws
hpx::exception – if called from outside the HPX runtime.

Returns
A `future<void>` which is ready when the thread pool has been suspended.

void **suspend_pool_cb**(*thread_pool_base* &pool, *hpx*::*function*<void()> callback, *error_code* &ec = *throws*)

Suspends the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been suspended.

> **Note**
>
> A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

- **pool** – [in] The thread pool to suspend.
- **callback** – [in] called when the thread pool has been suspended.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

hpx::exception – if called from an HPX thread which is running on the pool itself.

thread_support

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/thread_support/spinlock.hpp

Defined in header hpx/thread_support/spinlock.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

hpx::unlock_guard

Defined in header hpx/mutex.hpp[969].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **Lock**>

class **unlock_guard**

The class *unlock_guard* is a mutex wrapper that provides a convenient mechanism for releasing a mutex for the duration of a scoped block.

unlock_guard performs the opposite functionality of `lock_guard`.

When a `lock_guard` object is created, it attempts to take ownership of the mutex it is given. When control leaves the scope in which the `lock_guard` object was created, the `lock_guard` is destructed and the mutex is released. Accordingly, when an *unlock_guard* object is created, it attempts to release the ownership of the mutex it is given. So, when control leaves the scope in which the *unlock_guard* object was created, the *unlock_guard* is destructed and the mutex is owned again. In this way, the

[969] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/mutex.hpp

mutex is unlocked in the constructor and locked in the destructor, so that one can have an unlocked section within a locked one.

> **Note**
>
> *unlock_guard* is non-copyable and non-movable.

Template Parameters

`Lock` – The type of the lockable object managed by the *unlock_guard*.

threading

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::thread

Defined in header hpx/thread.hpp[970].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::this_thread::yield*
- *hpx::this_thread::get_id*
- *hpx::this_thread::sleep_for*
- *hpx::this_thread::sleep_until*

class **thread**

The class thread represents a single thread of execution. Threads allow multiple functions to execute concurrently. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, *hpx::terminate* is called. The top-level function may communicate its return value or an exception to the caller via hpx::promise or by modifying shared variables (which may require synchronization, see *hpx::mutex* and hpx::atomic) *hpx::thread* objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may not be associated with any thread objects (after detach). No two *hpx::thread* objects may represent the same thread of execution; hpx::thread is not *CopyConstructible* or *CopyAssignable*, although it is *MoveConstructible* and *MoveAssignable*.

[970] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/thread.hpp

hpx::this_thread::yield

Defined in header hpx/thread.hpp[971].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::thread*
- *hpx::this_thread::get_id*
- *hpx::this_thread::sleep_for*
- *hpx::this_thread::sleep_until*

void `hpx::this_thread::yield() noexcept`

Provides a hint to the implementation to reschedule the execution of threads, allowing other threads to run.

> **Note**
>
> The exact behavior of this function depends on the implementation, in particular on the mechanics of the OS scheduler in use and the state of the system. For example, a first-in-first-out realtime scheduler (SCHED_FIFO in Linux) would suspend the current thread and put it on the back of the queue of the same-priority threads that are ready to run (and if there are no other threads at the same priority, yield has no effect).

hpx::this_thread::get_id

Defined in header hpx/thread.hpp[972].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::thread*
- *hpx::this_thread::yield*
- *hpx::this_thread::sleep_for*
- *hpx::this_thread::sleep_until*

thread::id `hpx::this_thread::get_id() noexcept`

Returns the id of the current thread.

[971] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/thread.hpp
[972] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/thread.hpp

hpx::this_thread::sleep_for

Defined in header hpx/thread.hpp[973].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::thread*
- *hpx::this_thread::yield*
- *hpx::this_thread::get_id*
- *hpx::this_thread::sleep_until*

inline void `hpx::this_thread::sleep_for`(*hpx*::chrono::steady_duration const &rel_time)

Blocks the execution of the current thread for at least the specified *rel_time*. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

It is recommended to use a steady clock to measure the duration. If an implementation uses a system clock instead, the wait time may also be sensitive to clock adjustments.

Parameters

rel_time – time duration to sleep

hpx::this_thread::sleep_until

Defined in header hpx/thread.hpp[974].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::thread*
- *hpx::this_thread::yield*
- *hpx::this_thread::get_id*
- *hpx::this_thread::sleep_for*

void `hpx::this_thread::sleep_until`(*hpx*::chrono::steady_time_point const &abs_time)

Blocks the execution of the current thread until specified *abs_time* has been reached.

It is recommended to use the clock tied to *abs_time*, in which case adjustments of the clock may be taken into account. Thus, the duration of the block might be more or less than `abs_time-Clock::now()` at the time of the call, depending on the direction of the adjustment and whether it is honored by the implementation. The function also may block until after *abs_time* has been reached due to process scheduling or resource contention delays.

Parameters

abs_time – absolute time to block until

[973] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/thread.hpp
[974] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/thread.hpp

hpx::jthread

Defined in header hpx/jthread.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **jthread**

The class *jthread* represents a single thread of execution. It has the same general behavior as hpx::thread, except that *jthread* automatically rejoins on destruction, and can be cancelled/stopped in certain situations. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, *hpx::terminate* is called. The top-level function may communicate its return value or an exception to the caller via hpx::promise or by modifying shared variables (which may require synchronization, see hpx::mutex and *hpx::atomic*) Unlike hpx::thread, the jthread logically holds an internal private member of type hpx::stop_source, which maintains a shared stop-state. The *jthread* constructor accepts a function that takes a hpx::stop_token as its first argument, which will be passed in by the jthread from its internal stop_source. This allows the function to check if stop has been requested during its execution, and return if it has. hpx::jthread objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may be not associated with any *jthread* objects (after detach). No two hpx::jthread objects may represent the same thread of execution; hpx::jthread is not *CopyConstructible* or *CopyAssignable*, although it is *MoveConstructible* and *MoveAssignable*.

threading_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/threading_base/thread_helpers.hpp

Defined in header hpx/threading_base/thread_helpers.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **this_thread**

Functions

threads::*thread_restart_state* **suspend**(*threads*::*thread_schedule_state* state, *threads*::thread_id_type nextid, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *hpx*::*error_code* &ec = *hpx*::*throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

> **Note**
>
> Must be called from within a HPX-thread.

Throws

`If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

inline *threads*::*thread_restart_state* **suspend**(*threads*::*thread_schedule_state* state = *threads*::*thread_schedule_state*::*pending*, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *hpx*::*error_code* &ec = *hpx*::*throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

> **Note**
>
> Must be called from within a HPX-thread.

Throws

`If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

threads::*thread_restart_state* **suspend**(*hpx*::chrono::steady_time_point const &abs_time, *threads*::thread_id_type id, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *hpx*::*error_code* &ec = *hpx*::*throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

> **Note**
>
> Must be called from within a HPX-thread.

Throws

`If – &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

inline *threads*::*thread_restart_state* **suspend**(*hpx*::chrono::steady_time_point const &abs_time, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *hpx*::*error_code* &ec = *hpx*::*throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

> **Note**
>
> Must be called from within a HPX-thread.

Throws

`If – &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

inline *threads*::*thread_restart_state* **suspend**(*hpx*::chrono::steady_duration const &rel_time, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *hpx*::*error_code* &ec = *hpx*::*throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

> **Note**
>
> Must be called from within a HPX-thread.

Throws

`If – &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

inline *threads*::*thread_restart_state* **suspend**(*hpx*::chrono::steady_duration const &rel_time, *threads*::thread_id_type const &id, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *hpx*::*error_code* &ec = *hpx*::*throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

> **Note**
>
> Must be called from within a HPX-thread.

Throws

`If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

inline *threads*::*thread_restart_state* **suspend**(*std*::uint64_t ms, *threads*::*thread_description* const &description = *threads*::*thread_description*("this_thread::suspend"), *hpx*::*error_code* &ec = *hpx*::*throws*)

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given time (specified in milliseconds).

> **Note**
>
> Must be called from within a HPX-thread.

Throws

`If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

threads::*thread_pool_base* ***get_pool**(*hpx*::*error_code* &ec = *hpx*::*throws*)

Returns a pointer to the pool that was used to run the current thread

Throws

`If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

namespace **threads**

Functions

thread_state **set_thread_state**(thread_id_type const &id, *thread_schedule_state* state = *thread_schedule_state*::*pending*, *thread_restart_state* stateex = *thread_restart_state*::*signaled*, *thread_priority* priority = *thread_priority*::*normal*, bool retry_on_active = true, *hpx*::*error_code* &ec = *hpx*::*throws*)

Set the thread state of the *thread* referenced by the thread_id *id*.

> **Note**
>
> If the thread referenced by the parameter *id* is in *thread_state::active* state this function schedules a new thread which will set the state of the thread as soon as it is not active anymore. The function returns *thread_state::active* in this case.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the previous state of the thread referenced by the *id* parameter. It will return one of the values as defined by the *thread_state* enumeration. If the thread is not known to the thread-manager the return value will be *thread_state::unknown*.

thread_id_ref_type **set_thread_state**(thread_id_type const &id, *hpx*::chrono::steady_time_point const &abs_time, *std*::atomic<bool> *started, *thread_schedule_state* state = *thread_schedule_state*::*pending*, *thread_restart_state* stateex = *thread_restart_state*::*timeout*, *thread_priority* priority = *thread_priority*::*normal*, bool retry_on_active = true, *hpx*::*error_code* &ec = *hpx*::*throws*)

Set the thread state of the *thread* referenced by the thread_id *id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (at the given time)

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- `id` – [in] The thread id of the thread the state should be modified for.
- `abs_time` – [in] Absolute point in time for the new thread to be run
- `started` – [in,out] A helper variable allowing to track the state of the timer helper thread
- `state` – [in] The new state to be set for the thread referenced by the *id* parameter.
- `stateex` – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- `priority` – [in]
- `retry_on_active` – [in]
- `ec` – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

inline thread_id_ref_type **set_thread_state**(thread_id_type const &id, *hpx*::chrono::steady_time_point const &abs_time, *thread_schedule_state* state = *thread_schedule_state*::*pending*, *thread_restart_state* stateex = *thread_restart_state*::*timeout*, *thread_priority* priority = *thread_priority*::*normal*, bool retry_on_active = true, *hpx*::*error_code*& = *throws*)

inline thread_id_ref_type **set_thread_state**(thread_id_type const &id, *hpx*::chrono::steady_duration const &rel_time, *thread_schedule_state* state = *thread_schedule_state*::*pending*, *thread_restart_state* stateex = *thread_restart_state*::*timeout*, *thread_priority* priority = *thread_priority*::*normal*, bool retry_on_active = true, *hpx*::*error_code* &ec = *hpx*::*throws*)

Set the thread state of the *thread* referenced by the thread_id *id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (after the given duration)

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- `id` – [in] The thread id of the thread the state should be modified for.
- `rel_time` – [in] Time duration after which the new thread should be run
- `state` – [in] The new state to be set for the thread referenced by the *id* parameter.

- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

thread_state **get_thread_state**(thread_id_type const &id, *hpx*::*error_code* &ec = *hpx*::*throws*) noexcept

The function get_thread_backtrace is part of the thread related API allows to query the currently stored thread back trace (which is captured during thread suspension).

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception. The function get_thread_state is part of the thread related API. It queries the state of one of the threads known to the thread-manager.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.
- **id** – [in] The thread id of the thread the state should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the currently captured stack back trace of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the zero.

Returns

This function returns the thread state of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be *terminated*.

std::size_t **get_thread_phase**(thread_id_type const &id, *hpx*::*error_code* &ec = *hpx*::*throws*) noexcept

The function get_thread_phase is part of the thread related API. It queries the phase of one of the threads known to the thread-manager.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but re-

turns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread the phase should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the thread phase of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be ~0.

bool **get_thread_interruption_enabled**(thread_id_type const &id, *hpx*::*error_code* &ec = *hpx*::*throws*)

Returns whether the given thread can be interrupted at this point.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns *true* if the given thread can be interrupted at this point in time. It will return *false* otherwise.

bool **set_thread_interruption_enabled**(thread_id_type const &id, bool enable, *hpx*::*error_code* &ec = *hpx*::*throws*)

Set whether the given thread can be interrupted at this point.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread which should receive the new value.
- **enable** – [in] This value will determine the new interruption enabled status for the given thread.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the previous value of whether the given thread could have been interrupted.

bool **get_thread_interruption_requested**(thread_id_type const &id, *hpx*::*error_code* &ec = *hpx*::*throws*)

Returns whether the given thread has been flagged for interruption.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns *true* if the given thread was flagged for interruption. It will return *false* otherwise.

void **interrupt_thread**(thread_id_type const &id, bool flag, *hpx*::*error_code* &ec = *hpx*::*throws*)

Flag the given thread for interruption.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **flag** – [in] The flag encodes whether the thread should be interrupted (if it is *true*), or 'uninterrupted' (if it is *false*).
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline void **interrupt_thread**(thread_id_type const &id, *hpx*::*error_code* &ec = *hpx*::*throws*)

void **interruption_point**(thread_id_type const &id, *hpx*::*error_code* &ec = *hpx*::*throws*)

Interrupt the current thread at this point if it was canceled. This will throw a thread_interrupted exception, which will cancel the thread.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::*thread_priority* **get_thread_priority**(thread_id_type const &id, *hpx*::*error_code* &ec = *hpx*::*throws*) noexcept

Return priority of the given thread

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::ptrdiff_t **get_stack_size**(thread_id_type const &id, *hpx*::*error_code* &ec = *hpx*::*throws*) noexcept

Return stack size of the given thread

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::*thread_pool_base* ***get_pool**(thread_id_type const &id, *hpx*::*error_code* &ec = *hpx*::*throws*)

Returns a pointer to the pool that was used to run the current thread

Throws

`If` – `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

hpx/threading_base/thread_pool_base.hpp

Defined in header hpx/threading_base/thread_pool_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **thread_pool_base**

#include <thread_pool_base.hpp> The base class used to manage a pool of OS threads.

Public Functions

virtual void **`suspend_processing_unit_direct`**(*std*::size_t virt_core, *error_code* &ec = *throws*) = 0

Suspends the given processing unit. Blocks until the processing unit has been suspended.

Parameters

- **`virt_core`** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.
- **`ec`** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **`resume_processing_unit_direct`**(*std*::size_t virt_core, *error_code* &ec = *throws*) = 0

Resumes the given processing unit. Blocks until the processing unit has been resumed.

Parameters

- **`virt_core`** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.
- **`ec`** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **`resume_direct`**(*error_code* &ec = *throws*) = 0

Resumes the thread pool. Blocks until all OS threads on the thread pool have been resumed.

Parameters

`ec` – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **`suspend_direct`**(*error_code* &ec = *throws*) = 0

Suspends the thread pool. Blocks until all OS threads on the thread pool have been suspended.

> **Note**
>
> A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

`ec` – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

`hpx::exception` – if called from an HPX thread which is running on the pool itself.

hpx/threading_base/print.hpp

Defined in header hpx/threading_base/print.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::annotated_function

Defined in header hpx/functional.hpp[975].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **F**>

constexpr *F* &&*hpx*::**annotated_function**(*F* &&f, char const* = nullptr) noexcept

Returns a function annotated with the given annotation.

Annotating includes setting the thread description per thread id.

Parameters

f – Function to annotate

template<typename **F**>

constexpr *F* &&*hpx*::**annotated_function**(*F* &&f, *std*::string const&) noexcept

hpx/threading_base/register_thread.hpp

Defined in header hpx/threading_base/register_thread.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

[975] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

Functions

template<typename **F**>

thread_function_type **make_thread_function**(*F* &&f)

template<typename **F**, typename ...**Ts**>

thread_function_type **make_thread_function_nullary**(*F* &&f, *Ts*&&... ts)

void **register_thread**(*threads*::thread_init_data &data, *threads*::*thread_pool_base* *pool, *threads*::thread_id_ref_type &id, *error_code* &ec = *hpx*::*throws*)

Create a new *thread* using the given data.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- `data` – [in] The data to use for creating the thread.
- `pool` – [in] The thread pool to use for launching the work.
- `id` – [out] The id of the newly created thread (if applicable)
- `ec` – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

`invalid_status` – if the runtime system has not been started yet.

Returns

This function will return the internal id of the newly created HPX-thread.

threads::thread_id_ref_type **register_thread**(*threads*::thread_init_data &data, *threads*::*thread_pool_base* *pool, *error_code* &ec = *hpx*::*throws*)

void **register_thread**(*threads*::thread_init_data &data, *threads*::thread_id_ref_type &id, *error_code* &ec = *throws*)

Create a new *thread* using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **data** – [in] The data to use for creating the thread.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws
invalid_status – if the runtime system has not been started yet.

Returns
This function will return the internal id of the newly created HPX-thread.

threads::thread_id_ref_type **register_thread**(*threads*::thread_init_data &data, *error_code* &ec = *throws*)

thread_id_ref_type **register_work**(*threads*::thread_init_data &data, *threads*::*thread_pool_base* *pool, *error_code* &ec = *hpx*::*throws*)

Create a new work item using the given data.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws
invalid_status – if the runtime system has not been started yet.

thread_id_ref_type **register_work**(*threads*::thread_init_data &data, *error_code* &ec = *throws*)

Create a new work item using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of hpx::exception.

Parameters

- **data** – [in] The data to use for creating the thread.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws
invalid_status – if the runtime system has not been started yet.

hpx/threading_base/thread_description.hpp

Defined in header hpx/threading_base/thread_description.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

std::ostream &**operator<<**(*std*::ostream&, *thread_description* const&)

std::string **as_string**(*thread_description* const &desc)

threads::*thread_description* **get_thread_description**(thread_id_type const &id, *error_code* &ec = *throws*)

The function get_thread_description is part of the thread related API allows to query the description of one of the threads known to the thread-manager.

> **Note**
>
> As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of hpx::exception.

Parameters

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the description of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the string "<unknown>".

threads::*thread_description* **set_thread_description**(thread_id_type const &id, *threads*::*thread_description* const &desc = *threads*::*thread_description*(), *error_code* &ec = *throws*)

threads::*thread_description* **get_thread_lco_description**(thread_id_type const &id, *error_code* &ec = *throws*) *threads*::*thread_description* **set_thread_lco_description**(thread_id_type const &id, *threads*::*thread_description* const &desc = *threads*::*thread_description*(), *error_code* &ec = *throws*)

struct **thread_description**

hpx/threading_base/threading_base_fwd.hpp

Defined in header hpx/threading_base/threading_base_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

thread_data ***get_self_id_data**() noexcept

The function *get_self_id_data* returns the data of the HPX thread id associated with the current thread (or nullptr if the current thread is not a HPX thread).

thread_self &**get_self**()

The function *get_self* returns a reference to the (OS thread specific) self reference to the current HPX thread.

thread_self ***get_self_ptr**() noexcept

The function *get_self_ptr* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

thread_self_impl_type ***get_ctx_ptr**()

The function *get_ctx_ptr* returns a pointer to the internal data associated with each coroutine.

thread_self ***get_self_ptr_checked**(*error_code* &ec = *throws*)

The function *get_self_ptr_checked* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

thread_id_type **get_self_id**() noexcept

The function *get_self_id* returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

HPX_DEPRECATED_V (2, 0, "hpx::threads::get_outer_self_id is deprecated, use " "hpx::threads::get_self_id instead") inline thread_id_type get_outer_self_id() noexcept

The function *get_outer_self_id* returns the HPX thread id of the current outer thread (or zero if the current thread is not a HPX thread). This now always returns the same as *get_self_id*, even for directly executed threads.

thread_id_type **get_parent_id**() noexcept

The function *get_parent_id* returns the HPX thread id of the current thread's parent (or zero if the current thread is not a HPX thread).

> **Note**
>
> This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_PARENT_REFERENCE being defined.

std::size_t **get_parent_phase**() noexcept

The function *get_parent_phase* returns the HPX phase of the current thread's parent (or zero if the current thread is not a HPX thread).

> **Note**
>
> This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_PARENT_REFERENCE being defined.

std::ptrdiff_t **get_self_stacksize**() noexcept

The function *get_self_stacksize* returns the stack size of the current thread (or zero if the current thread is not a HPX thread).

thread_stacksize **get_self_stacksize_enum**() noexcept

The function *get_self_stacksize_enum* returns the stack size of the /.

std::uint32_t **get_parent_locality_id**() noexcept

The function *get_parent_locality_id* returns the id of the locality of the current thread's parent (or zero if the current thread is not a HPX thread).

> **Note**
>
> This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_PARENT_REFERENCE being defined.

std::uint64_t **get_self_component_id**() noexcept

The function *get_self_component_id* returns the lva of the component the current thread is acting on

> **Note**
>
> This function will return a meaningful value only if the code was compiled with HPX_HAVE_THREAD_TARGET_ADDRESS being defined.

namespace **policies**

namespace **tracing**

hpx::get_worker_thread_num

Defined in header hpx/runtime.hpp[976].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::get_local_worker_thread_num*
- *hpx::get_thread_pool_num*

std::size_t *hpx*::**get_worker_thread_num**() noexcept

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

> **Note**
>
> The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by *get_os_thread_count()*).

> **Note**
>
> This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

std::size_t *hpx*::**get_worker_thread_num**(*error_code* &ec) noexcept

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

> **Note**
>
> The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by *get_os_thread_count()*). It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

> **Note**
>
> This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

[976] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

Parameters

ec – [in,out] this represents the error status on exit (obsolete, ignored).

hpx::get_local_worker_thread_num

Defined in header hpx/runtime.hpp[977].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::get_worker_thread_num*
- *hpx::get_thread_pool_num*

std::size_t *hpx*::**get_local_worker_thread_num**() noexcept

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

> **Note**
>
> The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

> **Note**
>
> This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

std::size_t *hpx*::**get_local_worker_thread_num**(*error_code* &ec) noexcept

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

> **Note**
>
> The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

[977] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

> **Note**
>
> This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters

ec – [in,out] this represents the error status on exit (obsolete, ignored).

hpx::get_thread_pool_num

Defined in header hpx/runtime.hpp[978].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::get_worker_thread_num*
- *hpx::get_local_worker_thread_num*

std::size_t *hpx*::**get_thread_pool_num**() noexcept

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

> **Note**
>
> The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

> **Note**
>
> This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

std::size_t *hpx*::**get_thread_pool_num**(*error_code* &ec) noexcept

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

> **Note**
>
> The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

[978] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/full/include/include/hpx/runtime.hpp

Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters

`ec` – [in,out] this represents the error status on exit (obsolete, ignored).

hpx::scoped_annotation

Defined in header hpx/functional.hpp[979].

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **scoped_annotation**

scoped_annotation associates a `name` with a section of code (scope). It can be used to visualize code execution in profiling tools like *Intel VTune*, *Apex Profiler*, etc. That allows analyzing performance to figure out which part(s) of code is (are) responsible for performance degradation, etc.

hpx/threading_base/thread_data.hpp

Defined in header hpx/threading_base/thread_data.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

constexpr *thread_data* ***get_thread_id_data**(thread_id_ref_type const &tid) noexcept

constexpr *thread_data* ***get_thread_id_data**(thread_id_type const &tid) noexcept

constexpr *tracing*::*region_init_data* **get_region_init_data**(*thread_data* const*) noexcept

[979] http://github.com/TheHPXProject/hpx/blob/19fe7fe3cad79cf1ed28b4a7ede713343209d8d7/libs/core/include_local/include/hpx/functional.hpp

constexpr *tracing*::*fiber_region_init_data* **get_fiber_region_init_data**(*thread_data* const*) noexcept

class **thread_data** : public detail::thread_data_reference_counting

#include <thread_data.hpp> A *thread* is the representation of a HPX thread. It's a first class object in HPX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the *thread-manager*.

A *thread* encapsulates:

- A thread status word (see the functions *thread::get_state* and *thread::set_state*)
- A function to execute (the thread function)
- A frame (in this implementation this is a block of memory used as the threads stack)
- A block of registers (not implemented yet)

Generally, *threads* are not created or executed directly. All functionality related to the management of *threads* is implemented by the thread-manager.

Public Types

using **mutex_type** = *util*::detail::spinlock_no_backoff

Public Functions

thread_data(*thread_data* const&) = delete

thread_data(*thread_data*&&) = delete

thread_data &**operator=**(*thread_data* const&) = delete

thread_data &**operator=**(*thread_data*&&) = delete

inline thread_state **get_state**(*std*::memory_order const order = *std*::memory_order_acquire) const noexcept

The get_state function queries the state of this thread instance.

Note

This function will seldom be used directly. Most of the time the state of a thread will be retrieved by using the function *threadmanager::get_state*.

Returns

This function returns the current state of this thread. It will return one of the values as defined by the *thread_state* enumeration.

inline thread_state **`set_state`**(*thread_schedule_state* const state, *thread_restart_state* state_ex = *thread_restart_state*::*unknown*, *std*::memory_order const load_order = *std*::memory_order_acquire, *std*::memory_order const exchange_order = *std*::memory_order_acq_rel) const noexcept

The set_state function changes the state of this thread instance.

> **Note**
>
> This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the thread-manager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status *threadmanager::set_state* should be used.

Parameters

- **`state`** – [in] The new state to be set for the thread.
- **`state_ex`** – [in]
- **`load_order`** – [in]
- **`exchange_order`** – [in]

inline bool **`set_state_tagged`**(*thread_schedule_state* const newstate, thread_state const &prev_state, thread_state &new_tagged_state, *std*::memory_order const exchange_order = *std*::memory_order_acq_rel) const noexcept

inline bool **`restore_state`**(thread_state const new_state, thread_state const old_state, *std*::memory_order const load_order = *std*::memory_order_relaxed, *std*::memory_order const load_exchange = *std*::memory_order_acq_rel) const noexcept

The restore_state function changes the state of this thread instance depending on its current state. It will change the state atomically only if the current state is still the same as passed as the second parameter. Otherwise, it won't touch the thread state of this instance.

> **Note**
>
> This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the threadmanager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status *threadmanager::set_state* should be used.

Parameters

- **`new_state`** – [in] The new state to be set for the thread.
- **`old_state`** – [in] The old state of the thread which still has to be the current state.
- **`load_order`** – [in]
- **`load_exchange`** – [in]

Returns

This function returns *true* if the state has been changed successfully

inline bool **restore_state**(*thread_schedule_state* const new_state, *thread_restart_state* const state_ex, thread_state old_state, *std*::memory_order const load_exchange = *std*::memory_order_acq_rel) const noexcept

template<typename **ThreadQueue**>

inline constexpr *ThreadQueue* &**get_queue**() noexcept

inline coroutine_type::result_type **operator()**(*hpx*::execution_base::this_thread::detail::agent_storage *agent_storage)

Execute the thread function.

Returns

This function returns the thread state the thread should be scheduled from this point on. The thread manager will use the returned value to set the thread's scheduling status.

inline coroutine_type::result_type **invoke_directly**()

Directly execute the thread function (inline)

Returns

This function returns the thread state the thread should be scheduled from this point on. The thread manager will use the returned value to set the thread's scheduling status.

inline virtual thread_id_type **get_thread_id**() const

static inline constexpr *std*::uint32_t **get_parent_locality_id**() noexcept

Return the locality of the parent thread.

static inline constexpr thread_id_type **get_parent_thread_id**() noexcept

Return the thread id of the parent thread.

static inline constexpr *std*::size_t **get_parent_thread_phase**() noexcept

Return the phase of the parent thread.

static inline constexpr *util*::backtrace const ***get_backtrace**() noexcept

static inline constexpr *util*::backtrace const ***set_backtrace**(*util*::backtrace const*) noexcept

Protected Functions

inline *thread_restart_state* **set_state_ex**(*thread_restart_state* const new_state, *std*::memory_order const load_order = *std*::memory_order_acquire, *std*::memory_order const load_exchange = *std*::memory_order_acq_rel) const noexcept

The set_state function changes the extended state of this thread instance.

> **Note**
>
> This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the threadmanager.

Parameters

- **new_state** – [in] The new extended state to be set for the thread.

- **load_order** – [in]
- **load_exchange** – [in]

threadmanager

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/threadmanager/threadmanager.hpp

Defined in header hpx/threadmanager/threadmanager.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

class **threadmanager**

#include <threadmanager.hpp> The *thread-manager* class is the central instance of management for all (non-depleted) threads

Public Types

using **notification_policy_type** = *threads*::*policies*::callback_notifier

using **pool_type** = *std*::unique_ptr<*thread_pool_base*>

using **pool_vector** = *std*::vector<*pool_type*>

Public Functions

threadmanager(*hpx*::*util*::*runtime_configuration* &rtcfg_, *notification_policy_type* &notifier, detail::network_background_callback_type network_background_callback = detail::network_background_callback_type())

threadmanager(*threadmanager* const&) = delete

threadmanager(*threadmanager*&&) = delete

threadmanager &**operator=**(*threadmanager* const&) = delete

threadmanager &**operator=**(*threadmanager*&&) = delete

~threadmanager()

void **init**() const

void **create_pools**()

void **print_pools**(*std*::ostream&) const

FIXME move to private and add —hpx:printpools cmd line option.

thread_pool_base &**default_pool**() const

thread_pool_base &**get_pool**(*std*::string const &pool_name) const

thread_pool_base &**get_pool**(pool_id_type const &pool_id) const

thread_pool_base &**get_pool**(*std*::size_t thread_index) const bool **pool_exists**(*std*::string const &pool_name) const

bool **pool_exists**(*std*::size_t pool_index) const

thread_id_ref_type **register_work**(thread_init_data &data, *error_code* &ec = *throws*) const

The function *register_work* adds a new work item to the thread manager. It doesn't immediately create a new *thread*, it just adds the task parameters (function, initial state and description) to the internal management data structures. The thread itself will be created when the number of existing threads drops below the number of threads specified by the constructors max_count parameter.

Parameters

- `data` – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- `ec` –

void **register_thread**(thread_init_data &data, thread_id_ref_type &id, *error_code* &ec = *throws*) const

The function *register_thread* adds a new work item to the thread manager. It creates a new *thread*, adds it to the internal management data structures, and schedules the new thread, if appropriate.

Parameters

- `data` – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- `id` – [out] This parameter will hold the id of the created thread. This id is guaranteed to be validly initialized before the thread function is executed.
- `ec` –

bool **run**() const

Run the thread manager's work queue. This function instantiates the specified number of OS threads in each pool. All OS threads are started to execute the function *tfunc*.

Returns

The function returns *true* if the thread manager has been started successfully, otherwise it returns *false*.

void **stop**(bool blocking = true) const

Forcefully stop the thread-manager.

Parameters

`blocking` –

bool **is_busy**() const

bool **is_idle**() const

void **wait**() const

bool **wait_for**(*hpx*::chrono::steady_duration const &rel_time) const

template<typename **StopToken**>

inline bool **wait_for**(*StopToken* &&stop_token, *hpx*::chrono::steady_duration const &rel_time) const

void **suspend**() const

void **resume**() const

hpx::state **status**() const

Return whether the thread manager is still running This returns the "minimal state", i.e. the state of the least advanced thread pool

std::int64_t **get_thread_count**(*thread_schedule_state* state = *thread_schedule_state*::*unknown*, *thread_priority* priority = *thread_priority*::*default_*, *std*::size_t num_thread = static_cast<*std*::size_t>(-1), bool reset = false) const

return the number of HPX-threads with the given state

> **Note**
>
> This function locks the internal OS lock in the thread manager

std::int64_t **get_idle_core_count**() const

mask_type **get_idle_core_mask**() const

std::int64_t **get_background_thread_count**() const

bool **cleanup_terminated**(bool delete_all) const

std::size_t **get_os_thread_count**() const

Return the number of OS threads running in this thread-manager.

This function will return correct results only if the thread-manager is running.

std::thread &**get_os_thread_handle**(*std*::size_t num_thread) const

void **report_error**(*std*::size_t num_thread, *std*::exception_ptr const &e) const

API functions forwarding to notification policy.

This notifies the thread manager that the passed exception has been raised. The exception will be routed through the notifier and the scheduler (which will result in it being passed to the runtime object, which in turn will report it to the console, etc.).

mask_type **get_used_processing_units**() const

Returns the mask identifying all processing units used by this thread manager.

hwloc_bitmap_ptr **get_pool_numa_bitmap**(*std*::string const &pool_name) const

void **set_scheduler_mode**(*threads*::*policies*::scheduler_mode mode, *hpx*::*threads*::mask_cref_type pu_mask) const noexcept

thrust

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/thrust/algorithms.hpp

Defined in header hpx/thrust/algorithms.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **thrust**

Functions

template<typename **Tag**, typename **ThrustPolicy**, typename ...**Args**>

decltype(auto) **hpx_invoke**(*Tag* tag, *ThrustPolicy* &&policy, *Args*&&... args)

ADL hook dispatching HPX algorithm CPOs to Thrust backends.

When a Thrust execution policy is passed to an HPX algorithm CPO, this hook maps the call to the corresponding Thrust implementation. Async policies wrap the result in a future.

Template Parameters

- **Tag** – The algorithm CPO tag type.
- **ThrustPolicy** – A Thrust execution policy satisfying is_thrust_execution_policy.
- **Args** – Arguments forwarded to the Thrust algorithm.

Parameters

- **tag** – The algorithm CPO tag instance.
- **policy** – Thrust execution policy controlling dispatch.
- **args** – Arguments forwarded to the mapped algorithm.

Returns

The algorithm result, or a future thereof for async policies.

timed_execution

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/timed_execution/timed_execution_fwd.hpp

Defined in header hpx/timed_execution/timed_execution_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

~topology()

inline *std*::size_t **get_socket_number**(*std*::size_t num_thread, [[maybe_unused]] *error_code* &ec = *throws*) const noexcept

Return the Socket number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline *std*::size_t **get_numa_node_number**(*std*::size_t num_thread, [[maybe_unused]] *error_code* &ec = *throws*) const noexcept

Return the NUMA node number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline *std*::size_t **get_numa_distance**(*std*::size_t node_a, *std*::size_t node_b) const noexcept

Return the hardware latency distance between two NUMA nodes. Values are sourced from hwloc's distance matrix when available; otherwise a standard default (10 = local, 20 = remote) is returned.

Parameters

- **node_a** – [in] logical index of the first NUMA node
- **node_b** – [in] logical index of the second NUMA node

mask_cref_type **get_machine_affinity_mask**(*error_code* &ec = *throws*) const noexcept

Return a bit mask where each set bit corresponds to a processing unit available to the application.

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_type **get_service_affinity_mask**(mask_cref_type used_processing_units, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the service threads in the application.

Parameters

- **used_processing_units** – [in] This is the mask of processing units which are not available for service threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_socket_affinity_mask**(*std*::size_t num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the socket it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_numa_node_affinity_mask**(*std*::size_t num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the NUMA domain it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_core_affinity_mask**(*std*::size_t num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the core it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_thread_affinity_mask**(*std*::size_t num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **set_thread_affinity_mask**(mask_cref_type mask, *error_code* &ec = *throws*) const

Use the given bit mask to set the affinity of the given thread. Each set bit corresponds to a processing unit the thread will be allowed to run on.

> **Note**
>
> Use this function on systems where the affinity must be set from inside the thread itself.

Parameters

- **mask** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_type **get_thread_affinity_mask_from_lva**(void const *lva, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit co-located with the memory the given address is currently allocated on.

Parameters

- **lva** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **print_affinity_mask**(*std*::ostream &os, *std*::size_t num_thread, mask_cref_type m, *std*::string const &pool_name) const

Prints the given mask *m* to os in a human-readable form.

bool **reduce_thread_priority**(*error_code* &ec = *throws*) const

Reduce thread priority of the current thread.

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::size_t **get_number_of_sockets**() const

Return the number of available NUMA domains.

std::size_t **get_number_of_numa_nodes**() const

Return the number of available NUMA domains.

std::size_t **get_number_of_cores**() const

Return the number of available cores.

std::size_t **get_number_of_pus**() const noexcept

Return the number of available hardware processing units.

std::size_t **get_number_of_numa_node_cores**(*std*::size_t numa) const

Return number of cores in given numa domain.

std::size_t **get_number_of_numa_node_pus**(*std*::size_t numa) const

Return number of processing units in a given numa domain.

std::size_t **get_number_of_socket_pus**(*std*::size_t socket) const

Return number of processing units in a given socket.

std::size_t **get_number_of_core_pus**(*std*::size_t core) const

Return number of processing units in given core.

std::size_t **get_number_of_socket_cores**(*std*::size_t socket) const

Return number of cores units in given socket.

inline *std*::size_t **get_core_number**(*std*::size_t num_thread, *error_code*& = *throws*) const

std::size_t **get_pu_number**(*std*::size_t num_core, *std*::size_t num_pu, *error_code* &ec = *throws*) const

std::size_t **get_cache_size**(mask_cref_type mask, int level) const

Return the size of the cache associated with the given mask.

mask_type **get_cpubind_mask**(*error_code* &ec = *throws*) const

mask_type **get_cpubind_mask**(*std*::thread &handle, *error_code* &ec = *throws*) const

hwloc_bitmap_ptr **cpuset_to_nodeset**(mask_cref_type mask) const

convert a cpu mask into a numa node mask in hwloc bitmap form

void **write_to_log**() const

void *__allocate__(*std*::size_t len) const

This is equivalent to malloc(), except that it tries to allocate page-aligned memory from the OS.

void *__allocate_membind__(*std*::size_t len, *hwloc_bitmap_ptr* const &bitmap, *hpx_hwloc_membind_policy* policy, int flags) const

allocate memory with binding to a numa node set as specified by the policy and flags (see hwloc docs)

threads::mask_type **get_area_membind_nodeset**(void const *addr, *std*::size_t len) const

bool **set_area_membind_nodeset**(void const *addr, *std*::size_t len, void *nodeset) const

int **get_numa_domain**(void const *addr) const

void **deallocate**(void *addr, *std*::size_t len) const noexcept

Free memory that was previously allocated by allocate.

void **print_hwloc**(*std*::ostream&) const

mask_type **init_socket_affinity_mask_from_socket**(*std*::size_t num_socket) const

mask_type **init_numa_node_affinity_mask_from_numa_node**(*std*::size_t num_numa_node) const

mask_type **init_core_affinity_mask_from_core**(*std*::size_t num_core, mask_cref_type default_mask = *empty_mask*) const mask_type **init_thread_affinity_mask**(*std*::size_t num_thread) const

mask_type **init_thread_affinity_mask**(*std*::size_t num_core, *std*::size_t num_pu) const

hwloc_bitmap_t **mask_to_bitmap**(mask_cref_type mask, hwloc_obj_type_t htype, unsigned *count = nullptr) const

mask_type **bitmap_to_mask**(hwloc_bitmap_t bitmap, hwloc_obj_type_t htype) const

struct **`lock_context`**

#include <tracing.hpp> Context for annotating lock acquisitions and releases.

This struct is used to provide tracing annotations for synchronization primitives such as spinlocks and mutexes. It registers the creation, acquisition, and release of locks to the active tracing backend.

Public Functions

explicit **`lock_context`**(char const *name = nullptr, void const *addr = nullptr) noexcept

Constructs a lock context.

Parameters

- **`name`** – The name or description of the lock.
- **`addr`** – The memory address of the lock, used to track it uniquely.

explicit **lock_context**(char const *prefix, char const *suffix, void const *addr = nullptr) noexcept

Constructs a lock context with a dynamic name.

Parameters

- **prefix** – The prefix for the lock name.
- **suffix** – The suffix for the lock name.
- **addr** – The memory address of the lock, used to track it uniquely.

bool **before_lock**() const noexcept

Called immediately before attempting to acquire the lock.

Returns

true if the prepare event was recorded and after_lock should be called.

void **after_lock**() const noexcept

Called immediately after the lock is successfully acquired.

void **after_try_lock**(bool success) const noexcept

Called after a try-lock operation completes.

Parameters

success – true if the lock was acquired, false if it failed.

void **before_unlock**() const noexcept

Called immediately before releasing the lock.

void **after_unlock**() const noexcept

Called immediately after releasing the lock.

namespace **util**

namespace **external_timer**

hpx/tracing/backends/empty.hpp

Defined in header hpx/tracing/backends/empty.hpp.

Typedefs

`bool(*)() enable_parent_task_handler_type`

Functions

inline constexpr *annotation_handle* **create_annotation_handle**(char const*) noexcept

inline constexpr void **set_thread_name**(char const *name) noexcept

Set the OS thread name in the profiler timeline.

inline constexpr char const ***rename_region**(char const *name) noexcept

Rename the currently active region on this thread; returns the previous name, or the caller's input if no rename occurred.

constexpr *task_timer_data* **create_task_timer**(*threads*::*thread_description* const&, *std*::uint32_t, *threads*::*thread_id* const&) noexcept

constexpr void **update_task_timer**(*task_timer_data*&, char const*) noexcept

constexpr void **task_staged**(char const*, void const* = nullptr) noexcept

constexpr void **task_created**(char const*, void const*, void const* = nullptr) noexcept

constexpr void **task_executing**(void const*, char const*, *std*::size_t) noexcept

constexpr void **task_yielded**(void const*, char const*) noexcept

constexpr void **task_suspended**(void const*, char const*, char const* = nullptr) noexcept

constexpr void **task_resumed**(void const*, char const*, char const* = nullptr) noexcept constexpr void **`task_completed`**(void const*, char const*) noexcept

constexpr void **`task_deleted`**(void const*) noexcept

constexpr void **`future_fulfilled`**(void const*, char const* = nullptr) noexcept

Producer-side signal: future state fulfilled (no-op stub).

