Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *set_symmetric_difference* algorithm returns a *hpx::future<FwdIter3>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter3* otherwise. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =
hpx::parallel::detail::less>
FwdIter3 hpx::set_symmetric_difference(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2,
FwdIter3 dest, Pred &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::abs(m-n)` times. If *m>n*, then the last *m-n* of those elements are copied from *[first1, last1)*, otherwise the last *n-m* elements are copied from *[first2, last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The `set_symmetric_difference` algorithm returns a *FwdIter3*. The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::experimental::reduction_bit_or

Defined in header `hpx/algorithm.hpp`⁶⁹⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename T>

```
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_or<T>> hpx::experimental::reduction_bit_or(T  
                                                                                                     &var)
```

The function template `reduction_bit_or` returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::bit_or{ }` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the `reduction_bit_or` object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_or{ }` operation until a single value remains, which is then assigned back to the live-out object.

⁶⁹⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The live-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of *identity*, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_or<T>> hpx::experimental::reduction_bit_or(T
                                                                                                     &var,
                                                                                                     T
                                                                                                     const
                                                                                                     &iden-
                                                                                                     tity)
```

hpx::starts_with

Defined in header *hpx/algorithm.hpp*⁶⁹¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename InIter2, typename Pred = hpx::parallel::detail::equal_to>
```

```
bool hpx::starts_with(InIter1 first1, InIter1 last1, InIter2 first2, InIter2 last2, Pred &&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

⁶⁹¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear: at most $\min(N1, N2)$ applications of the predicate.

Template Parameters

- **InIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The binary predicate that compares the elements. This defaults to *hpx::parallel::detail::equal_to*.

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

Returns

The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename InIter1, typename InIter2, typename Pred = ranges::equal_to>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::starts_with(ExPolicy &&policy, InIter1  
first1, InIter1 last1, InIter2  
first2, InIter2 last2, Pred  
&&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2). Executed according to the policy.

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear: at most $\min(N1, N2)$ applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The binary predicate that compares the elements. This defaults to `ranges::equal_to`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

Returns

The `starts_with` algorithm returns a `hpx::future<bool>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `bool` otherwise. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

hpx::transform_reduce

Defined in header `hpx/algorithm.hpp`⁶⁹².

See [Public API](#) for a list of names and headers that are part of the public HPX API.

template<typename **ExPolicy**, typename **FwdIter**, typename **T**, typename **Reduce**, typename **Convert**>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy,
                                                                 FwdIter first, FwdIter last,
                                                                 T init, Reduce &&red_op,
                                                                 Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))). Executed according to the policy.

The reduce operations in the parallel `transform_reduce` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

⁶⁹² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename InIter, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(InIter first, InIter last, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy,  
                                                                 FwdIter1 first1, FwdIter1  
                                                                 last1, FwdIter2 first2, T  
                                                                 init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*. Executed according to the policy.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename InIter1, typename InIter2, typename T>
```

```
T hpx::transform_reduce(InIter1 first1, InIter1 last1, InIter2 first2, T init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note

Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **InIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as return values (deduced).

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns a *T*.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T, typename Reduce,  
typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy,  
                                                                 FwdIter1 first1, FwdIter1  
                                                                 last1, FwdIter2 first2, T init,  
                                                                 Reduce &&red_op, Convert  
                                                                 &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*. Executed according to the policy.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\textit{last} - \textit{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

- **FwdIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *red_op*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename InIter1, typename InIter2, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(ExPolicy &&policy, InIter1 first1, InIter1 last1, InIter2 first2, T init, Reduce
                        &&red_op, Convert &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note

Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **InIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as return values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *red_op*.

Returns

The *transform_reduce* algorithm returns a *T*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Iter  
first, Sent last, T init,  
Reduce &&red_op, Convert  
&&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(Iter first, Sent last, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1

- `op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN))`,
where:
- `b1, ..., bN` may be any permutation of `a1, ..., aN` and
- $1 < K+1 = M \leq N$.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for **Iter**.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of `conv_op`. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from `conv_op` can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The `transform_reduce` algorithm returns *T*. The `transform_reduce` algorithm returns the result of the generalized sum over the values returned from `conv_op` when applied to the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Iter  
first, Sent last, Iter2 first2, T  
init)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)),
where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.

- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename Iter2, typename T>
```

```
T hpx::transform_reduce(Iter first, Sent last, Iter2 first2, T init)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.

- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter`.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [*first*, *last*).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T, typename Reduce,  
typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Iter  
first, Sent last, Iter2 first2, T  
init, Reduce &&red_op,  
Convert &&conv_op)
```

Returns GENERALIZED_SUM(*red_op*, *init*, *conv_op*(**first*), ..., *conv_op**(*first* + (*last* - *first*) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\textit{last} - \textit{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)),
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(Iter first, Sent last, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.

- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename T, typename Reduce, typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Rng
&&rng, T init, Reduce
&&red_op, Convert
&&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range `[first, last)`.

```
template<typename Rng, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(Rng &&rng, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns `GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1)))`.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

`GENERALIZED_SUM(op, a1, ..., aN)` is defined as follows:

- `a1` when `N` is 1
- `op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN))`, where:
 - `b1, ..., bN` may be any permutation of `a1, ..., aN` and
 - `1 < K+1 = M <= N`.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Rng  
                                                                 &&rng, Iter2 first2, T init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename Rng, typename Iter2, typename T>
```

```
T hpx::transform_reduce(Rng &&rng, Iter2 first2, T init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns *T*.

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Rng &&rng, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(Rng &&rng, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.

- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns

The *transform_reduce* algorithm returns *T*.

hpx::remove

Defined in header `hpx/algorithm.hpp`⁶⁹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::remove_if*

```
template<typename FwdIter, typename T = typename std::iterator_traits<FwdIter>::value_type>
```

```
FwdIter hpx::remove(FwdIter first, FwdIter last, T const &value)
```

Removes all elements satisfying specific criteria from the range `[first, last)` and returns a past-the-end iterator for the new end of the range. This version removes all elements that are equal to *value*.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

⁶⁹³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator==().

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

Returns

The *remove* algorithm returns a *FwdIter*. The *remove* algorithm returns the iterator to the new end of the range.

```
template<typename ExPolicy, typename FwdIter, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::remove(ExPolicy &&policy, FwdIter first,
FwdIter last, T const &value)
```

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements that are equal to *value*. Executed according to the policy.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator==().

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

Returns

The *remove* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove* algorithm returns the iterator to the new end of the range.

`hpx::remove_if`

Defined in header `hpx/algorithm.hpp`⁶⁹⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::remove*

`template<typename FwdIter, typename Pred>`

FwdIter `hpx::remove_if(FwdIter first, FwdIter last, Pred &&pred)`

Removes all elements satisfying specific criteria from the range `[first, last)` and returns a past-the-end iterator for the new end of the range. This version removes all elements for which predicate *pred* returns true.

The assignments in the parallel *remove_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

⁶⁹⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *remove_if* algorithm returns a *FwdIter*. The *remove_if* algorithm returns the iterator to the new end of the range.

```
template<typename ExPolicy, typename FwdIter, typename Pred>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::remove_if(ExPolicy &&policy, FwdIter
                                                                    first, FwdIter last, Pred
                                                                    &&pred)
```

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements for which predicate *pred* returns true. Executed according to the policy.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

`bool pred(const Type &a);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *remove_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove_if* algorithm returns the iterator to the new end of the range.

hpx::find

Defined in header `hpx/algorithm.hpp`⁶⁹⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::find_if*
- *hpx::find_if_not*
- *hpx::find_end*
- *hpx::find_first_of*

template<typename **ExPolicy**, typename **FwdIter**, typename T>

util::detail::algorithm_result_t<ExPolicy, FwdIter> **hpx::find**(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *T* const &val)

Returns the first element in the range [first, last) that is equal to value. Executed according to the policy.

⁶⁹⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *find* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most last - first applications of the operator==().

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to find (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **val** – the value to compare the elements to

Returns

The *find* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find* algorithm returns the first element in the range [first,last) that is equal to *val*. If no such element in the range of [first,last) is equal to *val*, then the algorithm returns *last*.

```
template<typename InIter, typename T>
```

```
InIter hpx::find(InIter first, InIter last, T const &val)
```

Returns the first element in the range [first, last) that is equal to value. Executed according to the policy.

Note

Complexity: At most last - first applications of the operator==().

Template Parameters

- **InIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to find (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **val** – the value to compare the elements to

Returns

The *find* algorithm returns a *InIter*. The *find* algorithm returns the first element in the range [first,last) that is equal to *val*. If no such element in the range of [first,last) is equal to *val*, then the algorithm returns *last*.

hpx::find_if

Defined in header [hpx/algorithm.hpp](#)⁶⁹⁶.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::find](#)
- [hpx::find_if_not](#)
- [hpx::find_end](#)
- [hpx::find_first_of](#)

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

[util::detail::algorithm_result_t](#)<[ExPolicy](#), [FwdIter](#)> **hpx::find_if**([ExPolicy](#) &&policy, [FwdIter](#) first, [FwdIter](#) last, [F](#) &&f)

Returns the first element in the range [first, last) for which predicate *f* returns true. Executed according to the policy.

The comparison operations in the parallel *find_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

⁶⁹⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: At most last - first applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns true for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_if* algorithm returns the first element in the range `[first,last)` that satisfies the predicate *f*. If no such element exists that satisfies the predicate *f*, the algorithm returns *last*.

```
template<typename InIter, typename F>
```

```
InIter hpx::find_if(InIter first, InIter last, F &&f)
```

Returns the first element in the range `[first, last)` for which predicate *f* returns true.

Note

Complexity: At most last - first applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns true for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if* algorithm returns a *InIter*. The *find_if* algorithm returns the first element in the range `[first,last)` that satisfies the predicate *f*. If no such element exists that satisfies the predicate *f*, the algorithm returns *last*.

hpx::find_if_not

Defined in header `hpx/algorithm.hpp`⁶⁹⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::find`
- `hpx::find_if`
- `hpx::find_end`
- `hpx::find_first_of`

```
template<typename ExPolicy, typename FwdIter, typename F>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::find_if_not(ExPolicy &&policy, FwdIter first, FwdIter  
                                                                    last, F &&f)
```

Returns the first element in the range `[first, last)` for which predicate *f* returns false. Executed according to the policy.

The comparison operations in the parallel *find_if_not* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

⁶⁹⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *find_if_not* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most last - first applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns false for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if_not* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_if_not* algorithm returns the first element in the range `[first, last)` that does **not** satisfy the predicate *f*. If no such element exists that does not satisfy the predicate *f*, the algorithm returns *last*.

```
template<typename FwdIter, typename F>
```

```
FwdIter hpx::find_if_not(FwdIter first, FwdIter last, F &&f)
```

Returns the first element in the range `[first, last)` for which predicate *f* returns false.

Note

Complexity: At most last - first applications of the predicate.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns false for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if_not* algorithm returns a *FwdIter*. The *find_if_not* algorithm returns the first element in the range [first, last) that does **not** satisfy the predicate *f*. If no such element exists that does not satisfy the predicate *f*, the algorithm returns *last*.

hpx::find_end

Defined in header `hpx/algorithm.hpp`⁶⁹⁸.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::find`
- `hpx::find_if`
- `hpx::find_if_not`
- `hpx::find_first_of`

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_end(ExPolicy &&policy, FwdIter1 first1,
                                                                    FwdIter1 last1, FwdIter2 first2, FwdIter2
                                                                    last2, Pred &&op = Pred())
```

⁶⁹⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Returns the last subsequence of elements `[first2, last2)` found in the range `[first, last)` using the given predicate *op* to compare elements. Executed according to the policy.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *find_end* is available if the user decides to provide the algorithm their own predicate *op*.

Note

Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *replace* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_end* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_end* algorithm returns an iterator to the beginning of the last subsequence `[first2, last2)` in range `[first, last)`. If the length of the subsequence `[first2, last2)` is greater than the length of the range `[first1, last1)`, *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_end(ExPolicy &&policy, FwdIter1 first1,  
                                                                FwdIter1 last1, FwdIter2 first2, FwdIter2  
                                                                last2)
```

Returns the last subsequence of elements `[first2, last2)` found in the range `[first, last)`. Elements are compared using *operator==*. Executed according to the policy.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_end* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_end* algorithm returns an iterator to the beginning of the last subsequence [first2, last2) in range [first, last). If the length of the subsequence [first2, last2) is greater than the length of the range [first1, last1), *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
FwdIter1 hpx::find_end(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns the last subsequence of elements [first2, last2) found in the range [first, last) using the given predicate *op* to compare elements.

This overload of *find_end* is available if the user decides to provide the algorithm their own predicate *op*.

Note

Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *replace* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_end* algorithm returns a *FwdIter1*. The *find_end* algorithm returns an iterator to the beginning of the last subsequence [first2, last2) in range [first, last). If the length of the subsequence [first2, last2) is greater than the length of the range [first1, last1), *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter1 hpx::find_end(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns the last subsequence of elements [first2, last2) found in the range [first, last). Elements are compared using *operator==*.

Note

Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_end* algorithm returns a *FwdIter1*. The *find_end* algorithm returns an iterator to the beginning of the last subsequence [first2, last2) in range [first, last). If the length of the subsequence [first2, last2) is greater than the length of the range [first1, last1), *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

hpx::find_first_of

Defined in header [hpx/algorithm.hpp](#)⁶⁹⁹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::find](#)
- [hpx::find_if](#)
- [hpx::find_if_not](#)
- [hpx::find_end](#)

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_first_of(ExPolicy &&policy, FwdIter1 first,  
                                                                    FwdIter1 last, FwdIter2 s_first,  
                                                                    FwdIter2 s_last, Pred &&op = Pred())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses binary predicate *op* to compare elements. Executed according to the policy.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *find_first_of* is available if the user decides to provide the algorithm their own predicate *op*.

Note

Complexity: at most ($S \cdot N$) comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

⁶⁹⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_first_of* algorithm returns a `hpx::future<FwdIter1>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter1* otherwise. The *find_first_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_first_of(ExPolicy &&policy, FwdIter1 first,  
                                                                    FwdIter1 last, FwdIter2 s_first,  
                                                                    FwdIter2 s_last)
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Elements are compared using *operator==*. Executed according to the policy.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_first_of* algorithm returns a *hpx::future<FwdIter1>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter1* otherwise. The *find_first_of* algorithm returns an iterator to the first element in the range $[first, last)$ that is equal to an element from the range $[s_first, s_last)$. If the length of the subsequence $[s_first, s_last)$ is greater than the length of the range $[first, last)$, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
FwdIter1 hpx::find_first_of(FwdIter1 first, FwdIter1 last, FwdIter2 s_first, FwdIter2 s_last, Pred &&op = Pred())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses binary predicate *op* to compare elements.

This overload of *find_first_of* is available if the user decides to provide the algorithm their own predicate *op*.

Note

Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_first_of* algorithm returns a *FwdIter1*. The *find_first_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter1 hpx::find_first_of(FwdIter1 first, FwdIter1 last, FwdIter2 s_first, FwdIter2 s_last)
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Elements are compared using *operator==*.

Note

Complexity: at most ($S \cdot N$) comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_first_of* algorithm returns a *FwdIter1*. The *find_first_of* algorithm returns an iterator to the first element in the range [first, last) that is equal to an element from the range [s_first, s_last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

hpx::unique

Defined in header [hpx/algorithm.hpp](#)⁷⁰⁰.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::unique_copy](#)

```
template<typename FwdIter, typename Pred = hpx::parallel::detail::equal_to, typename Proj = hpx::identity>
```

⁷⁰⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

FwdIter **hpx::unique**(*FwdIter* first, *FwdIter* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

Note

Complexity: Performs not more than *last* - *first* assignments, exactly *last* - *first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique* algorithm returns *FwdIter*. The *unique* algorithm returns the iterator to the new end of the range.

```
template<typename ExPolicy, typename FwdIter, typename Pred = hpx::parallel::detail::equal_to, typename
Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::unique(ExPolicy &&policy, FwdIter first,
FwdIter last, Pred &&pred =
Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements

from the range `[first, last)` and returns a past-the-end iterator for the new logical end of the range. Executed according to the policy.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type

sequenced_task_policy or *parallel_task_policy* and returns *FwdIter* otherwise. The *unique* algorithm returns the iterator to the new end of the range.

hpx::unique_copy

Defined in header `hpx/algorithm.hpp`⁷⁰¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::unique*

```
template<typename InIter, typename OutIter, typename Pred = hpx::parallel::detail::equal_to, typename Proj = hpx::identity>
```

```
OutIter hpx::unique_copy(InIter first, InIter last, OutIter dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

⁷⁰¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique_copy* algorithm returns a *OutIter*. The *unique_copy* algorithm returns the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred =
hpx::parallel::detail::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type hpx::unique_copy(ExPolicy &&policy,
FwdIter1 first, FwdIter1
last, FwdIter2 dest, Pred
&&pred = Pred(), Proj
&&proj = Proj())
```

Copies the elements from the range `[first, last)`, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied. Executed according to the policy.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique_copy* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

hpx::copy

Defined in header [hpx/algorithm.hpp](#)⁷⁰².

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::copy_n](#)
- [hpx::copy_if](#)

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::copy(ExPolicy &&policy, FwdIter1 first,  
FwdIter1 last, FwdIter2 dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Executed according to the policy.

The assignments in the *parallel copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

⁷⁰² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter2 hpx::copy(FwdIter1 first, FwdIter1 last, FwdIter2 dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a *FwdIter2* . The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::copy_n

Defined in header [hpx/algorithm.hpp](#)⁷⁰³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::copy](#)
- [hpx::copy_if](#)

template<typename **ExPolicy**, typename **FwdIter1**, typename **Size**, typename **FwdIter2**>

[hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2>](#) **hpx::copy_n**(*ExPolicy* &&policy, *FwdIter1* first, *Size* count, *FwdIter2* dest)

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. Executed according to the policy.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

⁷⁰³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy_n* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *copy_n* algorithm returns Iterator in the destination range, pointing past the last element copied if count>0 or result otherwise.

```
template<typename FwdIter1, typename Size, typename FwdIter2>
```

```
FwdIter2 hpx::copy_n(FwdIter1 first, Size count, FwdIter2 dest)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest.

Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy_n* algorithm returns a *FwdIter2*. The *copy_n* algorithm returns Iterator in the destination range, pointing past the last element copied if count>0 or result otherwise.

hpx::copy_if

Defined in header [hpx/algorithm.hpp](#)⁷⁰⁴.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::copy](#)
- [hpx::copy_n](#)

template<typename **ExPolicy**, typename **FwdIter1**, typename **FwdIter2**, typename **Pred**>

[hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2>](#) **hpx::copy_if**(*ExPolicy* &&policy, *FwdIter1* first, *FwdIter1* last, *FwdIter2* dest, *Pred* &&pred)

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *f* returns true. The order of the elements that are not removed is preserved. Executed according to the policy.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

⁷⁰⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

Returns

The *copy_if* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *copy_if* algorithm returns output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename Pred>
```

```
FwdIter2 hpx::copy_if(FwdIter1 first, FwdIter1 last, FwdIter2 dest, Pred &&pred)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *f* returns true. The order of the elements that are not removed is preserved.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

`bool pred(const Type &a);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

Returns

The *copy_if* algorithm returns a *FwdIter2*. The *copy_if* algorithm returns output iterator to the element in the destination range, one past the last element copied.

hpx::experimental::reduction_bit_xor

Defined in header `hpx/algorithm.hpp`⁷⁰⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename T>

constexpr *hpx::parallel::detail::reduction_helper*<*T*, *std::bit_xor*<*T*>> *hpx::experimental::reduction_bit_xor*(*T* &var)

The function template *reduction_bit_xor* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::bit_xor{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_bit_xor* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_xor{}` operation until a single value remains, which is then assigned back to the live-out object.

⁷⁰⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The live-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of *identity*, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_xor<T>> hpx::experimental::reduction_bit_xor(T
                                                                                                     &var,
                                                                                                     T
                                                                                                     const
                                                                                                     &iden-
                                                                                                     tity)
```

hpx::experimental::induction

Defined in header *hpx/algorithm.hpp*⁷⁰⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::induction_stride_helper<T> hpx::experimental::induction(T &&value,
                                                                                         std::size_t stride)
```

The function template returns an induction object of unspecified type having a value type and encapsulating an initial *value* of that type and, optionally, a stride.

⁷⁰⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

For each element in the input range, a looping algorithm over input sequence S computes an induction value from an induction variable and ordinal position p within S by the formula $i + p * \text{stride}$ if a stride was specified or $i + p$ otherwise. This induction value is passed to the element access function.

If the *value* argument to *induction* is a non-const lvalue, then that lvalue becomes the live-out object for the returned induction object. For each induction object that has a live-out object, the looping algorithm assigns the value of $i + n * \text{stride}$ to the live-out object upon return, where n is the number of elements in the input range.

Template Parameters

T – The value type to be used by the induction object.

Parameters

- **value** – [in] The initial value to use for the induction object
- **stride** – [in] The (optional) stride to use for the induction object (default: 1)

Returns

This returns an induction object with value type T , initial *value*, and (if specified) *stride*. If T is a lvalue of non-const type, *value* is used as the live-out object for the induction object; otherwise there is no live-out object.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::induction_helper< $T$ > hpx::experimental::induction( $T$  &&value)
```

hpx::experimental::reduction_bit_and

Defined in header *hpx/algorithm.hpp*⁷⁰⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper< $T$ , std::bit_and< $T$ >> hpx::experimental::reduction_bit_and( $T$  &var)
```

The function template *reduction_bit_and* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses *std::bit_and*{ } as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_bit_and* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

⁷⁰⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_and{}` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_and<T>> hpx::experimental::reduction_bit_and(T
                                                                    &var,
                                                                    T
                                                                    const
                                                                    &iden-
                                                                    tity)
```

hpx::equal

Defined in header `hpx/algorithm.hpp`⁷⁰⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
util::detail::algorithm_result_t<ExPolicy, bool> hpx::equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,  
                                                         FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise. Executed according to the policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$ applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

⁷⁰⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
util::detail::algorithm_result_t<ExPolicy, bool> hpx::equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,
                                                           FwdIter2 first2, FwdIter2 last2)
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise. Executed according to policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$ applications of the predicate *std::equal_to*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses operator== to determine if two

elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
util::detail::algorithm_result_t<ExPolicy, bool> hpx::equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,  
                                                         FwdIter2 first2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise. Executed according to policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$ applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range $[\text{first1}, \text{last1})$, **i* equals $*(\text{first2} + (i - \text{first1}))$. This overload of *equal* uses `operator==` to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
util::detail::algorithm_result_t<ExPolicy, bool> hpx::equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,  
                                                         FwdIter2 first2)
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise. Executed according to policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most *last1 - first1* applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal*

algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range `[first1, last1)` does not equal the length of the range `[first2, last2)`, it returns false.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
bool hpx::equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns true if the range `[first1, last1)` is equal to the range `[first2, last2)`, and false otherwise.

Note

Complexity: At most $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range `[first1, last1)`, `*i` equals `*(first2 + (i - first1))`. This overload of `equal` uses `operator==` to determine if two elements are equal.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1*

and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *bool* . The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename FwdIter1, typename FwdIter2>
```

```
bool hpx::equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

Note

Complexity: At most $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the predicate *std::equal_to*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *equal* algorithm returns a *bool* . The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
bool hpx::equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range [first2, first2 + (last1 - first1)), and false otherwise.

Note

Complexity: At most *last1* - *first1* applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to *std::equal_to*<>

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *bool* . The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

hpx::nth_element

Defined in header `hpx/algorithm.hpp`⁷⁰⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Pred = hpx::parallel::detail::less>
```

```
void hpx::nth_element(RandomIt first, RandomIt nth, RandomIt last, Pred &&pred = Pred())
```

`nth_element` is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by `nth` is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new `nth` element are less than or equal to the elements after the new `nth` element. Executed according to the policy.

The comparison operations in the parallel `nth_element` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear in `std::distance(first, last)` on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

Template Parameters

- **RandomIt** – The type of the source begin, `nth`, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second. This defaults to `std::less<>`.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type `randomIt` can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

Returns

The `nth_element` algorithms returns nothing.

⁷⁰⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename RandomIt, typename Pred = hpx::parallel::detail::less>
void hpx::nth_element(ExPolicy &&policy, RandomIt first, RandomIt nth, RandomIt last, Pred &&pred =
    Pred())
```

nth_element is a partial sorting algorithm that rearranges elements in $[first, last)$ such that the element pointed at by *nth* is changed to whatever element would occur in that position if $[first, last)$ were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth_element* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *nth_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in $\text{std::distance}(first, last)$ on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = last - first$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source begin, *nth*, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second. This defaults to $\text{std::less}<>$.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to *Type*. This defaults to $\text{std::less}<>$.

Returns

The *nth_element* algorithms returns nothing.

hpx::transform_exclusive_scan

Defined in header `hpx/algorithm.hpp`⁷¹⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename OutIter, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<InIter>::value_type>
```

```
OutIter hpx::transform_exclusive_scan(InIter first, InIter last, OutIter dest, T init, BinOp &&binary_op,
UnOp &&unary_op)
```

Transforms each element in the range `[first, last)` with *unary_op*, then computes an exclusive prefix sum operation using *binary_op* over the resulting range, with *init* as the initial value, and writes the results to the range beginning at *dest*. “exclusive” means that the *i*-th input element is not included in the *i*-th sum. Formally, assigns through each iterator *i* in `[dest, d_first + (last - first))` the value of the generalized noncommutative sum of *init*, *unary_op*(**j*)... for every *j* in `[first, first + (i - d_first))` over *binary_op*, where generalized noncommutative sum `GNSUM(op, a1, ..., a N)` is defined as follows:

- if $N=1$, a_1
- if $N > 1$, $op(GNSUM(op, a_1, \dots, a_K), GNSUM(op, a_M, \dots, a_N))$ for any K where $1 < K+1 = M \leq N$ In other words, the summation operations may be performed in arbitrary order, and the behavior is nondeterministic if *binary_op* is not associative.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *unary_op* nor *binary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of each of *binary_op* and *unary_op*.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- a_1 when N is 1
- $op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \dots, a_K), GENERALIZED_NONCOMMUTATIVE_SUM(op, a_M, \dots, a_N))$ where $1 < K+1 = M \leq N$.

⁷¹⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Binary *FunctionObject* that will be applied to the result of *unary_op*, the results of other *binary_op*, and *init*.
- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.

Returns

The *transform_exclusive_scan* algorithm returns a *returns OutIter*. The *transform_exclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename BinOp, typename UnOp,
typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type hpx::transform_exclusive_scan(ExPolicy
                                                                                               &&policy,
                                                                                               FwdIter1
                                                                                               first,
                                                                                               FwdIter1
                                                                                               last,
                                                                                               FwdIter2
                                                                                               dest, T init,
                                                                                               BinOp
                                                                                               &&bi-
                                                                                               nary_op,
                                                                                               UnOp
                                                                                               &&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))). Executed according to the policy.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *unary_op* nor *binary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges $[first, last)$ or $[result, result + (last - first))$.

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(last - first)$ applications of each of *binary_op* and *unary_op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aK*), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *aM*, ..., *aN*)) where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **init** – The initial value for the generalized sum.
- **binary_op** – Binary *FunctionObject* that will be applied in to the result of *unary_op*, the results of other *binary_op*, and *init*.
- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.

Returns

The *transform_exclusive_scan* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *transform_exclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::uninitialized_move

Defined in header `hpx/algorithm.hpp`⁷¹¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::uninitialized_move_n`

```
template<typename InIter, typename FwdIter>
```

```
FwdIter hpx::uninitialized_move(InIter first, InIter last, FwdIter dest)
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

⁷¹¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Returns

The *uninitialized_move* algorithm returns *FwdIter*. The *uninitialized_move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::uninitialized_move(ExPolicy  
                                                                 &&policy,  
                                                                 FwdIter1 first,  
                                                                 FwdIter1 last,  
                                                                 FwdIter2 dest)
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state. Executed according to the policy.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move* algorithm returns a *hpx::future<FwdIter2>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2*

otherwise. The *uninitialized_move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

hpx::uninitialized_move_n

Defined in header `hpx/algorithm.hpp`⁷¹².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::uninitialized_move*

```
template<typename InIter, typename Size, typename FwdIter>
```

```
std::pair<InIter, FwdIter> hpx::uninitialized_move_n(InIter first, Size count, FwdIter dest)
```

Moves the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1`, to another range beginning at `dest`. If an exception is thrown during the initialization, some objects in `[first, first + count)` are left in a valid but unspecified state.

Note

Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move_n* algorithm returns a `std::pair<InIter, FwdIter>`. The *uninitialized_move_n* algorithm returns A pair whose first element is an iterator to the element past the last element moved in the source range, and whose second element is an iterator to the element past the last element moved in the destination range.

⁷¹² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, std::pair<FwdIter1, FwdIter2>>::type hpx::uninitialized_move_n(ExPolicy
&&pol-
icy,
FwdIter1
first,
Size
count,
FwdIter2
dest)
```

Moves the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1.`, to another range beginning at `dest`. If an exception is thrown during the initialization, some objects in `[first, first + count)` are left in a valid but unspecified state. Executed according to the policy.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move_n* algorithm returns a `hpx::future<std::pair<FwdIter1,FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::pair<FwdIter1,FwdIter2>` otherwise. The *uninitialized_move_n* algorithm returns A pair whose first element is an iterator to the element past the last element moved in the source range, and whose second element is an iterator to the element past the last element moved in the destination range.

`hpx::experimental::reduction_min`

Defined in header `hpx/algorithm.hpp`⁷¹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::min_of<T>> hpx::experimental::reduction_min(T
&var)
```

The function template *reduction_min* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::min_of{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_min* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::min_of{}` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

⁷¹³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of *identity*, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::min_of<T>> hpx::experimental::reduction_min(T
                                                                                                     &var,
                                                                                                     T
                                                                                                     const
                                                                                                     &iden-
                                                                                                     tity)
```

hpx::ranges::uninitialized_fill

Defined in header *hpx/algorithm.hpp*⁷¹⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::uninitialized_fill_n*

```
template<typename FwdIter, typename Sent, typename T>
```

```
FwdIter hpx::ranges::uninitialized_fill(FwdIter first, Sent last, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the ranges *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*

Template Parameters

⁷¹⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_fill(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
last, T
const
&value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename Rng, typename T>
```

```
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::uninitialized_fill(Rng &&rng, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename T>
```

```
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng1>::iterator_type>::type hpx::ranges::uninitial
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a *hpx::future*<typename *hpx::traits::range_traits*<*Rng*>::iterator_type>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename hpx::traits::range_traits*<*Rng*>::iterator_type otherwise. The *uninitialized_fill* algorithm returns the iterator to one past the last element filled in the range.

hpx::ranges::uninitialized_fill_n

Defined in header `hpx/algorithm.hpp`⁷¹⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_fill`

```
template<typename FwdIter, typename Size, typename T>
```

```
FwdIter hpx::ranges::uninitialized_fill_n(FwdIter first, Size count, T const &value)
```

Copies the given *value* value to the first *count* elements in an uninitialized memory area beginning at *first*. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_fill_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The `uninitialized_fill_n` algorithm returns a `FwdIter`. The `uninitialized_fill_n` algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T>
```

⁷¹⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> *hpx::ranges::uninitialized_fill_n*(*ExPolicy* &&*policy*, *FwdIter* *first*, *Size* *count*, *T* *const* &*value*)

Copies the given *value* value to the first *count* elements in an uninitialized memory area beginning at *first*. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill_n* algorithm returns a *hpx::future<FwdIter>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter*

otherwise. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

hpx::ranges::shift_right

Defined in header `hpx/algorithm.hpp`⁷¹⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **FwdIter**, typename **Sent**, typename **Size**>

FwdIter **hpx::ranges::shift_right**(*FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: At most (last - first) - n assignments.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

⁷¹⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Returns

The *shift_right* algorithm returns *FwdIter*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::shift_right(ExPolicy
                                                                 &&policy,
                                                                 FwdIter first,
                                                                 Sent last, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most (last - first) - n assignments.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename Rng, typename Size>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::shift_right(Rng &&rng, Size n)
```

Shifts the elements in the range [first, last) by *n* positions towards the end of the range. For every integer *i* in [0, last - first - *n*), moves the element originally at position first + *i* to position first

- *n* + *i*.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: At most (last - first) - *n* assignments.