Producer-side signal: future state fulfilled (no-op stub for APEX).

Producer-side signal: future state fulfilled (no-op stub for ITTNotify).

constexpr void **`future_exception_set`**(void const*, char const* = nullptr) noexcept

Producer-side signal: future exception set (no-op stub).

Producer-side signal: future exception set (no-op stub for APEX).

Producer-side signal: future exception set (no-op stub for ITTNotify).

constexpr void **`continuation_run`**(void const* = nullptr) noexcept

Consumer-side signal: continuation started (no-op stub).

Consumer-side signal: continuation started (no-op stub for APEX).

Consumer-side signal: continuation started (no-op stub for ITTNotify).

constexpr void **`continuation_finished`**(void const* = nullptr) noexcept

Consumer-side signal: continuation finished (no-op stub).

Consumer-side signal: continuation finished (no-op stub for APEX).

Consumer-side signal: continuation finished (no-op stub for ITTNotify).

constexpr void **`handle_on_completed_fired`**(void const* = nullptr) noexcept

Consumer-side signal: handle_on_completed fired (no-op stub).

Consumer-side signal: handle_on_completed fired (no-op stub for APEX).

Consumer-side signal: handle_on_completed fired (no-op stub for ITTNotify).

constexpr void **`work_stolen`**(*std*::size_t, *std*::size_t, void const*, char const* = nullptr) noexcept

Signal emitted when a worker thread steals a task from another worker.

inline constexpr void **`frame_mark`**(char const* = nullptr) noexcept

Frame boundary marker (no-op stub).

Emit a frame/stage boundary marker in Tracy timeline.

Frame boundary marker (no-op stub for APEX).

Frame boundary marker (no-op stub for ITTNotify).

Parameters

`name` – Optional name for the frame/stage.

inline constexpr void **os_thread_sleep**(*std*::size_t num_thread) noexcept

Point message emitted just before an OS worker thread suspends on its condition variable.

Parameters

`num_thread` – Index of the worker thread entering sleep.

constexpr void **tracing_init**(char const*, int, char**, *std*::uint32_t = 0, *std*::uint32_t = 1) noexcept

constexpr void **tracing_finalize**() noexcept

constexpr void **register_thread**(char const*) noexcept

constexpr void **create_counter**(*std*::string const&, *std*::string const&) noexcept

constexpr void **sample_counter**(*std*::string const&, *std*::string const&, double) noexcept

inline constexpr void **send_parcel**(*std*::uint64_t, *std*::uint64_t, *std*::uint64_t, *std*::uint64_t) noexcept

Parcel-send signal: parcel handed to parcelport (no-op stub).

Parcel-send signal: a parcel has been handed to the parcelport for transmission.

Parcel-send signal: parcel handed to parcelport (APEX shim).

Parcel-send signal: parcel handed to parcelport (no-op stub for ITTNotify).

Parameters

- `tag_msb` – High 64 bits of the parcel id.
- `tag_lsb` – Low 64 bits of the parcel id. Together with tag_msb they form the full 128-bit id used to pair events across localities; lsb alone restarts per locality and would produce false matches.
- `size` – Wire size of the parcel in bytes.
- `target_locality_id` – Destination locality id, or `naming::invalid_locality_id` if unknown.

inline constexpr void **recv_parcel**(*std*::uint64_t, *std*::uint64_t, *std*::uint64_t) noexcept

Parcel-receive signal: parcel arrived (no-op stub).

Parcel-receive signal: a parcel has arrived and its header has been deserialized.

Parcel-receive signal: parcel arrived (APEX shim).

Parcel-receive signal: parcel arrived (no-op stub for ITTNotify).

Parameters

- `tag_msb` – High 64 bits of the parcel id.
- `tag_lsb` – Low 64 bits of the parcel id.
- `source_locality_id` – Sending locality id, or `naming::invalid_locality_id` when the parcel has no source id yet (pre-AGAS handshake parcels).

inline constexpr void **parcel_scheduled**(*std*::uint64_t, *std*::uint64_t, *std*::uint64_t, *std*::uint64_t) noexcept

Parcel-scheduled signal: action entered local scheduler (no-op stub).

Parcel-scheduled signal: an action carried by a parcel has been placed onto the local scheduler. Fires for deferred receives (zero-copy or multi-parcel message), for AGAS-routed parcels, and for parcels the AGAS re-route chain delivered after a migration detection. Does not fire for the non-deferred path where load_schedule schedules inline.

Parcel-scheduled signal: action entered local scheduler (no-op stub for APEX).

Parcel-scheduled signal: action entered local scheduler (no-op stub for ITTNotify).

Parameters

- `tag_msb` – High 64 bits of the parcel id.
- `tag_lsb` – Low 64 bits of the parcel id.
- `source_locality_id` – Sending locality id (see recv_parcel).
- `source_thread_id` – Parent HPX thread id captured on the sender; may be 0 when unavailable.

bool **parse_sed_expression**(*std*::string const &input, *std*::string &search, *std*::string &replace)

Parse a sed command.

> **Note**
>
> Currently, only supports search and replace syntax (s/search/replace/)

Parameters

- **input** – [in] The content to parse.
- **search** – [out] If the parsing is successful, this string is set to the search expression.
- **replace** – [out] If the parsing is successful, this string is set to the replace expression.

Returns

true if the parsing was successful, false otherwise.

struct **sed_transform**

#include <sed_transform.hpp> An unary function object which applies a sed command to its subject and returns the resulting string.

namespace **util**

Functions

template<typename **Iterator**>

constexpr bool **insert_checked**(*std*::pair<*Iterator*, bool> const &r) noexcept

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters

r – [in] The return value of a std::map insert operation.

Returns

This function returns **r.second**.

template<typename **Iterator**>

bool **insert_checked**(*std*::pair<*Iterator*, bool> const &r, *Iterator* &it)

Helper function for writing predicates that test whether an std::map insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy std::pair<Iterator, bool> type.

Parameters

- **r** – [in] The return value of a std::map insert operation.
- **r** – [out] A reference to an Iterator, which is set to **r.first**.
- **it** – [out] on exit, will hold the iterator referring to the inserted element

Returns

This function returns **r.second**.

component_storage

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/components/component_storage/migrate_to_storage.hpp

Defined in header hpx/components/component_storage/migrate_to_storage.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

Functions

template<typename **Component**>

future<*hpx*::id_type> **migrate_to_storage**(*hpx*::id_type const &to_migrate, *hpx*::id_type const &target_storage)

Migrate the component with the given id to the specified target storage

The function *migrate_to_storage<Component>* will migrate the component referenced by *to_migrate* to the storage facility specified with *target_storage*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The global id of the component to migrate.
- **target_storage** – [in] The id of the storage facility to migrate this object to.

Template Parameters

The – only template argument specifies the component type of the component to migrate to the given storage facility.

Returns

A future representing the global id of the migrated component instance. This should be the same as *migrate_to*.

template<typename **Derived**, typename **Stub**, typename **Data**>

inline *Derived* **migrate_to_storage**(*client_base*<*Derived*, *Stub*, *Data*> const &to_migrate, *hpx*::*components*::component_storage const &target_storage)

Migrate the given component to the specified target storage

The function *migrate_to_storage* will migrate the component referenced by *to_migrate* to the storage facility specified with *target_storage*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The client side representation of the component to migrate.
- **target_storage** – [in] The id of the storage facility to migrate this object to.

Returns

A client side representation of representing of the migrated component instance. This should be the same as *migrate_to*.

hpx/components/component_storage/migrate_from_storage.hpp

Defined in header hpx/components/component_storage/migrate_from_storage.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

Functions

template<typename **Component**>

future<*hpx*::id_type> **migrate_from_storage**(*hpx*::id_type const &to_resurrect, *hpx*::id_type const &target = *hpx*::invalid_id)

Migrate the component with the given id from the specified target storage (resurrect the object)

The function *migrate_from_storage*<*Component*> will migrate the component referenced by *to_resurrect* from the storage facility specified where the object is currently stored on. It returns a future referring to the migrated component instance. The component instance is resurrected on the locality specified by *target_locality*.

Parameters

- **to_resurrect** – [in] The global id of the component to migrate.

- `target` – [in] The optional locality to resurrect the object on. By default the object is resurrected on the locality it was located on last.

Template Parameters

The – only template argument specifies the component type of the component to migrate from the given storage facility.

Returns

A future representing the global id of the migrated component instance. This should be the same as *to_resurrect*.

process

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/components/process/process.hpp

Defined in header hpx/components/process/process.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

namespace **process**

Functions

template<typename ...**Ts**>

child **execute**(*hpx*::id_type const &id, *Ts*&&... ts)

```
HPX_PROCESS_EXPORT child launch_connecting_locality (std::string const &to_launch,
std::vector< std::string > const &outer_args={},
std::vector< std::string > const &outer_env={},
std::optional< std::uint64_t > spawn_id=nullopt)
```

Launch an executable as a new HPX locality that connects to the currently running (bootstrap) locality via TCP.

This function spawns `to_launch` as a child process configured to join the calling HPX runtime as an additional, connecting locality. It forces the TCP parcelport for bootstrapping, forwards AGAS server address/port information from the current runtime's configuration, lets the operating system pick an ephemeral parcel port for the new locality, and blocks the caller until the spawned locality signals that it has finished starting up (via a named latch derived from the executable name and, optionally, `spawn_id`).

> **Note**
>
> The following environment variables are set (overriding any inherited values) before launching:
>
> - `HPX_AGAS_SERVER_ADDRESS` / `HPX_AGAS_SERVER_PORT` ? taken from the current runtime's `hpx.agas.address` / `hpx.agas.port` configuration entries.
> - `HPX_PARCEL_SERVER_ADDRESS` ? same address as the AGAS server.
> - `HPX_PARCEL_SERVER_PORT` ? set to `"0"` so the OS assigns an ephemeral port.
> - `HPX_ON_STARTUP_WAIT_ON_LATCH` ? the startup latch name described above, used to synchronize with the caller.

Parameters

- **`to_launch`** – Path to the executable to launch as the connecting locality.
- **`outer_args`** – Additional command-line arguments appended after the mandatory HPX bootstrap arguments (`--hpx:ignore-batch-env`, `--hpx:ini=hpx.parcel.tcp.priority=1000`, `--hpx:ini=hpx.parcel.bootstrap=tcp`). Defaults to an empty list.
- **`outer_env`** – Additional environment variable entries in `"NAME=value"` form (or just `"NAME"` to set an empty value) that are merged into (and override) the inherited environment before launching the child process. Defaults to an empty list.
- **`spawn_id`** – Optional identifier used to disambiguate the startup latch name when multiple instances of the same executable are launched concurrently. When present, the latch name is `"<exe-stem>/<spawn_id>"`; otherwise it is just `"<exe-stem>"`.

Throws

`hpx::exception` – (or a derived type) if the child process could not be started (`process::throw_on_error()` is used).

Returns

A `child` object representing the launched connecting-locality process, once it has signaled startup completion.

supervision_dispatch

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::supervision::init

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::finalize*
- *hpx::supervision::is_initialized*

hpx::shared_future<registry> `hpx::supervision::init`(*hpx*::chrono::steady_duration const &discovery_timeout = default_discovery_timeout)

Performs one-shot, idempotent initialization of the supervision-dispatch runtime for this locality. On the first successful call, this function atomically transitions the internal lifecycle state from *uninitialized* to *initializing*, after incrementing the internal epoch, then owns the entire startup sequence: it creates a local *registry* for hpx::find_here(), publishes *event::started* for this locality *before* the registry's symbol name is registered (so that no peer can discover and join a not-yet-started locality), registers that symbol name, and finally performs a single *discover_and_join()* pass to join every currently reachable peer registry. On success the state transitions to *active*; if any step throws, all partial state is rolled back and the lifecycle reverts to *uninitialized* so that a subsequent call can retry from scratch.

Calling init() while already *active* is a no-op that resolves immediately without repeating any side effect. Calling it while another call is still *initializing* attaches the caller to the in-flight operation's outcome rather than racing it, so concurrent callers never create more than one registry. Calling it while *finalizing* is in progress is rejected; callers should wait for *finalize()* to complete before re-initializing.

> **Note**
>
> This function has no effect on any state that has not yet been created by a successful call - in particular, no symbol name is ever registered and no event is ever published unless this function (or a concurrent call it is attached to) actually runs the initialization sequence.

Parameters

`discovery_timeout` – The maximum duration to wait, across all discovery candidates combined, for peer registry symbol names to resolve during the *discover_and_join()* step (see *discover_peers()*).

Returns

A shared future that becomes ready, holding the *registry* owned by this *init()* cycle, once the supervision runtime has reached the *active* state, or that becomes exceptional if initialization fails.

registry `hpx::supervision::init`(*hpx*::*launch*::sync_policy policy, *hpx*::chrono::steady_duration const &discovery_timeout = default_discovery_timeout)

Performs one-shot, idempotent initialization of the supervision-dispatch runtime for this locality, blocking the calling thread until the operation completes. This is the synchronous counterpart of init(hpx::chrono::steady_duration const&): it carries out the exact same lifecycle transition and startup sequence (registry creation, *event::started* publication, symbol name registration, and a single *discover_and_join()* pass), but waits for the resulting future to become ready (or exceptional) before returning, rather than handing the future back to the caller.

> **Note**
>
> As with the asynchronous overload, no symbol name is registered and no event is published unless this call (or a concurrent call it attaches to) actually performs the initialization sequence.

Parameters

- **`policy`** – Tag selecting the blocking overload of init().

- **discovery_timeout** – The maximum duration to wait, across all discovery candidates combined, for peer registry symbol names to resolve during the *discover_and_join()* step (see *discover_peers()*).

Throws

hpx::exception – if initialization could not complete (e.g. due to a concurrent *finalize()* still in progress). Calling this while already *active* is a no-op that returns immediately.

Returns

The *registry* owned by this *init()* cycle.

hpx::supervision::finalize

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::init*
- *hpx::supervision::is_initialized*

void *hpx::supervision::***finalize**()

Performs one-shot, idempotent teardown of the supervision-dispatch runtime previously started by *init()*. On the first call observing the *active* state, this function atomically transitions the lifecycle to *finalizing*, publishes *event::completed* for the local locality at the current epoch, unregisters the registry's symbol name, and then releases ownership of the registry (relying on *client_base's* default lifetime management to destroy it once no other references remain) before resetting the lifecycle back to *uninitialized*, allowing a subsequent *init()* call to re-arm the runtime from scratch.

Calling finalize() when the runtime is *uninitialized*, still *initializing*, or already *finalizing* is a documented no-op: it resolves immediately without publishing any event, unregistering any symbol name, or otherwise touching component state.

> **Note**
>
> Because finalize() is a no-op unless the runtime is currently *active*, it is always safe to call speculatively, e.g. during shutdown, without first checking *is_initialized()*.

hpx::supervision::is_initialized

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::init*
- *hpx::supervision::finalize*

bool *hpx*::*supervision*::**is_initialized**() noexcept

Returns whether the supervision-dispatch runtime for this locality is currently *active*, i.e. has completed *init()* and has not yet been torn down by *finalize()*.

> **Note**
>
> This function never blocks and performs a single atomic load; it is safe to call from any thread, including while *init()* or *finalize()* is concurrently in flight.

Returns

true if the lifecycle state is *active*, *false* if it is *uninitialized*, *initializing*, or *finalizing*.

hpx::supervision::dispatch_work

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::invoke_fenced_action*

hpx::supervision::invoke_fenced_action

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::dispatch_work*

template<typename **Action**, typename **IdType**, typename **Epoch**, typename ...**Ts**>

decltype(auto) *hpx*::*supervision*::**invoke_fenced_action**(*Action* act, *IdType* target, *Epoch* const epoch, *Ts*... ts)

Remote dispatch point that performs the authoritative admission re-check and invokes the wrapped action.

This is the function body that actually runs as the action on the *destination* locality (the target's own locality, reached via hpx::colocated in dispatch_work()). It is invoked by fenced_action once the action has been dispatched.

The admission check performed here runs on the same locality/thread that owns the target's *supervision_manager* state, so there is no suspension point between this check and the actual invocation below. This is what closes the client-side/dispatch race: even if the client's own (non-authoritative) *check_admission()* in dispatch_work() returned `admitted`, the target may have latched a terminal event for this epoch in the meantime, and this re-check will catch it.

This re-check is authoritative only because a joining registry (see components/supervision_dispatch/src/server/registry_server.cpp) dual-publishes lifecycle mirrors for a joined peer onto that peer's own locality, in addition to the joining registry's local copy: `target` must resolve to that same peer locality for this guarantee to hold. Dispatching `target` against an unrelated third locality - one that never received the dual-published mirror for this target - remains out of contract; the re-check performed there consults a *supervision_manager* state that was never seeded for `target` and so cannot detect fencing.

Template Parameters

- `Action` – The wrapped HPX action type to invoke on admission.
- `IdType` – Type of the target identifier forwarded to `act` (this type is always `hpx::id_type`).
- `Epoch` – Type of the fencing epoch value (this type is always `std::uint64_t`).
- `Ts` – Types of the additional arguments forwarded to `act`.

Parameters

- `act` – The action instance to invoke once admission succeeds.
- `target` – Identifier of the component instance being dispatched to; forwarded to `act` (the epoch is fencing metadata only and is not part of `act's` argument list).
- `epoch` – The fencing epoch to check admission for.
- `ts` – Additional arguments forwarded to `act`.

Throws

`hpx::exception` – with hpx::error::target_fenced if the target has latched a terminal event for `epoch` since the client's own admission check, in which case the wrapped action is not invoked.

Returns

The result of invoking `act`, obtained via hpx::sync (run directly/locally, without an extra parcel hop, since this function already executes on the target's locality).

hpx::supervision::discover_peers

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::fan_out_join*
- *hpx::supervision::discover_and_join*

std::vector<*discovered_peer*> `hpx::supervision::discover_peers`(chrono::steady_duration const &timeout = default_discovery_timeout)

Performs a one-time discovery pull for supervision_dispatch peers: concurrently resolves the pinned registry name (see register_name()) of every remote locality (*hpx::find_remote_localities()*, which already excludes this locality), bounded by a single wait for *timeout* across all candidates.

Because constructing a registry client from a symbolic name (see client_base's symbolic-name constructor) waits/resolves once the symbol is bound rather than failing fast on one that is not (yet) registered, localities that never called register_name() (e.g. because they have not run init_supervision() yet) would otherwise hang this call indefinitely. Instead, once *timeout* elapses, only the candidates whose registry client was resolved by then (checked via the non-blocking is_ready()) are returned; every other candidate is simply excluded as not currently participating in supervision - *discover_peers()* itself never fails or throws on their account.

Parameters

timeout – The maximum duration to wait, across all candidates combined, for their registry names to resolve.

Returns

The peers whose registry client was resolved within *timeout*, as discovered_peer values carrying the hpx::id_type locality it is pinned to.

hpx::supervision::fan_out_join

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::discover_peers*
- *hpx::supervision::discover_and_join*

std::vector<*discovered_peer*> `hpx::supervision::fan_out_join`(*registry* const &local_registry, *std*::vector<*discovered_peer*> const &peers, chrono::steady_duration const &timeout = default_discovery_timeout)

Reactively fans out join() calls from *local_registry* to every peer in *peers* (typically the result of a prior *discover_peers()* call): for each entry, this calls `local_registry.join(peer.locality)`.

This reuses registry::join()'s existing reservation/idempotency machinery unchanged (see server::registry::reserve_ownership()) rather than duplicating any of it, so calling *fan_out_join()* more than once with (partially) overlapping peer lists - or racing with an inbound join() call from one of those same peers, e.g. because that peer is concurrently running its own *fan_out_join()* against this locality - is safe and never creates more than one registry entry per peer locality.

fan_out_join() itself is reactive only: it performs exactly one round of join() calls for the given *peers* and starts no background/polling activity of its own.

Parameters

- **local_registry** – The registry to join every peer in *peers* to.
- **peers** – The peers to join, typically returned by a prior *discover_peers()* call.
- **timeout** – The maximum duration to wait, across all peers combined, for their join() calls to settle. Peers whose join() has not settled (or failed) within this bound are silently dropped from the result, rather than hanging or throwing.

Returns

The discovered_peer values (locality + join_epoch) for peers whose join() calls settled successfully within *timeout*, in the same relative order as *peers* (with unsuccessful/ timed-out peers omitted, rather than left as gaps). Each returned discovered_peer::join_epoch is populated from the corresponding join() call, so callers can dispatch against `{peer.locality, peer.join_epoch}` directly, without needing a separate join() call to obtain it.

hpx::supervision::discover_and_join

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::discover_peers*
- *hpx::supervision::fan_out_join*

std::vector<*discovered_peer*> `hpx::supervision::discover_and_join`(*registry* const &local_registry, chrono::steady_duration const &timeout = default_discovery_timeout)

Composes a single reactive discovery-and-join pass for supervision_dispatch peers: performs exactly one *discover_peers()* pull to resolve the pinned registry name of every remote locality (*hpx::find_remote_localities()* already excludes this locality, so no separate self-exclusion is needed here), then fans the resulting peer list out to *local_registry* via a single *fan_out_join()* pass.

discover_and_join() introduces no state, polling thread, timer, or repeated broadcast of its own - it is a pure composition of *discover_peers()* and *fan_out_join()*, each of which is itself bounded to a single round of resolution/join calls. Because *fan_out_join()* reuses registry::join()'s existing reservation/idempotency machinery unchanged (see server::registry::reserve_ownership()), calling *discover_and_join()* more than once - whether to pick up newly started peers or purely by accident - is safe and never creates more than one registry entry per peer locality; repeated invocations simply return the (stable) join epochs already owned for peers that were previously joined.

Parameters

- `local_registry` – The registry to join every discovered peer to.
- `timeout` – The maximum duration to wait, across all discovery candidates combined, for their registry name to resolve (see *discover_peers()*).

Returns

The discovered_peer value that *local_registry* created (or already had) for each peer discovered and successfully joined within *timeout*, in the same relative order as returned by *discover_peers()*.

hpx::supervision::testing::local_snapshot_peers

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing*
- *hpx::supervision::testing::last_join_locality*
- *hpx::supervision::testing::suspend_heartbeat_for_testing*
- *hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing*

- *hpx::supervision::testing::stop_background_loops*

std::vector<*server*::*peer_snapshot*> `hpx::supervision::testing::local_snapshot_peers()`

Returns a snapshot of this locality's currently-joined, ready peers, as tracked by the local registry. Not part of the public dispatch API - exists so tests can inspect registry state directly.

hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::testing::local_snapshot_peers*
- *hpx::supervision::testing::last_join_locality*
- *hpx::supervision::testing::suspend_heartbeat_for_testing*
- *hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing*
- *hpx::supervision::testing::stop_background_loops*

void `hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing(`*hpx*::chrono::steady_duration const &timeout`)`

Overrides the timeout failure_detection_loop() passes to *await_terminal()* on each sweep. Must be called before *init()* starts the loop to take effect for that lifecycle; has no effect on a sweep already in flight. Not part of the public dispatch API - exists only to make failure-detection tests deterministic and fast instead of bound by the real 60s default_discovery_timeout.

Parameters

`timeout` – The new poll timeout.

hpx::supervision::testing::last_join_locality

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::testing::local_snapshot_peers*
- *hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing*
- *hpx::supervision::testing::suspend_heartbeat_for_testing*
- *hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing*
- *hpx::supervision::testing::stop_background_loops*

hpx::id_type `hpx::supervision::testing::last_join_locality()`

Returns the locality most recently returned by join(), regardless of whether the register_observers() call that followed it went on to succeed or fail. Lets tests verify that a failed join() does not leak that locality's local supervision state (see registry::register_observers()'s catch block).

hpx::supervision::testing::suspend_heartbeat_for_testing

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::testing::local_snapshot_peers*
- *hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing*
- *hpx::supervision::testing::last_join_locality*
- *hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing*
- *hpx::supervision::testing::stop_background_loops*

void `hpx::supervision::testing::suspend_heartbeat_for_testing()`

Stops this locality's own heartbeat_loop() without finalizing the dispatcher, simulating a hard crash (all lifecycle activity ceases, including the periodic event::running pulse) while staying joined in peers' registries. Idempotent; no-op if *init()* was never called or the loop is already stopped. Not part of the public dispatch API - exists only so failure-detection tests can deterministically simulate silence instead of relying on the absence of explicit calls, which no longer implies silence now that heartbeats are mirrored onto observers' local supervision state.

hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::testing::local_snapshot_peers*
- *hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing*
- *hpx::supervision::testing::last_join_locality*
- *hpx::supervision::testing::suspend_heartbeat_for_testing*
- *hpx::supervision::testing::stop_background_loops*

bool `hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing()`

Reports whether failure_detection_loop() currently has one or more *await_terminal()* calls outstanding against unresponsive peers (i.e. a sweep is mid-flight). Returns false before *init()* is called, between sweeps, and after *finalize()*. Not part of the public dispatch API - exists only so tests can deterministically synchronize on a real in-flight sweep instead of sleeping and hoping the loop got there first.

hpx::supervision::testing::stop_background_loops

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::testing::local_snapshot_peers*
- *hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing*
- *hpx::supervision::testing::last_join_locality*
- *hpx::supervision::testing::suspend_heartbeat_for_testing*
- *hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing*

void *hpx*::*supervision*::testing::**stop_background_loops**()

Stops this locality's failure_detection_loop() and heartbeat_loop() background tasks (joining both) without otherwise finalizing the dispatcher: unlike *finalize()*, this never publishes event::completed, never unregisters the registry symbol name, and never resets the lifecycle state back to uninitialized, so the sentinel's last published event stays stale and peers' failure_detection_loop() still eventually times out and observes target_fenced/rejected_fenced against this locality. Lets a caller depart the HPX runtime cleanly (e.g. via *hpx::disconnect()*) afterwards without leaving either background hpx::async task still running - simulating a worker that dies mid-epoch without corrupting AGAS or hanging runtime shutdown, as opposed to a true crash (no call at all) or a fully graceful departure (*finalize()*). Idempotent; no-op if *init()* was never called or the loops are already stopped. Not part of the public dispatch API - exists only for examples/tests that need to simulate this exact scenario deterministically.

hpx::supervision::registry

Defined in header hpx/supervision_dispatch.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **registry** : public *hpx*::*components*::*client_base*<*registry*, *server*::*registry*>

A registry is a lightweight, self-supervising handle for pairing with peer localities. It mirrors a peer's lifecycle state locally via join(), and can itself be discovered by name in AGAS like other supervision_dispatch components.

hpx/supervision_dispatch/server/registry.hpp

Defined in header hpx/supervision_dispatch/server/registry.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **supervision**

Fenced action dispatch for the supervision subsystem.

This header provides the machinery to dispatch an HPX action to a target component while enforcing supervision "fencing" semantics: once a target has latched a terminal event for a given epoch, no further actions for that epoch may execute against it. Dispatch performs a cheap, non-authoritative admission check on the caller's locality and an authoritative re-check on the target's own locality (via hpx::colocated), immediately before invoking the wrapped action, closing the race between admission and invocation.

Types and functions implementing HPX's supervision and fenced dispatch facilities.

Functions

inline bool **operator==**(*joined_peer* const &lhs, *joined_peer* const &rhs) noexcept

inline bool **operator!=**(*joined_peer* const &lhs, *joined_peer* const &rhs) noexcept

std::ostream &**operator<<**(*std*::ostream &strm, *joined_peer* const &peer)

struct **joined_peer**

#include <registry.hpp> Pairs the two values a caller obtains from a successful `registry::join()` and needs to perform a fenced dispatch.

See also

dispatch_work()

See also

server::registry::join()

Public Members

hpx::id_type **`target`**

The real, colocatable destination for the wrapped action.

The peer's locality id (i.e. `peer_locality`, the value originally passed into `registry::join()`). Forwarded to `hpx::colocated()` and used as the destination of `hpx::sync(act, target, ts...)` inside `dispatch_work()`.

std::uint64_t **`join_epoch`** = 0

The epoch at which this peer was joined.

Recorded by `registry::join()` and used to identify which registry entry a later `registry::leave()` call refers to - so that a racing re-join of the same peer locality (which mints a fresh `join_epoch` of its own) cannot be mistaken for the join this *`joined_peer`* was returned from.

namespace **`server`**

struct **`peer_snapshot`**

#include <registry.hpp> Plain-data view of a single joined peer, safe to hand out to callers outside the registry (unlike peer_entry, does not expose the ready/evict_pending bookkeeping used internally to coordinate concurrent join()/evict_peer() calls).

Public Members

hpx::id_type **`peer_locality`**

The peer locality this entry was joined against.

std::uint64_t **`join_epoch`**

The epoch at which `peer_locality` was joined.

class **`registry`** : public *hpx*::*components*::*component_base*<*registry*>

Public Functions

`registry``()`

joined_peer **`join`**(*hpx*::id_type const &peer_locality)

Joins a peer locality and creates or reuses its local supervision state.

Parameters

`peer_locality` – The peer locality to observe.

std::vector<*peer_snapshot*> **snapshot_peers**() const

Returns a point-in-time snapshot of all fully joined, non-evicting peers.

Intended for a future failure-detection poller (or other local consumers) that needs a stable, lock-safe list of peers to iterate over without reaching into `peers_` directly. Entries mid-join (ready == false) or already scheduled for eviction (evict_pending == true) are excluded, so a poller never observes a half-registered or torn-down peer.

Returns

A snapshot of every peer entry with `ready` == true and `evict_pending` == false at the time of the call.

void **leave**(*hpx*::id_type const &peer_locality, *std*::uint64_t join_epoch)

Removes a previously joined peer.

Parameters

- **peer_locality** – The peer locality to leave.
- **join_epoch** – Must match the join epoch currently recorded for `peer_locality` (i.e. the epoch returned by the corresponding *join()*). If `peer_locality` has since been re-joined (fresh epoch) or already evicted, this call is a no-op.

Protected Functions

std::tuple<*hpx*::id_type, *std*::uint64_t, bool> **reserve_ownership**(*hpx*::id_type const &peer_locality)

std::pair<*hpx*::id_type, *hpx*::id_type> **register_observers**(*hpx*::id_type const &peer_locality, *std*::uint64_t join_epoch)

void **evict_peer**(*hpx*::id_type const &peer_locality, *std*::uint64_t join_epoch, *hpx*::id_type keep_alive, bool preserve_terminal_state)

Protected Static Functions

static void **cleanup_peer**(*hpx*::id_type const &peer_locality, *hpx*::id_type const &lifecycle_observer, *hpx*::id_type const &activity_observer, bool preserve_terminal_state)

Unregisters a peer's observers and, unless `preserve_terminal_state` is set, removes its locally tracked supervision state.

Performs the actual peer teardown deferred by evict_peer(): unregisters `lifecycle_observer` and `activity_observer` on `peer_locality`, and removes `peer_locality's` locally tracked supervision state unless `preserve_terminal_state` is true, in which case that state - which was last set to the peer's terminal event by register_observers()'s lifecycle callback - is left in place as a tombstone rather than reset to "unknown". This lets any admission check still in flight against `peer_locality` (e.g. check_admission()) keep observing the fenced/terminal outcome after eviction has run, instead of racing against it. A subsequent *join()* re-seeding this locality with a fresh epoch naturally overwrites the tombstone. Kept separate from evict_peer() because evict_peer() only posts this work as a task (via hpx::post()) rather than performing it inline.

Parameters

- **peer_locality** – The locality that owns the observers, and whose local supervision state is removed.
- **lifecycle_observer** – The lifecycle observer id to unregister.
- **activity_observer** – The activity observer id to unregister.
- **preserve_terminal_state** – If true, leave peer_locality's local supervision state in place instead of removing it.

Private Members

mutable *hpx*::*spinlock* **mtx_**

hpx::*lcos*::*local*::detail::condition_variable **cond_**

std::map<*hpx*::id_type, *peer_entry*> **peers_**

struct **peer_entry**

Internal bookkeeping for a single joined (or joining) peer.

Not exposed outside the registry; see *peer_snapshot* for the plain-data subset safe to hand to external callers.

Public Functions

inline explicit **peer_entry**(*hpx*::id_type const &peer_locality)

Public Members

hpx::id_type const **peer_locality**

The locality that owns this peer's. Surfaced read-only via *peer_snapshot::peer_locality*.

hpx::id_type **lifecycle_observer**

The observer id registered on peer_locality to receive this peer's terminal lifecycle notification (drives evict_peer() via hpx::post()).

hpx::id_type **activity_observer**

The observer id registered on peer_locality to receive this peer's activity notifications (used to keep peer_locality's local state current between terminal events).

std::uint64_t **join_epoch** = 0

The epoch at which this peer was joined, recorded by *join()* and used by evict_peer() (instead of shadow) to identify and used by evict_peer() to identify which entry a deferred eviction refers to.

bool **ready** = false

False while a *join()* call has reserved ownership of this peer's locality (i.e. is in the process of performing the remote observer registrations) but has not yet filled in the rest of the entry. Concurrent *join()* calls for the same peer wait on cond_ instead of racing to register duplicate observers.

bool **evict_pending** = false

True once a terminal notification has been observed for this peer but eviction has not yet completed (deferred via hpx::post() to evict_peer()). Ensures a terminal notification racing ahead of *join()* completion is deferred instead of dropped, and lets *snapshot_peers()* exclude a peer that is already tearing down.

bool **evict_preserve_terminal_state** = false

The preserve_terminal_state argument evict_peer() was called with when it set evict_pending above, remembered so that *join()*'s deferred *cleanup_peer()* call (once the join in progress completes) preserves or drops peer_locality's local supervision state consistently with what the racing terminal notification requested.

2.10 Contributing to *HPX*

HPX development happens on Github. The following sections are a collection of useful information related to *HPX* development.

2.10.1 Contributing to *HPX*

The main source of information to understand the process of how to contribute to HPX can be found in this document[982]. This is a living document that is constantly updated with relevant information.

2.10.2 *HPX* governance model

The *HPX* project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. This document[983] describes how that participation takes place and how to set about earning merit within the project community.

[982] https://github.com/TheHPXProject/hpx/blob/master/.github/CONTRIBUTING.md
[983] http://hpx.dev/documents/governance/

2.10.3 Release procedure for *HPX*

Below is a step by step procedure for making an *HPX* release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an *HPX* release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.
2. For minor and major releases: create and check out a new branch at an appropriate point on `master` with the name `release-major.minor.X`. `major` and `minor` should be the major and minor versions of the release. For patch releases: check out the corresponding `release-major.minor.X` branch.
3. Write release notes in `docs/sphinx/releases/whats_new_$VERSION.rst`. Keep adding merged PRs and closed issues to this until just before the release is made. Use `tools/generate_pr_issue_list.sh` to generate the lists. Add the new release notes to the table of contents in `docs/sphinx/releases.rst`.
4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:

- `$HPX_SOURCE/README.rst`

– Update grant information

- `docs/sphinx/releases/whats_new_$VERSION.rst`
- `docs/sphinx/about_hpx/people.rst`

– Update collaborators

– Update grant information

5. This step does not apply to patch releases. For APEX:

- Change the release branch to be the most current release tag available in the APEX `git_external` section in the main `CMakeLists.txt`. Please contact the maintainers of the respective packages to generate a new release to synchronize with the *HPX* release (APEX[984]).

6. Make sure `HPX_VERSION_MAJOR/MINOR/SUBMINOR` in `CMakeLists.txt` contain the correct values. Change them if needed.
7. Change version references in CITATION.cff. There are two occurrences. Change year in the copyright file under `/libs/core/version/src/version.cpp`.
8. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main CMakeLists.txt and also deleting all related code and tests from the main source tree.

   The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:

a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.

[984] http://github.com/UO-OACISS/xpress-apex

b. Second release cycle: turn this build option OFF by default.

c. Third release cycle: completely remove the old code.

The main CMakeLists.txt contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don't have a replacement yet, we keep them around in case (like Vc for example).

9. Update the minimum required versions if necessary (compilers, dependencies, etc.) in `prerequisites.rst`. Update latest tested versions.

10. Verify that the Jenkins setups for the release branch on Rostam are running and do not display any errors.

11. Repeat the following steps until satisfied with the release.

1. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to `-rcN`, where `N` is the current iteration of this step. Start with `-rc1`.

2. Create a pre-release on GitHub using the script `tools/roll_release.sh`. This script automatically tag with the corresponding release number. The script requires that you have the STE||AR Group signing key.

3. This step is not necessary for patch releases. Notify `hpx-users@stellar-group.org` of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.

4. Allow at least a week for testing of the release candidate.

- Use `git merge` when possible, and fall back to `git cherry-pick` when needed. For patch releases `git cherry-pick` is most likely your only choice if there have been significant unrelated changes on master since the previous release.
- Go back to the first step when enough patches have been added.
- If there are no more patches, continue to make the final release.

12. Update any occurrences of the latest stable release to refer to the version about to be released. For example, `quickstart.rst` contains instructions to check out the latest stable tag. Make sure that refers to the new version.

13. Add a new entry to the RPM changelog (`cmake/packaging/rpm/Changelog.txt`) with the new version number and a link to the corresponding changelog.

14. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to an empty string.

15. Add the release date to the caption of the current "What's New" section in the docs, and change the value of `HPX_VERSION_DATE` in `CMakeLists.txt`.

16. Create a release on GitHub using the script `tools/roll_release.sh`. This script automatically tag the with the corresponding release number. The script requires that you have the STE||AR Group signing key.

17. Update the website (hpx.dev[985]). You can login on wordpress through *this page <https://hpx.dev/wp-login.php>*. You can update the pages with the following:

- Update links on the downloads page. Link to the release on GitHub.
- Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
- A new blog post announcing the release, which links to downloads and the "What's New" section in the documentation (see previous releases for examples).

[985] https://hpx.dev

18. Merge release branch into master.
19. Post-release cleanup. Create a new pull request against master with the following changes:
    1. Modify the release procedure if necessary.
    2. Change `HPX_VERSION_TAG` in `CMakeLists.txt` back to `-trunk`.
    3. Increment `HPX_VERSION_MINOR` in `CMakeLists.txt`.
20. Update Vcpkg (`https://github.com/Microsoft/vcpkg`) to pull from latest release.
    - Update version number in CONTROL
    - Update tag and SHA512 to that of the new release
21. Update spack (`https://github.com/spack/spack`) with the latest HPX package.
    - Update version number in `hpx/package.py` and SHA256 to that of the new release
22. Announce the release on hpx-users@stellar-group.org, stellar@cct.lsu.edu, all-cct@cct.lsu.edu, faculty@csc.lsu.edu, faculty@ece.lsu.edu, the *HPX* Slack channel, the STEllAR-GROUP Discord channel, our list of external collaborators, isocpp.org, reddit.com, HPC Wire, Inside HPC, Heise Online, and a CCT press release.
23. Beer and pizza.

2.10.4 Testing *HPX*

To ensure correctness of *HPX*, we ship a large variety of unit and regression tests. The tests are driven by the CTest[986] tool and are executed automatically on each commit to the *HPX* Github[987] repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our *HPX* Issues[988] tracker with detailed information about the target system.

Running tests manually

Running the tests manually is as easy as typing `make tests && make test`. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the `ctest` command. You can list all available test targets using `make help | grep tests`. Please see the CTest Documentation[989] for further details.

[986] https://gitlab.kitware.com/cmake/community/wikis/doc/ctest/Testing-With-CTest
[987] https://github.com/TheHPXProject/hpx/
[988] https://github.com/TheHPXProject/hpx/issues
[989] https://www.cmake.org/cmake/help/latest/manual/ctest.1.html

Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under `tools/perftests_ci/local_run.sh` (to be run in the build directory specifying the *HPX* source directory as the argument to the script, default is `$HOME/projects/hpx_perftests_ci`.

Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with `hpx::util::perftests_report`, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call `hpx::util::perftests_print_times`. To see an example of use, see `future_overhead_report.cpp`. Finally, you can add the test to the CI report editing the `hpx_targets` variable for the executable name and the `hpx_test_options` variable for the corresponding options to use for the run in the performance test script `.jenkins/cscs-perftests/launch_perftests.sh`. And then run the `tools/perftests_ci/local_run.sh` script to get a reference json run (use the name of the test) to be added in the `tools/perftests_ci/perftest/references/daint_default` directory.

Issue tracker

If you stumble over a bug or missing feature in *HPX*, please submit an issue to our *HPX* Issues[990] page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the Support Website[991] page.

Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both **|github|_**. You can see the dashboards CDash HPX dashboard[992] .

2.10.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, Docker[993] provides a convenient alternative to quickly get all the dependencies needed to start development of *HPX*. Our testing setup on **|github|_** uses a docker image to run all tests.

To get started you need to install Docker[994] using whatever means is most convenient on your system. Once you have Docker[995] installed, you can pull or directly run the docker

990 https://github.com/TheHPXProject/hpx/issues
991 https://stellar.cct.lsu.edu/support/
992 https://cdash.rostam.cct.lsu.edu/index.php?project=HPX
993 https://www.docker.com
994 https://www.docker.com
995 https://www.docker.com

image. The image is based on Debian and Clang, and can be found on Docker Hub[996].
To start a container using the *HPX* build environment, run:

```
$ docker␣
↪run --interactive --tty stellargroup/build_env:latest bash
```

You are now in an environment where all the *HPX* build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the Docker Documentation[997] for more information on using Docker[998].

Warning

All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the *HPX* source tree) after closing the container, you can bind directories from the host system into the container (see Docker Documentation (Bind mounts)[999]).

2.10.6 Documentation

This documentation is built using Sphinx[1000], and an automatically generated API reference using Doxygen[1001] and Breathe[1002].

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

Prerequisites

To build the *HPX* documentation, you need recent versions of the following packages:

- `python3` (3.9 or later)
- `sphinx` 7.2 or later (Python package)
- `sphinx-book-theme` (Python package)
- `breathe` 4.36.0 or later (Python package)
- `doxygen`
- `sphinxcontrib-bibtex`
- `sphinx-copybutton`

If the Python[1003] dependencies are not available through your system package manager, you can install them using the Python package manager `pip`. We recommend using a virtual environment:

[996] https://hub.docker.com/r/stellargroup/build_env/
[997] https://docs.docker.com/
[998] https://www.docker.com
[999] https://docs.docker.com/storage/bind-mounts/
[1000] http://www.sphinx-doc.org
[1001] https://www.doxygen.org
[1002] https://breathe.readthedocs.io/en/latest
[1003] https://www.python.org

```
mkdir -p build
python3 -m venv build/.venv
source build/.venv/bin/activate
pip install \
   "sphinx>=7.2" "breathe>=4.36.0" \
   sphinx-book-theme sphinxcontrib-bibtex \
   sphinx-copybutton
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

Doxygen_ROOT:PATH

Specifies where to look for the installation of the Doxygen[1004] tool.

Sphinx_ROOT:PATH

Specifies where to look for the installation of the Sphinx[1005] tool.

Breathe_APIDOC_ROOT:PATH

Specifies where to look for the installation of the Breathe[1006] tool.

Building documentation

Enable building of the documentation by setting `HPX_WITH_DOCUMENTATION=ON` during CMake[1007] configuration. To build the documentation, build the `docs` target using your build tool. The default output format is HTML documentation. You can choose alternative output formats (single-page HTML, PDF, and man) with the `HPX_WITH_DOCUMENTATION_OUTPUT_FORMATS` CMake option.

> **Note**
>
> If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

Style guide

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with `=`.
- Sub-headings use only underlines with characters in decreasing level of importance: `=`, `-` and `.`.
- Use sentence case in headings.

[1004] https://www.doxygen.org
[1005] http://www.sphinx-doc.org
[1006] https://breathe.readthedocs.io/en/latest
[1007] https://www.cmake.org

- Refer to common terminology using `:term:`Component``.
- Indent content of directives (`.. directive::`) by three spaces.
- For C++ code samples at the end of paragraphs, use `::` and indent the code sample by 4 spaces.

– For other languages (or if you don't want a colon at the end of the paragraph), use `.. code-block:: language` and indent by three spaces as with other directives.

- Use `.. list-table::` to wrap tables with a lot of text in cells.

API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the `doxygen_dependencies` variable in `docs/CMakeLists.txt`.

Adding new API documentation

When you add new public APIs to *HPX*, follow these guidelines to ensure the documentation is correctly generated and easy to use.

Documenting headers

At the top of a new header file, include the standard Doxygen documentation block. For example, if the new feature is called *my_new_feature*, you should:

- List the name of the new file under `\file`.
- Specify the page name with `\page` (e.g., `hpx::my_new_feature`).
- Reference the existing header that will include your new file under `\headerfile`.

```
/// \file my_new_feature.hpp
/// \page hpx::my_new_feature
/// \headerfile hpx/existing_header_of_new_feature.hpp
```

Adding to the public API reference

For the documentation to appear in the generated API reference, add your new API to `docs/sphinx/api/public_api.rst` under the appropriate table (usually "Functions") for the relevant header (for example, `hpx/existing_header_of_new_feature.hpp`).

Including examples

Do **not** inline examples in the API reference. If you want to provide an example of how to use the new API, there are two recommended options:

1. **Documentation page option** Edit an existing relevant manual page to explain the new functionality and include a code example. Use this option if you want to provide additional context about how the API works.
2. **Standalone examples option** Create a separate example under `docs/sphinx/examples/`. Examples in this directory are typically more comprehensive and executable, making them suitable for richer or more complex scenarios.

2.10.7 Module structure

This section explains the structure of an *HPX* module.

The tool create_library_skeleton.py[1008] can be used to generate a basic skeleton. To create a library skeleton, run the tool in the `libs` subdirectory with the module name as an argument:

```
$ ./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an *HPX* module. It will not create any actual source files. The structure of this skeleton is as follows:

- `<lib_name>/`
- `README.rst`
- `CMakeLists.txt`
- `cmake`
- `docs/`
- `index.rst`
- `examples/`
- `CMakeLists.txt`
- `include/`
- `hpx/`
- `<lib_name>`
- `src/`
- `CMakeLists.txt`
- `tests/`
- `CMakeLists.txt`
- `unit/`
- `CMakeLists.txt`
- `regressions/`

[1008] https://github.com/TheHPXProject/hpx/blob/master/libs/create_module_skeleton.py

· CMakeLists.txt

∗ performance/

· CMakeLists.txt

A README.rst should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main CMakeLists.txt is created in the root directory of the module. By default it contains a call to add_hpx_module which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

add_hpx_module requires a module name. Optional flags are:

Optional single-value arguments are:

- INSTALL_BINARIES: Install the resulting library.

Optional multi-value arguments-are:

- SOURCES: List of source files.
- HEADERS: List of header files.
- COMPAT_HEADERS: List of compatibility header files.
- DEPENDENCIES: Libraries that this module depends on, such as other modules.
- CMAKE_SUBDIRS: List of subdirectories to add to the module.

The include directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the src directory. This allows for clear separation. The cmake subdirectory may include additional CMake[1009] scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an include_compatibility directory. This directory is not created by default.

Documentation is placed in the docs folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the include directory will automatically be processed by Doxygen and included into the documentation.

Tests are placed in suitable subdirectories of tests.

When in doubt, consult existing modules for examples on how to structure the module.

Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it's not clear what is causing the circular dependency, running the cpp-dependencies[1010] tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the cpp-dependencies tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See *Using docker for development* for details on how to use the docker image.

[1009] https://www.cmake.org

[1010] https://github.com/tomtom-international/cpp-dependencies

To produce the graph produced by CI run the following command (`HPX_SOURCE` is assumed to hold the path to the *HPX* source directory):

```
$ cpp-dependencies␣
↪--dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a `dot` file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have `graphviz` installed:

```
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an `svg` file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on `config`, the following should give you a long list of paths from `algorithms` to `config`:

```
$ cpp-
↪dependencies --dir $HPX_SOURCE/libs --shortest algorithms config
```

The following should report that it can't find a path between the two modules:

```
$ cpp-
↪dependencies --dir $HPX_SOURCE/libs --shortest config algorithms
```

2.11 Releases

2.11.1 List of supported releases

HPX V2.0.0 (TBD)

General changes

Breaking changes

Closed pull requests

HPX V1.11.0 (Jun 30, 2025)

This release is the last version of HPX that supports C++17. Future versions of HPX will require compilation using C++20 or above.

General changes

- Added synchronous versions of all collective operations. Added global predefined communicator objects that are accessible through new APIs: `hpx::collectives::get_world_communicator()` refers to all localities and `hpx::collectives::get_local_communicator()` refers to all threads on the calling locality. We unified the interfaces of the different communicator objects.
- Added `hpx::experimental::run_on_all` allowing to run a given function (possibly concurrently) using a given execution policy.
- Added a helper object `hpx::runtime_manager` that simplifies the initialization of HPX without needing to modify the `main` function of the application.
- We improved the compatibility with various accelerator frameworks (SYCL, OneAPI).
- Applied build system changes that allow building HPX without any prerequisites. This requires to pass `-DHPX_WITH_FETCH_HWLOC=On` and `-DHPX_WITH_FETCH_BOOST=On` to the CMake[1011] configuration.
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- Added the `hpx::contains` and `hpx::contains_subrange` parallel algorithms.
- Adapted many of HPX' parallel algorithms to be usable with senders/receivers.

Breaking changes

- We have moved most of the APIs that were defined in the namespace `hpx::parallel::execution` to the namespace `hpx::execution::experimental`. It was not possible to add compatibility facilities that will allow to continue using the old APIs, applications will have to be changed in order to continue functioning correctly.
- The CMake configuration parameter `HPX_WITH_RUN_MAIN_EVERYWHERE` is now deprecated and will be removed in the future. Use the preprocessor macro `HPX_HAVE_RUN_MAIN_EVERYWHERE` on a target-by-target case instead.
- Removed the dysfunctional libfabric parcelport.
- Removed features that were long deprecated (starting V1.8): - `hpx::flush`, `hpx::endl`, `hpx::async_flush`, `hpx::async_endl` - Various enumerator types are now only available as `class enum` requiring explicit scoped use of the enumerator values - Various non-conforming overloads of parallel algorithms - `hpx::for_loop` and friends (now only available as

  `hpx::experimental::for_loop`)

  - `hpx::parallel::induction` is now only available as `hpx::experimental::induction`
  - `hpx::parallel::reduction` and friends are now only available as `hpx::experimental::reduction`
  - `hpx::assertion::source_location` is now only available as `hpx::source_location`
  - `hpx::lcos::split_future` is now only available as `hpx::split_future`

[1011] https://www.cmake.org

- hpx::lcos::wait and friends have been removed altogether
- hpx::lcos::wait_any and friends are now only available as hpx::wait_any
- hpx::lcos::wait_some and friends are now only available as hpx::wait_some
- hpx::lcos::wait_each and friends are now only available as hpx::wait_each
- hpx::lcos::wait_all and friends are now only available as hpx::wait_all
- hpx::lcos::when_all and friends are now only available as hpx::when_all
- hpx::lcos::when_any and friends are now only available as hpx::when_any
- hpx::lcos::when_each and friends are now only available as hpx::when_each
- hpx::lcos::when_some and friends are now only available as hpx::when_some
- hpx::util::optional and related facilities are now only available as hpx::optional
- hpx::util::bind and related facilities are now only available as hpx::bind
- hpx::util::function and friends are now only available as hpx::function
- hpx::traits::is_bound_action and related facilities are now only available as hpx::is_bound_action
- hpx::traits::is_bind_expression and related facilities are now only available as hpx::is_bind_expression
- hpx::traits::is_placeholder and related facilities are now only available as hpx::is_placeholder
- hpx::lcos::future and related facilities are now only available as hpx::future
- hpx::memory::intrusive_ptr is now only available as hpx::intrusive_ptr
- hpx::lcos::local::barrier is now only available as hpx::barrier
- hpx::lcos::barrier is now only available as hpx::distributed::barrier
- hpx::lcos::local::cpp20_binary_semaphore is now only available as hpx::detail::binary_semaphore
- hpx::lcos::local::condition_variable and friends are now only available as hpx::condition_variable
- hpx::lcos::local::counting_semaphore and friends are now only available as hpx::counting_semaphore
- hpx::lcos::local::cpp20_latch and is now only available as hpx::latch
- hpx::lcos::latch and is now only available as hpx::distributed::latch
- hpx::lcos::local::upgrade_lock and friends are now only available as hpx::upgrade_lock
- hpx::lcos::local::mutex and friends are now only available as hpx::mutex
- hpx::lcos::local::spinlock and friends are now only available as hpx::spinlock
- hpx::lcos::local::call_once and friends are now only available as hpx::call_once
- hpx::util::annotated_function and is now only available as hpx::annotated_function

- `hpx::components::abstract_simple_component_base` and is now only available as `hpx::components::abstract_component_base`
- `hpx::naming::id_type` and is now only available as `hpx::id_type`

2.11.2 List of older releases

HPX V1.10.0 (May 29, 2024)

General changes

- The HPX documentation has seen a major overhaul for this release. We finished documenting the public local HPX API, we have added migration guides from widely used parallelization platforms to HPX (OpenMP, TBB, and MPI).
- We have added facilities enabling optimizations for trivially-relocatable types (see P1144[1161] for more details).
- We have added (and use) the `scope_xxx` helper facilities as specified by the C++ library fundamentals TS v3 (see: N4948[1162]).
- We have added configuration options that allow to build HPX without pre-installing any prerequisites. Use `HPX_WITH_FETCH_HWLOC=On` to have Portable Hardware Locality (HWLOC)[1163] installed for you. Similarly, setting `HPX_WITH_FETCH_BOOST=On` during configuration time will install the necessary Boost[1164] libraries (currently V1.84.0).
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- The collective operations APIs have seen an unification, we have fixed issues and performance problems for the collectives.
- The HPX executors have seen a streamlining and some consistency changes. We have applied many performance improvements to the executor implementations that directly positively impact the performance of our parallel algorithms.
- We have added a new parcelport allowing to use Gasnet as a communication platform.
- We have added optimizations to various parcelports improving overall communication performance. This includes - amongst other things - send immediate optimizations and receiver-side zero-copy optimizations.
- Futures will now execute the associated task eagerly and inline on any wait operation if the task has not started running yet. This feature can be enabled using the `HPX_COROUTINES_WITH_THREAD_SCHEDULE_HINT_RUNS_AS_CHILD=On` configuration setting (which is *Off* by default).
- We have enabled using json files to supply configuration information through the command line. This feature can be enabled with the configuration option `HPX_COMMAND_LINE_HANDLING_WITH_JSON_CONFIGURATION_FILES=On`. This functionality depends on the external JSon library[1165], which can be built at configuration time by supplying `HPX_WITH_FETCH_JSON=On` to CMake[1166].
- We have applied many fixes to our CUDA, ROCm, and SYCL build environments.

[1166] https://www.cmake.org

Breaking changes

- The CMake[1167] configuration keys SOMELIB_ROOT (e.g., BOOST_ROOT) have been renamed to Somelib_ROOT (e.g., Boost_ROOT) to avoid warnings when using newer versions of CMake[1168]. Please update your scripts accordingly. For now, the old variable names are re-assigned to the new names and unset in the CMake[1169] cache.

Closed issues

HPX V1.9.1 (August 4, 2023)

General changes

This point release fixes a couple of problems reported for the V1.9.0 release. Most importantly, we fixed various occasional hanging during startup and shutdown in distributed scenarios. We also added support for zero-copy serialization on the receiving side to the TCP, MPI, and LCI parcelports. Last but not least, we have added support for Visual Studio 2019 and gcc using MINGW on Windows, and also support for gcc V13 and clang V15.

HPX headers are now made consistently named the same as their standard library counterparts, e.g. *#include <thread>* now corresponds to *#include <hpx/thread.hpp>*. This significantly simplifies porting existing standards conforming codes to HPX.

A lot of work has been done to improve and optimize our network communication layers. Primary focus of this work was on the LCI parcelport, but we have also cleaned up and improved the MPI parcelport.

Additionally, we have continued working on our documentation. The main focus here was on completing the API documentation of the most important API functions. We have started adding migration guides for people interested in moving their codes away from other, commonplace parallelization frameworks like OpenMP.

HPX V1.9.0 (May 2, 2023)

General changes

- Added RISC-V 64bit support. HPX is now compatible with RISC-V architectures which have revolutionized the HPC world.
- LCI parcelport has been optimized to transfer parcels with fewer messages and use the HPX resource partitioner for its progress thread allocation. It should generally provide better performance than before. It also removes its dependency on the MPI library.
- HPX dependency on Boost was further relaxed by replacing headers from Boost.Range, Boost.Tokenizer and Boost.Lockfree.
- Improvements took place on our parallel algorithms implementation.
- Our Senders/Receivers (P2300) integration was extended:

– Coroutines were integrated with senders/receivers.

`get_completion_signatures` now works with awaitable senders. - `with_awaitable_senders` allows the passed senders to retrieve the value i.e. senders are transparently awaitable from within a coroutine. - `when_all_vector` was added.

- `sync_wait` and `sync_wait_with_variant` sender consumers were added. The user can now initiate the execution of their asynchronous pipeline by blocking the current thread that executes the main() function until the result is retrieved.
- The combinators for futures (a.k.a. async_combinators) `when_*`, `wait_*`, `wait_*_nothrow` were turned into CPOs allowing for end-user customization. For more information on the async_combinators refer to the documentation, https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators.
- The new datapar backend SVE allows simd and par_simd execution policies to exploit dataparalleism in the processors that have SVE vector registers like A64FX and Neoverse V1.
- The documentation for parallel algorithms, container algorithms was further improved. The Public API page was vastly enriched.

1394 https://github.com/TheHPXProject/hpx/pull/6262
1395 https://github.com/TheHPXProject/hpx/pull/6266
1396 https://github.com/TheHPXProject/hpx/pull/6267
1397 https://github.com/TheHPXProject/hpx/pull/6278
1398 https://github.com/TheHPXProject/hpx/pull/6279
1399 https://github.com/TheHPXProject/hpx/pull/6281
1400 https://github.com/TheHPXProject/hpx/pull/6283

- Copy button shortkey was added at the top-right of code-blocks.
- Pragma directive that reports warnings as errors on MSVC was fixed.
- Command line argument `--hpx:loopback_network` was added to facilitate debugging with networks.
- We added an HPX-SYCL integration, allowing users to obtain HPX futures for SYCL events. This effectively enables the integration of arbitrary asynchronous SYCL operations into the HPX task graph. Bolted on top of this integration, we further added an HPX-SYCL executor for ease of use.

Breaking changes

- Stopped supporting Clang V8, the minimal version supported is now Clang V10.
- Stopped supporting gcc V8, the minimal version supported is now gcc V9.
- Stopped supporting Visual Studio 2015, the minimal version supported is now Visual Studio 2019.
- `tag_policy_tag` et.al. were re-added after HPX V1.8.1 depracation.
- `get_chunk_size` and `processing_units_count` API is now expecting the time for one iteration as an argument.
- The list of all the namespace changes can be found here: *HPX V1.9.0 Namespace changes*.

- Issue #5999[1412] - Add HPX Conda package to conda-forge
- Issue #5998[1413] - Serializing multiple arguments when applying distributed action results in segfault
- Issue #5958[1414] - HPX 1.8.0 and Blaze issues
- Issue #5908[1415] - Windows: duplicated symbols in static builds
- Issue #5802[1416] - Lost status is_ready from future
- Issue #5767[1417] - Performance drop on Piz Daint
- Issue #5752[1418] - Implement stride_view from P1899 (experimental)
- Issue #5744[1419] - HPX_WITH_FETCH_ASIO not working on Ookami
- Issue #5561[1420] - Possible race condition in helper thread / hpx::cout

Closed pull requests

- PR #6228[1421] - Fixing algorithms for zero length sequences when run with s/r scheduler
- PR #6227[1422] - Reliably disable background work when no networking is enabled
- PR #6225[1423] - Make heap fails in par for small sized heaps #6217
- PR #6222[1424] - Add documentation for *hpx::post*
- PR #6221[1425] - Fix segmented algorithms tests
- PR #6218[1426] - Creating INSTALL component 'runtime' to enable installing binaries only
- PR #6216[1427] - added tests for set_difference, updated set_operation.hpp to fix #6198
- PR #6213[1428] - Modernize and streamline MPI parcelport
- PR #6211[1429] - Modernize modules of level 11, 12, and 13
- PR #6210[1430] - Fixing MPI parcelport initialization if MPI is initialized outside of HPX
- PR #6209[1431] - Prevent thread stealing during scheduler shutdown
- PR #6208[1432] - Fix the compilation warning in the MPI parcelport with gcc 11.2

- PR #6207[1433] - Automatically enable Boost.Context when compiling for arm64.
- PR #6206[1434] - Update CMakeLists.txt
- PR #6205[1435] - Do not generate hpxcxx if support for pkgconfig was disabled
- PR #6204[1436] - Use **LRT_** instead of **LAPP_** logging in barrier implementation
- PR #6202[1437] - Fixing Fedora build errors on Power systems
- PR #6201[1438] - Update the LCI parcelport documents
- PR #6200[1439] - Par link jobs
- PR #6197[1440] - LCI parcelport: add doc, upgrade to v1.7.4, refactor cmake autofetch.
- PR #6195[1441] - Change the default tag of autofetch LCI to v1.7.3.
- PR #6192[1442] - Fix page *Writing single-node applications*
- PR #6189[1443] - Making sure restricted_thread_pool_executor properly reports used number of cores
- PR #6187[1444] - Enable using for_loop with range generators
- PR #6186[1445] - thread_support/CMakeLists: Fix build issue
- PR #6185[1446] - Fix EVE datapar with cxx_standard less than 20
- PR #6183[1447] - Update CI integration for EVE
- PR #6182[1448] - Fixing performance regressions
- PR #6181[1449] - LCI parcelport: backlog queue, aggregation, separate devices, and more
- PR #6180[1450] - Fixing use of for_loop with rebound execution policy (using *.with()*)
- PR #6179[1451] - Taking predicates for algorithms by value
- PR #6178[1452] - Changes needed to make chapel_hpx examples work
- PR #6176[1453] - Fixing warnings that were generated by PVS Studio
- PR #6174[1454] - Replace boost::integer::gcd with std::gcd
- PR #6172[1455] - [Docs] Fix example of how to run single/specific test(s)

- PR #6170[1456] - Adding missing fallback for processing_units_count customization point
- PR #6169[1457] - LCI parcelport: bypass the parcel queue and connection cache.
- PR #6167[1458] - Add create_local_communicator API function
- PR #6166[1459] - Add missing header for std::intmax_t
- PR #6165[1460] - Attempt to work around MSVC problem
- PR #6161[1461] - Update EVE integration
- PR #6160[1462] - More cleanup for module levels 0 to 10
- PR #6159[1463] - Fix minor spelling mistake in generate_issue_pr_list.sh
- PR #6158[1464] - Update documentation in *writing single-node applications* page
- PR #6157[1465] - Improve index_queue_spawning
- PR #6154[1466] - Avoid performing late command line handling twice in distributed runtime
- PR #6152[1467] - The -rd and -mr options didn't work, and they should have been –rd and –mr
- PR #6151[1468] - Refactoring the Manual page in documentation
- PR #6148[1469] - Investigate the failure of the LCI parcelport.
- PR #6147[1470] - Make posix co-routine stacks non-executable
- PR #6146[1471] - Avoid ambiguities wrt tag_invoke
- PR #6144[1472] - General improvements to scheduling and related fixes
- PR #6143[1473] - Add list of new namespaces for new release
- PR #6140[1474] - Fixing background scheduler to properly exit in the end
- PR #6139[1475] - [P2300] execution: Cleanup coroutines integration and improve ADL isolation
- PR #6137[1476] - Adding example of a simple master/slave distributed application

- PR #6136[1477] - Deprecate *execution::experimental::task_group* in favor of *experimental::task_group*
- PR #6135[1478] - Fixing warnings reported by MSVC analysis
- PR #6134[1479] - Adding notification function for parcelports to be called after early parcel handling
- PR #6132[1480] - Fixing to_non_par() for parallel simd policies
- PR #6131[1481] - modernize modules from level 25
- PR #6130[1482] - Remove the mutex lock in the critical path of get_partitioner.
- PR #6129[1483] - Modernize module from levels 22, 23
- PR #6127[1484] - Working around gccV9 problem that prevent us from storing enum classes in bit fields
- PR #6126[1485] - Deprecate hpx::parallel::task_block in favor of hpx::experimental::task_block
- PR #6125[1486] - Making sure sync_wait compiles when used with an lvalue sender involving bulk
- PR #6124[1487] - Fixing use of any_sender in combination with when_all
- PR #6123[1488] - Fixed issues found by PVS-Studio
- PR #6121[1489] - Modernize modules of level 21, 22
- PR #6120[1490] - Use index_queue for parallel executors bulk_async_execute
- PR #6119[1491] - Update CMakeLists.txt
- PR #6118[1492] - Modernize modules from level 17, 18, 19, and 20
- PR #6117[1493] - Initialize **buffer_allocate_time_** to 0
- PR #6116[1494] - Add new command line argument –hpx:loopback_network
- PR #6115[1495] - Modernize modules of levels 14, 15, and 16
- PR #6114[1496] - Enhance the formatting of the documentation
- PR #6113[1497] - Modernize modules in module level 11, 12, and 13

General changes

This patch release adds a number of small new features and fixes a handful of problems discovered since the last release, in particular:

- A lot of work has been done to improve vectorization support for our parallel algorithms. HPX now supports using EVE - the Expressive Vector Engine as a vectorization backend.
- Added a simple average power consumption performance counter.
- Added performance counters related to the use of zero-copy chunks in the networking layer.
- More work was done towards full compatibility with the sender/receivers proposal P2300.
- Fixing sync_wait to decay the result types
- Fixed collective operations to properly avoid overalapping consecutive operations on the same communicator.
- Simplified the implementation of our execution policies and added mapping functions between those.
- Fixed performance issues with our implementation of *small_vector*.
- Serialization now works with buffers of unsigned characters.
- Fixing dangling reference in serialization of non-default constructible types
- Fixed static linking on Windows.
- Fixed support for M1/MacOS based architectures.
- Fixed support for gentoo/musl.
- Fixed *hpx::counting_semaphore_var*.
- Properly check start and end bounds for *hpx::for_loop*
- A lot of changes and fixes to the documentation (see https://hpx-docs.stellar-group.org).

Breaking changes

- No breaking changes have been introduced.

- PR #5888[1688] - Support for data-parallelism for reduce, transform reduce, transform_binary_reduce algorithms
- PR #5887[1689] - Fixing dangling reference in serialization of non-default constructible types
- PR #5879[1690] - New performance counters related to zero-copy chunks.

HPX V1.8.0 (May 18, 2022)

With HPX parallel algorithms been fully adapted to C++20 the new release achieves full conformance with C++20 concurrency and parallelism facilities. HPX now supports all of the algorithms as specified by C++20. We have added support for vectorization to more of our algorithms. Much work has been done towards implementing P2300 (“std::execution”) and implementing the underlying senders/receivers facilities. Finally, The new release comes with a brand new documentation interface!

General changes

- The new documentation can now be found on our webpage: https://hpx-docs.stellar-group.org. This includes a completely new and user-friendly interface environment along with restructuring of certain components. The content in the "Quick start", "Manual" and "Examples" was improved, while the "Build system" page was adapted to include necessary information for newcommers.
- With the vectorization support available in modern hardware architectures HPX now provides new data-parallel vector execution policies `hpx::execution::simd` and `hpx::execution::par_simd` that enable significant speed-up of our parallel algorithm implementations. The following algorithms now support SIMD execution:
  - `copy`, `copy_n`
  - `generate`
  - `adjacent_difference`, `adjacent_find`
  - `all_of`, `any_of`, `none_of`
  - `equal`, `mismatch`,
  - `inner_product`
  - `count`, `count_if`
  - `fill`, `fill_n`
  - `find`, `find_end`, `find_first_of`, `find_if`, `find_if_not`
  - `for_each`, `for_each_n`
  - `generate`, `generate_n`.
- Based on top of P2300 the HPX parallel algorithms now support the pipeline syntax towards an effort to unify their usage along with senders/receivers. The HPX parallel algorithms can now bind with senders/receivers using the pipeline operator.
- Several changes took place on the executors provided by HPX:
- The executors now support the `num_cores` options in order for the user to be able to specify the desired number of cores to be used in the correspodning execution.
- The `scheduler` executor was implemented on top of senders/receivers and can be used with all HPX facilities that schedule new work, such as parallel algorithms, `hpx::async`, `hpx::dataflow`, etc.
- The performance of `fork_join_executor` was improved.
- The following algorithms have been added/adapted to be C++20 conformant:
  - `min_element`
  - `max_element`
  - `minmax_element`
  - `starts_with`
  - `ends_with`
  - `swap_ranges`
  - `unique`
  - `unique_copy`

- rotate
- rotate_copy
- sort
- shift_left
- shift_right
- stable_sort
- partition
- partition_copy
- stable_partition
- adjacent_difference
- nth_element
- partial_sort
- partial_sort_copy.

* HPX_FORWARD/HPX_MOVE macros were introduced that replaced the std::move and std::forward facilities that in the library code.
* Hangs on distributed barrier were fixed.
* The performance of scan_partitioner was improved.
* Support was added for thread_priority to the parallel_execution_policy
* Regarding senders/receivers and the P2300 proposal various actions took place. stop_token was adapted to the recent proposal version (in_place_stop_token was introduced). Also hint, annotation, priority and stacksize properties were added to the scheduler executor. Stop support was added to when_all. Support for completion signatures was added. The following schedulers and algorithms were added:

- get_completion_scheduler
- any_sender and unique_any_sender
- split sender
- transform_mpi sender
- transfer sender
- let_error, let_stopped
- get_env and related environment queries
- schedule, set_value, set_error, set_done, start and connect are now proper customization points as defined in P2300.

* Several namespaces were altered towards conformance with C++20. Compatibility layers have been added and the old versions will be removed in next releases. The namespace changes are the following:

- hpx::parallel::induction/reduction were movied into namespace hpx::experimental
- for_loop and friends were moved into namespace hpx::experimental.
- hpx::util::optional and friends were moved into namespace hpx.

- hpx::lcos::barrier has been moved into the hpx::distributed namespace and hpx::lcos::local::cpp20_barrier has been renamed to barrier and moved into the hpx namespace.
- hpx::lcos::latch has been moved into the hpx::distributed namespace and lcos::local::latch has been moved into the hpx namespace. The count_down_and_wait() functionality of latch has been renamed to arrive_and_wait().
- hpx::util::unique_function_nonser has been renamed to hpx::move_only_function.
- hpx::util::unique_function has been renamed to hpx::distributed::move_only_function.
- hpx::util::function has been renamed to hpx::distributed::function.
- hpx::util::function_nonser has been renamed to hpx::function.
- hpx::util::function_ref have been moved to namespace hpx.
- hpx::lcos::split_future changed namespace and is now used as hpx::split_future.
- hpx::lcos::local::counting_semaphore has been deprecated and hpx::lcos::local::cpp20_counting_semaphore has been renamed to hpx::counting_semaphore.
- hpx::lcos::local::cpp20_binary_semaphore has been renamed to hpx::binary_semaphore.
- hpx::lcos::local::sliding_semaphore has been renamed to hpx::sliding_semaphore and
- hpx::lcos::local::sliding_semaphore_var has been renamed to hpx::sliding_semaphore_var.
- hpx::lcos::local::spinlock has been renamed to hpx::spinlock.
- hpx::lcos::local::mutex has been renamed to hpx::mutex.
- hpx::lcos::local::timed_mutex has been renamed to hpx::timed_mutex.
- hpx::lcos::local::no_mutex has been renamed to hpx::no_mutex.
- hpx::lcos::local::recursive_mutex has been renamed to hpx::recursive_mutex.
- hpx::lcos::local::shared_mutex has been renamed to hpx::shared_mutex.
- hpx::lcos::local::upgrade_lock has been renamed to hpx::upgrade_lock.
- hpx::lcos::local::upgrade_to_unique_lock has been renamed to hpx::upgrade_to_unique_lock.
- hpx::lcos::local::condition_variable has been renamed to hpx::condition_variable. hpx::lcos::local::condition_variable_var has been renamed to hpx::condition_variable_var.
- hpx::lcos::local::once_flag has been renamed to hpx::once_flag, and . hpx::lcos::local::call_once has been renamed to hpx::call_once.

• The new LCI (Lightweight Communication Interface) parcelport was added that supports irregular and asynchronous applications like graph analysis, sparce linear algebra, modern parallel architectures etc. Major features include:

- Support for advanced communication primitives like two sided send/recv and one sided remote put.
- Better multi-threaded performance.
- Explicit user control of communication resource.
- Flexible signaling mechanisms (synchronizer, completion queue, active message handler).

- The following CMake flags were added, mostly to support using HPX as a backend for SHAD (https://github.com/pnnl/SHAD). Please note that these options enable questionable functionalities, partially they even enable undefined behavior. Please only use any of them if you know what you're doing:

- `HPX_SERIALIZATION_WITH_ALLOW_RAW_POINTER_SERIALIZATION`
- `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`
- `HPX_SERIALIZATION_WITH_ALLOW_CONST_TUPLE_MEMBERS`

Breaking changes

- Minimum required C++ standard library is C++17.
- Support for GCC 7 and Clang 8.0.0 and below has been removed.
- CUDA version required updated to 11.4.
- CMake version required updated to 3.18.
- The default version of Asio used was updated to 1.20.0.
- The default version of APEX used was updated to 2.5.1.
- APEX version was updated to 2.5.1.
- `tagged_pair` and `tagged_tuple` were removed.
- `tag_dispatch` was renamed to `tag_invoke`.
- `hpx.max_backgroud_threads` was renamed to `hpx.parcel.max_background_threads`.
- The following CMake flags were removed after being deprecated for at least two releases:

- `HPX_SCHEDULER_MAX_TERMINATED_THREADS`
- `HPX_WITH_GOOGLE_PERFTOOLS`
- `HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY`
- `HPX_HAVE_{COROUTINE,PLUGIN}_GCC_HIDDEN_VISIBILITY`
- `HPX_TOP_LEVEL`
- `HPX_WITH_COMPUTE_CUDA`
- `HPX_WITH_ASYNC_CUDA`

- `annotate_function` was renamed to `scoped_annotation`.
- `execution::transform` was renamed to `execution::then`.
- `execution::detach` was renamed to `execution::start_detached`.
- `execution::on_sender` was renamed to `execution::schedule_on`.

- `execution::just_on` was renamed to `execution::just_transfer`.
- `execution::set_done` was renamed to `execution::set_stopped`.

Closed issues

- Issue #5871[1691] - distributed::channel.regsiter_as terminates the active task.

- PR #5241[2079] - Adapt min_element, max_element and minmax_element to C++20

HPX V1.7.1 (Aug 12, 2021)

This is a bugfix release with a few minor fixes.

General changes

- Added a CMake option to assume that all types are bitwise serializable by default: `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`. The default value `OFF` corresponds to the old behaviour.
- Added a version check for Asio. The minimum Asio version supported by *HPX* is 1.12.0.
- Fixed a bug affecting usage of actions, where the internals of *HPX* relied on function addresses being unique. This was fixed by relying on variable addresses being unique instead.
- Made `hpx::util::bind` more strict in checking the validity of placeholders.
- Small performance improvement to spinlocks.

[2079] https://github.com/TheHPXProject/hpx/pull/5241

- Adapted the following parallel algorithms to C++20: `inclusive_scan`, `exclusive_scan`, `transform_inclusive_scan`, `transform_exclusive_scan`.

Breaking changes

- The experimental `hpx::execution::simdpar` execution policy (introduced in 1.7.0) was renamed to `hpx::execution::par_simd` for consistency with the other parallel policies.

Closed issues

- Issue #5494[2080] - Rename *simdpar* execution policy to *par_simd*
- Issue #5488[2081] - *hpx::util::bind* doesn't bounds-check placeholders
- Issue #5486[2082] - Possible V1.7.1 release

HPX V1.7.0 (Jul 14, 2021)

This release is again focused on C++20 conformance of algorithms. Additionally, many new experimental sender-based algorithms have been added based on the latest proposals.

General changes

- The following algorithms have been adapted to be C++20 conformant:
  - `remove`,
  - `remove_if`,
  - `remove_copy`,
  - `remove_copy_if`,
  - `replace`,
  - `replace_if`,
  - `reverse`, and
  - `lexicographical_compare`.
- When the compiler and standard library support the standard execution policies `std::execution::seq`, `std::execution::par`, and `std::execution::par_unseq` they can now be used in all *HPX* parallel algorithms with equivalent behaviour to the non-task policies `hpx::execution::seq`, `hpx::execution::par`, and `hpx::execution::par_unseq`.
- Vc support has been fixed, after being broken in 1.6.0. In addition, *HPX* now experimentally supports GCC's SIMD implementation, when available. The implementation can be used through the `hpx::execution::simd` and `hpx::execution::simdpar` execution policies.
- The customization points `sync_execute`, `async_execute`, `then_execute`, `post`, `bulk_sync_execute`, `bulk_async_execute`, and `bulk_then_execute` are now implemented using `tag_dispatch` (previously `tag_invoke`). Executors can still be implemented by providing the aforementioned functions as member functions of an executor.
- New functionality, enhancements, and fixes based on P0443r14 (executors proposal) and P1897 (sender-based algorithms) have been added to the `hpx::execution::experimental` namespace. These can be accessed through the `hpx/execution.hpp` and `hpx/local/execution.hpp` headers. In particular, the following sender-based algorithms have been added:
  - `detach`,
  - `ensure_started`,
  - `just`,
  - `just_on`,
  - `let_error`,
  - `let_value`,
  - on,

  - `transform`, and
  - `when_all`.

  Additionally, futures now implement the sender concept. `make_future` can be used to turn a sender into a future. All functionality is experimental and can change without notice.

- All `hpx::init` and `hpx::start` overloads now take `std::functions` instead of `hpx::util::function_nonser`. No changes should be required in user code to accommodate this change.
- `hpx::util::unwrapping` and other related unwrapping functionality has been moved up into the `hpx` namespace. Names in `hpx::util` are still usable with a deprecation warning. This functionality can now be accessed through the `hpx/unwrap.hpp` and `hpx/local/unwrap.hpp` headers.
- The default tag for APEX has been update from 2.3.1 to 2.4.0. In particular, this fixes a bug which could lead to hangs in distributed runs.
- The dependency on Boost.Asio has been replaced with the standalone Asio available at https://github.com/chriskohlhoff/asio. By default, a system-installed Asio will be used. `ASIO_ROOT` can be given as a hint to tell CMake where to find Asio. Alternatively, Asio can be fetched automatically using CMake's fetchcontent by setting `HPX_WITH_FETCH_ASIO=ON`. In general, dependencies on Boost have again been reduced.
- Modularization of the library has continued. In this release almost all functionality has been moved into modules. These changes do not generally affect user code. Warnings are still issued for headers that have moved.
- hipBLAS is now optional when compiling with `hipcc`. A warning instead of an error will be printed if hipBLAS is not found during configuration.
- Previously `HPX_COMPUTE_HOST_CODE` was defined in host code only if HPX was configured with CUDA or HIP. In this release `HPX_COMPUTE_HOST_CODE` is always defined in host code.
- An experimental `HPX_WITH_PRECOMPILED_HEADERS` CMake option has been added to use precompiled headers when building *HPX*. This option should not be used on Windows.
- Numerous bug fixes.

Breaking changes

- The minimum required CMake version is now 3.17.
- The minimum required Boost version is now 1.71.0.
- The customization mechanism used to implement and extend sender functionality and algorithms has been renamed from `tag_invoke` to `tag_dispatch`. All customization of sender functionality should be done by overloading `tag_dispatch`.
- The following compatibility options have been removed, along with their compatibility implementations: - `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY` - `HPX_WITH_ACTION_BASE_COMPATIBILITY` - `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY` - `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. - `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY` - `HPX_WITH_REGISTER_THREAD_COMPATIBILITY` -

HPX_WITH_REGISTER_THREAD_OVERLOADS_COMPATIBILITY - HPX_WITH_THREAD_AWARE_TIMER_COMPATIBILITY - HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY - HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY

- The HPX_WITH_THREAD_SCHEDULERS CMake option has been removed. All schedulers are now enabled when possible.
- HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY has been turned off by default.

HPX V1.6.0 (Feb 17, 2021)

General changes

This release continues the focus on C++20 conformance with multiple new algorithms adapted to be C++20 conformant and becoming customization point objects (CPOs). We have also added experimental support for HIP, allowing previous CUDA features to now be compiled with hipcc and run on AMD GPUs.

- The following algorithms have been adapted to be C++20 conformant: `adjacent_find`, `includes`, `inplace_merge`, `is_heap`, `is_heap_until`, `is_partitioned`, `is_sorted`, `is_sorted_until`, `merge`, `set_difference`, `set_intersection`, `set_symmetric_difference`, `set_union`.
- Experimental HIP support can be enabled by compiling *HPX* with `hipcc`. All CUDA functionality in *HPX* can now be used with HIP. The HIP functionality is for the time being exposed through the same API as the CUDA functionality, i.e. no changes are required in user code. The CUDA, and now HIP, functionality is in the `hpx::cuda` namespace.
- We have added `partial_sort` based on Francisco Tapia's implementation.
- `hpx::init` and `hpx::start` gained new overloads taking an `hpx::init_params` struct in 1.5.0. All overloads not taking an `hpx::init_params` are now deprecated.
- We have added an experimental `fork_join_executor`. This executor can be used for OpenMP-style fork-join parallelism, where the latency of a parallel region is important for performance.
- The `parallel_executor` now uses a hierarchical spawning scheme for bulk execution, which improves data locality and performance.
- `hpx::dataflow` can now be used with executors that inject additional parameters into the call of the user-provided function.
- We have added experimental support for properties as proposed in P2220[2340]. Currently the only supported property is the scheduling hint on `parallel_executor`.