Note

The type of dereferenced *std::ranges::iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns *std::ranges::iterator_t<Rng>*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename Rng, typename Size>
```

```
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::shift_right(ExPolicy
&&pol-
icy,
Rng
&&rng,
Size
n)
```

Shifts the elements in the range [first, last) by *n* positions towards the end of the range. For every integer *i* in [0, last - first - *n*), moves the element originally at position first + *i* to position first

- *n* + *i*.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most (last - first) - *n* assignments.

Note

The type of dereferenced *std::ranges::iterator_t*<*Rng*> must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

`hpx::ranges::shift_left`

Defined in header `hpx/algorithm.hpp`⁷¹⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **FwdIter**, typename **Sent**, typename **Size**>

FwdIter `hpx::ranges::shift_left`(*FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: At most (last - first) - n assignments.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

⁷¹⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Returns

The *shift_left* algorithm returns *FwdIter*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::shift_left(ExPolicy
&&policy, FwdIter
first, Sent last, Size
n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most (last - first) - n assignments.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename Rng, typename Size>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::shift_left(Rng &&rng, Size n)
```

Shifts the elements in the range [first, last) by *n* positions towards the beginning of the range. For every integer *i* in [0, last - first

- *n*), moves the element originally at position first + *n* + *i* to position first + *i*.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: At most (last - first) - *n* assignments.

Note

The type of dereferenced *std::ranges::iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns *std::ranges::iterator_t<Rng>*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename Rng, typename Size>
```

```
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::shift_left(ExPolicy
&&pol-
icy,
Rng
&&rng,
Size
n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the beginning of the range. For every integer `i` in `[0, last - first`

- `n`), moves the element originally at position `first + n + i` to position `first + i`.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $(last - first) - n$ assignments.

Note

The type of dereferenced `std::ranges::iterator_t<Rng>` must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

hpx/parallel/container_algorithms/iota.hpp

Defined in header `hpx/parallel/container_algorithms/iota.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**, typename **T**>

`iota_result<FwdIter, T> iota(FwdIter first, Sent last, T value)`

Fills the range `[first, last)` with sequentially increasing values, starting with *value* and repetitively evaluating `++value`.

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Exactly `std::distance(first, last)` assignments and increments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input or output iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a `hpx::ranges::iota_result` containing the final iterator and the final value.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **T**>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, iota_result<FwdIter, T>> iota(ExPolicy
&&policy,
FwdIter first,
Sent last, T
value)
```

Fills the range `[first, last)` with sequentially increasing values, starting with *value* and repetitively evaluating `++value`.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly `std::distance(first, last)` assignments and increments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a `hpx::future<iota_result>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *iota_result* otherwise.

```
template<typename Range, typename T>
```

```
iota_result<typename hpx::traits::range_traits<Range>::iterator_type, T> iota(Range &&r, T value)
```

Fills the range *r* with sequentially increasing values, starting with *value* and repetitively evaluating `++value`.

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Exactly `std::ranges::distance(r)` assignments and increments.

Template Parameters

- **Range** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input or output iterator
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **r** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a `hpx::ranges::iota_result` containing the final iterator and the final value.

```
template<typename ExPolicy, typename Range, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, iota_result<typename hpx::traits::range_traits<Range>::iterator_type, T>> iota(ExPolicy, Range, T, value)
```

Fills the range *r* with sequentially increasing values, starting with *value* and repetitively evaluating `++value`.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly `std::ranges::distance(r)` assignments and increments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Range** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **r** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a *hpx::future<iota_result>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *iota_result* otherwise.

hpx::ranges::generate

Defined in header [hpx/algorithm.hpp](#)⁷¹⁸.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::generate_n](#)

template<typename **ExPolicy**, typename **Rng**, typename **F**>

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::generate(ExPolicy
&&pol-
icy,
Rng
&&rng,
F
&&f)
```

Assign each element in range [first, last) a value generated by the given function object *f*

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

⁷¹⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

`Ret fun();`

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **F**>

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> *hpx::ranges::generate*(*ExPolicy* &&policy, *Iter* first, *Sent* last, *F* &&f)

Assign each element in range [first, last) a value generated by the given function object *f*

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source end iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

```
template<typename Rng, typename F>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::generate(Rng &&rng, F &&f)
```

Assign each element in range [first, last) a value generated by the given function object *f*

Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns *last*.

```
template<typename Iter, typename Sent, typename F>
```

```
Iter hpx::ranges::generate(Iter first, Sent last, F &&f)
```

Assign each element in range [first, last) a value generated by the given function object *f*

Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **Iter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source end iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns *last*.

hpx::ranges::generate_n

Defined in header `hpx/algorithm.hpp`⁷¹⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::generate*

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F>
```

⁷¹⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

*hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::generate_n(ExPolicy
&&policy, FwdIter
first, Size count, F
&&f)*

Assigns each element in range [first, first+count) a value generated by the given function object *g*.

The assignments in the parallel *generate_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly *count* invocations of *f* and assignments, for *count* > 0.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

```
Ret fun();
```

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

```
template<typename FwdIter, typename Size, typename F>
```

```
FwdIter hpx::ranges::generate_n(FwdIter first, Size count, F &&f)
```

Assigns each element in range [first, first+count) a value generated by the given function object *g*.

Note

Complexity: Exactly *count* invocations of *f* and assignments, for *count* > 0.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

```
Ret fun();
```

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns *last*.

hpx::ranges::rotate

Defined in header [hpx/algorithm.hpp](#)⁷²⁰.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::rotate_copy](#)

```
template<typename FwdIter, typename Sent>
```

⁷²⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

`subrange_t<FwdIter, Sent> hpx::ranges::rotate(FwdIter first, FwdIter middle, Sent last)`

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element middle becomes the first element of the new range and middle - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a `subrange_t<FwdIter, Sent>`. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

`template<typename ExPolicy, typename FwdIter, typename Sent>`

`parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::rotate(ExPolicy
&&pol-
icy,
FwdIter
first,
FwdIter
mid-
dle,
Sent
last)`

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range `[first, last)` in such a way that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a `hpx::future<subrange_t<FwdIter, Sent>>` if the execution policy is of type *parallel_task_policy* and returns a `subrange_t<FwdIter, Sent>` otherwise. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

```
template<typename Rng>
```

```
subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>> hpx::ranges::rotate(Rng &&rng,
                                                                 std::ranges::iterator_t<Rng>
                                                                 middle)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

Returns

The *rotate* algorithm returns a *subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>*. The *rotate* algorithm returns the iterator equal to *pair(first + (last - middle), last)*.

```
template<typename ExPolicy, typename Rng>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> hpx::ranges::rotate(Rng &&rng,
                                                                 std::ranges::iterator_t<Rng>
                                                                 middle)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

Returns

The *rotate* algorithm returns a `hpx::future <subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>` otherwise. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

`hpx::ranges::rotate_copy`

Defined in header `hpx/algorithm.hpp`⁷²¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::rotate`

template<typename **FwdIter**, typename **Sent**, typename **OutIter**>

⁷²¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
rotate_copy_result<FwdIter, OutIter> hpx::ranges::rotate_copy(FwdIter first, FwdIter middle, Sent last,
                                                             OutIter dest_first)
```

Copies the elements from the range `[first, last)`, to another range beginning at `dest_first` in such a way, that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel `rotate_copy` algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range `[first,last)`.

Returns

The `rotate_copy` algorithm returns a `rotate_copy_result<FwdIter, OutIter>`. The `rotate_copy` algorithm returns the output iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2>
```

`parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<FwdIter1, FwdIter2>>::type hpx::ranges::rotate_copy(ExPolicy &&policy, FwdIter1 first, FwdIter1 middle, Sent last, FwdIter2 dest_first)`

Copies the elements from the range `[first, last)`, to another range beginning at `dest_first` in such a way, that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel `rotate_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `rotate_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `last - first` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns

The *rotate_copy* algorithm returns `hpx::future< rotate_copy_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *rotate_copy_result<FwdIter1, FwdIter2>* otherwise. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename Rng, typename OutIter>
```

```
rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::rotate_copy(Rng &&rng,
                                                                 std::ranges::iterator_t<Rng>
                                                                 middle, OutIter
                                                                 dest_first)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns

The *rotate* algorithm returns a *rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>*. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename ExPolicy, typename Rng, typename OutIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>> hpx::ranges::rotate_copy
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range $[first, last)$, to another range beginning at *dest_first* in such a way, that the element *new_first* becomes the first element of the new range and *new_first* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range $[first, last)$.

Returns

The `rotate_copy` algorithm returns a `hpx::future<rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>>` if the execution policy is of type `parallel_task_policy` and returns `rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>` otherwise. The `rotate_copy` algorithm returns the output iterator to the element past the last element copied.

`hpx::ranges::for_each`

Defined in header `hpx/algorithm.hpp`⁷²².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::for_each_n`

template<typename **InIter**, typename **Sent**, typename **F**, typename **Proj** = `hpx::identity`>

`for_each_result<InIter, F> hpx::ranges::for_each(InIter first, Sent last, F &&f, Proj &&proj = Proj())`

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Note

Complexity: Applies *f* exactly *last - first* times.

Template Parameters

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **InIter**.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `for_each` requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

⁷²² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

`<ignored> pred(const Type &a);`

The signature does not need to have `const&`. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

{last, HPX_MOVE(f)} where last is the iterator corresponding to the input sentinel last.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```
for_each_result<std::ranges::iterator_t<Rng>, F> hpx::ranges::for_each(Rng &&rng, F &&f, Proj &&proj =  
Proj())
```

Applies *f* to the result of dereferencing every iterator in the given range *rng*.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Note

Complexity: Applies *f* exactly *size(rng)* times.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

`<ignored> pred(const Type &a);`

The signature does not need to have `const&`. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

{std::end(rng), HPX_MOVE(f)}

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::for_each(ExPolicy &&policy,  
                                                                 FwdIter first, Sent  
                                                                 last, F &&f, Proj  
                                                                 &&proj = Proj())
```

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Applies *f* exactly *last - first* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

`<ignored> pred(const Type &a);`

The signature does not need to have `const&`. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *for_each* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Rng**, typename **F**, typename **Proj** = *hpx::identity*>

hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> *hpx::ranges::for_each*(*ExPolicy* &&policy, *Rng* &&rng, *F* &&f, *Proj* &&proj) = *Proj*()

Applies *f* to the result of dereferencing every iterator in the given range *rng*.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Applies f exactly $size(rng)$ times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires F to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *for_each* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

hpx::ranges::for_each_n

Defined in header `hpx/algorithm.hpp`⁷²³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::for_each*

```
template<typename InIter, typename Size, typename F, typename Proj = hpx::identity>
```

⁷²³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
for_each_n_result<InIter, F> hpx::ranges::for_each_n(InIter first, Size count, F &&f, Proj &&proj = Proj())
```

Applies f to the result of dereferencing every iterator in the range $[first, first + count)$, starting from $first$ and proceeding to $first + count - 1$.

If f returns a result, the result is ignored.

If the type of $first$ satisfies the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

Note

Complexity: Applies f exactly $count$ times.

Template Parameters

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply f to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires F to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by $[first, last)$. The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

It returns *last*.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F, typename Proj = hpx::identity>
```

```

hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::for_each_n(ExPolicy
&&policy,
FwdIter first,
Size count, F
&&f, Proj
&&proj =
Proj())

```

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Applies *f* exactly *count* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

`<ignored> pred(const Type &a);`

The signature does not need to have `const&`. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *for_each* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

hpx::ranges::count

Defined in header `hpx/algorithm.hpp`⁷²⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::count_if`

template<typename **ExPolicy**, typename **Rng**, typename **Proj** = `hpx::identity`, typename **T** = typename `hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type`

`hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::`

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

⁷²⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Performs exactly *last - first* comparisons.

Note

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns a *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Proj = hpx::identity, typename T =  
typename hpx::parallel::traits::projected<Iter, Proj>::value_type>
```

```

    hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<Iter>::difference_type>::type hpx::ranges::count(ExPolicy const&&,
                                                                    Iter first, Iter last, const T& value) const {
        constexpr auto& v = value;
        PreProcessor p{v};
        return count(first, last, p);
    }

```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* comparisons.

Note

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns a *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::difference_type hpx::ranges::count(Rng
&&rng,
T
const
&value,
Proj
&&proj
=
Proj())
```

Returns the number of elements in the range [first, last) satisfying a specific criteria.
This version counts the elements that are equal to the given *value*.

Note

Complexity: Performs exactly *last - first* comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename Iter, typename Sent, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<Iter, Proj>::value_type>
```

`std::iterator_traits<Iter>::difference_type hpx::ranges::count(Iter first, Sent last, T const &value, Proj &&proj = Proj())`

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

Note

Complexity: Performs exactly *last - first* comparisons.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

`hpx::ranges::count_if`

Defined in header `hpx/algorithm.hpp`⁷²⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::count`

`template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>`

⁷²⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::`

Returns the number of elements in the range [first, last) satisfying a specific criteria.
This version counts elements for which predicate *f* returns true.

Note

Complexity: Performs exactly *last - first* applications of the predicate.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count_if* algorithm returns *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<Iter>::difference_type>::type hpx::ranges::count_if
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

Note

Complexity: Performs exactly *last - first* applications of the predicate.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `count_if` requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The `count_if` algorithm returns `hpx::future<difference_type>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `difference_type` otherwise (where `difference_type` is defined by `std::iterator_traits<FwdIter>::difference_type`). The `count` algorithm returns the number of elements satisfying the given criteria.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```

std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::difference_type hpx::ranges::count_if(Rng
&&rng,
F
&&f,
Proj
&&proj
=
Proj())

```

Returns the number of elements in the range [first, last) satisfying a specific criteria.
This version counts elements for which predicate *f* returns true.

Note

Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```

std::iterator_traits<Iter>::difference_type hpx::ranges::count_if(Iter first, Sent last, F &&f, Proj &&proj =
Proj())

```

Returns the number of elements in the range [first, last) satisfying a specific criteria.
This version counts elements for which predicate *f* returns true.

Note

Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

hpx::ranges::destroy

Defined in header `hpx/algorithm.hpp`⁷²⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::destroy_n*

template<typename **ExPolicy**, typename **Rng**>

⁷²⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::destroy(ExPolicy  
                                                                                                     &&pol-  
                                                                                                     icy,  
                                                                                                     Rng  
                                                                                                     &&rng)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* operations.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns a `hpx::future<void>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

```
template<typename ExPolicy, typename Iter, typename Sent>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::destroy(ExPolicy &&policy, Iter  
                                                                                                     first, Sent last)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* operations.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns a `hpx::future<void>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

template<typename **Rng**>

`hpx::traits::range_iterator<Rng>::type hpx::ranges::destroy(Rng &&rng)`

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

Note

Complexity: Performs exactly *last - first* operations.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns *void*.

template<typename **Iter**, typename **Sent**>

`Iter hpx::ranges::destroy(It first, Sent last)`

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

Note

Complexity: Performs exactly *last - first* operations.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns *void*.

`hpx::ranges::destroy_n`

Defined in header `hpx/algorithm.hpp`⁷²⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::destroy`

`template<typename ExPolicy, typename FwdIter, typename Size>`

&&policy,
FwdIter first,
Size count)`

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, first + count)`.

The operations in the parallel *destroy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

⁷²⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *destroy_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *destroy_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename FwdIter, typename Size>
```

```
FwdIter hpx::ranges::destroy_n(FwdIter first, Size count)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, first + count)`.

Note

Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *destroy_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

`hpx::ranges::experimental::for_loop`

Defined in header `hpx/algorithm.hpp`⁷²⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::experimental::for_loop_strided`
- `hpx::ranges::experimental::for_loop_n`
- `hpx::ranges::experimental::for_loop_n_strided`

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename ...**Args**>

`hpx::parallel::util::detail::algorithm_result<ExPolicy>::type` `hpx::ranges::experimental::for_loop`(*ExPolicy* &&pol-
icy, *Iter* first,
Sent last,
Args&&... args)

The `for_loop` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Iter* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack

⁷²⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of f in the input sequence.

Complexity: Applies f exactly once for each element of the input sequence.

Remarks: If f returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of f , even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the iteration variable (forward iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Iter const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop* algorithm returns a *hpx::future<void>* if the execution policy is of type

`hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Iter, typename Sent, typename ...Args>
```

```
void hpx::ranges::experimental::for_loop(Iter first, Sent last, Args&&... args)
```

The `for_loop` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Iter* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using `advance` and `distance`.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **Iter** – The type of the iteration variable (input iterator).