[2333] https://github.com/TheHPXProject/hpx/pull/5144
[2334] https://github.com/TheHPXProject/hpx/pull/5125
[2335] https://github.com/TheHPXProject/hpx/pull/5117
[2336] https://github.com/TheHPXProject/hpx/pull/5099
[2337] https://github.com/TheHPXProject/hpx/pull/5092
[2338] https://github.com/TheHPXProject/hpx/pull/5053
[2339] https://github.com/TheHPXProject/hpx/pull/5044
[2340] https://wg21.link/p2220

- `hpx::util::annotated_function` can now be passed a dynamically generated `std::string`.
- In moving functionality to new namespaces, old names have been deprecated. A deprecation warning will be issued if you are using deprecated functionality, with instructions on how to correct or ignore the warning.
- We have removed all support for C and Fortran from our build system.
- We have further reduced the use of Boost types within *HPX* (`boost::system::error_code` and `boost::detail::spinlock`).
- We have enabled more warnings in our CI builds (unused variables and unused typedefs).

Breaking changes

- hpxMP support has been completely removed.
- The `verbs` parcelport has been removed.
- The following compatibility options have been disabled by default: `HPX_WITH_ACTION_BASE_COMPATIBILITY`, `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`, `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`, `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`, `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`, `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`, `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`, `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`, `HPX_THREAD_AWARE_TIMER_COMPATIBILITY`, `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. Unless noted here, the above functionalities do not come with replacements. Unscoped enumerations have been replaced by scoped enumerations. Previously deprecated unscoped enumerations are disabled by `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`. Newly deprecated unscoped enumerations have been given deprecation warnings and replaced by scoped enumerations. `hpx::promise` has been replaced with `hpx::distributed::promise`. `hpx::program_options` is a drop-in replacement for `boost::program_options`. `hpx::execution::parallel_executor` now has constructors which take a thread pool, covering the use case of `hpx::threads::executors::pool_executor`. A pool can be supplied with `hpx::resource::get_thread_pool`.

- PR #5167[2369] - Fixing deprecation warnings that slipped through the net
- PR #5159[2370] - Update APEX tag to 2.3.1
- PR #5154[2371] - Splitting unit tests on circleci to avoid timeouts
- PR #5151[2372] - Use C++20 on `clang-newest` Jenkins CI configuration
- PR #5149[2373] - Rename `'module'` symbols to avoid keyword conflict
- PR #5145[2374] - Adjust handling of CUDA/HIP options in CMake
- PR #5142[2375] - Store annotated_function annotations as `std::strings`
- PR #5140[2376] - Scheduler mode
- PR #5139[2377] - Fix path problem in pre-commit hook, add summary commit line
- PR #5138[2378] - Add program options variable map to resource partitioner init
- PR #5137[2379] - Remove the use of `boost::throw_exception`
- PR #5136[2380] - Make sure codespell checks run on CircleCI
- PR #5132[2381] - Fixing spelling errors
- PR #5131[2382] - Mark `counting_iterator` member functions as `HPX_HOST_DEVICE`
- PR #5130[2383] - Adding specialization for `std::hash<hpx::thread::id>`
- PR #5128[2384] - Fixing environment handling for FreeBSD
- PR #5127[2385] - Fix typo in fibonacci documentation
- PR #5123[2386] - Reduce vector sizes in partial sort benchmarks when running in debug mode
- PR #5122[2387] - Making sure exceptions during runtime initialization are correctly reported
- PR #5121[2388] - Working around hwloc limitation on certain platforms
- PR #5120[2389] - Fixing compatibility warnings in `hpx::transform` implementation
- PR #5119[2390] - Use `sequential_find` and friends from separate detail header

- PR #5116[2391] - Fix compilation with timer pool off
- PR #5114[2392] - Fix 5112 - make sure libatomic is used when needed
- PR #5109[2393] - Remove default runtime mode argument from init overload, again
- PR #5108[2394] - Refactor `iter_sent.hpp` to make structs lowercase
- PR #5107[2395] - Relax `dataflow` internals
- PR #5106[2396] - Change initialization of property CPOs to satisfy older nvcc versions
- PR #5104[2397] - Fix regeneration of two files that trigger unnecessary rebuilds
- PR #5103[2398] - Remove default runtime mode argument from start/init overloads
- PR #5102[2399] - Untie deprecated thread enums from the CMake option
- PR #5101[2400] - Update APEX tag for 1.6.0
- PR #5100[2401] - Bump minimum required Boost version to 1.66 and update CI configurations
- PR #5098[2402] - Minor fixes to public API listing
- PR #5097[2403] - Remove hpxMP support
- PR #5096[2404] - Remove fractals examples
- PR #5095[2405] - Use all AMD nodes again on rostam
- PR #5094[2406] - Attempt to remove macOS workaround for GH actions environment
- PR #5093[2407] - Remove verbs parcelport
- PR #5091[2408] - Avoid moving from lvalues
- PR #5090[2409] - Adopt C++20 `std::endian`
- PR #5085[2410] - Update daint CI to use Boost 1.75.0
- PR #5084[2411] - Disable compatibility options for 1.6.0 release
- PR #5083[2412] - Remove duplicated call to the `limiting_executor` in `future_overhead` test

- PR #5079[2413] - Add checks to make sure that MPI/CUDA polling is enabled/not disabled too early
- PR #5078[2414] - Add install lib directory to list of component search paths
- PR #5076[2415] - Fix a typo in the jenkins `clang-newest` cmake config
- PR #5074[2416] - Fixing warnings generated by MSVC
- PR #5073[2417] - Allow using noncopyable types with unwrapping
- PR #5072[2418] - Fix `is_convertible` args in `result_types`
- PR #5071[2419] - Fix unused parameters
- PR #5070[2420] - Fix unused variables warnings in hipcc
- PR #5069[2421] - Add support for sentinels to `adjacent_find`
- PR #5068[2422] - Fix string split function
- PR #5066[2423] - Adapt `search` to C++20 and Range TS
- PR #5065[2424] - Fix `hpx::range::adjacent_find` doxygen function signatures
- PR #5064[2425] - Refactor runtime configuration, command line handling, and resource partitioner
- PR #5063[2426] - Limit the device code guards to the distributed parts of the `future_overhead` bench
- PR #5061[2427] - Remove hipcc guards in examples and tests
- PR #5060[2428] - Fix deprecation warnings generated by msvc
- PR #5059[2429] - Add warning about suspending/resuming the runtime in multi-locality scenarios
- PR #5057[2430] - Fix unused variable warnings
- PR #5056[2431] - Fix `hpx::util::get`
- PR #5055[2432] - Remove hipcc guards
- PR #5054[2433] - Fix typo

- PR #5051[2434] - Adapt transform to C++20
- PR #5050[2435] - Replace old init overloads in tests and examples
- PR #5048[2436] - Limit jenkins hipcc to the reno node
- PR #5047[2437] - Limit cuda jenkins run to nodes with exclusively Nvidia GPUs
- PR #5046[2438] - Convert thread and future enums to class enums
- PR #5043[2439] - Improve `hpxrun.py` for Phylanx
- PR #5042[2440] - Add missing header to partial sort test
- PR #5041[2441] - Adding Francisco Tapia's implementation of `partial_sort`
- PR #5040[2442] - Remove generated headers left behind from a previous configuration
- PR #5039[2443] - Fix GCC 10 release builds
- PR #5037[2444] - Add `is_invocable` typedefs to top-level `hpx` namespace and public API list
- PR #5036[2445] - Deprecate `hpx::util::decay` in favor of `std::decay`
- PR #5034[2446] - Use versioned container image on CircleCI
- PR #5033[2447] - Implement P2220 properties module
- PR #5032[2448] - Do codespell comparison only on files changed from common ancestor
- PR #5031[2449] - Moving traits files to `actions_base`
- PR #5030[2450] - Add codespell version print in circleci
- PR #5029[2451] - Work around problems in GitHub actions macOS builder
- PR #5028[2452] - Moving move files to naming and naming_base
- PR #5027[2453] - Lessen constraints on certain algorithm arguments
- PR #5025[2454] - Adapt `is_sorted` and `is_sorted_until` to C++20
- PR #5024[2455] - Moving `naming_base` to full modules
- PR #5022[2456] - Remove C language from `CMakeLists.txt`

- PR #4642[2512] - Implementing `operation_state` concept in terms of P0443r13
- PR #4640[2513] - Implementing receiver concept in terms of P0443r13
- PR #4622[2514] - Sanitizer fixes

HPX V1.5.1 (Sep 30, 2020)

General changes

This is a patch release. It contains the following changes:

- Remove restriction on suspending runtime with multiple localities, users are now responsible for synchronizing work between localities before suspending.
- Fixes several compilation problems and warnings.
- Adds notes in the documentation explaining how to cite HPX.

HPX V1.5.0 (Sep 02, 2020)

General changes

The main focus of this release is on APIs and C++20 conformance. We have added many new C++20 features and adapted multiple algorithms to be fully C++20 conformant. As part of the modularization we have begun specifying the public API of *HPX* in terms of headers and functionality, and aligning it more closely to the C++ standard. All non-distributed modules are now in place, along with an experimental option to completely disable distributed features in *HPX*. We have also added experimental asynchronous MPI and CUDA executors. Lastly this release introduces CMake targets for depending projects, performance improvements, and many bug fixes.

[2528] https://github.com/TheHPXProject/hpx/pull/4939

- We have added the C++20 features `hpx::jthread` and `hpx::stop_token`. `hpx::condition_variable_any` now exposes new functions supporting `hpx::stop_token`.
- We have added `hpx::stable_sort` based on Francisco Tapia's implementation.
- We have adapted existing synchronization primitives to be fully conformant C++20: `hpx::barrier`, `hpx::latch`, `hpx::counting_semaphore`, and `hpx::binary_semaphore`.
- We have started using customization point objects (CPOs) to make the corresponding algorithms fully conformant to C++20 as well as to make algorithm extension easier for the user. `all_of`/`any_of`/`none_of`, `copy`, `count`, `destroy`, `equal`, `fill`, `find`, `for_each`, `generate`, `mismatch`, `move`, `reduce`, `transform_reduce` are using those CPOs (all in namespace `hpx`). We also have adapted their corresponding `hpx::ranges` versions to be conforming to C++20 in this release.
- We have adapted support for `co_await` to C++20, in addition to `hpx::future` it now also supports `hpx::shared_future`. We have also added allocator support for futures returned by `co_return`. It is no longer in the `experimental` namespace.
- We added serialization support for `std::variant` and `std::tuple`.
- `result_of` and `is_callable` are now deprecated and replaced by `invoke_result` and `is_invocable` to conform to C++20.
- We continued with the modularization, making it easier for us to add the new experimental `HPX_WITH_DISTRIBUTED_RUNTIME` CMake option (see below) . An significant amount of headers have been deprecated. We adapted the namespaces and headers we could to be closer to the standard ones (*Public API*). Depending code should still compile, however warnings are now generated instructing to change the include statements accordingly.
- It is now possible to have a basic CUDA support including a helper function to get a future from a CUDA stream and target handling. They are available under the `hpx::cuda::experimental` namespace and they can be enabled with the `-DHPX_WITH_ASYNC_CUDA=ON` CMake option.
- We added a new `hpx::mpi::experimental` namespace for getting futures from an asynchronous MPI call and a new minimal MPI executor `hpx::mpi::experimental::executor`. These can be enabled with the `-DHPX_WITH_ASYNC_MPI=On` CMake option.
- A polymorphic executor has been implemented to reduce compile times as a function accepting executors can potentially be instantiated only once instead of multiple times with different executors. It accepts the function signature as a template argument. It needs to be constructed from any other executor. Please note, that the function signatures that can be scheduled using `then_execute`, `bulk_sync_execute`, `bulk_async_execute` and `bulk_then_execute` are slightly different (See the comment in PR #4514[2529] for more details).
- The underlying executor of `block_executor` has been updated to a newer one.
- We have added a parameter to `auto_chunk_size` to control the amount of iterations to measure.
- All executor parameter hooks can now be exposed through the executor itself. This will allow to deprecate the `.with()` functionality on execution policies in the future. This is

[2529] https://github.com/TheHPXProject/hpx/pull/4514

also a first step towards simplifying our executor APIs in preparation for the upcoming C++23 executors (senders/receivers).

- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`. Please note this is a breaking change without backwards-compatibility option. We have converted all of those APIs to be based on customization point objects. Two new executors have been added to enable easy integration of the existing resiliency features with other facilities (like the parallel algorithms): `replay_executor` and `replicate_executor`.
- We have added performance counters type information (`aggregating`, `monotonically increasing`, `average count`, `average timer`, etc.).
- HPX threads are now re-scheduled on the same worker thread they were suspended on to avoid cache misses from moving from one thread to the other. This behavior doesn't prevent the thread from being stolen, however.
- We have added a new configuration option `hpx.exception_verbosity` to allow to control the level of verbosity of the exceptions (3 levels available).
- `broadcast_to`, `broadcast_from`, `scatter_to` and `scatter_from` have been added to the collectives, modernization of `gather_here` and `gather_there` with futures taken by rvalue references. See the breaking change on `all_to_all` in the next section. None of the collectives need supporting macros anymore (e.g. specifying the data types used for a collective operation using `HPX_REGISTER_ALLGATHER` and similar is not needed anymore).
- New API functions have been added: a) to get the number of cores which are idle (`hpx::get_idle_core_count`) and b) returning a bitmask representing the currently idle cores (`hpx::get_idle_core_mask`).
- We have added an experimental option to only enable the local runtime, you can disable the distributed runtime with `HPX_WITH_DISTRIBUTED_RUNTIME=OFF`. You can also enable the local runtime by using the `--hpx:local` runtime option.
- We fixed task annotations for actions.
- The alias `hpx::promise` to `hpx::lcos::promise` is now deprecated. You can use `hpx::lcos::promise` directly instead. `hpx::promise` will refer to the local-only promise in the future.
- We have added a `prepare_checkpoint` API function that calculates the amount of necessary buffer space for a particular set of arguments checkpointed.
- We have added `hpx::upgrade_lock` and `hpx::upgrade_to_unique_lock`, which make `hpx::shared_mutex` (and similar) usable in more flexible ways.
- We have changed the CMake targets exposed to the user, it now includes `HPX::hpx`, `HPX::wrap_main` (`int main` as the first *HPX* thread of the application, see *Starting the HPX runtime*), `HPX::plugin`, `HPX::component`. The CMake variables `HPX_INCLUDE_DIRS` and `HPX_LIBRARIES` are deprecated and will be removed in a future release, you should now link directly to the `HPX::hpx` CMake target.
- A new example is demonstrating how to create and use a wrapping executor (`quickstart/executor_with_thread_hooks.cpp`)
- A new example is demonstrating how to disable thread stealing during the execution of parallel algorithms (`quickstart/disable_thread_stealing_executor.cpp`)
- We now require for our CMake build system configuration files to be formatted using cmake-format.

- We have removed more dependencies on various Boost libraries.
- We have added an experimental option enabling unity builds of HPX using the `-DHPX_WITH_UNITY_BUILD=On` CMake option.
- Many bug fixes.

Breaking changes

- *HPX* now requires a C++14 capable compiler. We have set the *HPX* C++ standard automatically to C++14 and if it needs to be set explicitly, it should be specified through the `CMAKE_CXX_STANDARD` setting as mandated by CMake. The `HPX_WITH_CXX*` variables are now deprecated and will be removed in the future.
- Building and using HPX is now supported only when using CMake V3.13 or later, Boost V1.64 or newer, and when compiling with clang V5, gcc V7, or VS2019, or later. Other compilers might still work but have not been tested thoroughly.
- We have added a `hpx::init_params` struct to pass parameters for *HPX* initialization e.g. the resource partitioner callback to initialize thread pools (*Using the resource partitioner*).
- The `all_to_all` algorithm is renamed to `all_gather`, and the new `all_to_all` algorithm is not compatible with the old one.
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`.

- PR #4926[2627] - Rename distributed_executors module to executors_distributed
- PR #4925[2628] - Making transform_reduce conforming to C++20
- PR #4923[2629] - Don't acquire lock if not needed
- PR #4921[2630] - Update the release notes for the release candidate 3
- PR #4920[2631] - Disable libcds release
- PR #4919[2632] - Make cuda event pool dynamic instead of fixed size
- PR #4917[2633] - Move chrono functionality to hpx::chrono namespace
- PR #4916[2634] - HPX_HAVE_DEPRECATION_WARNINGS needs to be set even when disabled
- PR #4915[2635] - Moving more action related files to actions modules
- PR #4914[2636] - Add alias targets with namespaces used for exporting
- PR #4912[2637] - Aggregate initialize CPOs
- PR #4910[2638] - Explicitly specify hwloc root on Jenkins CSCS builds
- PR #4908[2639] - Fix algorithms documentation
- PR #4907[2640] - Remove HPX::hpx_no_wrap_main target
- PR #4906[2641] - Fixing unused variable warning
- PR #4905[2642] - Adding specializations for simple for_loops
- PR #4904[2643] - Update boost to 1.74.0 for the newest jenkins configs
- PR #4903[2644] - Hide GITHUB_TOKEN environment variables from environment variable output
- PR #4902[2645] - Cancel previous pull requests builds before starting a new one with Jenkins
- PR #4901[2646] - Update public API list with updated algorithms
- PR #4899[2647] - Suggested changes for HPX V1.5 release notes
- PR #4898[2648] - Minor tweak to hpx::equal implementation

- PR #4896[2649] - Making generate() and generate_n conforming to C++20
- PR #4895[2650] - Update apex tag
- PR #4894[2651] - Fix exception handling for tasks
- PR #4893[2652] - Remove last use of std::result_of, removed in C++20
- PR #4892[2653] - Adding replay_executor and replicate_executor
- PR #4889[2654] - Restore old behaviour of not requiring linking to hpx_wrap when HPX_WITH_DYNAMIC_HPX_MAIN=OFF
- PR #4887[2655] - Making sure remotely thrown (non-hpx) exceptions are properly marshaled back to invocation site
- PR #4885[2656] - Adapting hpx::find and friends to C++20
- PR #4884[2657] - Adapting mismatch to C++20
- PR #4883[2658] - Adapting hpx::equal to be conforming to C++20
- PR #4882[2659] - Fixing exception handling for hpx::copy and adding missing tests
- PR #4881[2660] - Adds different runtime exception when registering thread with the HPX runtime
- PR #4876[2661] - Adding example demonstrating how to disable thread stealing during the execution of parallel algorithms
- PR #4874[2662] - Adding non-policy tests to all_of, any_of, and none_of
- PR #4873[2663] - Set CUDA compute capability on rostam Jenkins builds
- PR #4872[2664] - Force partitioned vector scan tests to run serially
- PR #4870[2665] - Making move conforming with C++20
- PR #4869[2666] - Making destroy and destroy_n conforming to C++20
- PR #4868[2667] - Fix miscellaneous header problems
- PR #4867[2668] - Add CPOs for for_each
- PR #4865[2669] - Adapting count and count_if to be conforming to C++20

- PR #4864[2670] - Release notes 1.5.0
- PR #4863[2671] - adding libcds-hpx tag to prepare for hpx1.5 release
- PR #4862[2672] - Adding version specific deprecation options
- PR #4861[2673] - Limiting executor improvements
- PR #4860[2674] - Making fill and fill_n compatible with C++20
- PR #4859[2675] - Adapting all_of, any_of, and none_of to C++20
- PR #4857[2676] - Improve libCDS integration
- PR #4856[2677] - Correct typos in the documentation of the hpx performance counters
- PR #4854[2678] - Removing obsolete code
- PR #4853[2679] - Adding test that derives component from two other components
- PR #4852[2680] - Fix mpi_ring test in distributed mode by ensuring all ranks run hpx_main
- PR #4851[2681] - Converting resiliency APIs to tag_invoke based CPOs
- PR #4849[2682] - Enable use of future_overhead test when DISTRIBUTED_RUNTIME is OFF
- PR #4847[2683] - Fixing 'error prone' constructs as reported by Codacy
- PR #4846[2684] - Disable Boost.Asio concepts support
- PR #4845[2685] - Fix PAPI counters
- PR #4843[2686] - Remove dependency on various Boost headers
- PR #4841[2687] - Rearrange public API headers
- PR #4840[2688] - Fixing TSS problems during thread termination
- PR #4839[2689] - Fix async_cuda build problems when distributed runtime is disabled
- PR #4837[2690] - Restore compatibility for old (now deprecated) copy algorithms
- PR #4836[2691] - Adding CPOs for hpx::reduce
- PR #4835[2692] - Remove *using util::result_of* from namespace hpx

- PR #4834[2693] - Fixing the calculation of the number of idle cores and the corresponding idle masks
- PR #4833[2694] - Allow thread function destructors to yield
- PR #4832[2695] - Fixing assertion in split_gids and memory leaks in 1d_stencil_7
- PR #4831[2696] - Making sure MPI_CXX_COMPILE_FLAGS is interpreted as a sequence of options
- PR #4830[2697] - Update documentation on using HPX::wrap_main
- PR #4827[2698] - Update clang-newest configuration to use clang 10
- PR #4826[2699] - Add Jenkins configuration for rostam
- PR #4825[2700] - Move all CUDA functionality to hpx::cuda::experimental namespace
- PR #4824[2701] - Add support for building master/release branches to Jenkins configuration
- PR #4821[2702] - Implement customization point for hpx::copy and hpx::ranges::copy
- PR #4819[2703] - Allow finding Boost components before finding HPX
- PR #4817[2704] - Adding range version of stable sort
- PR #4815[2705] - Fix a wrong #ifdef for IO/TIMER pools causing build errors
- PR #4814[2706] - Replace hpx::function_nonser with std::function in error module
- PR #4809[2707] - Foreach adapt
- PR #4808[2708] - Make internal algorithms functions const
- PR #4807[2709] - Add Jenkins configuration for running on Piz Daint
- PR #4806[2710] - Update documentation links to new domain name
- PR #4805[2711] - Applying changes that resolve time complexity issues in sort
- PR #4803[2712] - Adding implementation of stable_sort
- PR #4802[2713] - Fix datapar header paths
- PR #4801[2714] - Replace boost::shared_array<T> with std::shared_ptr<T[]> if supported

- PR #4799[2715] - Fixing #include paths in compatibility headers
- PR #4798[2716] - Include the main module header (fixes partially #4488)
- PR #4797[2717] - Change cmake targets
- PR #4794[2718] - Removing 128bit integer emulation
- PR #4793[2719] - Make sure global variable is handled properly
- PR #4792[2720] - Replace enable_if with **HPX_CONCEPT_REQUIRES_** and add is_sentinel_for constraint
- PR #4790[2721] - Move deprecation warnings from base template to template specializations for result_of etc. structs
- PR #4789[2722] - Fix hangs during assertion handling and distributed runtime construction
- PR #4788[2723] - Fixing inclusive transform scan algorithm to properly handle initial value
- PR #4785[2724] - Fixing barrier test
- PR #4784[2725] - Fixing deleter argument bindings in serialize_buffer
- PR #4783[2726] - Add coveralls badge
- PR #4782[2727] - Make header tests parallel again
- PR #4780[2728] - Remove outdated comment about hpx::stop in documentation
- PR #4776[2729] - debug print improvements
- PR #4775[2730] - Checkpoint cleanup
- PR #4771[2731] - Fix compilation with HPX_WITH_NETWORKING=OFF
- PR #4767[2732] - Remove all force linking leftovers
- PR #4765[2733] - Fix 1d stencil index calculation
- PR #4764[2734] - Force some tests to run serially
- PR #4762[2735] - Update pointees in compatibility headers
- PR #4761[2736] - Fix running and building of execution module tests on CircleCI

- PR #4725[2760] - Add more compatibility headers for deprecated module headers
- PR #4724[2761] - Fix 4723
- PR #4721[2762] - Attempt to fixing migration tests
- PR #4717[2763] - Make the compatilibility headers macro conditional
- PR #4716[2764] - Add hpx/runtime.hpp and hpx/distributed/runtime.hpp API headers
- PR #4714[2765] - Add hpx/future.hpp header
- PR #4713[2766] - Remove hpx/runtime/threads_fwd.hpp and hpx/util_fwd.hpp
- PR #4711[2767] - Make module deprecation warnings overridable
- PR #4710[2768] - Add compatibility headers and other fixes after module header renaming
- PR #4708[2769] - Add termination handler for parallel algorithms
- PR #4707[2770] - Use hpx::function_nonser instead of std::function internally
- PR #4706[2771] - Move header file to module
- PR #4705[2772] - Fix incorrect behaviour of cmake-format check
- PR #4704[2773] - Fix resource tests
- PR #4701[2774] - Fix missing includes for future::then specializations
- PR #4700[2775] - Removing obsolete memory component
- PR #4699[2776] - Add short descriptions to modules missing documentation
- PR #4696[2777] - Rename generated modules headers
- PR #4693[2778] - Overhauling thread_mapper for public consumption
- PR #4688[2779] - Fix thread stack size handling
- PR #4687[2780] - Adding all_gather and fixing all_to_all
- PR #4684[2781] - Miscellaneous compilation fixes
- PR #4683[2782] - Fix HPX_WITH_DYNAMIC_HPX_MAIN=OFF

- PR #4682[2783] - Fix compilation of pack_traversal_rebind_container.hpp
- PR #4681[2784] - Add missing hpx/execution.hpp includes for future::then
- PR #4678[2785] - Typeless communicator
- PR #4677[2786] - Forcing registry option to be accepted without checks.
- PR #4676[2787] - Adding scatter_to/scatter_from collective operations
- PR #4673[2788] - Fix PAPI counters compilation
- PR #4671[2789] - Deprecate hpx::promise alias to hpx::lcos::promise
- PR #4670[2790] - Explicitly instantiate get_exception
- PR #4667[2791] - Add *stopValue* in *Sentinel* struct instead of *Iterator*
- PR #4666[2792] - Add release build on Windows to GitHub actions
- PR #4664[2793] - Creating itt_notify module.
- PR #4663[2794] - Mpi fixes
- PR #4659[2795] - Making sure declarations match definitions in register_locks implementation
- PR #4655[2796] - Fixing task annotations for actions
- PR #4653[2797] - Making sure APEX is linked into every application, if needed
- PR #4651[2798] - Update get_function_annotation.hpp
- PR #4646[2799] - Runtime type
- PR #4645[2800] - Add a few more API headers
- PR #4644[2801] - Fixing support for mpirun (and similar)
- PR #4643[2802] - Fixing the fix for get_idle_core_count() API
- PR #4638[2803] - Remove HPX_API_EXPORT missed in previous cleanup
- PR #4636[2804] - Adding C++20 barrier
- PR #4635[2805] - Adding C++20 latch API

- PR #4634[2806] - Adding C++20 counting semaphore API
- PR #4633[2807] - Unify execution parameters customization points
- PR #4632[2808] - Adding missing bulk_sync_execute wrapper to example executor
- PR #4631[2809] - Updates to documentation; grammar edits.
- PR #4630[2810] - Updates to documentation; moved hyperlink
- PR #4624[2811] - Export set_self_ptr in thread_data.hpp instead of with forward declarations where used
- PR #4623[2812] - Clean up export macros
- PR #4621[2813] - Trigger an error for older boost versions on power architectures
- PR #4617[2814] - Ignore user-set compatibility header options if the module does not have compatibility headers
- PR #4616[2815] - Fix cmake-format warning
- PR #4615[2816] - Add handler for serializing custom exceptions
- PR #4614[2817] - Fix error message when HPX_IGNORE_CMAKE_BUILD_TYPE_COMPATIBILITY=OFF
- PR #4613[2818] - Make partitioner constructor private
- PR #4611[2819] - Making auto_chunk_size execute the given function using the given executor
- PR #4610[2820] - Making sure the thread-local lock registration data is moving to the core the suspended HPX thread is resumed on
- PR #4609[2821] - Adding an API function that exposes the number of idle cores
- PR #4608[2822] - Fixing moodycamel namespace
- PR #4607[2823] - Moving winsocket initialization to core library
- PR #4606[2824] - Local runtime module etc.
- PR #4604[2825] - Add config_registry module
- PR #4603[2826] - Deal with distributed modules in their respective CMakeLists.txt

- PR #4455[2916] - Move deadlock_detection and maintain_queue_wait_times source files into schedulers module
- PR #4450[2917] - Fixing compilation with std::filesystem enabled
- PR #4449[2918] - Fixing build system to actually build variant test
- PR #4447[2919] - This fixes an obsolete #include
- PR #4446[2920] - Resume tasks where they were suspended
- PR #4444[2921] - Minor CUDA fixes
- PR #4443[2922] - Add missing tests to CircleCI config
- PR #4442[2923] - Adding a tag to all auto-generated files allowing for tools to visually distinguish those
- PR #4441[2924] - Adding performance counter type information
- PR #4440[2925] - Fixing MSVC build
- PR #4439[2926] - Link HPX::plugin and component privately in hpx_setup_target
- PR #4437[2927] - Adding a test that verifies the problem can be solved using a trait specialization
- PR #4434[2928] - Clean up Boost dependencies and copy string algorithms to new module
- PR #4433[2929] - Fixing compilation issues (!) if MPI parcelport is enabled
- PR #4431[2930] - Ignore warnings about name mangling changing
- PR #4430[2931] - Add performance_counters module
- PR #4428[2932] - Don't add compatibility headers to module API reference
- PR #4426[2933] - Add currently failing tests on GitHub actions to blacklist
- PR #4425[2934] - Clean up and correct minimum required versions
- PR #4424[2935] - Making sure hpx.lock_detection=0 works as advertized
- PR #4421[2936] - Making sure interval time stops underlying timer thread on termination
- PR #4417[2937] - Adding serialization support for std::variant (if available) and std::tuple

- PR #4415[2938] - Partially reverting changes applied by PR 4373
- PR #4414[2939] - Added documentation for the compiler-wrapper script hpxcxx.in in creating_hpx_projects.rst
- PR #4413[2940] - Merging from V1.4.1 release
- PR #4412[2941] - Making sure to issue a warning if a file specified using –hpx:options-file is not found
- PR #4411[2942] - Make test specific to HPX_WITH_SHARED_PRIORITY_SCHEDULER
- PR #4407[2943] - Adding minimal MPI executor
- PR #4405[2944] - Fix cross pool injection test, use default scheduler as falback
- PR #4404[2945] - Fix a race condition and clean-up usage of scheduler mode
- PR #4399[2946] - Add more threading modules
- PR #4398[2947] - Add CODEOWNERS file
- PR #4395[2948] - Adding a parameter to auto_chunk_size allowing to control the amount of iterations to measure
- PR #4393[2949] - Use appropriate cache-line size defaults for different platforms
- PR #4391[2950] - Fixing use of allocator for C++20
- PR #4390[2951] - Making –hpx:help behavior consistent
- PR #4388[2952] - Change the resource partitioner initialization
- PR #4387[2953] - Fix roll_release.sh
- PR #4386[2954] - Add warning messages for using thread binding options on macOS
- PR #4385[2955] - Cuda futures
- PR #4384[2956] - Make enabling dynamic hpx_main on non-Linux systems a configuration error
- PR #4383[2957] - Use configure_file for HPXCacheVariables.cmake
- PR #4382[2958] - Update spellchecking whitelist and fix more typos

- PR #4017[3027] - Require C++14

HPX V1.4.1 (Feb 12, 2020)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation issues on Windows, macOS, FreeBSD, and with gcc 10
- Install missing `pdb` files on Windows
- Allow running tests using an installed version of *HPX*
- Skip MPI finalization if HPX has not initialized MPI
- Give a hard error when attempting to use IO counters on Windows

Closed issues

- Issue #4320[3028] - HPX 1.4.0 does not compile with gcc 10
- Issue #4336[3029] - Building HPX 1.4.0 with IO Counters breaks (Windows)
- Issue #4334[3030] - HPX `Debug` and `RelWithDebinfo` builds on Windows not installing `.pdb` files
- Issue #4322[3031] - Undefine VT1 and VT2 after boost includes
- Issue #4314[3032] - Compile error on 1.4.0
- Issue #4307[3033] - `ld: error: duplicate symbol: freebsd_environ`

Closed pull requests

- PR #4376[3034] - Attempt to fix some test build errors on Windows
- PR #4357[3035] - Adding missing `#include`s to fix gcc V10 linker problems
- PR #4353[3036] - Skip `MPI_Finalize` if `MPI_Init` is not called from HPX
- PR #4343[3037] - Give a hard error if IO counters are enabled on non-Linux systems
- PR #4337[3038] - Installing pdb files on Windows
- PR #4335[3039] - Adding capability to buildsystem to use an installed version of HPX

- PR #4310[3041] - Remove environment handling from `exception.cpp`

HPX V1.4.0 (January 15, 2020)

General changes

- We have added the collectives `all_to_all` and `all_reduce`.
- We have added APIs for resiliency, which allows replication and replay for failed tasks. See the *documentation* for more details.
- Components can now be checkpointed.
- Performance improvements to schedulers and coroutines. A significant change is the addition of stackless coroutines. These are to be used for tasks that do not need to be suspended and can reduce overheads noticeably in applications with short tasks. A stackless coroutine can be created with the new stack size `thread_stacksize_nostack`.
- We have added an implementation of `unique_any`, which is a non-copyable version of `any`.
- The `shared_priority_queue_scheduler` has been improved. It now has lower overheads than the default scheduler in many situations. Unlike the default scheduler it fully supports NUMA scheduling hints. Enable it with the command line option `--hpx:queuing=shared-priority`. This scheduler should still be considered experimental, but its use is encouraged in real applications to help us make it production ready.
- We have added the performance counters `background-receive-duration` and `background-receive-overhead` for inspecting the time and overhead spent on receiving parcels in the background.
- Compilation time has been further improved when `HPX_WITH_NETWORKING=OFF`.
- We no longer require compiled Boost dependencies in certain configurations. This requires at least Boost 1.70, compiling on x86 with GCC 9, clang (libc++) 9, or VS2019 in C++17 mode. The dependency on Boost.Filesystem can explicitly be turned on with `HPX_FILESYSTEM_WITH_BOOST_FILESYSTEM_COMPATIBILITY=ON` (it is off by default if the standard library supports `std::filesystem`). Boost.ProgramOptions has been copied into the HPX repository. We have a compatibility layer for users who must explicitly use Boost.ProgramOptions instead of the ProgramOptions provided by HPX. To remove the dependency `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY` must be explicitly set to `OFF`. This option will be removed in a future release. We have also removed several other header-only dependencies on Boost.
- It is now possible to use the process affinity mask set by tools like `numactl` and various batch environments with the command line option `--hpx:use-process-mask`. Enabling this option implies `--hpx:ignore-batch-env`.
- It is now possible to create standalone thread pools without starting the runtime. See the `standalone_thread_pool_executor.cpp` test in the `execution` module for an example.

[3040] https://github.com/TheHPXProject/hpx/pull/4315
[3041] https://github.com/TheHPXProject/hpx/pull/4310

- Tasks annotated with `hpx::util::annotated_function` now have their correct name when using APEX to generate OTF2 files.
- Cloning of APEX was defective in previous releases (it required manual intervention to check out the correct tag or branch). This has been fixed.
- The option `HPX_WITH_MORE_THAN_64_THREADS` is now ignored and will be removed in a future release. The value is instead derived directly from `HPX_WITH_MAX_CPU_COUNT` option.
- We have deprecated compiling in C++11 mode. The next release will require a C++14 capable compiler.
- We have deprecated support for the Vc library. This option will be replaced with SIMD support from the standard library in a future release.
- We have significantly refactored our CMake setup. This is intended to be a non-breaking change and will allow for using HPX through CMake targets in the future.
- We have continued modularizing the HPX library. In the process we have rearranged many header files into module-specific directories. All moved headers have compatibility headers which forward from the old location to the new location, together with a deprecation warning. The compatibility headers will eventually be removed.
- We now enforce formatting with `clang-format` on the majority of our source files.
- We have added SPDX license tags to all files.
- Many bugfixes.

Breaking changes

- The `HPX_WITH_THREAD_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_UNWRAPPED_COMPATIBLITY` option and the associated compatibility layer has been removed.

- Issue #4105[3070] - Bug in `hpx:bind=numa-balanced`
- Issue #4101[3071] - Bound tasks
- Issue #4100[3072] - Add SPDX identifier to all files
- Issue #4085[3073] - `hpx_topology` library should depend on hwloc
- Issue #4067[3074] - HPX fails to build on macOS
- Issue #4056[3075] - Building without thread manager idle backoff fails
- Issue #4052[3076] - Enforce `clang-format` style for modules
- Issue #4032[3077] - Simple hello world fails to launch correctly
- Issue #4030[3078] - Allow threads to skip context switching
- Issue #4029[3079] - Add support for mimalloc
- Issue #4005[3080] - Can't link HPX when APEX enabled
- Issue #4002[3081] - Missing header for algorithm module
- Issue #3989[3082] - conversion from `long` to `unsigned int` requires a narrowing conversion on MSVC
- Issue #3958[3083] - `/statistics/average@` perf counter can't be created
- Issue #3953[3084] - CMake errors from `HPX_AddPseudoDependencies`
- Issue #3941[3085] - CMake error for APEX install target
- Issue #3940[3086] - Convert pseudo-doxygen function documentation into actual doxygen documentation
- Issue #3935[3087] - HPX compiler match too strict?
- Issue #3929[3088] - Buildbot failures on latest HPX stable
- Issue #3912[3089] - I recommend publishing a version that does not depend on the boost library
- Issue #3890[3090] - `hpx.ini` not working
- Issue #3883[3091] - cuda compilation fails because of `-faligned-new`

- PR #4176[3180] - Add back `HPX_LIBRARIES` and friends to `HPXConfig.cmake`
- PR #4175[3181] - Make Vc public and add it to `HPXConfig.cmake`
- PR #4173[3182] - Wait for runtime to be running before returning from hpx::start
- PR #4172[3183] - More protection against shutdown problems in error handling scenarios.
- PR #4171[3184] - Ignore lock in `condition_variable::wait`
- PR #4170[3185] - Adding APEX dependency to MPI parcelport
- PR #4168[3186] - Adding utility include
- PR #4167[3187] - Add a condition to setup the external libraries
- PR #4166[3188] - Add an `INTERNAL_FLAGS` option to link to `hpx_internal_flags`
- PR #4165[3189] - Forward `HPX_*` cmake cache variables to external projects
- PR #4164[3190] - Affinity and batch environment modules
- PR #4162[3191] - Handle `quick exit`
- PR #4160[3192] - Using `target_link_libraries` for cmake versions >= 3.12
- PR #4159[3193] - Make sure `HPX_WITH_NATIVE_TLS` is forwarded to dependent projects
- PR #4158[3194] - Adding allocator imported target as a dependency of allocator module
- PR #4157[3195] - Add `hpx_memory` as a dependency of parcelport plugins
- PR #4156[3196] - Stackless coroutines now can refer to themselves (through get_self() and friends)
- PR #4154[3197] - Added CMake policy CMP0060 for HPX applications.
- PR #4153[3198] - add header `iomanip` to tests and tool
- PR #4152[3199] - Casting MPI tag value
- PR #4149[3200] - Add back private `m_desc` member variable in program_options module
- PR #4147[3201] - Resource partitioner and threadmanager modules
- PR #4146[3202] - Google Season of Docs updates to documentation; creating hpx projects

- PR #3701[3405] - MoodyCamel lockfree
- PR #3496[3406] - Disabling MPI's (deprecated) C++ interface
- PR #3192[3407] - Move type info into `hpx::debug` namespace and add print helper functions
- PR #3159[3408] - Support Checkpointing Components

HPX V1.3.0 (May 23, 2019)

General changes

- Performance improvements: the schedulers have significantly reduced overheads from removing false sharing and the parallel executor has been updated to create fewer futures.
- HPX now defaults to not turning on networking when running on one locality. This means that you can run multiple instances on the same system without adding command line options.
- Multiple issues reported by Clang sanitizers have been fixed.
- We have added (back) single-page HTML documentation and PDF documentation.
- We have started modularizing the HPX library. This is useful both for developers and users. In the long term users will be able to consume only parts of the HPX libraries if they do not require all the functionality that HPX currently provides.
- We have added an implementation of `function_ref`.
- The `barrier` and `latch` classes have gained a few additional member functions.

Breaking changes

- Executable and library targets are now created without the `_exe` and `_lib` suffix respectively. For example, the target `1d_stencil_1_exe` is now simply called `1d_stencil_1`.
- We have removed the following deprecated functionality: `queue`, `scoped_unlock`, and support for input iterators in algorithms.
- We have turned off the compatibility layer for `unwrapped` by default. The functionality will be removed in the next release. The option can still be turned on using the CMake[3409] option `HPX_WITH_UNWRAPPED_SUPPORT`. Likewise, `inclusive_scan` compatibility overloads have been turned off by default. They can still be turned on with `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY`.
- The minimum compiler and dependency versions have been updated. We now support GCC from version 5 onwards, Clang from version 4 onwards, and Boost from version 1.61.0 onwards.

[3404] https://github.com/TheHPXProject/hpx/pull/3799
[3405] https://github.com/TheHPXProject/hpx/pull/3701
[3406] https://github.com/TheHPXProject/hpx/pull/3496
[3407] https://github.com/TheHPXProject/hpx/pull/3192
[3408] https://github.com/TheHPXProject/hpx/pull/3159
[3409] https://www.cmake.org

- The headers for preprocessor macros have moved as a result of the functionality being moved to a separate module. The old headers are deprecated and will be removed in a future version of HPX. You can turn off the warnings by setting `HPX_PREPROCESSOR_WITH_DEPRECATION_WARNINGS=OFF` or turn off the compatibility headers completely with `HPX_PREPROCESSOR_WITH_COMPATIBILITY_HEADERS=OFF`.

Closed issues

- PR #3800[3512] - Attempt to fix Posix context switching after lazy init changes
- PR #3798[3513] - count and count_if accepts different iterator types
- PR #3797[3514] - Adding a couple of `override` keywords to overloaded virtual functions
- PR #3796[3515] - Re-enable testing all schedulers in shutdown_suspended_test
- PR #3795[3516] - Change `std::terminate` to std::abort in `SIGSEGV` handler
- PR #3794[3517] - Fixing #3792
- PR #3793[3518] - Extending migrate_polymorphic_component unit test
- PR #3791[3519] - Change `throw()` to `noexcept`
- PR #3790[3520] - Remove deprecated options for 1.3.0 release
- PR #3789[3521] - Remove Boost filesystem compatibility header
- PR #3788[3522] - Disabled even more spots that should not execute if networking is disabled
- PR #3787[3523] - Bump minimal boost supported version to 1.61.0
- PR #3786[3524] - Bump minimum required versions for 1.3.0 release
- PR #3785[3525] - Explicitly set number of jobs for all ninja invocations on CircleCI
- PR #3784[3526] - Fix leak and address sanitizer problems
- PR #3783[3527] - Disabled even more spots that should not execute is networking is disabled
- PR #3782[3528] - Cherry-picked tuple and thread_init_data fixes from #3701
- PR #3781[3529] - Fix generic context coroutines after lazy stack allocation changes
- PR #3780[3530] - Rename hello world examples
- PR #3776[3531] - Sort algorithms now use the supplied chunker to determine the required minimal chunk size
- PR #3775[3532] - Disable Boost auto-linking
- PR #3774[3533] - Tag and push stable builds

- PR #3773[3534] - Enable migration of polymorphic components
- PR #3771[3535] - Fix link to stackoverflow in documentation
- PR #3770[3536] - Replacing constexpr if in brace-serialization code
- PR #3769[3537] - Fix SIGSEGV handler
- PR #3768[3538] - Adding flags to scheduler allowing to control thread stealing and idle back-off
- PR #3767[3539] - Fix help formatting in hpxrun.py
- PR #3765[3540] - Fix a couple of bugs in the thread test
- PR #3764[3541] - Workaround for SFINAE regression in msvc14.2
- PR #3762[3542] - Prevent MSVC from prematurely instantiating things
- PR #3761[3543] - Update python scripts to work with python 3
- PR #3760[3544] - Fix callable vtable for GCC4.9
- PR #3759[3545] - Rename `PAGE_SIZE` to `PAGE_SIZE_` because AppleClang
- PR #3755[3546] - Making sure locks are not held during suspension
- PR #3754[3547] - Disable more code if networking is not available/not enabled
- PR #3752[3548] - Move `util::format` implementation to source file
- PR #3751[3549] - Fixing problems with `lcos::barrier` and iostreams
- PR #3750[3550] - Change error message to take into account `use_guard_page` setting
- PR #3749[3551] - Fix lifetime problem in `run_as_hpx_thread`
- PR #3748[3552] - Fixed unusable behavior of the clang code analyzer.
- PR #3747[3553] - Added `PMIX_RANK` to the defaults of `HPX_WITH_PARCELPORT_MPI_ENV`.
- PR #3745[3554] - Introduced `cache_aligned_data` and `cache_line_data` helper structure
- PR #3742[3555] - Remove more unused functionality from util/logging

- PR #3740[3556] - Fix includes in partitioned vector tests
- PR #3739[3557] - More fixes to make sure that `std::flush` really flushes all output
- PR #3737[3558] - Fix potential shutdown problems
- PR #3736[3559] - Fix `guided_pool_executor` after dataflow changes caused compilation fail
- PR #3734[3560] - Limiting executor
- PR #3732[3561] - More constrained bound constructors
- PR #3730[3562] - Attempt to fix deadlocks during component loading
- PR #3729[3563] - Add latch member function `count_up` and reset, requested by hpxMP
- PR #3728[3564] - Send even empty buffers on `hpx::endl` and `hpx::flush`
- PR #3727[3565] - Adding example demonstrating how to customize the memory management for a component
- PR #3726[3566] - Adding support for passing command line options through the `HPX_COMMANDLINE_OPTIONS` environment variable
- PR #3722[3567] - Document known broken OpenMPI builds
- PR #3716[3568] - Add barrier reset function, requested by hpxMP for reusing barrier
- PR #3715[3569] - More work on functions and vtables
- PR #3714[3570] - Generate single-page HTML, PDF, manpage from documentation
- PR #3713[3571] - Updating default APEX version to 2.1.2
- PR #3712[3572] - Update release procedure
- PR #3710[3573] - Fix the C++11 build, after #3704
- PR #3709[3574] - Move some component_registry functionality to source file
- PR #3708[3575] - Ignore all locks while handling assertions
- PR #3707[3576] - Remove obsolete hpx runtime executable
- PR #3705[3577] - Fix and simplify `make_ready_future` overload sets

- PR #3633[3622] - Replace deprecated boost endian macros
- PR #3632[3623] - Add instructions on getting HPX to documentation
- PR #3631[3624] - Simplify parcel creation
- PR #3630[3625] - Small additions and fixes to release procedure
- PR #3629[3626] - Modular pp
- PR #3627[3627] - Implement `util::function_ref`
- PR #3626[3628] - Fix cancelable_action_client example
- PR #3625[3629] - Added automatic serialization for simple structs (see #3034)
- PR #3624[3630] - Updating the default order of priority for `thread_description`
- PR #3621[3631] - Update copyright year and other small formatting fixes
- PR #3620[3632] - Adding support for gitlab runner
- PR #3619[3633] - Store debug logs and core dumps on CircleCI
- PR #3618[3634] - Various optimizations
- PR #3617[3635] - Fix link to the gpg key (#2)
- PR #3615[3636] - Fix unused variable warnings with networking off
- PR #3614[3637] - Restructuring counter data in scheduler to reduce false sharing
- PR #3613[3638] - Adding support for gitlab runners
- PR #3610[3639] - Don't wait for `stop_condition` in main thread
- PR #3608[3640] - Add inline keyword to `invalid_thread_id` definition for nvcc
- PR #3607[3641] - Adding configuration key that allows one to explicitly add a directory to the component search path
- PR #3606[3642] - Add nvcc to exclude constexpress since is it not supported by nvcc
- PR #3605[3643] - Add `inline` to definition of checkpoint stream operators to fix link error
- PR #3604[3644] - Use format for string formatting

HPX V1.2.1 (Feb 19, 2019)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation on ARM, s390x and 32-bit architectures.
- Fix a critical bug in the `future` implementation.
- Fix several problems in the CMake configuration which affects external projects.

HPX V1.2.0 (Nov 12, 2018)

General changes

Here are some of the main highlights and changes for this release:

- Thanks to the work of our Google Summer of Code student, Nikunj Gupta, we now have a new implementation of `hpx_main.hpp` on supported platforms (Linux, BSD and MacOS). This is intended to be a less fragile drop-in replacement for the old implementation relying on preprocessor macros. The new implementation does not require changes if you are using the CMake[3703] or pkg-config. The old behaviour can be restored by setting `HPX_WITH_DYNAMIC_HPX_MAIN=OFF` during CMake[3704] configuration. The implementation on Windows is unchanged.
- We have added functionality to allow passing scheduling hints to our schedulers. These will allow us to create executors that for example target a specific NUMA domain or allow for *HPX* threads to be pinned to a particular worker thread.
- We have significantly improved the performance of our futures implementation by making the shared state atomic.
- We have replaced Boostbook by Sphinx for our documentation. This means the documentation is easier to navigate with built-in search and table of contents. We have also added a quick start section and restructured the documentation to be easier to follow for new users.
- We have added a new option to the `--hpx:threads` command line option. It is now possible to use `cores` to tell *HPX* to only use one worker thread per core, unlike the existing option `all` which uses one worker thread per processing unit (processing unit can be a hyperthread if hyperthreads are available). The default value of `--hpx:threads` has also been changed to `cores` as this leads to better performance in most cases.
- All command line options can now be passed alongside configuration options when initializing *HPX*. This means that some options that were previously only available on the command line can now be set as configuration options.
- HPXMP is a portable, scalable, and flexible application programming interface using the OpenMP specification that supports multi-platform shared memory multiprocessing programming in C and C++. HPXMP can be enabled within *HPX* by setting `DHPX_WITH_HPXMP=ON` during CMake[3705] configuration.
- Two new performance counters were added for measuring the time spent doing background work. `/threads/time/background-work-duration` returns the time spent doing background on a given thread or locality, while `/threads/time/background-overhead` returns the fraction of time spent doing background work with respect to the overall time spent running the scheduler. The new performance counters are disabled by default and can be turned on by setting `HPX_WITH_BACKGROUND_THREAD_COUNTERS=ON` during CMake[3706] configuration.
- The idling behaviour of *HPX* has been tweaked to allow for faster idling. This is useful in interactive applications where the *HPX* worker threads may not have work all the time. This behaviour can be tweaked and turned off as before with `HPX_WITH_THREAD_MANAGER_IDLE_BACKOFF=OFF` during CMake[3707] configuration.

[3703] https://www.cmake.org
[3704] https://www.cmake.org
[3705] https://www.cmake.org
[3706] https://www.cmake.org
[3707] https://www.cmake.org

- It is now possible to register callback functions for *HPX* worker thread events. Callbacks can be registered for starting and stopping worker threads, and for when errors occur.

Breaking changes

- The implementation of `hpx_main.hpp` has changed. If you are using custom Makefiles you will need to make changes. Please see the documentation on *using Makefiles* for more details.
- The default value of `--hpx:threads` has changed from `all` to `cores`. The new option `cores` only starts one worker thread per core.
- We have dropped support for Boost 1.56 and 1.57. The minimal version of Boost we now test is 1.58.
- Our `boost::format`-based formatting implementation has been revised and replaced with a custom implementation. This changes the formatting syntax and requires changes if you are relying on `hpx::util::format` or `hpx::util::format_to`. The pull request for this change contains more information: PR #3266[3708].
- The following deprecated options have now been completely removed: `HPX_WITH_ASYNC_FUNCTION_COMPATIBILITY`, `HPX_WITH_LOCAL_DATAFLOW`, `HPX_WITH_GENERIC_EXECUTION_POLICY`, `HPX_WITH_BOOST_CHRONO_COMPATIBILITY`, `HPX_WITH_EXECUTOR_COMPATIBILITY`, `HPX_WITH_EXECUTION_POLICY_COMPATIBILITY`, and `HPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY`.

- PR #3495[3786] - Fixing dataflow
- PR #3493[3787] - Remove deprecated options for 1.2.0 part 2
- PR #3492[3788] - Add CUDA_LINK_LIBRARIES_KEYWORD to allow PRIVATE keyword in linkage t…
- PR #3491[3789] - Changing Base docker image
- PR #3490[3790] - Don't create tasks immediately with hpx::apply
- PR #3489[3791] - Remove deprecated options for 1.2.0
- PR #3488[3792] - Revert "Use BUILD_INTERFACE generator expression to fix cmake flag exports"
- PR #3487[3793] - Revert "Fixing type attribute warning for transfer_action"
- PR #3485[3794] - Use BUILD_INTERFACE generator expression to fix cmake flag exports
- PR #3483[3795] - Fixing type attribute warning for transfer_action
- PR #3481[3796] - Remove unused variables
- PR #3480[3797] - Towards a more lightweight transfer action
- PR #3479[3798] - Fix FLAGS - Use correct version of target_compile_options
- PR #3478[3799] - Making sure the application's exit code is properly propagated back to the OS
- PR #3476[3800] - Don't print docker credentials as part of the environment.
- PR #3473[3801] - Fixing invalid cmake code if no jemalloc prefix was given
- PR #3472[3802] - Attempting to work around recent clang test compilation failures
- PR #3471[3803] - Enable jemalloc on windows
- PR #3470[3804] - Updates readme
- PR #3468[3805] - Avoid hang if there is an exception thrown during startup
- PR #3467[3806] - Add compiler specific fallthrough attributes if C++17 attribute is not available

- PR #3466[3807] - - bugfix : fix compilation with llvm-7.0
- PR #3465[3808] - This patch adds various optimizations extracted from the thread_local_allocator work
- PR #3464[3809] - Check for forked repos in CircleCI docker push step
- PR #3463[3810] - - cmake : create the parent directory before symlinking
- PR #3459[3811] - Remove unused/incomplete functionality from util/logging
- PR #3458[3812] - Fix a problem with scope of CMAKE_CXX_FLAGS and hpx_add_compile_flag
- PR #3457[3813] - Fixing more size_t -> int16_t (and similar) warnings
- PR #3456[3814] - Add #ifdefs to topology.cpp to support old hwloc versions again
- PR #3454[3815] - Fixing warnings related to silent conversion of size_t –> int16_t
- PR #3451[3816] - Add examples as unit tests
- PR #3450[3817] - Constexpr-fying bind and other functional facilities
- PR #3446[3818] - Fix some thread suspension timeouts
- PR #3445[3819] - Fix various warnings
- PR #3443[3820] - Only enable service pool config options if pools are enabled
- PR #3441[3821] - Fix missing closing brackets in documentation
- PR #3439[3822] - Use correct MPI CXX libraries for MPI parcelport
- PR #3436[3823] - Add projection function to find_* (and fix very bad bug)
- PR #3435[3824] - Fixing 1205
- PR #3434[3825] - Fix threads cores
- PR #3433[3826] - Add Heise Online to release announcement list
- PR #3432[3827] - Don't track task dependencies for distributed runs
- PR #3431[3828] - Circle CI setting changes for hpxMP

- PR #3430[3829] - Fix unused params warning
- PR #3429[3830] - One thread per core
- PR #3428[3831] - This suppresses a deprecation warning that is being issued by MSVC 19.15.26726
- PR #3427[3832] - Fixes #3426
- PR #3425[3833] - Use source cache and workspace between job steps on CircleCI
- PR #3421[3834] - Add CDash timing output to future overhead test (for graphs)
- PR #3420[3835] - Add guided_pool_executor
- PR #3419[3836] - Fix typo in CircleCI config
- PR #3418[3837] - Add sphinx documentation
- PR #3415[3838] - Scheduler NUMA hint and shared priority scheduler
- PR #3414[3839] - Adding step to synchronize the APEX release
- PR #3413[3840] - Fixing multiple defines of APEX_HAVE_HPX
- PR #3412[3841] - Fixes linking with libhpx_wrap error with BSD and Windows based systems
- PR #3410[3842] - Fix typo in CMakeLists.txt
- PR #3409[3843] - Fix brackets and indentation in existing_performance_counters.qbk
- PR #3407[3844] - Fix unused param and extra ; warnings emitted by gcc 8.x
- PR #3406[3845] - Adding thread local allocator and use it for future shared states
- PR #3405[3846] - Adding DHPX_HAVE_THREAD_LOCAL_STORAGE=ON to builds
- PR #3404[3847] - fixing multiple definition of main() in linux
- PR #3402[3848] - Allow debug option to be enabled only for Linux systems with dynamic main on
- PR #3401[3849] - Fix cuda_future_helper.h when compiling with C++11
- PR #3400[3850] - Fix floating point exception scheduler_base idle backoff

- PR #3398[3851] - Atomic future state
- PR #3397[3852] - Fixing code for older gcc versions
- PR #3396[3853] - Allowing to register thread event functions (start/stop/error)
- PR #3394[3854] - Fix small mistake in primary_namespace_server.cpp
- PR #3393[3855] - Explicitly instantiate configured schedulers
- PR #3392[3856] - Add performance counters background overhead and background work duration
- PR #3391[3857] - Adapt integration of HPXMP to latest build system changes
- PR #3390[3858] - Make AGAS measurements optional
- PR #3389[3859] - Fix deadlock during shutdown
- PR #3388[3860] - Add several functionalities allowing to optimize synchronous action invocation
- PR #3387[3861] - Add cmake option to opt out of fail-compile tests
- PR #3386[3862] - Adding support for boost::container::small_vector to dataflow
- PR #3385[3863] - Adds Debug option for hpx initializing from main
- PR #3384[3864] - This hopefully fixes two tests that occasionally fail
- PR #3383[3865] - Making sure thread local storage is enable for hpxMP
- PR #3382[3866] - Fix usage of HPX_CAPTURE together with default value capture [=]
- PR #3381[3867] - Replace undefined instantiations of uniform_int_distribution
- PR #3380[3868] - Add missing semicolons to uses of HPX_COMPILER_FENCE
- PR #3379[3869] - Fixing #3378
- PR #3377[3870] - Adding build system support to integrate hpxmp into hpx at the user's machine
- PR #3375[3871] - Replacing wrapper for __libc_start_main with main

- PR #3374[3872] - Adds hpx_wrap to HPX_LINK_LIBRARIES which links only when specified.
- PR #3373[3873] - Forcing cache settings in HPXConfig.cmake to guarantee updated values
- PR #3372[3874] - Fix some more c++11 build problems
- PR #3371[3875] - Adds HPX_LINKER_FLAGS to HPX applications without editing their source codes
- PR #3370[3876] - util::format: add type_specifier<> specializations for %!s(MISSING) and %!l(MISSING)s
- PR #3369[3877] - Adding configuration option to allow explicit disable of the new hpx_main feature on Linux
- PR #3368[3878] - Updates doc with recent hpx_wrap implementation
- PR #3367[3879] - Adds Mac OS implementation to hpx_main.hpp
- PR #3365[3880] - Fix order of hpx libs in HPX_CONF_LIBRARIES.
- PR #3363[3881] - Apex fixing null wrapper
- PR #3361[3882] - Making sure all parcels get destroyed on an HPX thread (TCP pp)
- PR #3359[3883] - Feature/improveerrorforcompiler
- PR #3357[3884] - Static/dynamic executable implementation
- PR #3355[3885] - Reverting changes introduced by #3283 as those make applications hang
- PR #3354[3886] - Add external dependencies to HPX_LIBRARY_DIR
- PR #3353[3887] - Fix libfabric tcp
- PR #3351[3888] - Move obsolete header to tests directory.
- PR #3350[3889] - Renaming two functions to avoid problem described in #3285
- PR #3349[3890] - Make idle backoff exponential with maximum sleep time
- PR #3347[3891] - Replace *simple_component** with *component** in the Documentation
- PR #3346[3892] - Fix CMakeLists.txt example in quick start

- PR #3345[3893] - Fix automatic setting of HPX_MORE_THAN_64_THREADS
- PR #3344[3894] - Reduce amount of information printed for unknown command line options
- PR #3343[3895] - Safeguard HPX against destruction in global contexts
- PR #3341[3896] - Allowing for all command line options to be used as configuration settings
- PR #3340[3897] - Always convert inspect results to JUnit XML
- PR #3336[3898] - Only run docker push on master on CircleCI
- PR #3335[3899] - Update description of hpx.os_threads config parameter.
- PR #3334[3900] - Making sure early logging settings don't get mixed with others
- PR #3333[3901] - Update CMake links and versions in documentation
- PR #3332[3902] - Add notes on target suffixes to CMake documentation
- PR #3331[3903] - Add quickstart section to documentation
- PR #3330[3904] - Rename resource_partitioner test to avoid conflicts with pseudodependencies
- PR #3328[3905] - Making sure object is pinned while executing actions, even if action returns a future
- PR #3327[3906] - Add missing std::forward to tuple.hpp
- PR #3326[3907] - Make sure logging is up and running while modules are being discovered.
- PR #3324[3908] - Replace C++14 overload of std::equal with C++11 code.
- PR #3323[3909] - Fix a missing apex thread data (wrapper) initialization
- PR #3320[3910] - Adding support for -std=c++2a (define *HPX_WITH_CXX2A=On*)
- PR #3319[3911] - Replacing C++14 feature with equivalent C++11 code
- PR #3317[3912] - Fix compilation with VS 15.7.1 and /std:c++latest
- PR #3316[3913] - Fix includes for 1d_stencil_*_omp examples

- PR #3314[3914] - Remove some unused parameter warnings
- PR #3313[3915] - Fix pu-step and pu-offset command line options
- PR #3312[3916] - Add conversion of inspect reports to JUnit XML
- PR #3311[3917] - Fix escaping of closing braces in format specification syntax
- PR #3310[3918] - Don't overwrite user settings with defaults in registration database
- PR #3309[3919] - Fixing potential stack overflow for dataflow
- PR #3308[3920] - This updates the .clang-format configuration file to utilize newer features
- PR #3306[3921] - Marking migratable objects in their gid to allow not handling migration in AGAS
- PR #3305[3922] - Add proper exception handling to run_as_hpx_thread
- PR #3303[3923] - Changed std::rand to a better inbuilt PRNG Generator
- PR #3302[3924] - All non-migratable (simple) components now encode their lva and component type in their gid
- PR #3301[3925] - Add nullptr_t overloads to resource partitioner
- PR #3298[3926] - Apex task wrapper memory bug
- PR #3295[3927] - Fix mistakes after merge of CircleCI config
- PR #3294[3928] - Fix partitioned vector include in partitioned_vector_find tests
- PR #3293[3929] - Adding emplace support to promise and make_ready_future
- PR #3292[3930] - Add new cuda kernel synchronization with hpx::future demo
- PR #3291[3931] - Fixes #3290
- PR #3289[3932] - Fixing Docker image creation
- PR #3288[3933] - Avoid allocating shared state for wait_all
- PR #3287[3934] - Fixing /scheduler/utilization/instantaneous performance counter
- PR #3286[3935] - dataflow() and future::then() use sync policy where possible

- PR #3036[3964] - Switching to CircleCI 2.0

HPX V1.1.0 (Mar 24, 2018)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- We have changed the way *HPX* manages the processing units on a node. We do not longer implicitly bind all available cores to a single thread pool. The user has now full control over what processing units are bound to what thread pool, each with a separate scheduler. It is now also possible to create your own scheduler implementation and control what processing units this scheduler should use. We added the `hpx::resource::partitioner` that manages all available processing units and assigns resources to the used thread pools. Thread pools can be now be suspended/resumed independently. This functionality helps in running *HPX* concurrently to code that is directly relying on OpenMP[3965] and/or MPI[3966].
- We have continued to implement various parallel algorithms. *HPX* now almost completely implements all of the parallel algorithms as specified by the C++17 Standard[3967]. We have also continued to implement these algorithms for the distributed use case (for segmented data structures, such as `hpx::partitioned_vector`).
- Added a compatibility layer for `std::thread`, `std::mutex`, and `std::condition_variable` allowing for the code to use those facilities where available and to fall back to the corresponding Boost facilities otherwise. The CMake[3968] configuration option `-DHPX_WITH_THREAD_COMPATIBILITY=On` can be used to force using the Boost equivalents.
- The parameter sequence for the `hpx::parallel::transform_inclusive_scan` overload taking one iterator range has changed (again) to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake[3969].

[3968] https://www.cmake.org
[3969] https://www.cmake.org

- The parameter sequence for the `hpx::parallel::inclusive_scan` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY=On` to CMake.
- Added a helper facility `hpx::local_new` which is equivalent to `hpx::new_` except that it creates components locally only. As a consequence, the used component constructor may accept non-serializable argument types and/or non-const references or pointers.
- Removed the (broken) component type `hpx::lcos::queue`<T>. The old type is still available at configure time by passing `-DHPX_WITH_QUEUE_COMPATIBILITY=On` to CMake.
- The parallel algorithms adopted for C++17 restrict the iterator categories usable with those to at least forward iterators. Our implementation of the parallel algorithms was supporting input iterators (and output iterators) as well by simply falling back to sequential execution. We have now made our implementations conforming by requiring at least forward iterators. In order to enable the old behavior use the compatibility option `-DHPX_WITH_ALGORITHM_INPUT_ITERATOR_SUPPORT=On` on the CMake[3970] command line.
- We have added the functionalities allowing for LCOs being implemented using (simple) components. Before LCOs had to always be implemented using managed components.
- User defined components don't have to be default-constructible anymore. Return types from actions don't have to be default-constructible anymore either. Our serialization layer now in general supports non-default-constructible types.
- We have added a new launch policy `hpx::launch::lazy` that allows oneto defer the decision on what launch policy to use to the point of execution. This policy is initialized with a function (object) that – when invoked – is expected to produce the desired launch policy.

Breaking changes

- We have dropped support for the gcc compiler version V4.8. The minimal gcc version we now test on is gcc V4.9. The minimally required version of CMake[3971] is now V3.3.2.
- We have dropped support for the Visual Studio 2013 compiler version. The minimal Visual Studio version we now test on is Visual Studio 2015.5.
- We have dropped support for the Boost V1.51-V1.54. The minimal version of Boost we now test is Boost V1.55.
- We have dropped support for the `hpx::util::unwrapped` API. `hpx::util::unwrapped` will stay functional to some degree, until it finally gets removed in a later version of HPX. The functional usage of `hpx::util::unwrapped` should be changed to the new `hpx::util::unwrapping` function whereas the immediate usage should be replaced to `hpx::util::unwrap`.
- The performance counter names referring to properties as exposed by the threading subsystem have changes as those now additionally have to specify the thread-pool. See the corresponding documentation for more details.
- The overloads of `hpx::async` that invoke an action do not perform implicit unwrapping of the returned future anymore in case the invoked function does return a future in the

[3970] https://www.cmake.org
[3971] https://www.cmake.org

first place. In this case `hpx::async` now returns a `hpx::future<future<T>>` making its behavior conforming to its local counterpart.

- We have replaced the use of `boost::exception_ptr` in our APIs with the equivalent `std::exception_ptr`. Please change your codes accordingly. No compatibility settings are provided.
- We have removed the compatibility settings for `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` as their life-cycle has reached its end.
- We have removed the experimental thread schedulers hierarchy_scheduler, periodic_priority_scheduler and throttling_scheduler in an effort to clean up and consolidate our thread schedulers.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #3250[3972] - Apex refactoring with guids
- PR #3249[3973] - Updating People.qbk
- PR #3246[3974] - Assorted fixes for CUDA
- PR #3245[3975] - Apex refactoring with guids
- PR #3242[3976] - Modify task counting in thread_queue.hpp
- PR #3240[3977] - Fixed typos
- PR #3238[3978] - Readding accidentally removed std::abort
- PR #3237[3979] - Adding Pipeline example
- PR #3236[3980] - Fixing memory_block
- PR #3233[3981] - Make schedule_thread take suspended threads into account
- Issue #3226[3982] - memory_block is breaking, signaling SIGSEGV on a thread on creation and freeing
- PR #3225[3983] - Applying quick fix for hwloc-2.0
- Issue #3224[3984] - HPX counters crashing the application
- PR #3223[3985] - Fix returns when setting config entries

- Issue #3222[3986] - Errors linking libhpx.so
- Issue #3221[3987] - HPX on Mac OS X with HWLoc 2.0.0 fails to run
- PR #3216[3988] - Reorder a variadic array to satisfy VS 2017 15.6
- PR #3214[3989] - Changed prerequisites.qbk to avoid confusion while building boost
- PR #3213[3990] - Relax locks for thread suspension to avoid holding locks when yielding
- PR #3212[3991] - Fix check in sequenced_executor test
- PR #3211[3992] - Use preinit_array to set argc/argv in init_globally example
- PR #3210[3993] - Adapted parallel::{search | search_n} for Ranges TS (see #1668)
- PR #3209[3994] - Fix locking problems during shutdown
- Issue #3208[3995] - init_globally throwing a run-time error
- PR #3206[3996] - Addition of new arithmetic performance counter "Count"
- PR #3205[3997] - Fixing return type calculation for bulk_then_execute
- PR #3204[3998] - Changing std::rand() to a better inbuilt PRNG generator
- PR #3203[3999] - Resolving problems during shutdown for VS2015
- PR #3202[4000] - Making sure resource partitioner is not accessed if its not valid
- PR #3201[4001] - Fixing optional::swap
- Issue #3200[4002] - hpx::util::optional fails
- PR #3199[4003] - Fix sliding_semaphore test
- PR #3198[4004] - Set pre_main status before launching run_helper
- PR #3197[4005] - Update README.rst
- PR #3194[4006] - parallel::{fill|fill_n} updated for Ranges TS
- PR #3193[4007] - Updating Runtime.cpp by adding correct description of Performance counters during register
- PR #3191[4008] - Fix sliding_semaphore_2338 test

- PR #3117[4074] - Replace uses of boost/experimental::optional with util::optional
- PR #3116[4075] - Moving background thread APEX timer #2980
- PR #3115[4076] - Fixing race condition in channel test
- PR #3114[4077] - Avoid using util::function for thread function wrappers
- PR #3113[4078] - cmake V3.10.2 has changed the variable names used for MPI
- PR #3112[4079] - Minor fixes to exclusive_scan algorithm
- PR #3111[4080] - Revert "fix detection of cxx11_std_atomic"
- PR #3110[4081] - Suspend thread pool
- PR #3109[4082] - Fixing thread scheduling when yielding a thread id
- PR #3108[4083] - Revert "Suspend thread pool"
- PR #3107[4084] - Remove UB from thread::id relational operators
- PR #3106[4085] - Add cmake test for std::decay_t to fix cuda build
- PR #3105[4086] - Fixing refcount for async traversal frame
- PR #3104[4087] - Local execution of direct actions is now actually performed directly
- PR #3103[4088] - Adding support for generic counter_raw_values performance counter type
- Issue #3102[4089] - Introduce generic performance counter type returning an array of values
- PR #3101[4090] - Revert "Adapting stack overhead limit for gcc 4.9"
- PR #3100[4091] - Fix #3068 (condition_variable deadlock)
- PR #3099[4092] - Fixing lock held during suspension in papi counter component
- PR #3098[4093] - Unbreak broadcast_wait_for_2822 test
- PR #3097[4094] - Adapting stack overhead limit for gcc 4.9
- PR #3096[4095] - fix detection of cxx11_std_atomic

- PR #3095[4096] - Add ciso646 header to get _LIBCPP_VERSION for testing inplace merge
- PR #3094[4097] - Relax atomic operations on performance counter values
- PR #3093[4098] - Short-circuit all_of/any_of/none_of instantiations
- PR #3092[4099] - Take advantage of C++14 lambda capture initialization syntax, where possible
- PR #3091[4100] - Remove more references to Boost from logging code
- PR #3090[4101] - Unify use of yield/yield_k
- PR #3089[4102] - Fix a strange thing in parallel::detail::handle_exception. (Fix #2834.)
- Issue #3088[4103] - A strange thing in parallel::sort.
- PR #3087[4104] - Fixing assertion in default_distribution_policy
- PR #3086[4105] - Implement parallel::remove and parallel::remove_if
- PR #3085[4106] - Addressing breaking changes in Boost V1.66
- PR #3084[4107] - Ignore build warnings round 2
- PR #3083[4108] - Fix typo HPX_WITH_MM_PREFECTH
- PR #3081[4109] - Pre-decay template arguments early
- PR #3080[4110] - Suspend thread pool
- PR #3079[4111] - Ignore build warnings
- PR #3078[4112] - Don't test inplace_merge with libc++
- PR #3076[4113] - Fixing 3075: Part 1
- PR #3074[4114] - Fix more build warnings
- PR #3073[4115] - Suspend thread cleanup
- PR #3072[4116] - Change existing symbol_namespace::iterate to return all data instead of invoking a callback
- PR #3071[4117] - Fixing pack_traversal_async test

- PR #3070[4118] - Fix dynamic_counters_loaded_1508 test by adding dependency to memory_component
- PR #3069[4119] - Fix scheduling loop exit
- Issue #3068[4120] - hpx::lcos::condition_variable could be suspect to deadlocks
- PR #3067[4121] - #ifdef out random_shuffle deprecated in later c++
- PR #3066[4122] - Make coalescing test depend on coalescing library to ensure it gets built
- PR #3065[4123] - Workaround for minimal_timed_async_executor_test compilation failures, attempts to copy a deferred call (in unevaluated context)
- PR #3064[4124] - Fixing wrong condition in wrapper_heap
- PR #3062[4125] - Fix exception handling for execution::seq
- PR #3061[4126] - Adapt MSVC C++ mode handling to VS15.5
- PR #3060[4127] - Fix compiler problem in MSVC release mode
- PR #3059[4128] - Fixing #2931
- Issue #3058[4129] - minimal_timed_async_executor_test_exe fails to compile on master (d6f505c)
- PR #3057[4130] - Fix stable_merge_2964 compilation problems
- PR #3056[4131] - Fix some build warnings caused by unused variables/unnecessary tests
- PR #3055[4132] - Update documentation for running tests
- Issue #3054[4133] - Assertion failure when using bulk hpx::**new_** in asynchronous mode
- PR #3052[4134] - Do not bind test running to cmake test build rule
- PR #3051[4135] - Fix HPX-Qt interaction in Qt example.
- Issue #3048[4136] - nqueen example fails occasionally
- PR #3047[4137] - Fixing #3044
- PR #3046[4138] - Add OS thread suspension
- PR #3042[4139] - PyCicle - first attempt at a build toold for checking PR's

- PR #3041[4140] - Fix a problem about asynchronous execution of parallel::merge and parallel::partition.
- PR #3040[4141] - Fix a mistake about exception handling in asynchronous execution of scan_partitioner.
- PR #3039[4142] - Consistently use executors to schedule work
- PR #3038[4143] - Fixing local direct function execution and lambda actions perfect forwarding
- PR #3035[4144] - Make parallel unit test names match build target/folder names
- PR #3033[4145] - Fix setting of default build type
- Issue #3032[4146] - Fix partitioner arg copy found in #2982
- Issue #3031[4147] - Errors linking libhpx.so due to missing references (master branch, commit 6679a8882)
- PR #3030[4148] - Revert "implement executor then interface with && forwarding reference"
- PR #3029[4149] - Run CI inspect checks before building
- PR #3028[4150] - Added range version of parallel::move
- Issue #3027[4151] - Implement all scheduling APIs in terms of executors
- PR #3026[4152] - implement executor then interface with && forwarding reference
- PR #3025[4153] - Fix typo uninitialized to uninitialized
- PR #3024[4154] - Inspect fixes
- PR #3023[4155] - P0356 Simplified partial function application
- PR #3022[4156] - Master fixes
- PR #3021[4157] - Segfault fix
- PR #3020[4158] - Disable command-line aliasing for applications that use user_main
- PR #3019[4159] - Adding enable_elasticity option to pool configuration
- PR #3018[4160] - Fix stack overflow detection configuration in header files

- PR #3017[4161] - Speed up local action execution
- PR #3016[4162] - Unify stack-overflow detection options, remove reference to libsigsegv
- PR #3015[4163] - Speeding up accessing the resource partitioner and the topology info
- Issue #3014[4164] - HPX does not compile on POWER8 with gcc 5.4
- Issue #3013[4165] - hello_world occasionally prints multiple lines from a single OS-thread
- PR #3012[4166] - Silence warning about casting away qualifiers in itt_notify.hpp
- PR #3011[4167] - Fix cpuset leak in hwloc_topology_info.cpp
- PR #3010[4168] - Remove useless decay_copy
- PR #3009[4169] - Fixing 2996
- PR #3008[4170] - Remove unused internal function
- PR #3007[4171] - Fixing wrapper_heap alignment problems
- Issue #3006[4172] - hwloc memory leak
- PR #3004[4173] - Silence C4251 (needs to have dll-interface) for future_data_void
- Issue #3003[4174] - Suspension of runtime
- PR #3001[4175] - Attempting to avoid data races in async_traversal while evaluating dataflow()
- PR #3000[4176] - Adding hpx::util::optional as a first step to replace experimental::optional
- PR #2998[4177] - Cleanup up and Fixing component creation and deletion
- Issue #2996[4178] - Build fails with HPX_WITH_HWLOC=OFF
- PR #2995[4179] - Push more future_data functionality to source file
- PR #2994[4180] - WIP: Fix throttle test
- PR #2993[4181] - Making sure –hpx:help does not throw for required (but missing) arguments
- PR #2992[4182] - Adding non-blocking (on destruction) service executors

HPX V1.0.0 (Apr 24, 2017)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- Added the facility `hpx::split_future` which allows one to convert a `future<tuple<Ts...>>` into a `tuple<future<Ts>...>`. This functionality is not available when compiling *HPX* with VS2012.
- Added a new type of performance counter which allows one to return a list of values for each invocation. We also added a first counter of this type which collects a histogram of the times between parcels being created.
- Added new LCOs: `hpx::lcos::channel` and `hpx::lcos::local::channel` which are very similar to the well known channel constructs used in the Go language.
- Added new performance counters reporting the amount of data handled by the networking layer on a action-by-action basis (please see PR #2289[4581] for more details).
- Added a new facility `hpx::lcos::barrier`, replacing the equally named older one. The new facility has a slightly changed API and is much more efficient. Most notable, the new facility exposes a (global) function `hpx::lcos::barrier::synchronize()` which represents a global barrier across all localities.
- We have started to add support for vectorization to our parallel algorithm implementations. This support depends on using an external library, currently either Vc Library or **|boost_simd|_**. Please see Issue #2333[4582] for a list of currently supported algorithms. This is an experimental feature and its implementation and/or API might change in the future. Please see this blog-post[4583] for more information.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overload can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17. The old inner_product names can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- Added versions of `hpx::get_ptr` taking client side representations for component instances as their parameter (instead of a global id).
- Added the helper utility `hpx::performance_counters::performance_counter_set` helping to encapsulate a set of performance counters to be managed concurrently.
- All execution policies and related classes have been renamed to be consistent with the naming changes applied for C++17. All policies now live in the namespace `hpx::parallel::execution`. The ols names can be still enabled at configure time by specifying `-DHPX_WITH_EXECUTION_POLICY_COMPATIBILITY=On` to CMake.
- The thread scheduling subsystem has undergone a major refactoring which results in significant performance improvements. We have also imroved the performance of creating `hpx::future` and of various facilities handling those.

[4581] https://github.com/TheHPXProject/hpx/pull/2289
[4582] https://github.com/TheHPXProject/hpx/issues/2333
[4583] http://stellar-group.org/2016/09/vectorized-cpp-parallel-algorithms-with-hpx/

- We have consolidated all of the code in HPX.Compute related to the integration of CUDA. `hpx::partitioned_vector` has been enabled to be usable with `hpx::compute::vector` which allows one to place the partitions on one or more GPU devices.
- Added new performance counters exposing various internals of the thread scheduling subsystem, such as the current idle- and busy-loop counters and instantaneous scheduler utilization.
- Extended and improved the use of the ITTNotify hooks allowing to collect performance counter data and function annotation information from within the Intel Amplifier tool.