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `Iter`.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Iter const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename R, typename ...Args>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy>::type hpx::ranges::experimental::for_loop(ExPolicy
&&policy, R
&&rng,
Args&&...
args)
```

The `for_loop` implements loop functionality over a range specified by a range. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Rng::iterator* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of Move-Constructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack

member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of f in the input sequence.

Complexity: Applies f exactly once for each element of the input sequence.

Remarks: If f returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of f , even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **R** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop* algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Rng, typename ...Args>
```

```
void hpx::ranges::experimental::for_loop(Rng &&rng, Args&&... args)
```

The `for_loop` implements loop functionality over a range specified by a range. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Rng::iterator* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using `advance` and `distance`.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

`<ignored> pred(Rng::iterator const& a, ...);`

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

`hpx::ranges::experimental::for_loop_strided`

Defined in header `hpx/algorithm.hpp`⁷²⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

Args&&...
args)`

The `for_loop_strided` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Iter* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

⁷²⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Effects: Applies f to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding f , an additional argument is passed to each application of f as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of f in the input sequence.

Complexity: Applies f exactly once for each element of the input sequence.

Remarks: If f returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of f , even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the iteration variable (forward iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *Iter*.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if *Iter* meets the requirements a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

`<ignored> pred(Iter const& a, ...);`

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The `for_loop_strided` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Iter, typename Sent, typename S, typename ...Args>
```

```
void hpx::ranges::experimental::for_loop_strided(Iter first, Sent last, S stride, Args&&... args)
```

The `for_loop_strided` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop_strided` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Iter* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of f , even though the applications themselves may be unordered.

Template Parameters

- **Iter** – The type of the iteration variable (input iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **S** – The type of the stride variable. This should be an integral type.

- **rng** – Refers to theof the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if `Rng::iterator` meets the requirements a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The `for_loop_strided` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Rng, typename S, typename ...Args>
```

```
void hpx::ranges::experimental::for_loop_strided(Rng &&rng, S stride, Args&&... args)
```

The `for_loop_strided` implements loop functionality over a range specified by a range. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop_strided` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: `Rng::iterator` shall meet the requirements of an input iterator type. The `args` parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the `args` parameter pack. The length

of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if `Rng::iterator` meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

⁷³⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

⁷³¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

⁷³² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_sorted(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Determines if the range [first, last) is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is_sorted* algorithm executes in sequential order in the calling thread.

Note

Complexity: at most $(N+S-1)$ comparisons where N = distance(first, last). S = number of partitions

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to Type.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a *bool*. The *is_sorted* algorithm returns true if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less,  
typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_sorted(ExPolicy &&policy,
                                                                 FwdIter first, Sent last,
                                                                 Pred &&pred = Pred(),
                                                                 Proj &&proj = Proj())
```

Determines if the range [first, last) is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(N+S-1)$ comparisons where N = distance(first, last). S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a `hpx::future<bool>` if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_sorted* algorithm returns a *bool* if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

```
template<typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_sorted(Rng &&rng, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Determines if the range *rng* is sorted. Uses *pred* to compare elements.

The comparison operations in the parallel *is_sorted* algorithm executes in sequential order in the calling thread.

Note

Complexity: at most $(N+S-1)$ comparisons where $N = \text{size}(\text{rng})$. S = number of partitions

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a *bool*. The *is_sorted* algorithm returns true if each

element in the rng satisfies the predicate passed. If the range rng contains less than two elements, the function always returns true.

```
template<typename ExPolicy, typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_sorted(ExPolicy &&policy,  
                                             Rng &&rng, Pred  
                                             &&pred = Pred(), Proj  
                                             &&proj = Proj())
```

Determines if the range rng is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(N+S-1)$ comparisons where $N = \text{size}(\text{rng})$. S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_sorted* algorithm returns a *bool* if each element in the range *rng* satisfies the predicate passed. If the range *rng* contains less than two elements, the function always returns true.

hpx::ranges::is_sorted_until

Defined in header [hpx/algorithm.hpp](#)⁷³³.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::is_sorted](#)

```
template<typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
FwdIter hpx::ranges::is_sorted_until(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm execute in sequential order in the calling thread.

Note

Complexity: at most (N+S-1) comparisons where *N* = distance(first, last). *S* = number of partitions

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.

⁷³³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* algorithm returns a *FwdIter*. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less,
typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::is_sorted_until(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent last,
Pred
&&pred
=
Pred(),
Proj
&&proj
=
Proj())
```

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(N+S-1)$ comparisons where N = distance(first, last). S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::is_sorted_until(Rng &&rng, Pred &&pred = Pred(), Proj  
                                                         &&proj = Proj())
```

Returns the first element in the range *rng* that is not sorted. Uses a predicate to compare elements or the less than operator.

Note

Complexity: at most $(N+S-1)$ comparisons where $N = \text{size}(\text{rng})$. S = number of partitions

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* returns *FwdIter*. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename ExPolicy, typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::is_sorted_until(ExPolicy  
                                                                                                     &&pol-  
                                                                                                     icy,  
                                                                                                     Rng  
                                                                                                     &&rng,  
                                                                                                     Pred  
                                                                                                     &&pred  
                                                                                                     =  
                                                                                                     Pred(),  
                                                                                                     Proj  
                                                                                                     &&proj  
                                                                                                     =  
                                                                                                     Proj())
```

Returns the first element in the range *rng* that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(N+S-1)$ comparisons where $N = \text{size}(\text{rng})$. S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

hpx::ranges::set_difference

Defined in header `hpx/algorithm.hpp`⁷³⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<Iter1, Iter3>>::type hpx::ranges::set_difference(ExPolicy,
&&pol-
icy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2()
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range *[first1, last1)* and not present in the range *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

⁷³⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns a `hpx::future<ranges::set_difference_result<Iter1, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_difference_result<Iter1, Iter3>` otherwise. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<std::ranges::iterator_t<Rng1>, Iter3>> hpx::ranges::set_dif
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range `[first1, last1)` and not present in the range `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in `[first1, last1)` and *n* times in `[first2, last2)`, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns a `hpx::future<ranges::set_difference_result<Iter1, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_difference_result<Iter1, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>`. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred
= hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
set_difference_result<Iter1, Iter3> hpx::ranges::set_difference(Iter1 first1, Sent1 last1, Iter2 first2, Sent2
last2, Iter3 dest, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 =
Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range *[first1, last1)* and not present in the range *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for *Iter2*.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

`bool pred(const Type1 &a, const Type1 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns `ranges::set_difference_result<Iter1, Iter3>`. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_difference_result<std::ranges::iterator_t<Rng1>, Iter3> hpx::ranges::set_difference(Rng1 &&rng1,
                                                                                      Rng2 &&rng2, Iter3
                                                                                      dest, Pred &&op =
                                                                                      Pred(), Proj1
                                                                                      &&proj1 = Proj1(),
                                                                                      Proj2 &&proj2 =
                                                                                      Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the

range `[first1, last1)` and not present in the range `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in `[first1, last1)` and *n* times in `[first2, last2)`, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns *ranges::set_difference_result<Iter1, Iter3>*, where *Iter1* is *range_iterator_t<Rng1>* and *Iter2* is *range_iterator_t<Rng2>*. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::reduce

Defined in header [hpx/algorithm.hpp](#)⁷³⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, FwdIter
first, Sent last, T init, F &&f)
```

Returns GENERALIZED_SUM(*f*, *init*, **first*, ..., **(first + (last - first) - 1)*).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *f*.

Note

GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.

⁷³⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename F, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, Rng
&&rng, T init, F &&f)
```

Returns GENERALIZED_SUM(f, init, *first, ..., *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate f .

Note

GENERALIZED_SUM($op, a1, \dots, aN$) is defined as follows:

- $a1$ when N is 1
- $op(\text{GENERALIZED_SUM}(op, b1, \dots, bK), \text{GENERALIZED_SUM}(op, bM, \dots, bN))$, where:
 - $b1, \dots, bN$ may be any permutation of $a1, \dots, aN$ and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires F to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, FwdIter
first, Sent last, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

GENERALIZED_SUM(+, *a*1, ..., *a**N*) is defined as follows:

- *a*1 when *N* is 1
- $\text{op}(\text{GENERALIZED_SUM}(+, \text{b1}, \dots, \text{bK}), \text{GENERALIZED_SUM}(+, \text{bM}, \dots, \text{bN}))$, where:
- *b*1, ..., *b**N* may be any permutation of *a*1, ..., *a**N* and
- $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.

- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying `operator+()`) over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename Rng, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, Rng
&&rng, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the `operator+()`.

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- `op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN))`,
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying `operator+()`) over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename FwdIter, typename Sent>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<FwdIter>::value_type>::type hpx::ranges::reduce(E
```

Returns `GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1))`.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the `operator+()`.

Note

The type of the initial value (and the result type) T is determined from the `value_type` of the used `FwdIterB`.

Note

`GENERALIZED_SUM(+, a1, ..., aN)` is defined as follows:

- $a1$ when N is 1
- $op(GENERALIZED_SUM(+, b1, \dots, bK), GENERALIZED_SUM(+, bM, \dots, bN))$, where:
 - $b1, \dots, bN$ may be any permutation of $a1, \dots, aN$ and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns T otherwise (where T is the `value_type` of `FwdIterB`). The *reduce* algorithm returns the result of the generalized sum (applying operator`+`()) over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename Rng>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::
```

Returns `GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1))`.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

The type of the initial value (and the result type) T is determined from the `value_type` of the used *FwdIterB*.

Note

GENERALIZED_SUM(+, $a_1, \dots, a_N$) is defined as follows:

- a_1 when N is 1
- $\text{op}(\text{GENERALIZED_SUM}(+, b_1, \dots, b_K), \text{GENERALIZED_SUM}(+, b_M, \dots, b_N))$, where:
 - $b_1, \dots, b_N$ may be any permutation of $a_1, \dots, a_N$ and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns T otherwise (where T is the `value_type` of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename FwdIter, typename Sent, typename F, typename T = typename
std::iterator_traits<FwdIter>::value_type>
```

```
T hpx::ranges::reduce(FwdIter first, Sent last, T init, F &&f)
```

Returns GENERALIZED_SUM(*f*, *init*, **first*, ..., *(*first* + (*last* - *first*) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *f*.

Note

GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)),
where:
- *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
- $1 < K+1 = M \leq N$.

Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1 Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename Rng, typename F, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
T hpx::ranges::reduce(Rng &&rng, T init, F &&f)
```

Returns GENERALIZED_SUM(f, init, *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *f*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename FwdIter, typename Sent, typename T = typename std::iterator_traits<FwdIter>::value_type>
```

```
T hpx::ranges::reduce(FwdIter first, Sent last, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename Rng, typename T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
T hpx::ranges::reduce(Rng &&rng, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)),
where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename FwdIter, typename Sent>
```

`std::iterator_traits<FwdIter>::value_type hpx::ranges::reduce(FwdIter first, Sent last)`

Returns GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

The type of the initial value (and the result type) *T* is determined from the `value_type` of the used *FwdIterB*.

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns *T* (where T is the `value_type` of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

template<typename **Rng**>

`std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::value_type hpx::ranges::reduce(Rng &&rng)`

Returns GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

The type of the initial value (and the result type) *T* is determined from the *value_type* of the used *FwdIterB*.

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)),
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns *T* (where *T* is the *value_type* of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

hpx::ranges::move

Defined in header `hpx/algorithm.hpp`⁷³⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**>

⁷³⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, move_result<Iter1, Iter2>>::type hpx::ranges::move(ExPolicy &&policy, Iter1 first, Sent1 last, Iter2 dest)`

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a `hpx::future<ranges::move_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::move_result<iterator_t<Rng>, FwdIter2>` otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename Rng, typename Iter2>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, move_result<std::ranges::iterator_t<Rng>, Iter2>>>::type hpx::ranges::move(ExPolicy
&&pol
icy,
Rng
&&rng
Iter2
dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a `hpx::future<ranges::move_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::move_result<iterator_t<Rng>, FwdIter2>` otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Iter1, typename Sent1, typename Iter2>
```

```
move_result<Iter1, Iter2> hpx::ranges::move(Iter1 first, Sent1 last, Iter2 dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns `ranges::move_result<iterator_t<Rng>, FwdIter2>`. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Rng, typename Iter2>
```

```
move_result<std::ranges::iterator_t<Rng>, Iter2> hpx::ranges::move(Rng &&rng, Iter2 dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a *ranges::move_result<iterator_t<Rng>, FwdIter2>*. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

hpx::ranges::transform

Defined in header [hpx/algorithm.hpp](#)⁷³⁷.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **F**, typename **Proj** = *hpx::identity*>

parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<FwdIter1, FwdIter2>>::type **hpx::ranges::transform**(

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at *dest*.

The invocations of *f* in the *parallel transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the *parallel transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly *size(rng)* applications of *f*

Template Parameters

⁷³⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for **FwdIter1**.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns a `hpx::future<ranges::unary_transform_result<FwdIter1, FwdIter2>>` if the execution policy is of type *parallel_task_policy* and returns `ranges::unary_transform_result<FwdIter1, FwdIter2>` otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
```

`parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<std::ranges::iterator_t<Rng>, FwdIter>> hpx::ranges::t`

Applies the given function f to the given range rng and stores the result in another range, beginning at $dest$.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly $\text{size}(rng)$ applications of f

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of f .
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires F to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

`Ret fun(const Type &a);`

The signature does not need to have `const&`. The type *Type* must be such that an object of type `range_iterator<Rng>::type` can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns a `hpx::future<ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>>` if the execution policy is of type *parallel_task_policy* and returns `ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>` otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename FwdIter3, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>::type hpx::ranges::tr
```

Applies the given function *f* to pairs of elements from two ranges: one defined by *rng* and the other beginning at *first2*, and stores the result in another range, beginning at *dest*.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly $\text{size}(\text{rng})$ applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns `A hpx::future<ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>` if the execution policy is of type *parallel_task_policy* and returns `ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>` otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename F, typename Proj = hpx::identity>
```

```
ranges::unary_transform_result<FwdIter1, FwdIter2> hpx::ranges::transform(FwdIter1 first, Sent1 last,
                                                                    FwdIter2 dest, F &&f, Proj
                                                                    &&proj = Proj())
```

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at *dest*.

Note

Complexity: Exactly `size(rng)` applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *FwdIter1*.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns *ranges::unary_transform_result<FwdIter1, FwdIter2>*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
```

```
ranges::unary_transform_result<std::ranges::iterator_t<Rng>, FwdIter> hpx::ranges::transform(Rng &&rng,
                                                                                          FwdIter dest,
                                                                                          F &&f, Proj
                                                                                          &&proj =
                                                                                          Proj())
```

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at *dest*.

Note

Complexity: Exactly `size(rng)` applications of *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *range_iterator<Rng>::type* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns *ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename FwdIter3,
typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3> hpx::ranges::transform(FwdIter1 first1,
Sent1 last1,
FwdIter2 first2,
Sent2 last2,
FwdIter3 dest, F
&&f, Proj1
&&proj1 = Proj1(),
Proj2 &&proj2 =
Proj2())
```

Applies the given function *f* to pairs of elements from two ranges: one defined by *rng* and the other beginning at *first2*, and stores the result in another range, beginning at *dest*.