Breaking changes

- We have dropped support for the gcc compiler versions V4.6 and 4.7. The minimal gcc version we now test on is gcc V4.8.
- We have removed (default) support for `boost::chrono` in interfaces, uses of it have been replaced with `std::chrono`. This facility can be still enabled at configure time by specifying `-DHPX_WITH_BOOST_CHRONO_COMPATIBILITY=On` to CMake.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17.
- the build options `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` are now disabled by default. Please change your code still depending on the deprecated interfaces.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #2596[4584] - Adding apex data
- PR #2595[4585] - Remove obsolete file
- Issue #2594[4586] - FindOpenCL.cmake mismatch with the official cmake module
- PR #2592[4587] - First attempt to introduce spmd_block in hpx
- Issue #2591[4588] - Feature request: continuation (then) which does not require the callable object to take a future<R> as parameter
- PR #2588[4589] - Daint fixes
- PR #2587[4590] - Fixing transfer_(continuation)_action::schedule

- PR #2508[4657] - Added documentation for debugging with core files
- PR #2506[4658] - Fixing background work invocations
- PR #2505[4659] - Fix tuple serialization
- Issue #2504[4660] - Ensure continuations are called in the order they have been attached
- PR #2503[4661] - Adding serialization support for Vc v2 (datapar)
- PR #2502[4662] - Resolve various, minor compiler warnings
- PR #2501[4663] - Some other fixes around cuda examples
- Issue #2500[4664] - nvcc / cuda clang issue due to a missing -DHPX_WITH_CUDA flag
- PR #2499[4665] - Adding support for std::array to wait_all and friends
- PR #2498[4666] - Execute background work as HPX thread
- PR #2497[4667] - Fixing configuration options for spinlock-deadlock detection
- PR #2496[4668] - Accounting for different compilers in CrayKNL toolchain file
- PR #2494[4669] - Adding component base class which ties a component instance to a given executor
- PR #2493[4670] - Enable controlling amount of pending threads which must be available to allow thread stealing
- PR #2492[4671] - Adding new command line option –hpx:print-counter-reset
- PR #2491[4672] - Resolve ambiguities when compiling with APEX
- PR #2490[4673] - Resuming threads waiting on future with higher priority
- Issue #2489[4674] - nvcc issue because -std=c++11 appears twice
- PR #2488[4675] - Adding performance counters exposing the internal idle and busy-loop counters
- PR #2487[4676] - Allowing for plain suspend to reschedule thread right away
- PR #2486[4677] - Only flag HPX code for CUDA if HPX_WITH_CUDA is set
- PR #2485[4678] - Making thread-queue parameters runtime-configurable

- PR #2484[4679] - Added atomic counter for parcel-destinations
- PR #2483[4680] - Added priority-queue lifo scheduler
- PR #2482[4681] - Changing scheduler to steal only if more than a minimal number of tasks are available
- PR #2481[4682] - Extending command line option –hpx:print-counter-destination to support value 'none'
- PR #2479[4683] - Added option to disable signal handler
- PR #2478[4684] - Making sure the sine performance counter module gets loaded only for the corresponding example
- Issue #2477[4685] - Breaking at a throw statement
- PR #2476[4686] - Annotated function
- PR #2475[4687] - Ensure that using %osthread% during logging will not throw for non-hpx threads
- PR #2474[4688] - Remove now superficial non_direct actions from base_lco and friends
- PR #2473[4689] - Refining support for ITTNotify
- PR #2472[4690] - Some fixes around hpx compute
- Issue #2470[4691] - redefinition of boost::detail::spinlock
- Issue #2469[4692] - Dataflow performance issue
- PR #2468[4693] - Perf docs update
- PR #2466[4694] - Guarantee to execute remote direct actions on HPX-thread
- PR #2465[4695] - Improve demo : Async copy and fixed device handling
- PR #2464[4696] - Adding performance counter exposing instantaneous scheduler utilization
- PR #2463[4697] - Downcast to future<void>
- PR #2462[4698] - Fixed usage of ITT-Notify API with Intel Amplifier
- PR #2461[4699] - Cublas demo

- PR #2460[4700] - Fixing thread bindings
- PR #2459[4701] - Make -std=c++11 nvcc flag consistent for in-build and installed versions
- Issue #2457[4702] - Segmentation fault when registering a partitioned vector
- PR #2452[4703] - Properly releasing global barrier for unhandled exceptions
- PR #2451[4704] - Fixing long shutdown times
- PR #2450[4705] - Attempting to fix initialization errors on newer platforms (Boost V1.63)
- PR #2449[4706] - Replace BOOST_COMPILER_FENCE with an HPX version
- PR #2448[4707] - This fixes a possible race in the migration code

•**PR #2445**[?] **- Fixing dataflow et.al. for futures or future-ranges wrapped**
into ref()

- PR #2444[4709] - Fix segfaults
- PR #2443[4710] - Issue 2442
- Issue #2442[4711] - Mismatch between #if/#endif and namespace scope brackets in this_thread_executers.hpp
- Issue #2441[4712] - undeclared identifier BOOST_COMPILER_FENCE
- PR #2440[4713] - Knl build
- PR #2438[4714] - Datapar backend
- PR #2437[4715] - Adapt algorithm parameter sequence changes from C++17
- PR #2436[4716] - Adapt execution policy name changes from C++17
- Issue #2435[4717] - Trunk broken, undefined reference to hpx::thread::interrupt(hpx::thread::id, bool)
- PR #2434[4718] - More fixes to resource manager
- PR #2433[4719] - Added versions of `hpx::get_ptr` taking client side representations
- PR #2432[4720] - Warning fixes
- PR #2431[4721] - Adding facility representing set of performance counters

- PR #2407[4743] - Solving #2402 and #2403
- PR #2406[4744] - Improve guards
- PR #2405[4745] - Enable parallel::for_each for iterators returning proxy types
- PR #2404[4746] - Forward the explicitly given result_type in the hpx invoke
- Issue #2403[4747] - datapar_execution + zip iterator: lambda arguments aren't references
- Issue #2402[4748] - datapar algorithm instantiated with wrong type #2402
- PR #2401[4749] - Added support for imported libraries to HPX_Libraries.cmake
- PR #2400[4750] - Use CMake policy CMP0060
- Issue #2399[4751] - Error trying to push back vector of futures to vector
- PR #2398[4752] - Allow config #defines to be written out to custom config/defines.hpp
- Issue #2397[4753] - CMake generated config defines can cause tedious rebuilds category
- Issue #2396[4754] - BOOST_ROOT paths are not used at link time
- PR #2395[4755] - Fix target_link_libraries() issue when HPX Cuda is enabled
- Issue #2394[4756] - Template compilation error using HPX_WITH_DATAPAR_LIBFLATARRAY
- PR #2393[4757] - Fixing lock registration for recursive mutex
- PR #2392[4758] - Add keywords in target_link_libraries in hpx_setup_target
- PR #2391[4759] - Clang goroutines
- Issue #2390[4760] - Adapt execution policy name changes from C++17
- PR #2389[4761] - Chunk allocator and pool are not used and are obsolete
- PR #2388[4762] - Adding functionalities to datapar needed by octotiger
- PR #2387[4763] - Fixing race condition for early parcels
- Issue #2386[4764] - Lock registration broken for recursive_mutex
- PR #2385[4765] - Datapar zip iterator

- PR #2332[4812] - Fixing hpx::lcos::local::barrier
- PR #2331[4813] - Updating APEX support to include OTF2
- PR #2330[4814] - Support for data-parallelism for parallel algorithms
- Issue #2329[4815] - Coordinate settings in cmake
- PR #2328[4816] - fix LibGeoDecomp builds with HPX + GCC 5.3.0 + CUDA 8RC
- PR #2326[4817] - Making scan_partitioner work (for now)
- Issue #2323[4818] - Constructing a vector of components only correctly initializes the first component
- PR #2322[4819] - Fix problems that bubbled up after merging #2278
- PR #2321[4820] - Scalable barrier
- PR #2320[4821] - Std flag fixes
- Issue #2319[4822] - -std=c++14 and -std=c++1y with Intel can't build recent Boost builds due to insufficient C++14 support; don't enable these flags by default for Intel
- PR #2318[4823] - Improve handling of –hpx:bind=<bind-spec>
- PR #2317[4824] - Making sure command line warnings are printed once only
- PR #2316[4825] - Fixing command line handling for default bind mode
- PR #2315[4826] - Set id_retrieved if set_id is present
- Issue #2314[4827] - Warning for requested/allocated thread discrepancy is printed twice
- Issue #2313[4828] - –hpx:print-bind doesn't work with –hpx:pu-step
- Issue #2312[4829] - –hpx:bind range specifier restrictions are overly restrictive
- Issue #2311[4830] - hpx_0.9.99 out of project build fails
- PR #2310[4831] - Simplify function registration
- PR #2309[4832] - Spelling and grammar revisions in documentation (and some code)
- PR #2306[4833] - Correct minor typo in the documentation

HPX V0.9.99 (Jul 15, 2016)

General changes

As the version number of this release hints, we consider this release to be a preview for the upcoming *HPX* V1.0. All of the functionalities we set out to implement for V1.0 are in place; all of the features we wanted to have exposed are ready. We are very happy with the stability and performance of *HPX* and we would like to present this release to the community in order for us to gather broad feedback before releasing V1.0. We still expect for some minor details to change, but on the whole this release represents what we would like to have in a V1.0.

Overall, since the last release we have had almost 1600 commits while closing almost 400 tickets. These numbers reflect the incredible development activity we have seen over the last couple of months. We would like to express a big 'Thank you!' to all contributors and those who helped to make this release happen.

The most notable addition in terms of new functionality available with this release is the full implementation of object migration (i.e. the ability to transparently move *HPX* components to a different compute node). Additionally, this release of *HPX* cleans up many minor issues and some API inconsistencies.

Here are some of the main highlights and changes for this release (in no particular order):

- We have fixed a couple of issues in AGAS and the parcel layer which have caused hangs, segmentation faults at exit, and a slowdown of applications over time. Fixing those has significantly increased the overall stability and performance of distributed runs.
- We have started to add parallel algorithm overloads based on the C++ Extensions for Ranges (N4560[4907]) proposal. This also includes the addition of projections to the existing algorithms. Please see Issue #1668[4908] for a list of algorithms which have been adapted to N4560[4909].
- We have implemented index-based parallel for-loops based on a corresponding standardization proposal (P0075R1[4910]). Please see Issue #2016[4911] for a list of available algorithms.

[4911] https://github.com/TheHPXProject/hpx/issues/2016

- We have added implementations for more parallel algorithms as proposed for the upcoming C++ 17 Standard. See Issue #1141[4912] for an overview of which algorithms are available by now.
- We have started to implement a new prototypical functionality with *HPX.Compute* which uniformly exposes some of the higher level APIs to heterogeneous architectures (currently CUDA). This functionality is an early preview and should not be considered stable. It may change considerably in the future.
- We have pervasively added (optional) executor arguments to all API functions which schedule new work. Executors are now used throughout the code base as the main means of executing tasks.
- Added `hpx::make_future<R>(future<T> &&)` allowing to convert a future of any type `T` into a future of any other type `R`, either based on default conversion rules of the embedded types or using a given explicit conversion function.
- We finally finished the implementation of transparent migration of components to another locality. It is now possible to trigger a migration operation without 'stopping the world' for the object to migrate. *HPX* will make sure that no work is being performed on an object before it is migrated and that all subsequently scheduled work for the migrated object will be transparently forwarded to the new locality. Please note that the global id of the migrated object does not change, thus the application will not have to be changed in any way to support this new functionality. Please note that this feature is currently considered experimental. See Issue #559[4913] and PR #1966[4914] for more details.
- The `hpx::dataflow` facility is now usable with actions. Similarly to `hpx::async`, actions can be specified as an explicit template argument (`hpx::dataflow<Action>(target, ...)`) or as the first argument (`hpx::dataflow(Action(), target, ...)`). We have also enabled the use of distribution policies as the target for dataflow invocations. Please see Issue #1265[4915] and PR #1912[4916] for more information.
- Adding overloads of `gather_here` and `gather_there` to accept the plain values of the data to gather (in addition to the existing overloads expecting futures).
- We have cleaned up and refactored large parts of the code base. This helped reducing compile and link times of *HPX* itself and also of applications depending on it. We have further decreased the dependency of *HPX* on the Boost libraries by replacing part of those with facilities available from the standard libraries.
- Wherever possible we have removed dependencies of our API on Boost by replacing those with the equivalent facility from the C++11 standard library.
- We have added new performance counters for parcel coalescing, file-IO, the AGAS cache, and overall scheduler time. Resetting performance counters has been overhauled and fixed.
- We have introduced a generic client type `hpx::components::client<>` and added support for using it with `hpx::async`. This removes the necessity to implement specific client types for every component type without losing type safety. This deemphasizes the need for using the low level `hpx::id_type` for referencing (possibly remote) component instances. The plan is to deprecate the direct use of `hpx::id_type` in user code in the future.

[4912] https://github.com/TheHPXProject/hpx/issues/1141
[4913] https://github.com/TheHPXProject/hpx/issues/559
[4914] https://github.com/TheHPXProject/hpx/pull/1966
[4915] https://github.com/TheHPXProject/hpx/issues/1265
[4916] https://github.com/TheHPXProject/hpx/pull/1912

- We have added a special iterator which supports automatic prefetching of one or more arrays for speeding up loop-like code (see `hpx::parallel::util::make_prefetcher_context()`).
- We have extended the interfaces exposed from executors (as proposed by N4406[4917]) to accept an arbitrary number of arguments.

Breaking changes

- In order to move the dataflow facility to `namespace hpx` we added a definition of `hpx::dataflow` which might create ambiguities in existing codes. The previous definition of this facility (`hpx::lcos::local::dataflow`) has been deprecated and is available only if the constant `-DHPX_WITH_LOCAL_DATAFLOW_COMPATIBILITY=On` to CMake[4918] is defined at configuration time. Please explicitly qualify all uses of the dataflow facility if you enable this compatibility setting and encounter ambiguities.
- The adaptation of the C++ Extensions for Ranges (N4560[4919]) proposal imposes some breaking changes related to the return types of some of the parallel algorithms. Please see Issue #1668[4920] for a list of algorithms which have already been adapted.
- The facility `hpx::lcos::make_future_void()` has been replaced by `hpx::make_future<void>()`.
- We have removed support for Intel V13 and gcc 4.4.x.
- We have removed (default) support for the generic `hpx::parallel::execution_poliy` because it was removed from the Parallelism TS (__cpp11_n4104__) while it was being added to the upcoming C++17 Standard. This facility can be still enabled at configure time by specifying `-DHPX_WITH_GENERIC_EXECUTION_POLICY=On` to CMake.
- Uses of `boost::shared_ptr` and related facilities have been replaced with `std::shared_ptr` and friends. Uses of `boost::unique_lock`, `boost::lock_guard` etc. have also been replaced by the equivalent (and equally named) tools available from the C++11 standard library.
- Facilities that used to expect an explicit `boost::unique_lock` now take an `std::unique_lock`. Additionally, `condition_variable` no longer aliases `condition_variable_any`; its interface now only works with `std::unique_lock<local::mutex>`.
- Uses of `boost::function`, `boost::bind`, `boost::tuple` have been replaced by the corresponding facilities in *HPX* (`hpx::util::function`, `hpx::util::bind`, and `hpx::util::tuple`, respectively).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #2250[4921] - change default chunker of parallel executor to static one
- PR #2247[4922] - HPX on ppc64le
- PR #2244[4923] - Fixing MSVC problems
- PR #2238[4924] - Fixing small typos
- PR #2237[4925] - Fixing small typos
- PR #2234[4926] - Fix broken add test macro when extra args are passed in
- PR #2231[4927] - Fixing possible race during future awaiting in serialization
- PR #2230[4928] - Fix stream nvcc
- PR #2229[4929] - Fixed run_as_hpx_thread
- PR #2228[4930] - On prefetching_test branch : adding prefetching_iterator and related tests used for prefetching containers within lambda functions
- PR #2227[4931] - Support for HPXCL's opencl::event
- PR #2226[4932] - Preparing for release of V0.9.99
- PR #2225[4933] - fix issue when compiling components with hpxcxx
- PR #2224[4934] - Compute alloc fix
- PR #2223[4935] - Simplify promise
- PR #2222[4936] - Replace last uses of boost::function by util::function_nonser
- PR #2221[4937] - Fix config tests
- PR #2220[4938] - Fixing gcc 4.6 compilation issues
- PR #2219[4939] - nullptr support for `[unique_]function`
- PR #2218[4940] - Introducing clang tidy
- PR #2216[4941] - Replace NULL with nullptr

- Issue #2214[4942] - Let inspect flag use of NULL, suggest nullptr instead
- PR #2213[4943] - Require support for nullptr
- PR #2212[4944] - Properly find jemalloc through pkg-config
- PR #2211[4945] - Disable a couple of warnings reported by Intel on Windows
- PR #2210[4946] - Fixed host::block_allocator::bulk_construct
- PR #2209[4947] - Started to clean up new sort algorithms, made things compile for sort_by_key
- PR #2208[4948] - A couple of fixes that were exposed by a new sort algorithm
- PR #2207[4949] - Adding missing includes in /hpx/include/serialization.hpp
- PR #2206[4950] - Call package_action::get_future before package_action::apply
- PR #2205[4951] - The indirect_packaged_task::operator() needs to be run on a HPX thread
- PR #2204[4952] - Variadic executor parameters
- PR #2203[4953] - Delay-initialize members of partitioned iterator
- PR #2202[4954] - Added segmented fill for hpx::vector
- Issue #2201[4955] - Null Thread id encountered on partitioned_vector
- PR #2200[4956] - Fix hangs
- PR #2199[4957] - Deprecating hpx/traits.hpp
- PR #2198[4958] - Making explicit inclusion of external libraries into build
- PR #2197[4959] - Fix typo in QT CMakeLists
- PR #2196[4960] - Fixing a gcc warning about attributes being ignored
- PR #2194[4961] - Fixing partitioned_vector_spmd_foreach example
- Issue #2193[4962] - partitioned_vector_spmd_foreach seg faults
- PR #2192[4963] - Support Boost.Thread v4
- PR #2191[4964] - HPX.Compute prototype

- PR #2190[4965] - Spawning operation on new thread if remaining stack space becomes too small
- PR #2189[4966] - Adding callback taking index and future to when_each
- PR #2188[4967] - Adding new example demonstrating receive_buffer
- PR #2187[4968] - Mask 128-bit ints if CUDA is being used
- PR #2186[4969] - Make startup & shutdown functions unique_function
- PR #2185[4970] - Fixing logging output not to cause hang on shutdown
- PR #2184[4971] - Allowing component clients as action return types
- Issue #2183[4972] - Enabling logging output causes hang on shutdown
- Issue #2182[4973] - 1d_stencil seg fault
- Issue #2181[4974] - Setting small stack size does not change default
- PR #2180[4975] - Changing default bind mode to balanced
- PR #2179[4976] - adding prefetching_iterator and related tests used for prefetching containers within lambda functions
- PR #2177[4977] - Fixing 2176
- Issue #2176[4978] - Launch process test fails on OSX
- PR #2175[4979] - Fix unbalanced config/warnings includes, add some new ones
- PR #2174[4980] - Fix test categorization : regression not unit
- Issue #2172[4981] - Different performance results
- Issue #2171[4982] - "negative entry in reference count table" running octotiger on 32 nodes on queenbee
- Issue #2170[4983] - Error while compiling on Mac + boost 1.60
- PR #2168[4984] - Fixing problems with is_bitwise_serializable
- Issue #2167[4985] - startup & shutdown function should accept unique_function
- Issue #2166[4986] - Simple receive_buffer example

- PR #2165[4987] - Fix wait all
- PR #2164[4988] - Fix wait all
- PR #2163[4989] - Fix some typos in config tests
- PR #2162[4990] - Improve #includes
- PR #2160[4991] - Add inspect check for missing #include <list>
- PR #2159[4992] - Add missing finalize call to stop test hanging
- PR #2158[4993] - Algo fixes
- PR #2157[4994] - Stack check
- Issue #2156[4995] - OSX reports stack space incorrectly (generic context coroutines)
- Issue #2155[4996] - Race condition suspected in runtime
- PR #2154[4997] - Replace boost::detail::atomic_count with the new util::atomic_count
- PR #2153[4998] - Fix stack overflow on OSX
- PR #2152[4999] - Define is_bitwise_serializable as is_trivially_copyable when available
- PR #2151[5000] - Adding missing <cstring> for std::mem* functions
- Issue #2150[5001] - Unable to use component clients as action return types
- PR #2149[5002] - std::memmove copies bytes, use bytes*sizeof(type) when copying larger types
- PR #2146[5003] - Adding customization point for parallel copy/move
- PR #2145[5004] - Applying changes to address warnings issued by latest version of PVS Studio
- Issue #2148[5005] - hpx::parallel::copy is broken after trivially copyable changes
- PR #2144[5006] - Some minor tweaks to compute prototype
- PR #2143[5007] - Added Boost version support information over OSX platform
- PR #2142[5008] - Fixing memory leak in example

HPX V0.9.11 (Nov 11, 2015)

Our main focus for this release was the design and development of a coherent set of higher-level APIs exposing various types of parallelism to the application programmer. We introduced the concepts of an `executor`, which can be used to customize the `where` and `when` of execution of tasks in the context of parallelizing codes. We extended all APIs related to managing parallel tasks to support executors which gives the user the choce of either using one of the predefined executor types or to provide its own, possibly application specific, executor. We paid very close attention to align all of these changes with the existing C++ Standards documents or with the ongoing proposals for standardization.

This release is the first after our change to a new development policy. We switched all development to be strictly performed on branches only, all direct commits to our main branch (`master`) are prohibited. Any change has to go through a peer review before it will be merged to `master`. As a result the overall stability of our code base has significantly increased, the development process itself has been simplified. This change manifests itself in a large number of pull-requests which have been merged (please see below for a full list of closed issues and pull-requests). All in all for this release, we closed almost 100 issues and merged over 290 pull-requests. There have been over 1600 commits to the master branch since the last release.

General changes

- We are moving into the direction of unifying managed and simple components. As such, the classes *hpx::components::component* and *hpx::components::component_base* have been added which currently just forward to the currently existing simple component facilities. The examples have been converted to only use those two classes.
- Added integration with the CircleCI[5315] hosted continuous integration service. This gives us constant and immediate feedback on the health of our master branch.
- The compiler configuration subsystem in the build system has been reimplemented. Instead of using Boost.Config we now use our own lightweight set of cmake scripts to determine the available language and library features supported by the used compiler.
- The API for creating instances of components has been consolidated. All component instances should be created using the *hpx::new_* only. It allows one to instantiate both, single component instances and multiple component instances. The placement of the created components can be controlled by special distribution policies. Please see the corresponding documentation outlining the use of *hpx::new_*.
- Introduced four new distribution policies which can be used with many API functions which traditionally expected to be used with a locality id. The new distribution policies are:
  - *hpx::components::default_distribution_policy* which tries to place multiple component instances as evenly as possible.
  - *hpx::components::colocating_distribution_policy* which will refer to the locality where a given component instance is currently placed.
  - *hpx::components::binpacking_distribution_policy* which will place multiple component instances as evenly as possible based on any performance counter.

[5315] https://circleci.com/gh/TheHPXProject/hpx

- *hpx::components::target_distribution_policy* which allows one to represent a given locality in the context of a distrwibution policy.

- The new distribution policies can now be also used with `hpx::async`. This change also deprecates `hpx::async_colocated(id, ...)` which now is replaced by a distribution policy: `hpx::async(hpx::colocated(id), ...)`.
- The `hpx::vector` and `hpx::unordered_map` data structures can now be used with the new distribution policies as well.
- The parallel facility `hpx::parallel::task_region` has been renamed to `hpx::parallel::task_block` based on the changes in the corresponding standardization proposal N4411[5316].
- Added extensions to the parallel facility `hpx::parallel::task_block` allowing to combine a task_block with an execution policy. This implies a minor breaking change as the `hpx::parallel::task_block` is now a template.
- Added new LCOs: `hpx::lcos::latch` and `hpx::lcos::local::latch` which semantically conform to the proposed `std::latch` (see N4399[5317]).
- Added performance counters exposing data related to data transferred by input/output (filesystem) operations (thanks to Maciej Brodowicz).
- Added performance counters allowing to track the number of action invocations (local and remote invocations).
- Added new command line options –hpx:print-counter-at and –hpx:reset-counters.
- The `hpx::vector` component has been renamed to `hpx::partitioned_vector` to make it explicit that the underlying memory is not contiguous.
- Introduced a completely new and uniform higher-level parallelism API which is based on executors. All existing parallelism APIs have been adapted to this. We have added a large number of different executor types, such as a numa-aware executor, a this-thread executor, etc.
- Added support for the MingW toolchain on Windows (thanks to Eric Lemanissier).
- HPX now includes support for APEX, (Autonomic Performance Environment for eXascale). APEX is an instrumentation and software adaptation library that provides an interface to TAU profiling / tracing as well as runtime adaptation of HPX applications through policy definitions. For more information and documentation, please see https://github.com/UO-OACISS/xpress-apex. To enable APEX at configuration time, specify `-DHPX_WITH_APEX=On`. To also include support for TAU profiling, specify `-DHPX_WITH_TAU=On` and specify the `-DTAU_ROOT`, `-DTAU_ARCH` and `-DTAU_OPTIONS` cmake parameters.
- We have implemented many more of the *Using parallel algorithms*. Please see Issue #1141[5318] for the list of all available parallel algorithms (thanks to Daniel Bourgeois and John Biddiscombe for contributing their work).

Breaking changes

- We are moving into the direction of unifying managed and simple components. In order to stop exposing the old facilities, all examples have been converted to use the new classes. The breaking change in this release is that performance counters are now a *hpx::components::component_base* instead of *hpx::components::managed_component_base*.
- We removed the support for stackless threads. It turned out that there was no performance benefit when using stackless threads. As such, we decided to clean up our codebase. This feature was not documented.
- The CMake project name has changed from 'hpx' to 'HPX' for consistency and compatibility with naming conventions and other CMake projects. Generated config files go into <prefix>/lib/cmake/HPX and not <prefix>/lib/cmake/hpx.
- The macro `HPX_REGISTER_MINIMAL_COMPONENT_FACTORY` has been deprecated. Please use *HPX_REGISTER_COMPONENT*. instead. The old macro will be removed in the next release.
- The obsolete distributing_factory and binpacking_factory components have been removed. The corresponding functionality is now provided by the *hpx::new_* API function in conjunction with the `hpx::default_layout` and `hpx::binpacking` distribution policies (*hpx::components::default_distribution_policy* and *hpx::components::binpacking_distribution_policy*)
- The API function `hpx::new_colocated` has been deprecated. Please use the consolidated API *hpx::new_* in conjunction with the new `hpx::colocated` distribution policy (*hpx::components::colocating_distribution_policy*) instead. The old API function will still be available for at least one release of *HPX* if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The API function `hpx::async_colocated` has been deprecated. Please use the consolidated API `hpx::async` in conjunction with the new `hpx::colocated` distribution policy (*hpx::components::colocating_distribution_policy*) instead. The old API function will still be available for at least one release of *HPX* if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The obsolete remote_object component has been removed.
- Replaced the use of Boost.Serialization with our own solution. While the new version is mostly compatible with Boost.Serialization, this change requires some minor code modifications in user code. For more information, please see the corresponding announcement[5319] on the hpx-users@stellar.cct.lsu.edu mailing list.
- The names used by cmake to influence various configuration options have been unified. The new naming scheme relies on all configuration constants to start with `HPX_WITH_...`, while the preprocessor constant which is used at build time starts with `HPX_HAVE_...`. For instance, the former cmake command line `-DHPX_MALLOC=...` now has to be specified a `-DHPX_WITH_MALLOC=...` and will cause the preprocessor constant `HPX_HAVE_MALLOC` to be defined. The actual name of the constant (i.e. `MALLOC`) has not changed. Please see the corresponding documentation for more details (*CMake options*).
- The `get_gid()` functions exposed by the component base classes `hpx::components::server::simple_component_base`, `hpx::components::server::managed_component_base`, and `hpx::components::server::fixed_component_base` have been replaced by

[5319] http://thread.gmane.org/gmane.comp.lib.hpx.devel/196 two new functions: `get_unmanaged_id()` and `get_id()`. To enable the old function name for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.

- All functions which were named `get_gid()` but were returning `hpx::id_type` have been renamed to `get_id()`. To enable the old function names for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #1855[5320] - Completely removing external/endian
- PR #1854[5321] - Don't pollute CMAKE_CXX_FLAGS through find_package()
- PR #1853[5322] - Updating CMake configuration to get correct version of TAU library
- PR #1852[5323] - Fixing Performance Problems with MPI Parcelport
- PR #1851[5324] - Fixing hpx_add_link_flag() and hpx_remove_link_flag()

Phi creates very strange results for duration counters

- Issue #1615[5539] - hpx::make_continuation requires input and output to be the same
- PR #1614[5540] - Fixed remove copy test
- Issue #1613[5541] - Dataflow causes stack overflow
- PR #1612[5542] - Modified foreach partitioner to use bulk execute
- PR #1611[5543] - Limit recursion-depth in dataflow to a configurable constant
- PR #1610[5544] - Increase timeout for CircleCI
- PR #1609[5545] - Refactoring thread manager, mainly extracting thread pool
- PR #1608[5546] - Fixed running multiple localities without localities parameter
- PR #1607[5547] - More algorithm fixes to adjacentfind
- Issue #1606[5548] - Running without localities parameter binds to bogus port range
- Issue #1605[5549] - Too many serializations
- PR #1604[5550] - Changes the HPX image into a hyperlink
- PR #1601[5551] - Fixing problems with remove_copy algorithm tests
- PR #1600[5552] - Actions with ids cleanup
- PR #1599[5553] - Duplicate binding of global ids should fail
- PR #1598[5554] - Fixing array access
- PR #1597[5555] - Improved the reliability of connecting/disconnecting localities
- Issue #1596[5556] - Duplicate id binding should fail
- PR #1595[5557] - Fixing more cmake config constants
- PR #1594[5558] - Fixing preprocessor constant used to enable C++11 chrono
- PR #1593[5559] - Adding operator|() for hpx::launch
- Issue #1592[5560] - Error (typo) in the docs

- PR #1541[5607] - Removed stale cmake tests, unused since the great cmake refactoring
- PR #1540[5608] - Fix idle-rate on platforms without TSC
- PR #1539[5609] - Reporting situation if zero-copy-serialization was performed by a parcel generated from a plain apply/async
- PR #1538[5610] - Changed return type of bulk executors and added test
- Issue #1537[5611] - Incorrect cpuid config tests
- PR #1536[5612] - Changed return type of bulk executors and added test
- PR #1535[5613] - Make sure promise::get_gid() can be called more than once
- PR #1534[5614] - Fixed async_callback with bound callback
- PR #1533[5615] - Updated the link in the documentation to a publically- accessible URL
- PR #1532[5616] - Make sure sync primitives are not copyable nor movable
- PR #1531[5617] - Fix unwrapped issue with future ranges of void type
- PR #1530[5618] - Serialization complex
- Issue #1528[5619] - Unwrapped issue with future<void>
- Issue #1527[5620] - HPX does not build with Boost 1.58.0
- PR #1526[5621] - Added support for boost.multi_array serialization
- PR #1525[5622] - Properly handle deferred futures, fixes #1506
- PR #1524[5623] - Making sure invalid action argument types generate clear error message
- Issue #1522[5624] - Need serialization support for boost multi array
- Issue #1521[5625] - Remote async and zero-copy serialization optimizations don't play well together
- PR #1520[5626] - Fixing UB whil registering polymorphic classes for serialization
- PR #1519[5627] - Making detail::condition_variable safe to use
- PR #1518[5628] - Fix when_some bug missing indices in its result

HPX V0.9.10 (Mar 24, 2015)

General changes

This is the 12th official release of *HPX*. It coincides with the 7th anniversary of the first commit to our source code repository. Since then, we have seen over 12300 commits amounting to more than 220000 lines of C++ code.

The major focus of this release was to improve the reliability of large scale runs. We believe to have achieved this goal as we now can reliably run *HPX* applications on up to ~24k cores. We have also shown that HPX can be used with success for symmetric runs (applications using both, host cores and Intel Xeon/Phi coprocessors). This is a huge step forward in terms of the usability of *HPX*. The main focus of this work involved isolating the causes of the segmentation faults at start up and shut down. Many of these issues were discovered to be the result of the suspension of threads which hold locks.

A very important improvement introduced with this release is the refactoring of the code representing our parcel-port implementation. Parcel- ports can now be implemented by 3rd parties as independent plugins which are dynamically loaded at runtime (static linking of parcel-ports is also supported). This refactoring also includes a massive improvement of the performance of our existing parcel-ports. We were able to significantly reduce the networking latencies and to improve the available networking bandwidth. Please note that in this release we disabled the ibverbs and ipc parcel ports as those have not been ported to the new plugin system yet (see Issue #839[5724]).

Another corner stone of this release is our work towards a complete implementation of __cpp11_n4104__ (Working Draft, Technical Specification for C++ Extensions for Parallelism). This document defines a set of parallel algorithms to be added to the C++ standard library. We now have implemented about 75% of all specified parallel algorithms (see [link hpx.manual.parallel.parallel_algorithms Parallel Algorithms] for more details). We also implemented some extensions to __cpp11_n4104__ allowing to invoke all of the algorithms asynchronously.

This release adds a first implementation of `hpx::vector` which is a distributed data structure closely aligned to the functionality of `std::vector`. The difference is that `hpx::vector` stores the data in partitions where the partitions can be distributed over different localities. We started to work on allowing to use the parallel algorithms with `hpx::vector`. At this point we have implemented only a few of the parallel algorithms

[5718] https://github.com/TheHPXProject/hpx/pull/1300
[5719] https://github.com/TheHPXProject/hpx/issues/1251
[5720] https://github.com/TheHPXProject/hpx/issues/1008
[5721] https://github.com/TheHPXProject/hpx/issues/1001
[5722] https://github.com/TheHPXProject/hpx/issues/721
[5723] https://github.com/TheHPXProject/hpx/issues/524
[5724] https://github.com/TheHPXProject/hpx/issues/839

to support distributed data structures (like `hpx::vector`) for testing purposes (see Issue #1338[5725] for a documentation of our progress).

Breaking changes

With this release we put a lot of effort into changing the code base to be more compatible to C++11. These changes have caused the following issues for backward compatibility:

- Move to Variadics- All of the API now uses variadic templates. However, this change required to modify the argument sequence for some of the exiting API functions (*`hpx::async_continue`*, `hpx::apply_continue`, *hpx::when_each*, *hpx::wait_each*, synchronous invocation of actions).
- Changes to Macros- We also removed the macros `HPX_STD_FUNCTION` and `HPX_STD_TUPLE`. This shouldn't affect any user code as we replaced `HPX_STD_FUNCTION` with `hpx::util::function_nonser` which was the default expansion used for this macro. All *HPX* API functions which expect a `hpx::util::function_nonser` (or a `hpx::util::unique_function_nonser`) can now be transparently called with a compatible `std::function` instead. Similarly, `HPX_STD_TUPLE` was replaced by its default expansion as well: `hpx::util::tuple`.
- Changes to `hpx::unique_future`- `hpx::unique_future`, which was deprecated in the previous release for *hpx::future* is now completely removed from *HPX*. This completes the transition to a completely standards conforming implementation of `hpx::future`.
- Changes to Supported Compilers. Finally, in order to utilize more C++11 semantics, we have officially dropped support for GCC 4.4 and MSVC 2012. Please see our *Prerequisites* page for more details.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1402[5726] - Internal shared_future serialization copies
- Issue #1399[5727] - Build takes unusually long time…
- Issue #1398[5728] - Tests using the scan partitioner are broken on at least gcc 4.7 and intel compiler
- Issue #1397[5729] - Completely remove hpx::unique_future
- Issue #1396[5730] - Parallel scan algorithms with different initial values
- Issue #1395[5731] - Race Condition - 1d_stencil_8 - SuperMIC
- Issue #1394[5732] - "suspending thread while at least one lock is being held" - 1d_stencil_8 - SuperMIC

- Issue #1322[5800] - HPX fails to build aa182cf
- Issue #1321[5801] - Limiting size of outgoing messages while coalescing parcels
- Issue #1320[5802] - passing a future with launch::deferred in remote function call causes hang
- Issue #1319[5803] - An exception when tries to specify number high priority threads with abp-priority
- Issue #1318[5804] - Unable to run program with abp-priority and numa-sensitivity enabled
- Issue #1317[5805] - N4071 Search/Search_n finished, minor changes
- Issue #1316[5806] - Add config option to make -Ihpx.run_hpx_main!=1 the default
- Issue #1314[5807] - Variadic support for async and apply
- Issue #1313[5808] - Adjust when_any/some to the latest proposed interfaces
- Issue #1312[5809] - Fixing #857: hpx::naming::locality leaks parcelport specific information into the public interface
- Issue #1311[5810] - Distributed get'er/set'er_values for distributed vector
- Issue #1310[5811] - Crashing in hpx::parcelset::policies::mpi::connection_handler::handle_messages() on SuperMIC
- Issue #1308[5812] - Unable to execute an application with –hpx:threads
- Issue #1307[5813] - merge_graph linking issue
- Issue #1306[5814] - First batch of variadic templates support
- Issue #1305[5815] - Create a compiler wrapper
- Issue #1304[5816] - Provide a compiler wrapper for hpx
- Issue #1303[5817] - Drop support for GCC44
- Issue #1302[5818] - Fixing #1297
- Issue #1301[5819] - Compilation error when tried to use boost range iterators with wait_all
- Issue #1298[5820] - Distributed vector

[5820] https://github.com/TheHPXProject/hpx/issues/1298

- Issue #1297[5821] - Unable to invoke component actions recursively
- Issue #1294[5822] - HDF5 build error
- Issue #1275[5823] - The parcelport implementation is non-optimal
- Issue #1267[5824] - Added classes and unit tests for local_file, orangefs_file and pxfs_file
- Issue #1264[5825] - Error "assertion '!m_fun' failed" randomly occurs when using TCP
- Issue #1254[5826] - thread binding seems to not work properly
- Issue #1220[5827] - parallel::copy_if is broken
- Issue #1217[5828] - Find a better way of fixing the issue patched by #1216
- Issue #1168[5829] - Starting HPX on Cray machines using aprun isn't working correctly
- Issue #1085[5830] - Replace startup and shutdown barriers with broadcasts
- Issue #981[5831] - With SLURM, –hpx:threads=8 should not be necessary
- Issue #857[5832] - hpx::naming::locality leaks parcelport specific information into the public interface
- Issue #850[5833] - "flush" not documented
- Issue #763[5834] - Create buildbot instance that uses std::bind as HPX_STD_BIND
- Issue #680[5835] - Convert parcel ports into a plugin system
- Issue #582[5836] - Make exception thrown from HPX threads available from `hpx::init`
- Issue #504[5837] - Refactor Dataflow LCO to work with futures
- Issue #196[5838] - Don't store copies of the locality network metadata in the gva table

HPX V0.9.9 (Oct 31, 2014, codename Spooky)

General changes

We have had over 1500 commits since the last release and we have closed over 200 tickets (bugs, feature requests, pull requests, etc.). These are by far the largest numbers of commits and resolved issues for any of the *HPX* releases so far. We are especially happy about the large number of people who contributed for the first time to *HPX*.

- We completed the transition from the older (non-conforming) implementation of `hpx::future` to the new and fully conforming version by removing the old code and by renaming the type `hpx::unique_future` to `hpx::future`. In order to maintain backwards compatibility with existing code which uses the type `hpx::unique_future` we support the configuration variable `HPX_UNIQUE_FUTURE_ALIAS`. If this variable is set to `ON` while running cmake it will additionally define a template alias for this type.
- We rewrote and significantly changed our build system. Please have a look at the new (now generated) documentation here: *Building HPX*. Please revisit your build scripts to adapt to the changes. The most notable changes are:
- `HPX_NO_INSTALL` is no longer necessary.
- For external builds, you need to set `HPX_DIR` instead of `HPX_ROOT` as described here: *Using HPX with CMake-based projects*.
- IDEs that support multiple configurations (Visual Studio and XCode) can now be used as intended. that means no build dir.
- Building HPX statically (without dynamic libraries) is now supported (`-DHPX_STATIC_LINKING=On`).
- Please note that many variables used to configure the build process have been renamed to unify the naming conventions (see the section *CMake options* for more information).
- This also fixes a long list of issues, for more information see Issue #1204[5839].
- We started to implement various proposals to the C++ Standardization committee related to parallelism and concurrency, most notably N4409[5840] (Working Draft, Technical Specification for C++ Extensions for Parallelism), N4411[5841] (Task Region Rev. 3), and N4313[5842] (Working Draft, Technical Specification for C++ Extensions for Concurrency).
- We completely remodeled our automatic build system to run builds and unit tests on various systems and compilers. This allows us to find most bugs right as they were introduced and helps to maintain a high level of quality and compatibility. The newest build logs can be found at *HPX* Buildbot Website[5843].

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1296[5844] - Rename make_error_future to make_exceptional_future, adjust to N4123
- Issue #1295[5845] - building issue
- Issue #1293[5846] - Transpose example
- Issue #1292[5847] - Wrong abs() function used in example
- Issue #1291[5848] - non-synchronized shift operators have been removed
- Issue #1290[5849] - RDTSCP is defined as true for Xeon Phi build
- Issue #1289[5850] - Fixing 1288
- Issue #1288[5851] - Add new performance counters
- Issue #1287[5852] - Hierarchy scheduler broken performance counters
- Issue #1286[5853] - Algorithm cleanup
- Issue #1285[5854] - Broken Links in Documentation
- Issue #1284[5855] - Uninitialized copy
- Issue #1283[5856] - missing boost::scoped_ptr includes
- Issue #1282[5857] - Update documentation of build options for schedulers
- Issue #1281[5858] - reset idle rate counter
- Issue #1280[5859] - Bug when executing on Intel MIC
- Issue #1279[5860] - Add improved when_all/wait_all
- Issue #1278[5861] - Implement improved when_all/wait_all
- Issue #1277[5862] - feature request: get access to argc argv and variables_map
- Issue #1276[5863] - Remove merging map
- Issue #1274[5864] - Weird (wrong) string code in papi.cpp

[5864] https://github.com/TheHPXProject/hpx/issues/1274

- Issue #1273[5865] - Sequential task execution policy
- Issue #1272[5866] - Avoid CMake name clash for Boost.Thread library
- Issue #1271[5867] - Updates on HPX Test Units
- Issue #1270[5868] - hpx/util/safe_lexical_cast.hpp is added
- Issue #1269[5869] - Added default value for "LIB" cmake variable
- Issue #1268[5870] - Memory Counters not working
- Issue #1266[5871] - FindHPX.cmake is not installed
- Issue #1263[5872] - apply_remote test takes too long
- Issue #1262[5873] - Chrono cleanup
- Issue #1261[5874] - Need make install for papi counters and this builds all the examples
- Issue #1260[5875] - Documentation of Stencil example claims
- Issue #1259[5876] - Avoid double-linking Boost on Windows
- Issue #1257[5877] - Adding additional parameter to create_thread
- Issue #1256[5878] - added buildbot changes to release notes
- Issue #1255[5879] - Cannot build MiniGhost
- Issue #1253[5880] - hpx::thread defects
- Issue #1252[5881] - HPX_PREFIX is too fragile
- Issue #1250[5882] - switch_to_fiber_emulation does not work properly
- Issue #1249[5883] - Documentation is generated under Release folder
- Issue #1248[5884] - Fix usage of hpx_generic_coroutine_context and get tests passing on powerpc
- Issue #1247[5885] - Dynamic linking error
- Issue #1246[5886] - Make cpuid.cpp C++11 compliant
- Issue #1245[5887] - HPX fails on startup (setting thread affinity mask)

- Issue #1244[5888] - HPX_WITH_RDTSC configure test fails, but should succeed
- Issue #1243[5889] - CTest dashboard info for CSCS CDash drop location
- Issue #1242[5890] - Mac fixes
- Issue #1241[5891] - Failure in Distributed with Boost 1.56
- Issue #1240[5892] - fix a race condition in examples.diskperf
- Issue #1239[5893] - fix wait_each in examples.diskperf
- Issue #1238[5894] - Fixed #1237: hpx::util::portable_binary_iarchive failed
- Issue #1237[5895] - hpx::util::portable_binary_iarchive faileds
- Issue #1235[5896] - Fixing clang warnings and errors
- Issue #1234[5897] - TCP runs fail: Transport endpoint is not connected
- Issue #1233[5898] - Making sure the correct number of threads is registered with AGAS
- Issue #1232[5899] - Fixing race in wait_xxx
- Issue #1231[5900] - Parallel minmax
- Issue #1230[5901] - Distributed run of 1d_stencil_8 uses less threads than spec. & sometimes gives errors
- Issue #1229[5902] - Unstable number of threads
- Issue #1228[5903] - HPX link error (cmake / MPI)
- Issue #1226[5904] - Warning about struct/class thread_counters
- Issue #1225[5905] - Adding parallel::replace etc
- Issue #1224[5906] - Extending dataflow to pass through non-future arguments
- Issue #1223[5907] - Remaining find algorithms implemented, N4071
- Issue #1222[5908] - Merging all the changes
- Issue #1221[5909] - No error output when using mpirun with hpx
- Issue #1219[5910] - Adding new AGAS cache performance counters

5910 https://github.com/TheHPXProject/hpx/issues/1219

- Issue #1216[5911] - Fixing using futures (clients) as arguments to actions
- Issue #1215[5912] - Error compiling simple component
- Issue #1214[5913] - Stencil docs
- Issue #1213[5914] - Using more than a few dozen MPI processes on SuperMike results in a seg fault before getting to hpx_main
- Issue #1212[5915] - Parallel rotate
- Issue #1211[5916] - Direct actions cause the future's shared_state to be leaked
- Issue #1210[5917] - Refactored local::promise to be standard conformant
- Issue #1209[5918] - Improve command line handling
- Issue #1208[5919] - Adding parallel::reverse and parallel::reverse_copy
- Issue #1207[5920] - Add copy_backward and move_backward
- Issue #1206[5921] - N4071 additional algorithms implemented
- Issue #1204[5922] - Cmake simplification and various other minor changes
- Issue #1203[5923] - Implementing new launch policy for (local) async: `hpx::launch::fork`.
- Issue #1202[5924] - Failed assertion in connection_cache.hpp
- Issue #1201[5925] - pkg-config doesn't add mpi link directories
- Issue #1200[5926] - Error when querying time performance counters
- Issue #1199[5927] - library path is now configurable (again)
- Issue #1198[5928] - Error when querying performance counters
- Issue #1197[5929] - tests fail with intel compiler
- Issue #1196[5930] - Silence several warnings
- Issue #1195[5931] - Rephrase initializers to work with VC++ 2012
- Issue #1194[5932] - Simplify parallel algorithms

5932 https://github.com/TheHPXProject/hpx/issues/1194

- Issue #1193[5933] - Adding `parallel::equal`
- Issue #1192[5934] - HPX(out_of_memory) on including <hpx/hpx.hpp>
- Issue #1191[5935] - Fixing #1189
- Issue #1190[5936] - Chrono cleanup
- Issue #1189[5937] - Deadlock .. somewhere? (probably serialization)
- Issue #1188[5938] - Removed `future::get_status()`
- Issue #1186[5939] - Fixed FindOpenCL to find current AMD APP SDK
- Issue #1184[5940] - Tweaking future unwrapping
- Issue #1183[5941] - Extended `parallel::reduce`
- Issue #1182[5942] - `future::unwrap` hangs for `launch::deferred`
- Issue #1181[5943] - Adding `all_of`, `any_of`, and `none_of` and corresponding documentation
- Issue #1180[5944] - `hpx::cout` defect
- Issue #1179[5945] - `hpx::async` does not work for member function pointers when called on types with self-defined unary `operator*`
- Issue #1178[5946] - Implemented variadic `hpx::util::zip_iterator`
- Issue #1177[5947] - MPI parcelport defect
- Issue #1176[5948] - `HPX_DEFINE_COMPONENT_CONST_ACTION_TPL` does not have a 2-argument version
- Issue #1175[5949] - Create util::zip_iterator working with util::tuple<>
- Issue #1174[5950] - Error Building HPX on linux, root_certificate_authority.cpp
- Issue #1173[5951] - hpx::cout output lost
- Issue #1172[5952] - HPX build error with Clang 3.4.2
- Issue #1171[5953] - `CMAKE_INSTALL_PREFIX` ignored
- Issue #1170[5954] - Close hpx_benchmarks repository on Github

- Issue #44[6067] - Implement real futures

HPX V0.9.8 (Mar 24, 2014)

We have had over 800 commits since the last release and we have closed over 65 tickets (bugs, feature requests, etc.).

With the changes below, *HPX* is once again leading the charge of a whole new era of computation. By intrinsically breaking down and synchronizing the work to be done, *HPX* insures that application developers will no longer have to fret about where a segment of code executes. That allows coders to focus their time and energy to understanding the data dependencies of their algorithms and thereby the core obstacles to an efficient code. Here are some of the advantages of using *HPX*:

- *HPX* is solidly rooted in a sophisticated theoretical execution model – ParalleX
- *HPX* exposes an API fully conforming to the C++11 and the draft C++14 standards, extended and applied to distributed computing. Everything programmers know about the concurrency primitives of the standard C++ library is still valid in the context of *HPX*.
- It provides a competitive, high performance implementation of modern, future-proof ideas which gives an smooth migration path from today's mainstream techniques
- There is no need for the programmer to worry about lower level parallelization paradigms like threads or message passing; no need to understand pthreads, MPI, OpenMP, or Windows threads, etc.
- There is no need to think about different types of parallelism such as tasks, pipelines, or fork-join, task or data parallelism.
- The same source of your program compiles and runs on Linux, BlueGene/Q, Mac OS X, Windows, and Android.
- The same code runs on shared memory multi-core systems and supercomputers, on handheld devices and Intel® Xeon Phi™ accelerators, or a heterogeneous mix of those.

General changes

- A major API breaking change for this release was introduced by implementing `hpx::future` and `hpx::shared_future` fully in conformance with the C++11 Standard[6068]. While `hpx::shared_future` is new and will not create any compatibility problems, we revised the interface and implementation of the existing `hpx::future`. For more details please see the mailing list archive[6069]. To avoid any incompatibilities for existing code we named the type which implements the `std::future` interface as `hpx::unique_future`. For the next release this will be renamed to `hpx::future`, making it full conforming to C++11 Standard[6070].

[6070] http://www.open-std.org/jtc1/sc22/wg21

- A large part of the code base of *HPX* has been refactored and partially re-implemented. The main changes were related to
  - The threading subsystem: these changes significantly reduce the amount of overheads caused by the schedulers, improve the modularity of the code base, and extend the variety of available scheduling algorithms.
  - The parcel subsystem: these changes improve the performance of the *HPX* networking layer, modularize the structure of the parcelports, and simplify the creation of new parcelports for other underlying networking libraries.
  - The API subsystem: these changes improved the conformance of the API to C++11 Standard, extend and unify the available API functionality, and decrease the overheads created by various elements of the API.
  - The robustness of the component loading subsystem has been improved significantly, allowing to more portably and more reliably register the components needed by an application as startup. This additionally speeds up general application initialization.
- We added new API functionality like `hpx::migrate` and `hpx::copy_component` which are the basic building blocks necessary for implementing higher level abstractions for system-wide load balancing, runtime-adaptive resource management, and object-oriented checkpointing and state-management.
- We removed the use of C++11 move emulation (using Boost.Move), replacing it with C++11 rvalue references. This is the first step towards using more and more native C++11 facilities which we plan to introduce in the future.
- We improved the reference counting scheme used by *HPX* which helps managing distributed objects and memory. This improves the overall stability of *HPX* and further simplifies writing real world applications.
- The minimal Boost version required to use *HPX* is now V1.49.0.
- This release coincides with the first release of HPXPI (V0.1.0), the first implementation of the XPI specification[6071].

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1086[6072] - Expose internal boost::shared_array to allow user management of array lifetime
- Issue #1083[6073] - Make shell examples copyable in docs
- Issue #1080[6074] - /threads{locality#*/total}/count/cumulative broken
- Issue #1079[6075] - Build problems on OS X
- Issue #1078[6076] - Improve robustness of component loading
- Issue #1077[6077] - Fix a missing enum definition for 'take' mode

[6076] https://github.com/TheHPXProject/hpx/issues/1078
[6077] https://github.com/TheHPXProject/hpx/issues/1077

- Issue #1076[6078] - Merge Jb master
- Issue #1075[6079] - Unknown CMake command "add_hpx_pseudo_target"
- Issue #1074[6080] - Implement `apply_continue_callback` and `apply_colocated_callback`
- Issue #1073[6081] - The new `apply_colocated` and `async_colocated` functions lead to automatic registered functions
- Issue #1071[6082] - Remove deferred_packaged_task
- Issue #1069[6083] - serialize_buffer with allocator fails at destruction
- Issue #1068[6084] - Coroutine include and forward declarations missing
- Issue #1067[6085] - Add allocator support to util::serialize_buffer
- Issue #1066[6086] - Allow for MPI_Init being called before HPX launches
- Issue #1065[6087] - AGAS cache isn't used/populated on worker localities
- Issue #1064[6088] - Reorder includes to ensure ws2 includes early
- Issue #1063[6089] - Add `hpx::runtime::suspend` and `hpx::runtime::resume`
- Issue #1062[6090] - Fix `async_continue` to properly handle return types
- Issue #1061[6091] - Implement `async_colocated` and `apply_colocated`
- Issue #1060[6092] - Implement minimal component migration
- Issue #1058[6093] - Remove `HPX_UTIL_TUPLE` from code base
- Issue #1057[6094] - Add performance counters for threading subsystem
- Issue #1055[6095] - Thread allocation uses two memory pools
- Issue #1053[6096] - Work stealing flawed
- Issue #1052[6097] - Fix a number of warnings
- Issue #1049[6098] - Fixes for TLS on OSX and more reliable test running
- Issue #1048[6099] - Fixing after 588 hang

6099 https://github.com/TheHPXProject/hpx/issues/1048

- Issue #1047[6100] - Use port '0' for networking when using one locality
- Issue #1046[6101] - `composable_guard` test is broken when having more than one thread
- Issue #1045[6102] - Security missing headers
- Issue #1044[6103] - Native TLS on FreeBSD via __thread
- Issue #1043[6104] - `async` et.al. compute the wrong result type
- Issue #1042[6105] - `async` et.al. implicitly unwrap reference_wrappers
- Issue #1041[6106] - Remove redundant costly Kleene stars from regex searches
- Issue #1040[6107] - CMake script regex match patterns has unnecessary kleenes
- Issue #1039[6108] - Remove use of Boost.Move and replace with std::move and real rvalue refs
- Issue #1038[6109] - Bump minimal required Boost to 1.49.0
- Issue #1037[6110] - Implicit unwrapping of futures in async broken
- Issue #1036[6111] - Scheduler hangs when user code attempts to "block" OS-threads
- Issue #1035[6112] - Idle-rate counter always reports 100% idle rate
- Issue #1034[6113] - Symbolic name registration causes application hangs
- Issue #1033[6114] - Application options read in from an options file generate an error message
- Issue #1032[6115] - `hpx::id_type` local reference counting is wrong
- Issue #1031[6116] - Negative entry in reference count table
- Issue #1030[6117] - Implement condition_variable
- Issue #1029[6118] - Deadlock in thread scheduling subsystem
- Issue #1028[6119] - HPX-thread cumulative count performance counters report incorrect value
- Issue #1027[6120] - Expose `hpx::thread_interrupted` error code as a separate exception type

- Issue #1026[6121] - Exceptions thrown in asynchronous calls can be lost if the value of the future is never queried
- Issue #1025[6122] - `future::wait_for/wait_until` do not remove callback
- Issue #1024[6123] - Remove dependence to boost assert and create hpx assert
- Issue #1023[6124] - Segfaults with tcmalloc
- Issue #1022[6125] - prerequisites link in readme is broken
- Issue #1020[6126] - HPX Deadlock on external synchronization
- Issue #1019[6127] - Convert using `BOOST_ASSERT` to `HPX_ASSERT`
- Issue #1018[6128] - compiling bug with gcc 4.8.1
- Issue #1017[6129] - Possible crash in io_pool executor
- Issue #1016[6130] - Crash at startup
- Issue #1014[6131] - Implement Increment/Decrement Merging
- Issue #1013[6132] - Add more logging channels to enable greater control over logging granularity
- Issue #1012[6133] - `--hpx:debug-hpx-log` and `--hpx:debug-agas-log` lead to non-thread safe writes
- Issue #1011[6134] - After installation, running applications from the build/staging directory no longer works
- Issue #1010[6135] - Mergeable decrement requests are not being merged
- Issue #1009[6136] - `--hpx:list-symbolic-names` crashes
- Issue #1007[6137] - Components are not properly destroyed
- Issue #1006[6138] - Segfault/hang in set_data
- Issue #1003[6139] - Performance counter naming issue
- Issue #982[6140] - Race condition during startup
- Issue #912[6141] - OS X: component type not found in map

- Issue #663[6142] - Create a buildbot slave based on Clang 3.2/OSX
- Issue #636[6143] - Expose `this_locality::apply<act>(p1, p2);` for local execution
- Issue #197[6144] - Add `--console=address` option for PBS runs
- Issue #175[6145] - Asynchronous AGAS API

HPX V0.9.7 (Nov 13, 2013)

We have had over 1000 commits since the last release and we have closed over 180 tickets (bugs, feature requests, etc.).

General changes

- Ported HPX to BlueGene/Q
- Improved HPX support for Xeon/Phi accelerators
- Reimplemented `hpx::bind`, `hpx::tuple`, and `hpx::function` for better performance and better compliance with the C++11 Standard. Added `hpx::mem_fn`.
- Reworked `hpx::when_all` and `hpx::when_any` for better compliance with the ongoing C++ standardization effort, added heterogeneous version for those functions. Added `hpx::when_any_swapped`.
- Added `hpx::copy` as a precursor for a migrate functionality
- Added `hpx::get_ptr` allowing to directly access the memory underlying a given component
- Added the `hpx::lcos::broadcast`, `hpx::lcos::reduce`, and `hpx::lcos::fold` collective operations
- Added `hpx::get_locality_name` allowing to retrieve the name of any of the localities for the application.
- Added support for more flexible thread affinity control from the HPX command line, such as new modes for `--hpx:bind` (`balanced`, `scattered`, `compact`), improved default settings when running multiple localities on the same node.
- Added experimental executors for simpler thread pooling and scheduling. This API may change in the future as it will stay aligned with the ongoing C++ standardization efforts.
- Massively improved the performance of the HPX serialization code. Added partial support for zero copy serialization of array and bitwise-copyable types.
- General performance improvements of the code related to threads and futures.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1005[6146] - Allow one to disable array optimizations and zero copy optimizations for each parcelport
- Issue #1004[6147] - Generate new HPX logo image for the docs
- Issue #1002[6148] - If MPI parcelport is not available, running HPX under mpirun should fail
- Issue #1001[6149] - Zero copy serialization raises assert
- Issue #1000[6150] - Can't connect to a HPX application running with the MPI parcelport from a non MPI parcelport locality
- Issue #999[6151] - Optimize `hpx::when_n`
- Issue #998[6152] - Fixed const-correctness
- Issue #997[6153] - Making serialize_buffer::data() type save
- Issue #996[6154] - Memory leak in hpx::lcos::promise
- Issue #995[6155] - Race while registering pre-shutdown functions
- Issue #994[6156] - thread_rescheduling regression test does not compile
- Issue #992[6157] - Correct comments and messages
- Issue #991[6158] - setcap cap_sys_rawio=ep for power profiling causes an HPX application to abort
- Issue #989[6159] - Jacobi hangs during execution
- Issue #988[6160] - multiple_init test is failing
- Issue #986[6161] - Can't call a function called "init" from "main" when using `<hpx/hpx_main.hpp>`
- Issue #984[6162] - Reference counting tests are failing
- Issue #983[6163] - thread_suspension_executor test fails
- Issue #980[6164] - Terminating HPX threads don't leave stack in virgin state

- Issue #979[6165] - Static scheduler not in documents
- Issue #978[6166] - Preprocessing limits are broken
- Issue #977[6167] - Make tests.regressions.lcos.future_hang_on_get shorter
- Issue #976[6168] - Wrong library order in pkgconfig
- Issue #975[6169] - Please reopen #963
- Issue #974[6170] - Option pu-offset ignored in fixing_588 branch
- Issue #972[6171] - Cannot use MKL with HPX
- Issue #969[6172] - Non-existent INI files requested on the command line via `--hpx:config` do not cause warnings or errors.
- Issue #968[6173] - Cannot build examples in fixing_588 branch
- Issue #967[6174] - Command line description of `--hpx:queuing` seems wrong
- Issue #966[6175] - `--hpx:print-bind` physical core numbers are wrong
- Issue #965[6176] - Deadlock when building in Release mode
- Issue #963[6177] - Not all worker threads are working
- Issue #962[6178] - Problem with SLURM integration
- Issue #961[6179] - `--hpx:print-bind` outputs incorrect information
- Issue #960[6180] - Fix cut and paste error in documentation of get_thread_priority
- Issue #959[6181] - Change link to boost.atomic in documentation to point to boost.org
- Issue #958[6182] - Undefined reference to intrusive_ptr_release
- Issue #957[6183] - Make tuple standard compliant
- Issue #956[6184] - Segfault with a3382fb
- Issue #955[6185] - `--hpx:nodes` and `--hpx:nodefiles` do not work with foreign nodes
- Issue #954[6186] - Make order of arguments for hpx::async and hpx::broadcast consistent
- Issue #953[6187] - Cannot use MKL with HPX

6187 https://github.com/TheHPXProject/hpx/issues/953

- Issue #952[6188] - `register_[pre_]shutdown_function` never throw
- Issue #951[6189] - Assert when number of threads is greater than hardware concurrency
- Issue #948[6190] - `HPX_HAVE_GENERIC_CONTEXT_COROUTINES` conflicts with `HPX_HAVE_FIBER_BASED_COROUTINES`
- Issue #947[6191] - Need MPI_THREAD_MULTIPLE for backward compatibility
- Issue #946[6192] - HPX does not call `MPI_Finalize`
- Issue #945[6193] - Segfault with `hpx::lcos::broadcast`
- Issue #944[6194] - OS X: assertion `pu_offset_ < hardware_concurrency` failed
- Issue #943[6195] - #include <hpx/hpx_main.hpp> does not work
- Issue #942[6196] - Make the BG/Q work with -O3
- Issue #940[6197] - Use separator when concatenating locality name
- Issue #939[6198] - Refactor MPI parcelport to use `MPI_Wait` instead of multiple `MPI_Test` calls
- Issue #938[6199] - Want to officially access `client_base::gid_`
- Issue #937[6200] - `client_base::gid_` should be private``
- Issue #936[6201] - Want doxygen-like source code index
- Issue #935[6202] - Build error with gcc 4.6 and Boost 1.54.0 on hpx trunk and 0.9.6
- Issue #933[6203] - Cannot build HPX with Boost 1.54.0
- Issue #932[6204] - Components are destructed too early
- Issue #931[6205] - Make HPX work on BG/Q
- Issue #930[6206] - make git-docs is broken
- Issue #929[6207] - Generating index in docs broken
- Issue #928[6208] - Optimize `hpx::util::static_` for C++11 compilers supporting magic statics
- Issue #924[6209] - Make kill_process_tree (in process.py) more robust on Mac OSX

- Issue #923[6210] - Correct BLAS and RNPL cmake tests
- Issue #922[6211] - Cannot link against BLAS
- Issue #921[6212] - Implement `hpx::mem_fn`
- Issue #920[6213] - Output locality with `--hpx:print-bind`
- Issue #919[6214] - Correct grammar; simplify boolean expressions
- Issue #918[6215] - Link to hello_world.cpp is broken
- Issue #917[6216] - adapt cmake file to new boostbook version
- Issue #916[6217] - fix problem building documentation with xsltproc >= 1.1.27
- Issue #915[6218] - Add another TBBMalloc library search path
- Issue #914[6219] - Build problem with Intel compiler on Stampede (TACC)
- Issue #913[6220] - fix error messages in fibonacci examples
- Issue #911[6221] - Update OS X build instructions
- Issue #910[6222] - Want like to specify MPI_ROOT instead of compiler wrapper script
- Issue #909[6223] - Warning about void* arithmetic
- Issue #908[6224] - Buildbot for MIC is broken
- Issue #906[6225] - Can't use `--hpx:bind=balanced` with multiple MPI processes
- Issue #905[6226] - `--hpx:bind` documentation should describe full grammar
- Issue #904[6227] - Add hpx::lcos::fold and hpx::lcos::inverse_fold collective operation
- Issue #903[6228] - Add `hpx::when_any_swapped()`
- Issue #902[6229] - Add `hpx::lcos::reduce` collective operation
- Issue #901[6230] - Web documentation is not searchable
- Issue #900[6231] - Web documentation for trunk has no index
- Issue #898[6232] - Some tests fail with GCC 4.8.1 and MPI parcel port

- Issue #897[6233] - HWLOC causes failures on Mac
- Issue #896[6234] - pu-offset leads to startup error
- Issue #895[6235] - `hpx::get_locality_name` not defined
- Issue #894[6236] - Race condition at shutdown
- Issue #893[6237] - `--hpx:print-bind` switches std::cout to hexadecimal mode
- Issue #892[6238] - `hwloc_topology_load` can be expensive – don't call multiple times
- Issue #891[6239] - The documentation for `get_locality_name` is wrong
- Issue #890[6240] - `--hpx:print-bind` should not exit
- Issue #889[6241] - `--hpx:debug-hpx-log=FILE` does not work
- Issue #888[6242] - MPI parcelport does not exit cleanly for –hpx:print-bind
- Issue #887[6243] - Choose thread affinities more cleverly
- Issue #886[6244] - Logging documentation is confusing
- Issue #885[6245] - Two threads are slower than one
- Issue #884[6246] - is_callable failing with member pointers in C++11
- Issue #883[6247] - Need help with is_callable_test
- Issue #882[6248] - tests.regressions.lcos.future_hang_on_get does not terminate
- Issue #881[6249] - tests/regressions/block_matrix/matrix.hh won't compile with GCC 4.8.1
- Issue #880[6250] - HPX does not work on OS X
- Issue #878[6251] - `future::unwrap` triggers assertion
- Issue #877[6252] - "make tests" has build errors on Ubuntu 12.10
- Issue #876[6253] - tcmalloc is used by default, even if it is not present
- Issue #875[6254] - global_fixture is defined in a header file
- Issue #874[6255] - Some tests take very long

- Issue #842[6279] - Remove buffer_pool from MPI parcelport
- Issue #841[6280] - Add possibility to broadcast an index with hpx::lcos::broadcast
- Issue #838[6281] - Simplify `util::tuple`
- Issue #837[6282] - Adopt boost::tuple tests for `util::tuple`
- Issue #836[6283] - Adopt boost::function tests for `util::function`
- Issue #835[6284] - Tuple interface missing pieces
- Issue #833[6285] - Partially preprocessing files not working
- Issue #832[6286] - Native papi counters do not work with wild cards
- Issue #831[6287] - Arithmetics counter fails if only one parameter is given
- Issue #830[6288] - Convert hpx::util::function to use new scheme for serializing its base pointer
- Issue #829[6289] - Consistently use `decay<T>` instead of `remove_const< remove_reference<T>>`
- Issue #828[6290] - Update future implementation to N3721 and N3722
- Issue #827[6291] - Enable MPI parcelport for bootstrapping whenever application was started using mpirun
- Issue #826[6292] - Support command line option `--hpx:print-bind` even if `--hpx::bind` was not used
- Issue #825[6293] - Memory counters give segfault when attempting to use thread wild cards or numbers only total works
- Issue #824[6294] - Enable lambda functions to be used with hpx::async/hpx::apply
- Issue #823[6295] - Using a hashing filter
- Issue #822[6296] - Silence unused variable warning
- Issue #821[6297] - Detect if a function object is callable with given arguments
- Issue #820[6298] - Allow wildcards to be used for performance counter names
- Issue #819[6299] - Make the AGAS symbolic name registry distributed

- Issue #818[6300] - Add future::then() overload taking an executor
- Issue #817[6301] - Fixed typo
- Issue #815[6302] - Create an lco that is performing an efficient broadcast of actions
- Issue #814[6303] - Papi counters cannot specify thread#* to get the counts for all threads
- Issue #813[6304] - Scoped unlock
- Issue #811[6305] - simple_central_tuplespace_client run error
- Issue #810[6306] - ostream error when << any objects
- Issue #809[6307] - Optimize parcel serialization
- Issue #808[6308] - HPX applications throw exception when executed from the build directory
- Issue #807[6309] - Create performance counters exposing overall AGAS statistics
- Issue #795[6310] - Create timed make_ready_future
- Issue #794[6311] - Create heterogeneous `when_all`/`when_any`/etc.
- Issue #721[6312] - Make HPX usable for Xeon Phi
- Issue #694[6313] - CMake should complain if you attempt to build an example without its dependencies
- Issue #692[6314] - SLURM support broken
- Issue #683[6315] - python/hpx/process.py imports epoll on all platforms
- Issue #619[6316] - Automate the doc building process
- Issue #600[6317] - GTC performance broken
- Issue #577[6318] - Allow for zero copy serialization/networking
- Issue #551[6319] - Change executable names to have debug postfix in Debug builds
- Issue #544[6320] - Write a custom .lib file on Windows pulling in hpx_init and hpx.dll, phase out hpx_init

6319 https://github.com/TheHPXProject/hpx/issues/551
6320 https://github.com/TheHPXProject/hpx/issues/544

- Issue #534[6321] - `hpx::init` should take functions by `std::function` and should accept all forms of hpx_main
- Issue #508[6322] - FindPackage fails to set FOO_LIBRARY_DIR
- Issue #506[6323] - Add cmake support to generate ini files for external applications
- Issue #470[6324] - Changing build-type after configure does not update boost library names
- Issue #453[6325] - Document `hpx_run_tests.py`
- Issue #445[6326] - Significant performance mismatch between MPI and HPX in SMP for allgather example
- Issue #443[6327] - Make docs viewable from build directory
- Issue #421[6328] - Support multiple HPX instances per node in a batch environment like PBS or SLURM
- Issue #316[6329] - Add message size limitation
- Issue #249[6330] - Clean up locking code in big boot barrier
- Issue #136[6331] - Persistent CMake variables need to be marked as cache variables

HPX V0.9.6 (Jul 30, 2013)

We have had over 1200 commits since the last release and we have closed roughly 140 tickets (bugs, feature requests, etc.).

General changes

The major new features in this release are:

- We further consolidated the API exposed by *HPX*. We aligned our APIs as much as possible with the existing C++11 Standard[6332] and related proposals to the C++ standardization committee (such as N3632[6333] and N3857[6334]).
- We implemented a first version of a distributed AGAS service which essentially eliminates all explicit AGAS network traffic.
- We created a native ibverbs parcelport allowing to take advantage of the superior latency and bandwidth characteristics of Infiniband networks.
- We successfully ported *HPX* to the Xeon Phi platform.
- Support for the SLURM scheduling system was implemented.

6321 https://github.com/TheHPXProject/hpx/issues/534
6322 https://github.com/TheHPXProject/hpx/issues/508
6323 https://github.com/TheHPXProject/hpx/issues/506
6324 https://github.com/TheHPXProject/hpx/issues/470
6325 https://github.com/TheHPXProject/hpx/issues/453
6326 https://github.com/TheHPXProject/hpx/issues/445
6327 https://github.com/TheHPXProject/hpx/issues/443
6328 https://github.com/TheHPXProject/hpx/issues/421
6329 https://github.com/TheHPXProject/hpx/issues/316
6330 https://github.com/TheHPXProject/hpx/issues/249
6331 https://github.com/TheHPXProject/hpx/issues/136
6332 http://www.open-std.org/jtc1/sc22/wg21
6333 http://wg21.link/n3632
6334 http://wg21.link/n3857

- Major efforts have been dedicated to improving the performance counter framework, numerous new counters were implemented and new APIs were added.
- We added a modular parcel compression system allowing to improve bandwidth utilization (by reducing the overall size of the transferred data).
- We added a modular parcel coalescing system allowing to combine several parcels into larger messages. This reduces latencies introduced by the communication layer.
- Added an experimental executors API allowing to use different scheduling policies for different parts of the code. This API has been modelled after the Standards proposal N3562[6335]. This API is bound to change in the future, though.
- Added minimal security support for localities which is enforced on the parcelport level. This support is preliminary and experimental and might change in the future.
- We created a parcelport using low level MPI functions. This is in support of legacy applications which are to be gradually ported and to support platforms where MPI is the only available portable networking layer.
- We added a preliminary and experimental implementation of a tuple-space object which exposes an interface similar to such systems described in the literature (see for instance The Linda Coordination Language[6336]).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is again a very long list of newly implemented features and fixed issues.

- Issue #806[6337] - make (all) in examples folder does nothing
- Issue #805[6338] - Adding the introduction and fixing DOCBOOK dependencies for Windows use
- Issue #804[6339] - Add stackless (non-suspendable) thread type
- Issue #803[6340] - Create proper serialization support functions for util::tuple
- Issue #800[6341] - Add possibility to disable array optimizations during serialization
- Issue #798[6342] - HPX_LIMIT does not work for local dataflow
- Issue #797[6343] - Create a parcelport which uses MPI
- Issue #796[6344] - Problem with Large Numbers of Threads
- Issue #793[6345] - Changing dataflow test case to hang consistently
- Issue #792[6346] - CMake Error

6343 https://github.com/TheHPXProject/hpx/issues/797
6344 https://github.com/TheHPXProject/hpx/issues/796
6345 https://github.com/TheHPXProject/hpx/issues/793
6346 https://github.com/TheHPXProject/hpx/issues/792

- Issue #791[6347] - Problems with local::dataflow
- Issue #790[6348] - wait_for() doesn't compile
- Issue #789[6349] - HPX with Intel compiler segfaults
- Issue #788[6350] - Intel compiler support
- Issue #787[6351] - Fixed SFINAEd specializations
- Issue #786[6352] - Memory issues during benchmarking.
- Issue #785[6353] - Create an API allowing to register external threads with HPX
- Issue #784[6354] - util::plugin is throwing an error when a symbol is not found
- Issue #783[6355] - How does hpx:bind work?
- Issue #782[6356] - Added quotes around STRING REPLACE potentially empty arguments
- Issue #781[6357] - Make sure no exceptions propagate into the thread manager
- Issue #780[6358] - Allow arithmetics performance counters to expand its parameters
- Issue #779[6359] - Test case for 778
- Issue #778[6360] - Swapping futures segfaults
- Issue #777[6361] - hpx::lcos::details::when_xxx don't restore completion handlers
- Issue #776[6362] - Compiler chokes on dataflow overload with launch policy
- Issue #775[6363] - Runtime error with local dataflow (copying futures?)
- Issue #774[6364] - Using local dataflow without explicit namespace
- Issue #773[6365] - Local dataflow with unwrap: functor operators need to be const
- Issue #772[6366] - Allow (remote) actions to return a future
- Issue #771[6367] - Setting HPX_LIMIT gives huge boost MPL errors
- Issue #770[6368] - Add launch policy to (local) dataflow
- Issue #769[6369] - Make compile time configuration information available

- Issue #768[6370] - Const correctness problem in local dataflow
- Issue #767[6371] - Add launch policies to async
- Issue #766[6372] - Mark data structures for optimized (array based) serialization
- Issue #765[6373] - Align hpx::any with N3508: Any Library Proposal (Revision 2)
- Issue #764[6374] - Align hpx::future with newest N3558: A Standardized Representation of Asynchronous Operations
- Issue #762[6375] - added a human readable output for the ping pong example
- Issue #761[6376] - Ambiguous typename when constructing derived component
- Issue #760[6377] - Simple components can not be derived
- Issue #759[6378] - make install doesn't give a complete install
- Issue #758[6379] - Stack overflow when using locking_hook<>
- Issue #757[6380] - copy paste error; unsupported function overloading
- Issue #756[6381] - GTCX runtime issue in Gordon
- Issue #755[6382] - Papi counters don't work with reset and evaluate API's
- Issue #753[6383] - cmake bugfix and improved component action docs
- Issue #752[6384] - hpx simple component docs
- Issue #750[6385] - Add hpx::util::any
- Issue #749[6386] - Thread phase counter is not reset
- Issue #748[6387] - Memory performance counter are not registered
- Issue #747[6388] - Create performance counters exposing arithmetic operations
- Issue #745[6389] - apply_callback needs to invoke callback when applied locally
- Issue #744[6390] - CMake fixes
- Issue #743[6391] - Problem Building github version of HPX
- Issue #742[6392] - Remove HPX_STD_BIND

- Issue #741[6393] - assertion 'px != 0' failed: HPX(assertion_failure) for low numbers of OS threads
- Issue #739[6394] - Performance counters do not count to the end of the program or evaluation
- Issue #738[6395] - Dedicated AGAS server runs don't work; console ignores -a option.
- Issue #737[6396] - Missing bind overloads
- Issue #736[6397] - Performance counter wildcards do not always work
- Issue #735[6398] - Create native ibverbs parcelport based on rdma operations
- Issue #734[6399] - Threads stolen performance counter total is incorrect
- Issue #733[6400] - Test benchmarks need to be checked and fixed
- Issue #732[6401] - Build fails with Mac, using mac ports clang-3.3 on latest git branch
- Issue #731[6402] - Add global start/stop API for performance counters
- Issue #730[6403] - Performance counter values are apparently incorrect
- Issue #729[6404] - Unhandled switch
- Issue #728[6405] - Serialization of hpx::util::function between two localities causes seg faults
- Issue #727[6406] - Memory counters on Mac OS X
- Issue #725[6407] - Restore original thread priority on resume
- Issue #724[6408] - Performance benchmarks do not depend on main HPX libraries
- Issue #723[6409] - [teletype]–hpx:nodes=``cat $PBS_NODEFILE`` works; –hpx:nodefile=$PBS_NODEFILE does not.[c++]
- Issue #722[6410] - Fix binding const member functions as actions
- Issue #719[6411] - Create performance counter exposing compression ratio
- Issue #718[6412] - Add possibility to compress parcel data
- Issue #717[6413] - strip_credit_from_gid has misleading semantics

- Issue #716[6414] - Non-option arguments to programs run using `pbsdsh` must be before `--hpx:nodes`, contrary to directions
- Issue #715[6415] - Re-thrown exceptions should retain the original call site
- Issue #714[6416] - failed assertion in debug mode
- Issue #713[6417] - Add performance counters monitoring connection caches
- Issue #712[6418] - Adjust parcel related performance counters to be connection type specific
- Issue #711[6419] - configuration failure
- Issue #710[6420] - Error "timed out while trying to find room in the connection cache" when trying to start multiple localities on a single computer
- Issue #709[6421] - Add new thread state 'staged' referring to task descriptions
- Issue #708[6422] - Detect/mitigate bad non-system installs of GCC on Redhat systems
- Issue #707[6423] - Many examples do not link with Git HEAD version
- Issue #706[6424] - `hpx::init` removes portions of non-option command line arguments before last = sign
- Issue #705[6425] - Create rolling average and median aggregating performance counters
- Issue #704[6426] - Create performance counter to expose thread queue waiting time
- Issue #703[6427] - Add support to HPX build system to find librcrtool.a and related headers
- Issue #699[6428] - Generalize instrumentation support
- Issue #698[6429] - compilation failure with hwloc absent
- Issue #697[6430] - Performance counter counts should be zero indexed
- Issue #696[6431] - Distributed problem
- Issue #695[6432] - Bad perf counter time printed
- Issue #693[6433] - `--help` doesn't print component specific command line options
- Issue #692[6434] - SLURM support broken

HPX V0.9.5 (Jan 16, 2013)

We have had over 1000 commits since the last release and we have closed roughly 150 tickets (bugs, feature requests, etc.).

General changes

This release is continuing along the lines of code and API consolidation, and overall usability inprovements. We dedicated much attention to performance and we were able to significantly improve the threading and networking subsystems.

We successfully ported *HPX* to the Android platform. *HPX* applications now not only can run on mobile devices, but we support heterogeneous applications running across architecture boundaries. At the Supercomputing Conference 2012 we demonstrated connecting Android tablets to simulations running on a Linux cluster. The Android tablet was used to query performance counters from the Linux simulation and to steer its parameters.

We successfully ported *HPX* to Mac OSX (using the Clang compiler). Thanks to Pyry Jahkola for contributing the corresponding patches. Please see the section macos_installation for more details.

We made a special effort to make HPX usable in highly concurrent use cases. Many of the HPX API functions which possibly take longer than 100 microseconds to execute now can be invoked asynchronously. We added uniform support for composing futures which simplifies to write asynchronous code. HPX actions (function objects encapsulating possibly concurrent remote function invocations) are now well integrated with all other API facilities such like `hpx::bind`.

All of the API has been aligned as much as possible with established paradigms. HPX now mirrors many of the facilities as defined in the C++11 Standard, such as `hpx::thread`, `hpx::function`, `hpx::future`, etc.

A lot of work has been put into improving the documentation. Many of the API functions are documented now, concepts are explained in detail, and examples are better described than before. The new documentation index enables finding information with lesser effort.

This is the first release of HPX we perform after the move to Github[6477] This step has enabled a wider participation from the community and further encourages us in our decision to release HPX as a true open source library (HPX is licensed under the very liberal Boost Software License[6478]).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is by far the longest list of newly implemented features and fixed issues for any of HPX' releases so far.