Note

Complexity: Exactly size(rng) applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.

- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types FwdIter1 and FwdIter2 can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns *ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename FwdIter, typename F, typename Proj1 = hpx::identity,  
typename Proj2 = hpx::identity>
```

```
ranges::binary_transform_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, FwdIter> hpx::ranges::transform(Rng1  
&&rn  
Rng2  
&&rn  
FwdIt  
dest,  
F  
&&f,  
Proj1  
&&pr  
=  
Proj1  
Proj2  
&&pr  
=  
Proj2
```

Applies the given function f to pairs of elements from two ranges: one defined by $[first1, last1)$ and the other beginning at $first2$, and stores the result in another range, beginning at $dest$.

Note

Complexity: Exactly $\min(last2 - first2, last1 - first1)$ applications of f

Note

The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires F to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types `range_iterator<Rng1>::type` and `range_iterator<Rng2>::type` can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns `ranges::binary_transform_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, FwdIter>`. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

hpx::ranges::includes

Defined in header `hpx/algorithm.hpp`⁷³⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::includes(ExPolicy &&policy, Iter1
first1, Sent1 last1, Iter2
first2, Sent2 last2, Pred
&&op = Pred(), Proj1
&&proj1 = Proj1(),
Proj2 &&proj2 =
Proj2())
```

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

⁷³⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1 = \text{std::distance}(\text{first1}, \text{last1})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::includes(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

Note

At most $2*(N1+N2-1)$ comparisons, where $N1 = \text{std::distance}(\text{first1}, \text{last1})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

`bool pred(const Type1 &a, const Type2 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::parallel::detail::less,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::includes(ExPolicy &&policy,
                                                                                      Rng1 &&rng1, Rng2
                                                                                      &&rng2, Pred &&op =
                                                                                      Pred(), Proj1 &&proj1 =
                                                                                      Proj1(), Proj2 &&proj2
                                                                                      = Proj2())
```

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

At most $2*(N1+N2-1)$ comparisons, where $N1 = \text{std::distance}(\text{first1}, \text{last1})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range `[first2, last2)` is found within the sorted range `[first1, last1)`. Also returns true if `[first2, last2)` is empty.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::parallel::detail::less, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::includes(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(),
                          Proj2 &&proj2 = Proj2())
```

Returns true if every element from the sorted range `[first2, last2)` is found within the sorted range `[first1, last1)`. Also returns true if `[first2, last2)` is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

Note

At most $2*(N1+N2-1)$ comparisons, where $N1 = \text{std::distance}(\text{first1}, \text{last1})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

hpx::ranges::uninitialized_copy

Defined in header `hpx/algorithm.hpp`⁷³⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_copy_n`

template<typename **InIter**, typename **Sent1**, typename **FwdIter**, typename **Sent2**>

`hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_copy(InIter first1, Sent1 last1, FwdIter first2, Sent2 last2)`

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

⁷³⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy* algorithm returns an *in_out_result*<*InIter*, *FwdIter*>. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type hpx::ranges::uninitialized
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `in_out_result<InIter, FwdIter>` otherwise. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2>
```

```
hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns

The *uninitialized_copy* algorithm returns an *in_out_result*<typename `hpx::traits::range_traits<Rng1>::iterator_type`, typename `hpx::traits::range_traits<Rng2>::iterator_type`>. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, ty
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns

The *uninitialized_copy* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The *uninitialized_copy* algorithm returns the input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::uninitialized_copy_n

Defined in header `hpx/algorithm.hpp`⁷⁴⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_copy`

template<typename **InIter**, typename **Size**, typename **FwdIter**, typename **Sent2**>

`hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_copy_n(InIter first1, Size count, FwdIter first2, Sent2 last2)`

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

⁷⁴⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy_n* algorithm returns *in_out_result<InIter, FwdIter>*. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type hpx::ranges::uninitialized
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter2`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy_n* algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

`hpx::ranges::replace`

Defined in header `hpx/algorithm.hpp`⁷⁴¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace_if`
- `hpx::ranges::replace_copy`
- `hpx::ranges::replace_copy_if`

template<typename **Iter**, typename **Sent**, typename **Proj** = `hpx::identity`, typename **T1** = typename `hpx::parallel::traits::projected<Iter, Proj>::value_type`, typename **T2** = *T1*>

Iter `hpx::ranges::replace`(*Iter* first, *Sent* sent, *T1* const &old_value, *T2* const &new_value, *Proj* &&proj = `Proj()`)

⁷⁴¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Replaces all elements satisfying specific criteria with *new_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator it in the range [first,last) with *new_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace* algorithm returns an *Iter*.

```
template<typename Rng, typename Proj = hpx::identity, typename T1 = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
std::ranges::iterator_t<Rng> hpx::ranges::replace(Rng &&rng, T1 const &old_value, T2 const &new_value,
Proj &&proj = Proj())
```

Replaces all elements satisfying specific criteria with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace* algorithm returns an `hpx::traits::range_iterator<Rng>::type`.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Proj = hpx::identity, typename T1 =
typename hpx::parallel::traits::projected<Iter, Proj>::value_type, typename T2 = T1>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::replace(ExPolicy &&policy, Iter
    first, Sent sent, T1 const
    &old_value, T2 const
    &new_value, Proj &&proj
    = Proj())
```

Replaces all elements satisfying specific criteria with *new_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator *it* in the range [first,last) with *new_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename T1 = typename  
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
```

```

parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::replace(ExPolicy
&&policy, Rng
&&rng,
T1 const
&old_value,
T2 const
&new_value,
Proj
&&proj =
Proj())

```

Replaces all elements satisfying specific criteria with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Returns

The *replace* algorithm returns an `hpx::future<hpx::traits::range_iterator<Rng>::type>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `hpx::traits::range_iterator<Rng>::type` otherwise.

`hpx::ranges::replace_if`

Defined in header `hpx/algorithm.hpp`⁷⁴².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace`
- `hpx::ranges::replace_copy`
- `hpx::ranges::replace_copy_if`

template<typename **Iter**, typename **Sent**, typename **Pred**, typename **Proj** = `hpx::identity`, typename **T** = typename `hpx::parallel::traits::projected<Iter, Proj>::value_type`>

Iter `hpx::ranges::replace_if`(*Iter* first, *Sent* sent, *Pred* &&pred, *T* const &new_value, *Proj* &&proj = *Proj*())

Replaces all elements satisfying specific criteria (for which predicate *f* returns true) with *new_value* in the range [first, sent).

Effects: Substitutes elements referred by the iterator *it* in the range [first, sent) with *new_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

The assignments in the parallel *replace_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

⁷⁴² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns *Iter*. It returns *last*.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
std::ranges::iterator_t<Rng> hpx::ranges::replace_if(Rng &&rng, Pred &&pred, T const &new_value, Proj
&&proj = Proj())
```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by *rng*. This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns an *hpx::traits::range_iterator<Rng>::type*. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Pred, typename Proj = hpx::identity,
typename T = typename hpx::parallel::traits::projected<Iter, Proj>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::replace_if(ExPolicy &&policy,
                                                                                      Iter first, Sent sent,
                                                                                      Pred &&pred, T const
                                                                                      &new_value, Proj
                                                                                      &&proj = Proj())
```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

The assignments in the parallel *replace_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity, typename T =  
typename hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
```

```

parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::replace_if(ExPolicy
                                                                    &&pol-
                                                                    icy,
                                                                    Rng
                                                                    &&rng,
                                                                    Pred
                                                                    &&pred,
                                                                    T
                                                                    const
                                                                    &new_value,
                                                                    Proj
                                                                    &&proj
                                                                    =
                                                                    Proj())

```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `rng`. This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy*. It returns *last*.

hpx::ranges::replace_copy

Defined in header `hpx/algorithm.hpp`⁷⁴³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace`
- `hpx::ranges::replace_if`
- `hpx::ranges::replace_copy_if`

```
template<typename InIter, typename Sent, typename OutIter, typename Proj = hpx::identity, typename T1 =
typename hpx::parallel::traits::projected<InIter, Proj>::value_type, typename T2 = T1>
```

```
replace_copy_result<InIter, OutIter> hpx::ranges::replace_copy(InIter first, Sent sent, OutIter dest, T1 const
&old_value, T2 const &new_value, Proj
&&proj = Proj())
```

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator *it* in the range [result, result + (sent - first)) either *new_value* or **(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(proj, *(first + (i - result))) == old_value`

The assignments in the parallel *replace_copy* algorithm execute in sequential order in the calling thread.

⁷⁴³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns an *in_out_result<InIter, OutIter>*. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename OutIter, typename Proj = hpx::identity, typename T1 = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
```

```
replace_copy_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::replace_copy(Rng &&rng, OutIter
dest, T1 const
&old_value, T2 const
&new_value, Proj
&&proj = Proj())
```

Copies the all elements from the range *rbg* to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator *it* in the range $[result, result + (util::end(rng) - util::begin(rng)))$ either *new_value* or $*(first + (it - result))$ depending on whether the following corresponding condition holds: $INVOKE(proj, *(first + (i - result))) == old_value$

The assignments in the parallel *replace_copy* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns an *in_out_result<std::ranges::iterator_t<Rng>, OutIter>*. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Proj =
hpx::identity, typename T1 = typename hpx::parallel::traits::projected<FwdIter1, Proj>::value_type, typename T2 =
T1>
```

```

&&pol-
icy,
FwdIter
first,
Sent
sent,
FwdIter
dest,
T1
const
&old_v
T2
const
&new_v
Proj
&&proj
=
Proj())

```

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either *new_value* or **(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(proj, *(first + (i - result))) == old_value`

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T1** – The type of the old value to replace (deduced).

- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The `replace_copy` algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `in_out_result<FwdIter1, FwdIter2>` otherwise. The `copy` algorithm returns the pair of the forward iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename Proj = hpx::identity, typename T1 =  
typename hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
```

```
parallel::util::detail::algorithm_result<ExPolicy, replace_copy_result<std::ranges::iterator_t<Rng>, FwdIter>>::type hpx::ranges::repla
```

Copies the all elements from the range *rbg* to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator *it* in the range `[result, result + (util::end(rng) - util::begin(rng))]` either *new_value* or `*(first + (it - result))` depending on whether the following corresponding condition holds: `INVOKE(proj, *(first + (i - result))) == old_value`

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns a `hpx::future<in_out_result<std::ranges::iterator_t<Rng>, FwdIter>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `in_out_result<std::ranges::iterator_t<Rng>, FwdIter>>` The *copy* algorithm returns the pair of the input iterator *last* and the forward iterator to the element in the destination range, one past the last element copied.

hpx::ranges::replace_copy_if

Defined in header [hpx/algorithm.hpp](#)⁷⁴⁴.

```

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either *new_value* or **(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false`

The assignments in the parallel *replace_copy_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *InIter*.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

⁷⁴⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns a *in_out_result<InIter, OutIter>*. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename OutIter, typename Pred, typename T = typename  
std::iterator_traits<OutIter>::value_type, typename Proj = hpx::identity>
```

```
replace_copy_if_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::replace_copy_if(Rng &&rng,  
OutIter dest,  
Pred &&pred,  
T const  
&new_value,  
Proj &&proj =  
Proj())
```

Copies the all elements from the range *rng* to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator *it* in the range [*result*, *result* + (*util::end(rng)* - *util::begin(rng)*)) either *new_value* or **(first + (it - result))* depending on whether the following corresponding condition holds: *INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false*

The assignments in the parallel *replace_copy_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *util::end(rng)* - *util::begin(rng)* applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns an *in_out_result<std::ranges::iterator_t<Rng>, OutIter>*. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```

F

Copies the all elements from the range `[first, sent)` to another range beginning at `dest` replacing all elements satisfying a specific criteria with `new_value`.

Effects: Assigns to every iterator `it` in the range `[result, result + (sent - first))` either `new_value` or `*(first + (it - result))` depending on whether the following corresponding condition holds: `INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false`

The assignments in the parallel `replace_copy_if` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `replace_copy_if` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `sent - first` applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `InIter`.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential

form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).

- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns an *hpx::future<FwdIter1, FwdIter2>*. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename Pred, typename T = typename
std::iterator_traits<FwdIter>::value_type, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, replace_copy_if_result<std::ranges::iterator_t<Rng>, FwdIter>>::type hpx::ranges::rep
```

Copies the all elements from the range `rng` to another range beginning at `dest` replacing all elements satisfying a specific criteria with `new_value`.

Effects: Assigns to every iterator `it` in the range `[result, result + (util::end(rng) - util::begin(rng))]` either `new_value` or `*(first + (it - result))` depending on whether the following corresponding condition holds: `INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false`

The assignments in the parallel `replace_copy_if` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `replace_copy_if` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `equal` requires `Pred` to meet the requirements of `CopyConstructible`. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an unary predicate which returns `true` for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns an `hpx::future<in_out_result<std::ranges::iterator_t<Rng>, OutIter>>`. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::is_heap

Defined in header `hpx/algorithm.hpp`⁷⁴⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::is_heap_until`

```
template<typename ExPolicy, typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_heap(ExPolicy &&policy, Rng  
                                     &&rng, Comp &&comp =  
                                     Comp(), Proj &&proj =  
                                     Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most *N* applications of the comparison *comp*, at most $2 * N$ applications of the projection *proj*, where $N = \text{last} - \text{first}$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

⁷⁴⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less,  
typename Proj = hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_heap(ExPolicy &&policy, Iter  
first, Sent last, Comp  
&&comp = Comp(), Proj  
&&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_heap(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap* algorithm returns *bool*. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_heap(Iter first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap* algorithm returns *bool*. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

hpx::ranges::is_heap_until

Defined in header `hpx/algorithm.hpp`⁷⁴⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::is_heap*

```
template<typename ExPolicy, typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::is_heap_until(ExPolicy  
                                                         &&pol-  
                                                         icy,  
                                                         Rng  
                                                         &&rng,  
                                                         Comp  
                                                         &&comp  
                                                         =  
                                                         Comp(),  
                                                         Proj  
                                                         &&proj  
                                                         =  
                                                         Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

⁷⁴⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less,
typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::is_heap_until(ExPolicy
&&policy, Iter
first, Sent last,
Comp &&comp =
Comp(), Proj
&&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most $2 * N$ applications of the projection *proj*, where $N = \text{last} - \text{first}$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::is_heap_until(Rng &&rng, Comp &&comp = Comp(), Proj  
&&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most $2 * N$ applications of the projection *proj*, where $N = \text{last} - \text{first}$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap_until* algorithm returns *RandIter*. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [*first*, *it*) is a max heap.

```
template<typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
Iter hpx::ranges::is_heap_until(Iter first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [*first*, *it*) is a max heap. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

comp has to induce a strict weak ordering on the values.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most $2 * N$ applications of the projection *proj*, where $N = \text{last} - \text{first}$.

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter1*.

- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap_until* algorithm returns *RandIter*. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [*first*, *it*) is a max heap.

hpx::ranges::is_partitioned

Defined in header [hpx/algorithm.hpp](#)⁷⁴⁷.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter, typename Sent, typename Pred, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_partitioned(FwdIter first, Sent last, Pred &&pred, Proj &&proj = Proj())
```

Determines if the range [*first*, *last*) is partitioned.

Note

Complexity: at most (N) predicate evaluations where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

⁷⁴⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns *bool*. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range *[first, last)* contains less than two elements, the function is always true.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_partitioned(ExPolicy  
                                                    &&policy,  
                                                    FwdIter first,  
                                                    Sent last, Pred  
                                                    &&pred, Proj  
                                                    &&proj =  
                                                    Proj())
```

Determines if the range *[first, last)* is partitioned.

The predicate operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most (*N*) predicate evaluations where *N* = *distance*(*first*, *last*).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

executes the assignments.

- **FwdIter** – The type of the source iterators used for the `This` iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *CopyConstructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range [*first*, *last*) contains less than two elements, the function is always true.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_partitioned(Rng &&rng, Pred &&pred, Proj &&proj = Proj())
```

Determines if the range *rng* is partitioned.

Note

Complexity: at most (*N*) predicate evaluations where *N* = `std::size(rng)`.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns *bool*. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range *rng* contains less than two elements, the function is always true.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_partitioned(ExPolicy  
                                                                 &&policy, Rng  
                                                                 &&rng, Pred  
                                                                 &&pred, Proj  
                                                                 &&proj =  
                                                                 Proj())
```

Determines if the range [first, last) is partitioned.

The predicate operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most (*N*) predicate evaluations where *N* = `std::size(rng)`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *CopyConstructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range *rng* contains less than two elements, the function is always true.

hpx::ranges::exclusive_scan

Defined in header [hpx/algorithm.hpp](#)⁷⁴⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename T = typename
std::iterator_traits<InIter>::value_type, typename Op = std::plus<T>>
```

```
exclusive_scan_result<InIter, OutIter> hpx::ranges::exclusive_scan(InIter first, Sent last, OutIter dest, T init,
                                                                    Op &&op = Op())
```

Assigns through each iterator *i* in $[result, result + (last - first))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, ..., *(first + (i - result) - 1))`.

⁷⁴⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_N) is defined as:

- *a*₁ when *N* is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_K), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*_M, ..., *a*_N)) where $1 < K+1 = M \leq N$.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sen-

tinell and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename T = typename
std::iterator_traits<FwdIter1>::value_type, typename Op = std::plus<T>>
```

```
parallel::util::detail::algorithm_result<ExPolicy, exclusive_scan_result<FwdIter1, FwdIter2>>::type hpx::ranges::exclusive_scan(ExF
&&
icy,
Fwd
first
Sen
last
Fwd
dest
T
init,
Op
&&
=
Op
```

Assigns through each iterator i in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, ..., *(first + (i - result) - 1)).

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the i th input element in the i th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aK*), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *aM*, ..., *aN*)) where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

`Ret fun(const Type1 &a, const Type1 &b);`

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns a `hpx::future<util::in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `util::in_out_result<FwdIter1, FwdIter2>` otherwise. The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type, typename Op = std::plus<T>>
exclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::exclusive_scan(Rng &&rng, O dest, T
init, Op &&op = Op())
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, ..., *(first + (i - result) - 1))

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate `std::plus<T>`.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
- GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)
- GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type, typename Op = std::plus<T>>
parallel::util::detail::algorithm_result<ExPolicy, exclusive_scan_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::exclusive_scan
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, ..., *(first + (i - result) - 1))

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *std::plus<T>*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
- GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)
- GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::all_of

Defined in header `hpx/algorithm.hpp`⁷⁴⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::any_of`
- `hpx::ranges::none_of`

template<typename **ExPolicy**, typename **Rng**, typename **F**, typename **Proj** = `hpx::identity`>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::all_of(ExPolicy &&policy, Rng
&&rng, F &&f, Proj
&&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

⁷⁴⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::all_of(ExPolicy &&policy, Iter  
first, Sent last, F &&f, Proj  
&&proj = Proj())
```

Checks if unary predicate f returns true for all elements in the range rng .

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate f

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires F to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::all_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::all_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

hpx::ranges::any_of

Defined in header `hpx/algorithm.hpp`⁷⁵⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::all_of*
- *hpx::ranges::none_of*

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
```

⁷⁵⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::any_of(ExPolicy &&policy, Rng
&&rng, F &&f, Proj
&&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *any_of*

algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::any_of(ExPolicy &&policy, Iter  
first, Sent last, F &&f, Proj  
&&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::any_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::any_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

hpx::ranges::none_of

Defined in header `hpx/algorithm.hpp`⁷⁵¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::all_of`
- `hpx::ranges::any_of`

template<typename **ExPolicy**, typename **Rng**, typename **F**, typename **Proj** = `hpx::identity`>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::none_of(ExPolicy &&policy, Rng
&&rng, F &&f, Proj
&&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

⁷⁵¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::none_of(ExPolicy &&policy, Iter
                                                                    first, Sent last, F &&f,
                                                                    Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::none_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::none_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

Note

Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

`hpx::ranges::set_intersection`

Defined in header `hpx/algorithm.hpp`⁷⁵².

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename  
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =  
hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_intersection_result<Iter1, Iter2, Iter3>>::type hpx::ranges::set_intersection
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, the first `std::min(m, n)` elements will be copied from the first range to the destination range. The

⁷⁵² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N_1 + N_2 - 1)$ comparisons, where N_1 is the length of the first sequence and N_2 is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns a `hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>` otherwise. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =  
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

hpx::parallel::util::detail::algorithm_result<ExPolicy, set_intersection_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, It

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, the first $\text{std::min}(m, n)$ elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns a `hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>`. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred
= hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_intersection_result<Iter1, Iter2, Iter3> hpx::ranges::set_intersection(Iter1 first1, Sent1 last1, Iter2 first2,
                                                                    Sent2 last2, Iter3 dest, Pred &&op
                                                                    = Pred(), Proj1 &&proj1 =
                                                                    Proj1(), Proj2 &&proj2 = Proj2())
```

Constructs a sorted range beginning at `dest` consisting of all elements present in both sorted ranges `[first1, last1)` and `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in `[first1, last1)` and *n* times in `[first2, last2)`, the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

`bool pred(const Type1 &a, const Type1 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns *ranges::set_intersection_result<Iter1, Iter2, Iter3>*. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename  
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
set_intersection_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::set_intersection(Rng1  
                                                                &&rng1,  
                                                                Rng2  
                                                                &&rng2,  
                                                                Iter3  
                                                                dest,  
                                                                Pred  
                                                                &&op  
                                                                =  
                                                                Pred(),  
                                                                Proj1  
                                                                &&proj1  
                                                                =  
                                                                Proj1(),  
                                                                Proj2  
                                                                &&proj2  
                                                                =  
                                                                Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>`, where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>`. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

⁷⁵⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs at most $2 * N$ swaps, exactly N applications of the predicate and projection, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns *subrange_t<std::ranges::iterator_t<Rng>>* The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>>> hpx::ranges::partition(ExPolicy
                                                                 &&policy,
                                                                 Rng
                                                                 &&rng,
                                                                 Pred
                                                                 &&pred,
                                                                 Proj
                                                                 &&proj
                                                                 =
                                                                 Proj())
```

Reorders the elements in the range *rng* in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most $2 * N$ swaps, exactly N applications of the predicate and projection, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns a `hpx::future<subrange_t<std::ranges::iterator_t<Rng>>>` if the execution policy is of type *parallel_task_policy* and returns *subrange_t<std::ranges::iterator_t<Rng>>* The *partition* algorithm returns a subrange

starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

```
template<typename FwdIter, typename Sent, typename Pred, typename Proj = hpx::identity>
```

```
subrange_t<FwdIter> hpx::ranges::partition(FwdIter first, Sent last, Pred &&pred, Proj &&proj = Proj())
```

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: At most $2 * (\text{last} - \text{first})$ swaps. Exactly *last* - *first* applications of the predicate and projection.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns *subrange_t<FwdIter>*. The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =  
hpx::identity>  
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter>>::type hpx::ranges::partition(ExPolicy  
                                                    &&pol-  
                                                    icy,  
                                                    FwdIter  
                                                    first,  
                                                    Sent  
                                                    last,  
                                                    Pred  
                                                    &&pred,  
                                                    Proj  
                                                    &&proj  
                                                    =  
                                                    Proj())
```

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 * (last - first)$ swaps. Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns a `hpx::future<subrange_t<FwdIter>>` if the execution policy is of type *parallel_task_policy* and returns *subrange_t<FwdIter>* otherwise. The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

hpx::ranges::stable_partition

Defined in header `hpx/algorithm.hpp`⁷⁵⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::partition*
- *hpx::ranges::partition_copy*

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
subrange_t<std::iterator_t<Rng>> hpx::ranges::stable_partition(Rng &&rng, Pred &&pred, Proj
&&proj = Proj())
```

Permutes the elements in the range [first, last) such that there exists an iterator *i* such that for every iterator *j* in the range [first, *i*) `INVOKE(f, INVOKE (proj, *j)) != false`, and for every iterator *k* in the range [*i*, last), `INVOKE(f, INVOKE (proj, *k)) == false`

The invocations of *f* in the parallel *stable_partition* algorithm invoked without an execution policy object executes in sequential order in the calling thread.

⁷⁵⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: At most $(last - first) * \log(last - first)$ swaps, but only linear number of swaps if there is enough extra memory Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an bidirectional iterator
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *BidIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *stable_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range [first, *i*), $f(*j) \neq \text{false}$ INVOKE(*f*, INVOKE(*proj*, **j*)) $\neq \text{false}$, and for every iterator *k* in the range [*i*, last), $f(*k) == \text{false}$ INVOKE(*f*, INVOKE(*proj*, **k*)) $== \text{false}$. The relative order of the elements in both groups is preserved.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::stable_partition(ExPolicy
&&pol-
icy,
Rng
&&rng,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Permutes the elements in the range [first, last) such that there exists an iterator *i* such

that for every iterator j in the range $[first, i)$ $INVOKE(f, INVOKE(proj, *j)) \neq false$,
and for every iterator k in the range $[i, last)$, $INVOKE(f, INVOKE(proj, *k)) == false$

The invocations of f in the parallel *stable_partition* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The invocations of f in the parallel *stable_partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $(last - first) * \log(last - first)$ swaps, but only linear number of swaps if there is enough extra memory. Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of f .
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an bidirectional iterator
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by $[first, last)$. The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *BidIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate f is invoked.

Returns

The *stable_partition* algorithm returns an iterator i such that for every iterator j in the range $[first, i)$, $f(*j) \neq false$ $INVOKE(f, INVOKE(proj, *j)) \neq false$, and for every iterator k in the range $[i, last)$, $f(*k) == false$ $INVOKE(f, INVOKE(proj, *k)) == false$.

The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel_task_policy* the algorithm returns a future<> referring to this iterator.

```
template<typename BidirIter, typename Sent, typename Pred, typename Proj = hpx::identity>
subrange_t<BidirIter> hpx::ranges::stable_partition(BidirIter first, Sent last, Pred &&pred, Proj &&proj =
    Proj())
```

Permutates the elements in the range [first, last) such that there exists an iterator *i* such that for every iterator *j* in the range [first, *i*) INVOKE(*f*, INVOKE (*proj*, **j*)) != false, and for every iterator *k* in the range [*i*, last), INVOKE(*f*, INVOKE (*proj*, **k*)) == false

The invocations of *f* in the parallel *stable_partition* algorithm invoked without an execution policy object executes in sequential order in the calling thread.

Note

Complexity: At most (last - first) * log(last - first) swaps, but only linear number of swaps if there is enough extra memory Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for BidirIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *stable_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range $[first, i)$, $f(*j) \neq false$ INVOKE(*f*, INVOKE(*proj*, **j*)) $\neq false$, and for every iterator *k* in the range $[i, last)$, $f(*k) == false$ INVOKE(*f*, INVOKE (*proj*, **k*)) $== false$. The relative order of the elements in both groups is preserved.

```
template<typename ExPolicy, typename BidirIter, typename Sent, typename Pred, typename Proj =
    hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<BidirIter>>::type hpx::ranges::stable_partition(ExPolicy
    &&pol-
    icy,
    BidirIter
    first,
    Sent
    last,
    Pred
    &&pred,
    Proj
    &&proj
    =
    Proj())
```

Permutes the elements in the range $[first, last)$ such that there exists an iterator *i* such that for every iterator *j* in the range $[first, i)$ INVOKE(*f*, INVOKE (*proj*, **j*)) $\neq false$, and for every iterator *k* in the range $[i, last)$, INVOKE(*f*, INVOKE (*proj*, **k*)) $== false$

The invocations of *f* in the parallel *stable_partition* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The invocations of *f* in the parallel *stable_partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $(last - first) * \log(last - first)$ swaps, but only linear number of swaps if there is enough extra memory Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *BidirIter*.

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *stable_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range [first, *i*), *f*(*j) != false INVOKE(*f*, INVOKE(*proj*, *j)) != false, and for every iterator *k* in the range [*i*, last), *f*(*k) == false INVOKE(*f*, INVOKE(*proj*, *k)) == false. The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel_task_policy* the algorithm returns a *future<>* referring to this iterator.

hpx::ranges::partition_copy

Defined in header [hpx/algorithm.hpp](#)⁷⁵⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- [hpx::ranges::partition](#)
- [hpx::ranges::stable_partition](#)

```
template<typename Rng, typename OutIter2, typename OutIter3, typename Pred, typename Proj =  
hpx::identity>
```

⁷⁵⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
partition_copy_result<std::ranges::iterator_t<Rng>, OutIter2, OutIter3> hpx::ranges::partition_copy(Rng
&&rng,
OutIter2
dest_true,
OutIter3
dest_false,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Copies the elements in the range *rng*, to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs not more than N assignments, exactly N applications of the predicate *pred*, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*

- **dest_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

`bool pred(const Type &a);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns a `partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>>`. The *partition_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

```
template<typename ExPolicy, typename Rng, typename FwdIter2, typename FwdIter3, typename Pred,  
typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, partition_copy_result<std::ranges::iterator_t<RngFwdIter2, FwdIter3>>>::type hpx::rang
```

Copies the elements in the range *rng*, to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than N assignments, exactly N applications of the predicate *pred*, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns a `hpx::future<partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>>` if the execution policy is of type *parallel_task_policy* and returns `partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>` otherwise. The *partition_copy* algorithm returns the tuple of the

source iterator *last*, the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

```
template<typename InIter, typename Sent, typename OutIter2, typename OutIter3, typename Pred, typename Proj = hpx::identity>
```

```
partition_copy_result<InIter, OutIter2, OutIter3> hpx::ranges::partition_copy(InIter first, Sent last, OutIter2  
dest_true, OutIter3 dest_false,  
Pred &&pred, Proj &&proj =  
Proj())
```

Copies the elements in the range, defined by [first, last), to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*

- **dest_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns a *partition_copy_result*<*FwdIter*, *OutIter2*, *OutIter3*>. The *partition_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename OutIter2, typename OutIter3,  
typename Pred, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, partition_copy_result<FwdIter, OutIter2, OutIter3>>::type hpx::ranges::partition_co
```

Copies the elements in the range, defined by [first, last), to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns a `hpx::future<partition_copy_result<FwdIter, OutIter2, OutIter3>>` if the execution policy is of type *parallel_task_policy* and returns `partition_copy_result<FwdIter, OutIter2, OutIter3>` otherwise. The *partition_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

hpx::ranges::fill

Defined in header `hpx/algorithm.hpp`⁷⁵⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fill_n`

```
template<typename ExPolicy, typename Rng, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::fill(E
```

```
&
ic
R
&
T
c
&
```

Assigns the given value to the elements in the range [first, last).

The comparisons in the *parallel_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the *parallel_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

⁷⁵⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill* algorithm returns a `hpx::future<void>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *void*).

```
template<typename ExPolicy, typename Iter, typename Sent, typename T = typename  
std::iterator_traits<Iter>::value_type>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, Iter>::type hpx::ranges::fill(ExPolicy &&policy, Iter  
first, Sent last, T const  
&value)
```

Assigns the given value to the elements in the range [first, last).

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *void*).

```
template<typename Rng, typename T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::fill(Rng &&rng, T const &value)
```

Assigns the given value to the elements in the range [first, last).

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill* algorithm returns *void*.