- Issue #666[6479] - Segfault on calling hpx::finalize twice
- Issue #665[6480] - Adding declaration num_of_cores

[6477] https://github.com/TheHPXProject/hpx/
[6478] https://www.boost.org/LICENSE_1_0.txt
[6479] https://github.com/TheHPXProject/hpx/issues/666
[6480] https://github.com/TheHPXProject/hpx/issues/665

- Issue #662[6481] - pkgconfig is building wrong
- Issue #660[6482] - Need uninterrupt function
- Issue #659[6483] - Move our logging library into a different namespace
- Issue #658[6484] - Dynamic performance counter types are broken
- Issue #657[6485] - HPX v0.9.5 (RC1) hello_world example segfaulting
- Issue #656[6486] - Define the affinity of parcel-pool, io-pool, and timer-pool threads
- Issue #654[6487] - Integrate the Boost auto_index tool with documentation
- Issue #653[6488] - Make HPX build on OS X + Clang + libc++
- Issue #651[6489] - Add fine-grained control for thread pinning
- Issue #650[6490] - Command line no error message when using -hpx:(anything)
- Issue #645[6491] - Command line aliases don't work in [teletype]``@file``[c++]
- Issue #644[6492] - Terminated threads are not always properly cleaned up
- Issue #640[6493] - `future_data<T>::set_on_completed_` used without locks
- Issue #638[6494] - hpx build with intel compilers fails on linux
- Issue #637[6495] - –copy-dt-needed-entries breaks with gold
- Issue #635[6496] - Boost V1.53 will add Boost.Lockfree and Boost.Atomic
- Issue #633[6497] - Re-add examples to final 0.9.5 release
- Issue #632[6498] - Example `thread_aware_timer` is broken
- Issue #631[6499] - FFT application throws error in parcellayer
- Issue #630[6500] - Event synchronization example is broken
- Issue #629[6501] - Waiting on futures hangs
- Issue #628[6502] - Add an `HPX_ALWAYS_ASSERT` macro
- Issue #625[6503] - Port coroutines context switch benchmark

6503 https://github.com/TheHPXProject/hpx/issues/625

- Issue #621[6504] - New INI section for stack sizes
- Issue #618[6505] - pkg_config support does not work with a HPX debug build
- Issue #617[6506] - hpx/external/logging/boost/logging/detail/cache_before_init.hpp:139:67: error: 'get_thread_id' was not declared in this scope
- Issue #616[6507] - Change wait_xxx not to use locking
- Issue #615[6508] - Revert visibility 'fix' (fb0b6b8245dad1127b0c25ebafd9386b3945cca9)
- Issue #614[6509] - Fix Dataflow linker error
- Issue #613[6510] - find_here should throw an exception on failure
- Issue #612[6511] - Thread phase doesn't show up in debug mode
- Issue #611[6512] - Make stack guard pages configurable at runtime (initialization time)
- Issue #610[6513] - Co-Locate Components
- Issue #609[6514] - future_overhead
- Issue #608[6515] - `--hpx:list-counter-infos` problem
- Issue #607[6516] - Update Boost.Context based backend for coroutines
- Issue #606[6517] - 1d_wave_equation is not working
- Issue #605[6518] - Any C++ function that has serializable arguments and a serializable return type should be remotable
- Issue #604[6519] - Connecting localities isn't working anymore
- Issue #603[6520] - Do not verify any ini entries read from a file
- Issue #602[6521] - Rename argument_size to type_size/ added implementation to get parcel size
- Issue #599[6522] - Enable locality specific command line options
- Issue #598[6523] - Need an API that accesses the performance counter reporting the system uptime
- Issue #597[6524] - compiling on ranger

- Issue #595[6525] - I need a place to store data in a thread self pointer
- Issue #594[6526] - 32/64 interoperability
- Issue #593[6527] - Warn if logging is disabled at compile time but requested at runtime
- Issue #592[6528] - Add optional argument value to `--hpx:list-counters` and `--hpx:list-counter-infos`
- Issue #591[6529] - Allow for wildcards in performance counter names specified with `--hpx:print-counter`
- Issue #590[6530] - Local promise semantic differences
- Issue #589[6531] - Create API to query performance counter names
- Issue #587[6532] - Add get_num_localities and get_num_threads to AGAS API
- Issue #586[6533] - Adjust local AGAS cache size based on number of localities
- Issue #585[6534] - Error while using counters in HPX
- Issue #584[6535] - counting argument size of actions, initial pass.
- Issue #581[6536] - Remove `RemoteResult` template parameter for `future<>`
- Issue #580[6537] - Add possibility to hook into actions
- Issue #578[6538] - Use angle brackets in HPX error dumps
- Issue #576[6539] - Exception incorrectly thrown when `--help` is used
- Issue #575[6540] - HPX(bad_component_type) with gcc 4.7.2 and boost 1.51
- Issue #574[6541] - `--hpx:connect` command line parameter not working correctly
- Issue #571[6542] - `hpx::wait()` (callback version) should pass the future to the callback function
- Issue #570[6543] - `hpx::wait` should operate on `boost::arrays` and `std::lists`
- Issue #569[6544] - Add a logging sink for Android
- Issue #568[6545] - 2-argument version of `HPX_DEFINE_COMPONENT_ACTION`
- Issue #567[6546] - Connecting to a running HPX application works only once

- Issue #565[6547] - HPX doesn't shutdown properly
- Issue #564[6548] - Partial preprocessing of new component creation interface
- Issue #563[6549] - Add `hpx::start/hpx::stop` to avoid blocking main thread
- Issue #562[6550] - All command line arguments swallowed by hpx
- Issue #561[6551] - Boost.Tuple is not move aware
- Issue #558[6552] - `boost::shared_ptr<>` style semantics/syntax for client classes
- Issue #556[6553] - Creation of partially preprocessed headers should be enabled for Boost newer than V1.50
- Issue #555[6554] - `BOOST_FORCEINLINE` does not name a type
- Issue #554[6555] - Possible race condition in thread `get_id()`
- Issue #552[6556] - Move enable client_base
- Issue #550[6557] - Add stack size category 'huge'
- Issue #549[6558] - ShenEOS run seg-faults on single or distributed runs
- Issue #545[6559] - `AUTOGLOB` broken for add_hpx_component
- Issue #542[6560] - FindHPX_HDF5 still searches multiple times
- Issue #541[6561] - Quotes around application name in hpx::init
- Issue #539[6562] - Race conditition occurring with new lightweight threads
- Issue #535[6563] - hpx_run_tests.py exits with no error code when tests are missing
- Issue #530[6564] - Thread description(<unknown>) in logs
- Issue #523[6565] - Make thread objects more lightweight
- Issue #521[6566] - `hpx::error_code` is not usable for lightweight error handling
- Issue #520[6567] - Add full user environment to HPX logs
- Issue #519[6568] - Build succeeds, running fails
- Issue #517[6569] - Add a guard page to linux coroutine stacks

- Issue #516[6570] - hpx::thread::detach suspends while holding locks, leads to hang in debug
- Issue #514[6571] - Preprocessed headers for <hpx/apply.hpp> don't compile
- Issue #513[6572] - Buildbot configuration problem
- Issue #512[6573] - Implement action based stack size customization
- Issue #511[6574] - Move action priority into a separate type trait
- Issue #510[6575] - trunk broken
- Issue #507[6576] - no matching function for call to `boost::scoped_ptr<hpx::threads::topology>::scoped_ptr(hpx::threads::linux_topology*)`
- Issue #505[6577] - undefined_symbol regression test currently failing
- Issue #502[6578] - Adding OpenCL and OCLM support to HPX for Windows and Linux
- Issue #501[6579] - find_package(HPX) sets cmake output variables
- Issue #500[6580] - wait_any/wait_all are badly named
- Issue #499[6581] - Add support for disabling pbs support in pbs runs
- Issue #498[6582] - Error during no-cache runs
- Issue #496[6583] - Add partial preprocessing support to cmake
- Issue #495[6584] - Support HPX modules exporting startup/shutdown functions only
- Issue #494[6585] - Allow modules to specify when to run startup/shutdown functions
- Issue #493[6586] - Avoid constructing a string in make_success_code
- Issue #492[6587] - Performance counter creation is no longer synchronized at startup
- Issue #491[6588] - Performance counter creation is no longer synchronized at startup
- Issue #490[6589] - Sheneos on_completed_bulk seg fault in distributed
- Issue #489[6590] - compiling issue with g++44
- Issue #488[6591] - Adding OpenCL and OCLM support to HPX for the MSVC platform
- Issue #487[6592] - FindHPX.cmake problems

- Issue #485[6593] - Change distributing_factory and binpacking_factory to use bulk creation
- Issue #484[6594] - Change `HPX_DONT_USE_PREPROCESSED_FILES` to `HPX_USE_PREPROCESSED_FILES`
- Issue #483[6595] - Memory counter for Windows
- Issue #479[6596] - strange errors appear when requesting performance counters on multiple nodes
- Issue #477[6597] - Create (global) timer for multi-threaded measurements
- Issue #472[6598] - Add partial preprocessing using Wave
- Issue #471[6599] - Segfault stack traces don't show up in release
- Issue #468[6600] - External projects need to link with internal components
- Issue #462[6601] - Startup/shutdown functions are called more than once
- Issue #458[6602] - Consolidate hpx::util::high_resolution_timer and `hpx::util::high_resolution_clock`
- Issue #457[6603] - index out of bounds in `allgather_and_gate` on 4 cores or more
- Issue #448[6604] - Make HPX compile with clang
- Issue #447[6605] - 'make tests' should execute tests on local installation
- Issue #446[6606] - Remove SVN-related code from the codebase
- Issue #444[6607] - race condition in smp
- Issue #441[6608] - Patched Boost.Serialization headers should only be installed if needed
- Issue #439[6609] - Components using `HPX_REGISTER_STARTUP_MODULE` fail to compile with MSVC
- Issue #436[6610] - Verify that no locks are being held while threads are suspended
- Issue #435[6611] - Installing HPX should not clobber existing Boost installation
- Issue #434[6612] - Logging external component failed (Boost 1.50)
- Issue #433[6613] - Runtime crash when building all examples

HPX V0.9.0 (Jul 5, 2012)

We have had roughly 800 commits since the last release and we have closed approximately 80 tickets (bugs, feature requests, etc.).

General changes

- Significant improvements made to the usability of *HPX* in large-scale, distributed environments.
- Renamed `hpx::lcos::packaged_task` to `hpx::lcos::packaged_action` to reflect the semantic differences to a packaged_task as defined by the C++11 Standard[6635].
- *HPX* now exposes *hpx::thread* which is compliant to the C++11 std::thread type except that it (purely locally) represents an *HPX* thread. This new type does not expose any of the remote capabilities of the underlying *HPX*-thread implementation.
- The type `hpx::lcos::future` is now compliant to the C++11 std::future<> type. This type can be used to synchronize both, local and remote operations. In both cases the control flow will 'return' to the future in order to trigger any continuation.
- The types `hpx::lcos::local::promise` and `hpx::lcos::local::packaged_task` are now compliant to the C++11 `std::promise<>` and `std::packaged_task<>` types. These can be used to create a future representing local work only. Use the types `hpx::lcos::promise` and `hpx::lcos::packaged_action` to wrap any (possibly remote) action into a future.
- *hpx::thread* and `hpx::lcos::future` are now cancelable.
- Added support for sequential and logic composition of `hpx::lcos::futures`. The member function `hpx::lcos::future::when` permits futures to be sequentially composed. The helper functions *hpx::wait_all*, *hpx::wait_any*, and `hpx::wait_n` can be used to wait for more than one future at a time.
- *HPX* now exposes *`hpx::apply`* and *hpx::async* as the preferred way of creating (or invoking) any deferred work. These functions are usable with various types of functions, function objects, and actions and provide a uniform way to spawn deferred tasks.
- *HPX* now utilizes `hpx::util::bind` to (partially) bind local functions and function objects, and also actions. Remote bound actions can have placeholders as well.
- *HPX* continuations are now fully polymorphic. The class `hpx::actions::forwarding_continuation` is an example of how the user can write is own types of continuations. It can be used to execute any function as an continuation of a particular action.
- Reworked the action invocation API to be fully conformant to normal functions. Actions can now be invoked using *`hpx::apply`*, *hpx::async*, or using the `operator()` implemented on actions. Actions themselves can now be cheaply instantiated as they do not have any members anymore.
- Reworked the lazy action invocation API. Actions can now be directly bound using `hpx::util::bind` by passing an action instance as the first argument.
- A minimal *HPX* program now looks like this:

[6635] http://www.open-std.org/jtc1/sc22/wg21

```
#include <hpx/hpx_init.hpp>

int hpx_main()
{
    return hpx::finalize();
}

int main()
{
    return hpx::init();
}
```

This removes the immediate dependency on the Boost.Program_options[6636] library.

> **Note**
>
> This minimal version of an *HPX* program does not support any of the default command line arguments (such as –help, or command line options related to PBS). It is suggested to always pass `argc` and `argv` to *HPX* as shown in the example below.

- In order to support those, but still not to depend on Boost.Program_options[6637], the minimal program can be written as:

```
#include <hpx/hpx_init.hpp>

// The arguments
↪for hpx_main can be left off, which very similar to the
// behavior of ``main()`` as defined by C++.
int hpx_main(int argc, char* argv[])
{
    return hpx::finalize();
}

int main(int argc, char* argv[])
{
    return hpx::init(argc, argv);
}
```

- Added performance counters exposing the number of component instances which are alive on a given locality.
- Added performance counters exposing then number of messages sent and received, the number of parcels sent and received, the number of bytes sent and received, the overall time required to send and receive data, and the overall time required to serialize and deserialize the data.
- Added a new component: `hpx::components::binpacking_factory` which is equivalent to the existing `hpx::components::distributing_factory` component, except that it equalizes the overall population of the components to create. It exposes two factory methods, one based on the number of existing instances of the component type to

[6636] https://www.boost.org/doc/html/program_options.html
[6637] https://www.boost.org/doc/html/program_options.html

create, and one based on an arbitrary performance counter which will be queried for all relevant localities.

* Added API functions allowing to access elements of the diagnostic information embedded in the given exception: *hpx::get_locality_id*, `hpx::get_host_name`, `hpx::get_process_id`, `hpx::get_function_name`, `hpx::get_file_name`, `hpx::get_line_number`, `hpx::get_os_thread`, `hpx::get_thread_id`, and `hpx::get_thread_description`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

* Issue #71[6638] - GIDs that are not serialized via `handle_gid<>` should raise an exception
* Issue #105[6639] - Allow for `hpx::util::functions` to be registered in the AGAS symbolic namespace
* Issue #107[6640] - Nasty threadmanger race condition (reproducible in sheneos_test)
* Issue #108[6641] - Add millisecond resolution to *HPX* logs on Linux
* Issue #110[6642] - Shutdown hang in distributed with release build
* Issue #116[6643] - Don't use TSS for the applier and runtime pointers
* Issue #162[6644] - Move local synchronous execution shortcut from hpx::function to the applier
* Issue #172[6645] - Cache sources in CMake and check if they change manually
* Issue #178[6646] - Add an INI option to turn off ranged-based AGAS caching
* Issue #187[6647] - Support for disabling performance counter deployment
* Issue #202[6648] - Support for sending performance counter data to a specific file
* Issue #218[6649] - boost.coroutines allows different stack sizes, but stack pool is unaware of this
* Issue #231[6650] - Implement movable `boost::bind`
* Issue #232[6651] - Implement movable `boost::function`
* Issue #236[6652] - Allow binding `hpx::util::function` to actions
* Issue #239[6653] - Replace `hpx::function` with `hpx::util::function`

- Issue #426[6699] - AUTOGLOB needs to be updated to support fortran

HPX V0.8.1 (Apr 21, 2012)

This is a point release including important bug fixes for *HPX V0.8.0 (Mar 23, 2012)*.

General changes

- *HPX* does not need to be installed anymore to be functional.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this point release:

- Issue #295[6700] - Don't require install path to be known at compile time.
- Issue #371[6701] - Add hpx iostreams to standard build.
- Issue #384[6702] - Fix compilation with GCC 4.7.
- Issue #390[6703] - Remove keep_factory_alive startup call from ShenEOS; add shutdown call to H5close.
- Issue #393[6704] - Thread affinity control is broken.

Bug fixes (commits)

Here is a list of the important commits included in this point release:

- r7642 - External: Fix backtrace memory violation.
- **r7775 - Components: Fix symbol visibility bug with component startup** providers. This prevents one components providers from overriding another components.
- r7778 - Components: Fix startup/shutdown provider shadowing issues.

HPX V0.8.0 (Mar 23, 2012)

We have had roughly 1000 commits since the last release and we have closed approximately 70 tickets (bugs, feature requests, etc.).

General changes

- Improved PBS support, allowing for arbitrary naming schemes of node-hostnames.
- Finished verification of the reference counting framework.
- Implemented decrement merging logic to optimize the distributed reference counting system.
- Restructured the LCO framework. Renamed `hpx::lcos::eager_future<>` and `hpx::lcos::lazy_future<>` into `hpx::lcos::packaged_task` and `hpx::lcos::deferred_packaged_task`. Split `hpx::lcos::promise` into `hpx::lcos::packaged_task` and `hpx::lcos::future`. Added 'local' futures (in namespace `hpx::lcos::local`).
- Improved the general performance of local and remote action invocations. This (under certain circumstances) drastically reduces the number of copies created for each of the parameters and return values.
- Reworked the performance counter framework. Performance counters are now created only when needed, which reduces the overall resource requirements. The new framework allows for much more flexible creation and management of performance counters. The new sine example application demonstrates some of the capabilities of the new infrastructure.
- Added a buildbot-based continuous build system which gives instant, automated feedback on each commit to SVN.
- Added more automated tests to verify proper functioning of *HPX*.
- Started to create documentation for *HPX* and its API.
- Added documentation toolchain to the build system.
- Added dataflow LCO.
- Changed default *HPX* command line options to have `hpx:` prefix. For instance, the former option `--threads` is now `--hpx:threads`. This has been done to make ambiguities with possible application specific command line options as unlikely as possible. See the section *HPX Command Line Options* for a full list of available options.
- Added the possibility to define command line aliases. The former short (one-letter) command line options have been predefined as aliases for backwards compatibility. See the section *HPX Command Line Options* for a detailed description of command line option aliasing.
- Network connections are now cached based on the connected host. The number of simultaneous connections to a particular host is now limited. Parcels are buffered and bundled if all connections are in use.
- Added more refined thread affinity control. This is based on the external library Portable Hardware Locality (HWLOC).
- Improved support for Windows builds with CMake.
- Added support for components to register their own command line options.

- Added the possibility to register custom startup/shutdown functions for any component. These functions are guaranteed to be executed by an *HPX* thread.
- Added two new experimental thread schedulers: hierarchy_scheduler and periodic_priority_scheduler. These can be activated by using the command line options `--hpx:queuing=hierarchy` or `--hpx:queuing=periodic`.

Example applications

- Graph500 performance benchmark[6705] (thanks to Matthew Anderson for contributing this application).
- GTC (Gyrokinetic Toroidal Code)[6706]: a skeleton for particle in cell type codes.
- Random Memory Access: an example demonstrating random memory accesses in a large array
- ShenEOS example[6707], demonstrating partitioning of large read-only data structures and exposing an interpolation API.
- Sine performance counter demo.
- Accumulator examples demonstrating how to write and use *HPX* components.
- Quickstart examples (like hello_world, fibonacci, quicksort, factorial, etc.) demonstrating simple *HPX* concepts which introduce some of the concepts in *HPX*.
- Load balancing and work stealing demos.

API changes

- Moved all local LCOs into a separate namespace `hpx::lcos::local` (for instance, `hpx::lcos::local_mutex` is now `hpx::lcos::local::mutex`).
- Replaced `hpx::actions::function` with `hpx::util::function`. Cleaned up related code.
- Removed `hpx::traits::handle_gid` and moved handling of global reference counts into the corresponding serialization code.
- Changed terminology: `prefix` is now called `locality_id`, renamed the corresponding API functions (such as `hpx::get_prefix`, which is now called `hpx::get_locality_id`).
- Adding *hpx::find_remote_localities*, and *hpx::get_num_localities*.
- Changed performance counter naming scheme to make it more bash friendly. The new performance counter naming scheme is now

```
/object{parentname#parentindex/instance#index}/counter#parameters
```

- Added `hpx::get_worker_thread_num` replacing `hpx::threadmanager_base::get_thread_num`.
- Renamed `hpx::get_num_os_threads` to `hpx::get_os_threads_count`.
- Added `hpx::threads::get_thread_count`.

[6705] http://www.graph500.org/
[6706] http://www.nersc.gov/research-and-development/benchmarking-and-workload-characterization/nersc-6-benchmarks/gtc/
[6707] http://stellarcollapse.org/equationofstate

- Restructured the Futures sub-system, renaming types in accordance with the terminology used by the C++11 ISO standard.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #31[6708] - Specialize handle_gid<> for examples and tests
- Issue #72[6709] - Fix AGAS reference counting
- Issue #104[6710] - heartbeat throws an exception when decrefing the performance counter it's watching
- Issue #111[6711] - throttle causes an exception on the target application
- Issue #142[6712] - One failed component loading causes an unrelated component to fail
- Issue #165[6713] - Remote exception propagation bug in AGAS reference counting test
- Issue #186[6714] - Test credit exhaustion/splitting (e.g. prepare_gid and symbol NS)
- Issue #188[6715] - Implement remaining AGAS reference counting test cases
- Issue #258[6716] - No type checking of GIDs in stubs classes
- Issue #271[6717] - Seg fault/shared pointer assertion in distributed code
- Issue #281[6718] - CMake options need descriptive text
- Issue #283[6719] - AGAS caching broken (gva_cache needs to be rewritten with ICL)
- Issue #285[6720] - HPX_INSTALL root directory not the same as CMAKE_INSTALL_PREFIX
- Issue #286[6721] - New segfault in dataflow applications
- Issue #289[6722] - Exceptions should only be logged if not handled
- Issue #290[6723] - c++11 tests failure
- Issue #293[6724] - Build target for component libraries
- Issue #296[6725] - Compilation error with Boost V1.49rc1
- Issue #298[6726] - Illegal instructions on termination

- Issue #355[6752] - 'make' doesn't do anything after correct configuration
- Issue #356[6753] - Don't use `hpx::util::static_` in topology code
- Issue #359[6754] - Infinite recursion in hpx::tuple serialization
- Issue #361[6755] - Add compile time option to disable logging completely
- Issue #364[6756] - Installation seriously broken in r7443

HPX V0.7.0 (Dec 12, 2011)

We have had roughly 1000 commits since the last release and we have closed approximately 120 tickets (bugs, feature requests, etc.).

General changes

- Completely removed code related to deprecated AGAS V1, started to work on AGAS V2.1.
- Started to clean up and streamline the exposed APIs (see 'API changes' below for more details).
- Revamped and unified performance counter framework, added a lot of new performance counter instances for monitoring of a diverse set of internal *HPX* parameters (queue lengths, access statistics, etc.).
- Improved general error handling and logging support.
- Fixed several race conditions, improved overall stability, decreased memory footprint, improved overall performance (major optimizations include native TLS support and ranged-based AGAS caching).
- Added support for running *HPX* applications with PBS.
- Many updates to the build system, added support for gcc 4.5.x and 4.6.x, added C++11 support.
- Many updates to default command line options.
- Added many tests, set up buildbot for continuous integration testing.
- Better shutdown handling of distributed applications.

[6749] https://github.com/TheHPXProject/hpx/issues/343
[6750] https://github.com/TheHPXProject/hpx/issues/351
[6751] https://github.com/TheHPXProject/hpx/issues/353
[6752] https://github.com/TheHPXProject/hpx/issues/355
[6753] https://github.com/TheHPXProject/hpx/issues/356
[6754] https://github.com/TheHPXProject/hpx/issues/359
[6755] https://github.com/TheHPXProject/hpx/issues/361
[6756] https://github.com/TheHPXProject/hpx/issues/364

Example applications

- quickstart/factorial and quickstart/fibonacci, future-recursive parallel algorithms.
- quickstart/hello_world, distributed hello world example.
- quickstart/rma, simple remote memory access example
- quickstart/quicksort, parallel quicksort implementation.
- gtc, gyrokinetic torodial code.
- bfs, breadth-first-search, example code for a graph application.
- sheneos, partitioning of large data sets.
- accumulator, simple component example.
- balancing/os_thread_num, balancing/px_thread_phase, examples demonstrating load balancing and work stealing.

API changes

- Added `hpx::find_all_localities`.
- Added `hpx::terminate` for non-graceful termination of applications.
- Added `hpx::lcos::async` functions for simpler asynchronous programming.
- Added new AGAS interface for handling of symbolic namespace (`hpx::agas::*`).
- Renamed `hpx::components::wait` to `hpx::lcos::wait`.
- Renamed `hpx::lcos::future_value` to `hpx::lcos::promise`.
- Renamed `hpx::lcos::recursive_mutex` to `hpx::lcos::local_recursive_mutex`, `hpx::lcos::mutex` to `hpx::lcos::local_mutex`
- Removed support for Boost versions older than V1.38, recommended Boost version is now V1.47 and newer.
- Removed `hpx::process` (this will be replaced by a real process implementation in the future).
- Removed non-functional LCO code (`hpx::lcos::dataflow`, `hpx::lcos::thunk`, `hpx::lcos::dataflow_variable`).
- Removed deprecated `hpx::naming::full_address`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- Issue #28[6757] - Integrate Windows/Linux CMake code for *HPX* core
- Issue #32[6758] - hpx::cout() should be hpx::cout
- Issue #33[6759] - AGAS V2 legacy client does not properly handle error_code

[6757] https://github.com/TheHPXProject/hpx/issues/28
[6758] https://github.com/TheHPXProject/hpx/issues/32
[6759] https://github.com/TheHPXProject/hpx/issues/33

- Issue #60[6760] - AGAS: allow for registerid to optionally take ownership of the gid
- Issue #62[6761] - adaptive1d compilation failure in Fusion
- Issue #64[6762] - Parcel subsystem doesn't resolve domain names
- Issue #83[6763] - No error handling if no console is available
- Issue #84[6764] - No error handling if a hosted locality is treated as the bootstrap server
- Issue #90[6765] - Add general commandline option -N
- Issue #91[6766] - Add possibility to read command line arguments from file
- Issue #92[6767] - Always log exceptions/errors to the log file
- Issue #93[6768] - Log the command line/program name
- Issue #95[6769] - Support for distributed launches
- Issue #97[6770] - Attempt to create a bad component type in AMR examples
- Issue #100[6771] - factorial and factorial_get examples trigger AGAS component type assertions
- Issue #101[6772] - Segfault when hpx::process::here() is called in fibonacci2
- Issue #102[6773] - unknown_component_address in int_object_semaphore_client
- Issue #114[6774] - marduk raises assertion with default parameters
- Issue #115[6775] - Logging messages for SMP runs (on the console) shouldn't be buffered
- Issue #119[6776] - marduk linking strategy breaks other applications
- Issue #121[6777] - pbsdsh problem
- Issue #123[6778] - marduk, dataflow and adaptive1d fail to build
- Issue #124[6779] - Lower default preprocessing arity
- Issue #125[6780] - Move hpx::detail::diagnostic_information out of the detail namespace
- Issue #126[6781] - Test definitions for AGAS reference counting
- Issue #128[6782] - Add averaging performance counter

2.11.3 Namespace changes

HPX V1.9.0 Namespace changes

The latest release includes amongst others changes in the namespaces so that *HPX* facilities correspond to the C++ Standard Library. The old namespaces are deprecated. Below is a comprehensive list of the namespace changes.

Table 2.194: Namespace changes in V1.9.0

Old namespace	New namespace
`hpx::util::mem_fn`	*hpx::mem_fn*
`hpx::util::invoke`	*hpx::invoke*
`hpx::util::invoke_r`	`hpx::invoke_r`
`hpx::util::invoke_fused`	*hpx::invoke_fused*
`hpx::util::invoke_fused_r`	*hpx::invoke_fused_r*
`hpx::util::unlock_guard`	*hpx::unlock_guard*
`hpx::parallel::v1::reduce_by_key`	`hpx::experimental::reduce_by_key`
`hpx::parallel::v1::sort_by_key`	*hpx::experimental::sort_by_key*
`hpx::parallel::task_canceled_exception`	*hpx::experimental::task_canceled_exception*
`hpx::parallel::task_block`	*hpx::experimental::task_block*
`hpx::parallel::define_task_block`	*hpx::experimental::define_task_block* |
`hpx::parallel::define_task_block_restore_threac`	*hpx::experimental::define_task_block_restore_thread*
`hpx::execution::experimental::task_group`	*hpx::experimental::task_group*

2.14 About *HPX*

2.14.1 History

The development of High Performance ParalleX (*HPX*) began in 2007. At that time, Hartmut Kaiser became interested in the work done by the ParalleX group at the Center for Computation and Technology (CCT)[6837], a multi-disciplinary research institute at Louisiana State University (LSU)[6838]. The ParalleX group was working to develop a new and experimental execution model for future high performance computing architectures. This model was christened ParalleX. The first implementations of ParalleX were crude, and many of those designs had to be discarded entirely. However, over time the team learned quite a bit about how to design a parallel, distributed runtime system which implements the concepts of ParalleX.

From the very beginning, this endeavour has been a group effort. In addition to a handful of interested researchers, there have always been graduate and undergraduate students participating in the discussions, design, and implementation of *HPX*. In 2011 we decided to formalize our collective research efforts by creating the STE||AR[6839] group (**S**ystems **T**echnology, **E**mergent Para**ll**elism, and **A**lgorithm **R**esearch). Over time, the team grew to include researchers around the country and the world. In 2014, the STE||AR[6840] Group was reorganized to become the international community it is today. This consortium of researchers aims to develop stable, sustainable, and scalable tools which will enable application developers to exploit the parallelism latent in the machines of today and tomorrow. Our goal of the *HPX* project is to create a high quality, freely available, open source implementation of ParalleX concepts for conventional and future systems by building a modular and standards conforming runtime system for SMP and distributed application environments. The API exposed by *HPX* is conformant to the interfaces defined by the C++ ISO Standard and adheres to the programming guidelines used by the Boost[6841] collection of C++ libraries. We steer the development of *HPX* with real world applications and aim to provide a smooth migration path for domain scientists.

To learn more about STE||AR[6842] and ParalleX, see *People* and *Why HPX?*.

2.14.2 People

The STE||AR[6843] Group (pronounced as stellar) stands for "**S**ystems **T**echnology, **E**mergent Para**ll**elism, and **A**lgorithm **R**esearch". We are an international group of faculty, researchers, and students working at various institutions around the world. The goal of the STE||AR[6844] Group is to promote the development of scalable parallel applications by providing a community for ideas, a framework for collaboration, and a platform for communicating these concepts to the broader community.

Our work is focused on building technologies for scalable parallel applications. *HPX*, our general purpose C++ runtime system for parallel and distributed applications, is no exception. We use *HPX* for a broad range of scientific applications, helping scientists and developers to write code which scales better and shows better performance compared to more conventional programming models such as MPI.

HPX is based on *ParalleX* which is a new (and still experimental) parallel execution model aiming to overcome the limitations imposed by the current hardware and the techniques we use to write applications today. Our group focuses on two types of applications - those requiring excellent strong scaling, allowing for a dramatic reduction of execution time for fixed workloads and those needing highest level of sustained performance through massive parallelism. These applications are presently unable (through conventional practices) to effectively exploit a relatively small number of cores in a multi-core system. By extension, these application will not be able to exploit high-end exascale computing systems which are likely to employ hundreds of millions of such cores by the end of this decade.

Critical bottlenecks to the effective use of new generation high performance computing (HPC) systems include:

- *Starvation*: due to lack of usable application parallelism and means of managing it,
- *Overhead*: reduction to permit strong scalability, improve efficiency, and enable dynamic resource management,
- *Latency*: from remote access across system or to local memories,
- *Contention*: due to multicore chip I/O pins, memory banks, and system interconnects.

The ParalleX model has been devised to address these challenges by enabling a new computing dynamic through the application of message-driven computation in a global address space context with lightweight synchronization. The work on *HPX* is centered around implementing the concepts as defined by the ParalleX model. *HPX* is currently targeted at conventional machines, such as classical Linux based Beowulf clusters and SMP nodes.

We fully understand that the success of *HPX* (and ParalleX) is very much the result of the work of many people. To see a list of who is contributing see our tables below.

Acknowledgements

Thanks also to the following people who contributed directly or indirectly to the project through discussions, pull requests, documentation patches, etc.

- Panos Syskakis for benchmarking and optimizing our parallel algorithms.
- Shreyas Atre, for contributing fixes to our implementation of senders/receivers and extending our coroutines integration with senders/receivers.
- Alexander Neumann, for contributing fixes to the cmake build system.
- Dimitra Karatza, for her work on refactoring the documentation and providing a new user-friendly environment during and after Google Season of Docs 2021.
- Srinivas Yadav, for his work on SIMD support in algorithms before and during Google Summer of Code 2021.
- Akhil Nair, for his work on adapting algorithms to C++20 before and during Google Summer of Code 2021.
- Alexander Toktarev, for updating the parallel algorithm customization points to use `tag_fallback_invoke` for the default implementations.
- Brice Goglin, for reporting and helping fix issues related to the integration of hwloc in *HPX*.
- Giannis Gonidelis, for his work on the ranges adaptation during the Google Summer of Code 2020.
- Auriane Reverdell (Swiss National Supercomputing Centre[6874]), for her tireless work on refactoring our CMake setup and modularizing *HPX*.
- Christopher Hinz, for his work on refactoring our CMake setup.
- Weile Wei, for fixing *HPX* builds with CUDA on Summit.
- Severin Strobl, for fixing our CMake setup related to linking and adding new entry points to the *HPX* runtime.
- Rebecca Stobaugh, for her major documentation review and contributions during and after the 2019 Google Season of Documentation.
- Jan Melech, for adding automatic serialization of simple structs.
- Austin McCartney, for adding concept emulation of the Ranges TS bidirectional and random access iterator concepts.
- Marco Diers, reporting and fixing issues related PMIx.
- Maximilian Bremer, for reporting multiple issues and extending the component migration tests.

- Piotr Mikolajczyk, for his improvements and fixes to the set and count algorithms.
- Grant Rostig, for reporting several deficiencies on our web pages.
- Jakub Golinowski, for implementing an *HPX* backend for OpenCV and in the process improving documentation and reporting issues.
- Mikael Simberg (Swiss National Supercomputing Centre[6875]), for his tireless help cleaning up and maintaining *HPX*.
- Tianyi Zhang, for his work on HPXMP.
- Shahrzad Shirzad, for her contributions related to Phylanx.
- Christopher Ogle, for his contributions to the parallel algorithms.
- Surya Priy, for his work with statistic performance counters.
- Anushi Maheshwari, for her work on random number generation.
- Bruno Pitrus, for his work with parallel algorithms.
- Nikunj Gupta, for rewriting the implementation of `hpx_main.hpp` and for his fixes for tests.
- Christopher Taylor, for his interest in *HPX* and the fixes he provided. Chris also contributed support for RISC-V architectures.
- Shoshana Jakobovits, for her work on the resource partitioner.
- Denis Blank, who re-wrote our unwrapped function to accept plain values arbitrary containers, and properly deal with nested futures.
- Ajai V. George, who implemented several of the parallel algorithms.
- Taeguk Kwon, who worked on implementing parallel algorithms as well as adapting the parallel algorithms to the Ranges TS.
- Zach Byerly (Louisiana State University (LSU)[6876]), who in his work developing applications on top of *HPX* opened tickets and contributed to the *HPX* examples.
- Daniel Estermann, for his work porting *HPX* to the Raspberry Pi.
- Alireza Kheirkhahan (Louisiana State University (LSU)[6877]), who built and administered our local cluster as well as his work in distributed IO.
- Abhimanyu Rawat, who worked on stack overflow detection.
- David Pfander, who improved signal handling in *HPX*, provided his optimization expertise, and worked on incorporating the Vc vectorization into *HPX*.
- Denis Demidov, who contributed his insights with VexCL.
- Khalid Hasanov, who contributed changes which allowed to run *HPX* on 64Bit power-pc architectures.
- Zahra Khatami (Louisiana State University (LSU)[6878]), who contributed the prefetching iterators and the persistent auto chunking executor parameters implementation.
- Marcin Copik, who worked on implementing GPU support for C++AMP and HCC. He also worked on implementing a HCC backend for *HPX.Compute*.

- Minh-Khanh Do, who contributed the implementation of several segmented algorithms.
- Bibek Wagle (Louisiana State University (LSU)[6879]), who worked on fixing and analyzing the performance of the *parcel* coalescing plugin in *HPX*.
- Lukas Troska, who reported several problems and contributed various test cases allowing to reproduce the corresponding issues.
- Andreas Schaefer, who worked on integrating his library (LibGeoDecomp[6880]) with *HPX*. He reported various problems and submitted several patches to fix issues allowing for a better integration with LibGeoDecomp[6881].
- Satyaki Upadhyay, who contributed several examples to *HPX*.
- Brandon Cordes, who contributed several improvements to the inspect tool.
- Harris Brakmic, who contributed an extensive build system description for building *HPX* with Visual Studio.
- Parsa Amini (Louisiana State University (LSU)[6882]), who refactored and simplified the implementation of *AGAS* in *HPX* and who works on its implementation and optimization.
- Luis Martinez de Bartolome who implemented a build system extension for *HPX* integrating it with the Conan[6883] C/C++ package manager.
- Vinay C Amatya (Louisiana State University (LSU)[6884]), who contributed to the documentation and provided some of the *HPX* examples.
- Kevin Huck and Nick Chaimov (University of Oregon[6885]), who contributed the integration of APEX (Autonomic Performance Environment for eXascale) with *HPX*.
- Francisco Jose Tapia, who helped with implementing the parallel sort algorithm for *HPX*.
- Patrick Diehl, who worked on implementing CUDA support for our companion library targeting GPGPUs (HPXCL[6886]).
- Eric Lemanissier contributed fixes to allow compilation using the MingW toolchain.
- Nidhi Makhijani who helped cleaning up some enum consistencies in *HPX* and contributed to the resource manager used in the thread scheduling subsystem. She also worked on *HPX* in the context of the Google Summer of Code 2015.
- Larry Xiao, Devang Bacharwar, Marcin Copik, and Konstantin Kronfeldner who worked on *HPX* in the context of the Google Summer of Code program 2015.
- Daniel Bourgeois (Center for Computation and Technology (CCT)[6887]) who contributed to *HPX* the implementation of several parallel algorithms (as proposed by N4313[6888]).
- Anuj Sharma and Christopher Bross (Department of Computer Science 3 - Computer Architecture[6889]), who worked on *HPX* in the context of the Google Summer of Code[6890] program 2014.

- Martin Stumpf (Department of Computer Science 3 - Computer Architecture[6891]), who rebuilt our contiguous testing infrastructure (see the *HPX* Buildbot Website[6892]). Martin is also working on HPXCL[6893] (mainly all work related to OpenCL[6894]) and implementing an *HPX* backend for POCL[6895], a portable computing language solution based on OpenCL[6896].
- Grant Mercer (University of Nevada, Las Vegas[6897]), who helped creating many of the parallel algorithms (as proposed by N4313[6898]).
- Damond Howard (Louisiana State University (LSU)[6899]), who works on HPXCL[6900] (mainly all work related to CUDA[6901]).
- Christoph Junghans (Los Alamos National Lab), who helped making our buildsystem more portable.
- Antoine Tran Tan (Laboratoire de Recherche en Informatique, Paris), who worked on integrating *HPX* as a backend for NT2[6902]. He also contributed an implementation of an API similar to Fortran co-arrays on top of *HPX*.
- John Biddiscombe (Swiss National Supercomputing Centre[6903]), who helped with the BlueGene/Q port of *HPX*, implemented the parallel sort algorithm, and made several other contributions.
- Erik Schnetter (Perimeter Institute for Theoretical Physics), who greatly helped to make *HPX* more robust by submitting a large amount of problem reports, feature requests, and made several direct contributions.
- Mathias Gaunard (Metascale), who contributed several patches to reduce compile time warnings generated while compiling *HPX*.
- Andreas Buhr, who helped with improving our documentation, especially by suggesting some fixes for inconsistencies.
- Patricia Grubel (New Mexico State University[6904]), who contributed the description of the different *HPX* thread scheduler policies and is working on the performance analysis of our thread scheduling subsystem.
- Lars Viklund, whose wit, passion for testing, and love of odd architectures has been an amazing contribution to our team. He has also contributed platform specific patches for FreeBSD and MSVC12.
- Agustin Berge, who contributed patches fixing some very nasty hidden template metaprogramming issues. He rewrote large parts of the API elements ensuring strict conformance with the C++ ISO Standard.
- Anton Bikineev for contributing changes to make using `boost::lexical_cast` safer, he also contributed a thread safety fix to the iostreams module. He also contributed a

complete rewrite of the serialization infrastructure replacing Boost.Serialization inside *HPX*.

- Pyry Jahkola, who contributed the Mac OS build system and build documentation on how to build *HPX* using Clang and libc++.
- Mario Mulansky, who created an *HPX* backend for his Boost.Odeint library, and who submitted several test cases allowing us to reproduce and fix problems in *HPX*.
- Rekha Raj, who contributed changes to the description of the Windows build instructions.
- Jeremy Kemp how worked on an *HPX* OpenMP backend and added regression tests.
- Alex Nagelberg for his work on implementing a C wrapper API for *HPX*.
- Chen Guo, helvihartmann, Nicholas Pezolano, and John West who added and improved examples in *HPX*.
- Joseph Kleinhenz, Markus Elfring, Kirill Kropivyansky, Alexander Neundorf, Bryant Lam, and Alex Hirsch who improved our CMake.
- Tapasweni Pathak, Praveen Velliengiri, Jean-Loup Tastet, Michael Levine, Aalekh Nigam, HadrienG2, Prayag Verma, lslada, Alex Myczko, and Avyav Kumar who improved the documentation.
- Jayesh Badwaik, J. F. Bastien, Christoph Garth, Christopher Hinz, Brandon Kohn, Mario Lang, Maikel Nadolski, pierrele, hendrx, Dekken, woodmeister123, xaguilar, Andrew Kemp, Dylan Stark, Matthew Anderson, Jeremy Wilke, Jiazheng Yuan, CyberDrudge, david8dixon, Maxwell Reeser, Raffaele Solca, Marco Ippolito, Jules Penuchot, Weile Wei, Severin Strobl, Kor de Jong, albestro, Jeff Trull, Yuri Victorovich, and Gregor Daiss who contributed to the general improvement of *HPX*.

HPX Funding Acknowledgements[6905] lists current and past funding sources for *HPX*. Special thanks to Google Summer of Code[6906] and Google Season of Docs[6907] for the continuous support they provide which helps us enhance both our code and our documentation.