```
template<typename Iter, typename Sent, typename T = typename std::iterator_traits<Iter>::value_type>
```

```
Iter hpx::ranges::fill(Iter first, Sent last, T const &value)
```

Assigns the given value to the elements in the range [first, last).

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill* algorithm returns *void*.

hpx::ranges::fill_n

Defined in header [hpx/algorithm.hpp](#)⁷⁵⁹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::fill](#)

```
template<typename ExPolicy, typename Rng, typename T = typename  
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::fill_n(ExPolicy  
                                                         &&pol-  
                                                         icy,  
                                                         Rng  
                                                         &&rng,  
                                                         T  
                                                         const  
                                                         &value)
```

Assigns the given value value to the first count elements in the range beginning at first if count > 0. Does nothing otherwise.

The comparisons in the *parallel_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the *parallel_fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

⁷⁵⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *void*).

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::fill_n(ExPolicy &&policy,
FwdIter first, Size
count, T const
&value)
```

Assigns the given value *value* to the first *count* elements in the range beginning at *first* if *count* > 0. Does nothing otherwise.

The comparisons in the parallel *fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* assignments, for *count* > 0.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

- **value** – The value to be assigned.

Returns

The *fill_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *void*).

```
template<typename Rng, typename T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::fill_n(Rng &&rng, T const &value)
```

Assigns the given value *value* to the first *count* elements in the range beginning at *first* if *count* > 0. Does nothing otherwise.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill_n* algorithm returns an output iterator that compares equal to last.

```
template<typename FwdIter, typename Size, typename T = typename std::iterator_traits<FwdIter>::value_type>
```

```
FwdIter hpx::ranges::fill_n(Iterator first, Size count, T const &value)
```

Assigns the given value *value* to the first *count* elements in the range beginning at *first* if *count* > 0. Does nothing otherwise.

Note

Complexity: Performs exactly *count* assignments, for *count* > 0.

Template Parameters

- **Iterator** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill_n* algorithm returns an output iterator that compares equal to last.

hpx::ranges::ends_with

Defined in header `hpx/algorithm.hpp`⁷⁶⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred =
ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::ends_with(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

⁷⁶⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

Returns

The *ends_with* algorithm returns *bool*. The *ends_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ranges::ends_with(ExPolicy &&policy,
                                                                                      FwdIter1 first1, Sent1
                                                                                      last1, FwdIter2 first2,
                                                                                      Sent2 last2, Pred
                                                                                      &&pred = Pred(), Proj1
                                                                                      &&proj1 = Proj1(),
                                                                                      Proj2 &&proj2 =
                                                                                      Proj2())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *ends_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *ends_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
bool hpx::ranges::ends_with(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(),
                             Proj2 &&proj2 = Proj2())
```

Checks whether the second range *rng2* matches the suffix of the first range *rng1*.

The assignments in the parallel *ends_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear: at most $\min(N1, N2)$ applications of the predicate and both projections.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The `ends_with` algorithm returns `bool`. The `ends_with` algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ranges::ends_with(ExPolicy &&policy,
                                                                 Rng1 &&rng1,
                                                                 Rng2 &&rng2, Pred
                                                                 &&pred = Pred(),
                                                                 Proj1 &&proj1 =
                                                                 Proj1(), Proj2
                                                                 &&proj2 = Proj2())
```

Checks whether the second range `rng2` matches the suffix of the first range `rng1`.

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear: at most $\min(N1, N2)$ applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *ends_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *ends_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

hpx::ranges::swap_ranges

Defined in header `hpx/algorithm.hpp`⁷⁶¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename Sent1, typename InIter2, typename Sent2>
```

```
swap_ranges_result<InIter1, InIter2> hpx::ranges::swap_ranges(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2)
```

Exchanges elements between range `[first1, last1)` and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **InIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns

The *swap_ranges* algorithm returns *swap_ranges_result<InIter1, InIter2>*. The *swap_ranges* algorithm returns *in_in_result* with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

⁷⁶¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

`parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<FwdIter1, FwdIter2>>::type hpx::ranges::swap_ranges(ExPolicy &&policy, FwdIter1 first1, Sent1 last1, FwdIter2 first2, Sent2 last2)`

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between `first1` and `last1`

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for `FwdIter1`.
- **FwdIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for `FwdIter2`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns

The `swap_ranges` algorithm returns a `hpx::future<swap_ranges_result<FwdIter1, FwdIter2>>` if the execution policy is of type `parallel_task_policy` and returns `FwdIter2` otherwise. The `swap_ranges` algorithm returns in `in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

```
template<typename Rng1, typename Rng2>
```

```
swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>> hpx::ranges::swap_ranges(Rng1  
                                                                                                     &&rng1,  
                                                                                                     Rng2  
                                                                                                     &&rng2)
```

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between `first1` and `last1`

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns

The `swap_ranges` algorithm returns `swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>`. The `swap_ranges` algorithm returns in `in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
```

`parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>>> hpx::r`

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between `first1` and `last1`

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns

The `swap_ranges` algorithm returns a `hpx::future<swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>>` if the execution policy is of type `parallel_task_policy` and returns `swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>` otherwise. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

hpx::ranges::make_heap

Defined in header `hpx/algorithm.hpp`⁷⁶².

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::make_heap(ExPolicy &&policy, Iter  
first, Sent last, Comp  
&&comp, Proj &&proj  
= Proj{})
```

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most (3*N) comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

⁷⁶² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::make_heap(ExPolicy
                                                                                                     &&pol-
                                                                                                     icy,
                                                                                                     Rng
                                                                                                     &&rng,
                                                                                                     Comp
                                                                                                     &&comp,
                                                                                                     Proj
                                                                                                     &&proj
                                                                                                     =
                                                                                                     Proj{ })
```

Constructs a *max heap* in the range `[first, last)`.

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(3*N)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::make_heap(ExPolicy &&policy, Iter  
first, Sent last, Proj  
&&proj = Proj{ })
```

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(3*N)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter1`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns a `hpx::future<Iter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::make_heap(ExPolicy
&&pol-
icy,
Rng
&&rng,
Proj
&&proj
=
Proj{})
```

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

template<typename **Iter**, typename **Sent**, typename **Comp**, typename **Proj** = *hpx::identity*>

Iter *hpx::ranges::make_heap*(*Iter* first, *Sent* last, *Comp* &&comp, *Proj* &&proj = *Proj*{})

Constructs a *max heap* in the range [first, last).

Note

Complexity: at most (3*N) comparisons where *N* = distance(first, last).

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns *Iter*. It returns *last*.

```
template<typename Rng, typename Comp, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::make_heap(Rng &&rng, Comp &&comp, Proj &&proj = Proj{ })
```

Constructs a *max heap* in the range [first, last).

Note

Complexity: at most $(3*N)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns *Iter*. It returns *last*.

```
template<typename Iter, typename Sent, typename Proj = hpx::identity>
```

```
Iter hpx::ranges::make_heap(Iter first, Sent last, Proj &&proj = Proj{ })
```

Constructs a *max heap* in the range [first, last).

Note

Complexity: at most $(3*N)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns *Iter*. It returns *last*.

```
template<typename Rng, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::make_heap(Rng &&rng, Proj &&proj = Proj{})
```

Constructs a *max heap* in the range [first, last).

Note

Complexity: at most $(3*N)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *make_heap* algorithm returns *Iter*. It returns *last*.

hpx::ranges::adjacent_find

Defined in header `hpx/algorithm.hpp`⁷⁶³.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter, typename Sent, typename Proj = hpx::identity, typename Pred = detail::equal_to>
```

```
FwdIter hpx::ranges::adjacent_find(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Searches the range [first, last) for two consecutive identical elements.

Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`
- **Pred** – The type of an optional function/function object to use.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Proj = hpx::identity, typename Pred = detail::equal_to>
```

⁷⁶³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::adjacent_find(ExPolicy  
                                                                                      &&policy,  
                                                                                      FwdIter first,  
                                                                                      Sent last, Pred  
                                                                                      &&pred =  
                                                                                      Pred(), Proj  
                                                                                      &&proj =  
                                                                                      Proj())
```

Searches the range [*first*, *last*) for two consecutive identical elements. This version uses the given binary predicate *pred*

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *adjacent_find* algorithm returns a `hpx::future<InIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *InIter* otherwise. The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename Rng, typename Proj = hpx::identity, typename Pred = detail::equal_to>
```

```
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::adjacent_find(Rng &&rng, Pred &&pred =  
Pred(), Proj &&proj = Proj())
```

Searches the range *rng* for two consecutive identical elements.

Note

Complexity: Exactly the smaller of $(\text{result} - \text{std::begin}(\text{rng})) + 1$ and $(\text{std::begin}(\text{rng}) - \text{std::end}(\text{rng}) - 1)$ applications of the predicate where *result* is the value returned

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename Pred = detail::equal_to>
```

```
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::adjacent_f
```

Searches the range *rng* for two consecutive identical elements.

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

Note

Complexity: Exactly the smaller of $(\text{result} - \text{std::begin}(\text{rng})) + 1$ and $(\text{std::begin}(\text{rng}) - \text{std::end}(\text{rng})) - 1$ applications of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to*<>

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *adjacent_find* algorithm returns a `hpx::future<InIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *InIter* otherwise. The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

hpx::ranges::inclusive_scan

Defined in header `hpx/algorithm.hpp`⁷⁶⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename Op = std::plus<typename
std::iterator_traits<InIter>::value_type>>
```

```
inclusive_scan_result<InIter, OutIter> hpx::ranges::inclusive_scan(InIter first, Sent last, OutIter dest, Op
&&op)
```

Assigns through each iterator *i* in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *ith* input element in the *ith* sum.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

⁷⁶⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
- GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)
- GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where $1 < K+1 = M \leq N$.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *inclusive_scan* algorithm returns `util::in_out_result<InIter, OutIter>`. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Op =
std::plus<typename std::iterator_traits<FwdIter1>::value_type>>
```

`parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<FwdIter1, FwdIter2>>::type hpx::ranges::inclusive_scan(ExP`
`&&`
`icy,`
`Fwd`
`first`
`Sent`
`last,`
`Fwd`
`dest`
`Op`
`&&`

Assigns through each iterator i in $[result, result + (last - first))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel `inclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `inclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the i th input element in the i th sum.

Note

Complexity: $O(last - first)$ applications of the predicate op .

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- $a1$ when N is 1
- `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK)`
- `GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN)` where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *inclusive_scan* algorithm returns a `hpx::future<util::in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `util::in_out_result<FwdIter1, FwdIter2>` otherwise. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename Op = std::plus<typename  
hpx::traits::range_traits<Rng>::value_type>>  
inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::inclusive_scan(Rng &&rng, O dest, Op  
                                         &&op)
```

Assigns through each iterator *i* in $[result, result + (last - first))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(*op*, **first*, ..., *(*first* + (*i* - *result*))).

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note

Complexity: $O(last - first)$ applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
- GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)
- GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *inclusive_scan* algorithm returns *util::in_out_result<std::ranges::iterator_t<Rng>, O>*. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename Op = std::plus<typename  
hpx::traits::range_traits<Rng>::value_type>>
```

```
parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::inclusive_scan
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result))).

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
- GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK)
- GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *inclusive_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied

```
template<typename InIter, typename Sent, typename OutIter, typename Op, typename T = typename
std::iterator_traits<InIter>::value_type>
```

```
inclusive_scan_result<InIter, OutIter> hpx::ranges::inclusive_scan(InIter first, Sent last, OutIter dest, Op
&&op, T init)
```

Assigns through each iterator *i* in $[result, result + (last - first))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: $O(last - first)$ applications of the predicate *op*.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- *a1* when *N* is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.

- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

`Ret fun(const Type1 &a, const Type1 &b);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *inclusive_scan* algorithm returns `util::in_out_result<InIter, OutIter>`. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **Op**, typename **T** = typename `std::iterator_traits<FwdIter1>`::value_type>

`parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<FwdIter1, FwdIter2>>::type hpx::ranges::inclusive_scan(ExP`
&&
icy,
InIt
first
Sen
last,
Out
Iter
dest
Op
&&
T
init,

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_N) is defined as:

- *a*₁ when *N* is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_K), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*_M, ..., *a*_N)) where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *inclusive_scan* algorithm returns a `hpx::future<util::in_out_result<InIter, OutIter>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `util::in_out_result<InIter, OutIter>` otherwise. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename Op, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::inclusive_scan(Rng &&rng, O dest, Op
&&op, T init)
```

Assigns through each iterator *i* in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$ when N is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *inclusive_scan* algorithm returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>`. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename Op, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::inclusive_scan
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aK*), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *aM*, ..., *aN*)) where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *inclusive_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied

hpx::ranges::reverse

Defined in header [hpx/algorithm.hpp](#)⁷⁶⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::reverse_copy](#)

template<typename **Iter**, typename **Sent**>

Iter [hpx::ranges::reverse](#)(*Iter* first, *Sent* sent)

Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a *Iter*. It returns *last*.

template<typename **Rng**>

[std::ranges::iterator_t<Rng>](#) [hpx::ranges::reverse](#)(*Rng* &&rng)

Uses *rng* as the source range, as if using `util::begin(rng)` as *first* and `ranges::end(rng)` as *last*. Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

⁷⁶⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

Parameters

rng – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a `hpx::traits::range_iterator<Rng>::type`. It returns *last*.

template<typename **ExPolicy**, typename **Iter**, typename **Sent**>

`hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::reverse(ExPolicy &&policy, Iter first, Sent sent)`

Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a `hpx::future<Iter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Rng**>

```
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::reverse(ExPolicy
&&pol-
icy, Rng
&&rng)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Reverses the order of the elements in the range [first, last). Behaves as if applying *std::iter_swap* to every pair of iterators *first+i*, (*last-i*) - 1 for each non-negative *i* < (*last-first*)/2.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `hpx::future<std::ranges::iterator_t<Rng>>` otherwise. It returns *last*.

hpx::ranges::reverse_copy

Defined in header `hpx/algorithm.hpp`⁷⁶⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::reverse`

```
template<typename Iter, typename Sent, typename OutIter>
```

```
reverse_copy_result<Iter, OutIter> hpx::ranges::reverse_copy(Iter first, Sent last, OutIter result)
```

Copies the elements from the range `[first, last)` to another range beginning at `result` in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment `*(result + (last - first) - 1 - i) = *(first + i)` once for each non-negative $i < (last - first)$. If the source and destination ranges (that is, `[first, last)` and `[result, result+(last-first))` respectively) overlap, the behavior is undefined.

The assignments in the parallel `reverse_copy` algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `Iter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The `reverse_copy` algorithm returns a `reverse_copy_result<Iter, OutIter>`. The `reverse_copy` algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

⁷⁶⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename Rng, typename OutIter>
```

```
reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::reverse_copy(Rng &&rng, OutIter  
result)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range $[first, last)$ to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment $*(result + (last - first) - 1 - i) = *(first + i)$ once for each non-negative $i < (last - first)$. If the source and destination ranges (that is, $[first, last)$ and $[result, result + (last - first))$ respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a *ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>*. The *reverse_copy* algorithm returns an object equal to $\{last, result + N\}$ where $N = last - first$

```
template<typename ExPolicy, typename Iter, typename Sent, typename FwdIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, reverse_copy_result<Iter, FwdIter>>::type hpx::ranges::reverse_copy(ExPolicy  
&&pol-  
icy,  
Iter  
first,  
Sent  
last,  
FwdIter  
re-  
sult)
```

Copies the elements from the range $[first, last)$ to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment $*(result + (last - first) - 1 - i) = *(first + i)$ once for each

non-negative $i < (\text{last} - \text{first})$ If the source and destination ranges (that is, $[\text{first}, \text{last})$ and $[\text{result}, \text{result} + (\text{last} - \text{first}))$ respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a `hpx::future<reverse_copy_result<Iter, FwdIter>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *reverse_copy_result<Iter, FwdIter>* otherwise. The *reverse_copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename OutIter>
```

`parallel::util::detail::algorithm_result<ExPolicy, reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>>::type` `hpx::ranges::revers`

Uses *rng* as the source range, as if using `util::begin(rng)` as *first* and `ranges::end(rng)` as *last*. Copies the elements from the range `[first, last)` to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment `*(result + (last - first) - 1 - i) = *(first + i)` once for each non-negative $i < (last - first)$. If the source and destination ranges (that is, `[first, last)` and `[result, result+(last-first))` respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a `hpx::future<ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>` otherwise. The *reverse_copy* algorithm returns an object equal to `{last, result + N}` where $N = last - first$.

hpx::ranges::uninitialized_default_construct

Defined in header `hpx/algorithm.hpp`⁷⁶⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_default_construct_n`

template<typename **FwdIter**, typename **Sent**>

FwdIter `hpx::ranges::uninitialized_default_construct`(*FwdIter* first, *Sent* last)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **FwdIter**.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_default_construct* algorithm returns a *FwdIter*. The *uninitialized_default_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**>

⁷⁶⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> *hpx::ranges::uninitialized_default_construct*(*ExPolicy* &&policy, *FwdIter* first, *Sent* last)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_default_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_default_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename Rng>
```

`hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::uninitialized_default_construct(Rng
&&rng)`

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the range to which will be default constructed.

Returns

The `uninitialized_default_construct` algorithm returns a `returns hpx::traits::range_traits<Rng>::iterator_type`. The `uninitialized_default_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

`template<typename ExPolicy, typename Rng>`

`parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::uninitiali`

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be default constructed

Returns

The *uninitialized_default_construct* algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename hpx::traits::range_traits<Rng>::iterator_type* otherwise. The *uninitialized_default_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

`hpx::ranges::uninitialized_default_construct_n`

Defined in header `hpx/algorithm.hpp`⁷⁶⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_default_construct`

template<typename **FwdIter**, typename **Size**>

FwdIter `hpx::ranges::uninitialized_default_construct_n`(*FwdIter* first, *Size* count)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

⁷⁶⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_default_construct_n* algorithm returns a *FwdIter*. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Size>
```

```
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::uninitialized_default_construct_n(ExPolicy
&&pol-
icy,
FwdIter
first,
Size
count)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Size** – The type of the argument specifying the number of elements to apply f to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_default_construct_n* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::ranges::stable_sort

Defined in header `hpx/algorithm.hpp`⁷⁶⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
RandomIt hpx::ranges::stable_sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range $[first, last)$ in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *stable_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: $O(N \log(N))$, where $N = \text{std::distance}(first, last)$ comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *RandomIt*.

⁷⁶⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to *bool*, yields *true* if the first argument of the call is less than the second, and *false* otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type hpx::ranges::stable_sort(ExPolicy
&&policy,
RandomIt first,
Sent last, Comp
&&comp =
Comp(), Proj
&&proj =
Proj())
```

Sorts the elements in the range *[first, last)* in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i + n* is a valid iterator pointing to an element of the sequence, and *INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false*.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `RandomIt`.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

Returns

The `stable_sort` algorithm returns a `hpx::future<RandomIt>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `RandomIt` otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::stable_sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj
                                                    = Proj())
```

Sorts the elements in the range `[first, last)` in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

`comp` has to induce a strict weak ordering on the values.

The assignments in the parallel `stable_sort` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns *std::ranges::iterator_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::stable_sort(ExPolicy
                                                                                                     &&pol-
                                                                                                     icy,
                                                                                                     Rng
                                                                                                     &&rng,
                                                                                                     Comp
                                                                                                     &&comp
                                                                                                     =
                                                                                                     Comp(),
                                                                                                     Proj
                                                                                                     &&proj
                                                                                                     =
                                                                                                     Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to *bool*, yields *true* if the first argument of the call is less than the second, and *false* otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. It returns *last*.

hpx::ranges::sort

Defined in header `hpx/algorithm.hpp`⁷⁷⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
RandomIt hpx::ranges::sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range `[first, last)` in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

⁷⁷⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: $O(N \log(N))$, where $N = \text{detail::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename  
Proj = hpx::identity>  
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type hpx::ranges::sort(ExPolicy &&policy,  
                                                                                   RandomIt first, Sent last,  
                                                                                   Comp &&comp = Comp(),  
                                                                                   Proj &&proj = Proj())
```

Sorts the elements in the range `[first, last)` in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(N \log(N))$, where $N = \text{detail::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **RandomIt**.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – `comp` is a callable object. The return value of the `INVOKE` operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns a `hpx::future<RandomIt>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp, typename Proj>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$ comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the `INVOKE` operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns *std::ranges::iterator_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::sort(ExPolicy  
                                                    &&policy,  
                                                    Rng &&rng,  
                                                    Comp  
                                                    &&comp =  
                                                    Comp(), Proj  
                                                    &&proj =  
                                                    Proj())
```

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the `INVOKE` operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. It returns *last*.

hpx::ranges::partial_sort_copy

Defined in header `hpx/algorithm.hpp`⁷⁷¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent1, typename RandIter, typename Sent2, typename Comp =
ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
partial_sort_copy_result<InIter, RandIter> hpx::ranges::partial_sort_copy(InIter first, Sent1 last, RandIter
                                                                    r_first, Sent2 r_last, Comp
                                                                    &&comp = Comp(), Proj1
                                                                    &&proj1 = Proj1(), Proj2
                                                                    &&proj2 = Proj2())
```

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r_first, r_last). At most $r_last - r_first$ of the elements are placed sorted to the range [r_first, r_first + n) where n is the number of elements to sort ($n = \min(\text{last} - \text{first}, r_last - r_first)$).

The assignments in the parallel *partial_sort_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: $O(N \log(\min(D, N)))$, where $N = \text{std::distance}(\text{first}, \text{last})$ and $D = \text{std::distance}(r_first, r_last)$ comparisons.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **RandIter** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent2** – The type of the destination sentinel (deduced). This sentinel type must be a sentinel for RandIter.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

⁷⁷¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to the sentinel value denoting the end of the sequence of elements the algorithm will be applied to.
- **r_first** – Refers to the beginning of the destination range.
- **r_last** – Refers to the sentinel denoting the end of the destination range.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate `comp` is invoked.

Returns

The `partial_sort_copy` algorithm returns a `partial_sort_copy_result<InIter, RandIter>`. The algorithm returns `{last, result_first + N}`.

```
template<typename ExPolicy, typename FwdIter, typename Sent1, typename RandIter, typename Sent2,
typename Comp = ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, partial_sort_copy_result<FwdIter, RandIter>> hpx::ranges::partial_sort_copy(Ex
```

Sorts some of the elements in the range `[first, last)` in ascending order, storing the result in the range `[r_first, r_last)`. At most `r_last - r_first` of the elements are placed sorted to the range `[r_first, r_first + n)` where `n` is the number of elements to sort (`n = min(last - first, r_last - r_first)`).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(N \log(\min(D, N)))$, where $N = \text{std::distance}(\text{first}, \text{last})$ and $D = \text{std::distance}(\text{r_first}, \text{r_last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **RandIter** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent2** – The type of the destination sentinel (deduced). This sentinel type must be a sentinel for RandIter.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the sentinel value denoting the end of the sequence of elements the algorithm will be applied to.
- **r_first** – Refers to the beginning of the destination range.
- **r_last** – Refers to the sentinel denoting the end of the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.

- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate *comp* is invoked.

Returns

The *partial_sort_copy* algorithm returns a `hpx::future<partial_sort_copy_result<FwdIter, RandIter>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *partial_sort_copy_result<FwdIter, RandIter>* otherwise. The algorithm returns {last, result_first + N}.

```
template<typename Rng1, typename Rng2, typename Comp = ranges::less, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
```

```
partial_sort_copy_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>> hpx::ranges::partial_sort_copy(Rng1
&&rng1,
Rng2
&&rng2,
Comp
&&comp
=
Comp(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r_first, r_last). At most r_last - r_first of the elements are placed sorted to the range [r_first, r_first + n) where n is the number of elements to sort (n = min(last - first, r_last - r_first)).

The assignments in the parallel *partial_sort_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: $O(N \log(\min(D, N)))$, where $N = \text{std::distance}(\text{first}, \text{last})$ and $D = \text{std::distance}(\text{r_first}, \text{r_last})$ comparisons.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of a random iterator.

- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate *comp* is invoked.

Returns

The *partial_sort_copy* algorithm returns *partial_sort_copy_result*<*range_iterator_t*<*Rng1*>, *range_iterator_t*<*Rng2*>>. The algorithm returns {last, result_first + N}.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Comp = ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, partial_sort_copy_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>>> h
```

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r_first, r_last). At most r_last - r_first of the elements are placed sorted to the range [r_first, r_first + n) where n is the number of elements to sort (n = min(last - first, r_last - r_first)).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(N \log(\min(D, N)))$, where $N = \text{std::distance}(\text{first}, \text{last})$ and $D = \text{std::distance}(\text{r_first}, \text{r_last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of a random iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate *comp* is invoked.

Returns

The *partial_sort_copy* algorithm returns a `hpx::future<partial_sort_copy_result<range_iterator_t<Rng1>, range_iterator_t<Rng2>>>` if the execution policy

is of type *sequenced_task_policy* or *parallel_task_policy* and returns *partial_sort_copy_result*<*range_iterator_t*<*Rng1*>, *range_iterator_t*<*Rng2*>> otherwise. The algorithm returns {last, result_first + N}.

hpx::ranges::adjacent_difference

Defined in header `hpx/algorithm.hpp`⁷⁷².

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **FwdIter1**, typename **FwdIter2**, typename **Sent**>

FwdIter2 **hpx::ranges::adjacent_difference**(*FwdIter1* first, *Sent* last, *FwdIter2* dest)

Searches the range [first, last) for two consecutive identical elements.

Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

template<typename **Rng**, typename **FwdIter2**>

FwdIter2 **hpx::ranges::adjacent_difference**(*Rng* &&rng, *FwdIter2* dest)

Searches the *rng* for two consecutive identical elements.

⁷⁷² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Exactly the smaller of $(\text{result} - \text{first}) + 1$ and $(\text{last} - \text{first}) - 1$ application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               FwdIter1
                                                                                               first,
                                                                                               Sent
                                                                                               last,
                                                                                               FwdIter2
                                                                                               dest)
```

Searches the range [first, last) for two consecutive identical elements.

Note

Complexity: Exactly the smaller of $(\text{result} - \text{first}) + 1$ and $(\text{last} - \text{first}) - 1$ application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter2**>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy  
                                                                 &&pol-  
                                                                 icy,  
                                                                 Rng  
                                                                 &&rng,  
                                                                 FwdIter2  
                                                                 dest)
```

Searches the *rng* for two consecutive identical elements.

Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename FwdIter1, typename Sent, typename FwdIter2, typename Op>
```

```
FwdIter2 hpx::ranges::adjacent_difference(FwdIter1 first, Sent last, FwdIter2 dest, Op &&op)
```

Searches the range [first, last) for two consecutive identical elements.

Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &. The types *Type1* and *Type2* must be such that an object of type *iterator_traits<InputIt>::value_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename Rng, typename FwdIter2, typename Op>
```

FwdIter2 `hpx::ranges::adjacent_difference(Rng &&rng, FwdIter2 dest, Op &&op)`

Searches the *rng* for two consecutive identical elements.

Template Parameters

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type `iterator_traits<InputIt>::value_type` can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

`template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Op>`

`hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy
&&pol-
icy,
FwdIter1
first,
Sent
last,
FwdIter2
dest,
Op
&&op)`

Searches the range [first, last) for two consecutive identical elements.

Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type *iterator_traits<InputIt>::value_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename Rng, typename FwdIter2, typename Op>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               Rng
                                                                                               &&rng,
                                                                                               FwdIter2
                                                                                               dest,
                                                                                               Op
                                                                                               &&op)
```

Searches the *rng* for two consecutive identical elements.

Note

Complexity: Exactly the smaller of $(\text{result} - \text{first}) + 1$ and $(\text{last} - \text{first}) - 1$ application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type *iterator_traits<InputIt>::value_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

hpx::ranges::lexicographical_compare

Defined in header `hpx/algorithm.hpp`⁷⁷³.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename Sent1, typename InIter2, typename Sent2, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity, typename Pred = hpx::parallel::detail::less>
bool hpx::ranges::lexicographical_compare(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2, Pred
&&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 =
Proj2())
```

⁷⁷³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Checks if the first range [first1, last1) is lexicographically less than the second range [first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: At most $2 * \min(N1, N2)$ applications of the comparison operation, where $N1 = \text{std::distance}(\text{first1}, \text{last})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

Template Parameters

- **InIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for FwdIter1. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for FwdIter2. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *lexicographically_compare* algorithm returns *bool*. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity, typename Pred = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::lexicographical_compare(ExPolicy
&&pol-
icy,
FwdIter1
first1,
Sent1
last1,
FwdIter2
first2,
Sent2
last2,
Pred
&&pred
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Checks if the first range [first1, last1) is lexicographically less than the second range

[first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 * \min(N1, N2)$ applications of the comparison operation, where $N1 = \text{std::distance}(\text{first1}, \text{last})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

- **Proj1** – The type of an optional projection function for `FwdIter1`. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for `FwdIter2`. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *lexicographically_compare* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```
template<typename Rng1, typename Rng2, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity,  
        typename Pred = hpx::parallel::detail::less>
```

```
bool hpx::ranges::lexicographical_compare(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1  
                                         &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks if the first range `rng1` is lexicographically less than the second range `rng2`. uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: At most $2 * \min(N1, N2)$ applications of the comparison operation, where $N1 = \text{std::distance}(\text{std::begin}(\text{rng1}), \text{std::end}(\text{rng1}))$ and $N2 = \text{std::distance}(\text{std::begin}(\text{rng2}), \text{std::end}(\text{rng2}))$.

Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for elements of the second range. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *lexicographically_compare* algorithm returns *bool*. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```

template<typename ExPolicy, typename Rng1, typename Rng2, typename Proj1 = hpx::identity, typename Proj2
= hpx::identity, typename Pred = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::lexicographical_compare(ExPolicy
&&pol-
icy,
Rng1
&&rng1,
Rng2
&&rng2,
Pred
&&pred
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())

```

Checks if the first range *rng1* is lexicographically less than the second range *rng2*. uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 * \min(N1, N2)$ applications of the comparison operation, where $N1 = \text{std::distance}(\text{std::begin}(\text{rng1}), \text{std::end}(\text{rng1}))$ and $N2 = \text{std::distance}(\text{std::begin}(\text{rng2}), \text{std::end}(\text{rng2}))$.

Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other

- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for elements of the second range. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *lexicographically_compare* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

hpx::ranges::mismatch

Defined in header `hpx/algorithm.hpp`⁷⁷⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = equal_to, typename **Proj1** = *hpx::identity*, typename **Proj2** = *hpx::identity*>

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, mismatch_result<Iter1, Iter2>>::type hpx::ranges::mismatch(ExPolicy
&&pol-
icy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Returns true if the range [first1, last1) is mismatch to the range [first2, last2), and false otherwise.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the predicate *f*.
If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$ then no applications of the predicate *f* are made.

⁷⁷⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

The two ranges are considered mismatch if, for every iterator *i* in the range `[first1,last1)`, **i* mismatches `*(first2 + (i - first1))`. This overload of `mismatch` uses `operator==` to determine if two elements are mismatch.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *mismatch* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *mismatch* algorithm returns true if the elements in the two ranges are mismatch, otherwise it returns false. If the length of the range [first1, last1) does not mismatch the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 =  
hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, mismatch_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>
```

Returns `std::pair` with iterators to the first two non-equivalent elements.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most *last1 - first1* applications of the predicate *f*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::pair<FwdIter1, FwdIter2>` otherwise. The *mismatch* algorithm returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2, last2).

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred = equal_to,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
mismatch_result<Iter1, Iter2> hpx::ranges::mismatch(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred
&&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Returns true if the range `[first1, last1)` is mismatch to the range `[first2, last2)`, and false otherwise.

Note

Complexity: At most $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the predicate f . If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$ then no applications of the predicate f are made.

Note

The two ranges are considered mismatch if, for every iterator i in the range `[first1, last1)`, $*i$ mismatches $*(\text{first2} + (i - \text{first1}))$. This overload of *mismatch* uses `operator==` to determine if two elements are mismatch.

Template Parameters

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *mismatch* algorithm returns *bool*. The *mismatch* algorithm returns true if the elements in the two ranges are mismatch, otherwise it returns false. If the length of the range `[first1, last1)` does not mismatch the length of the range `[first2, last2)`, it returns false.

```
template<typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
mismatch_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type> hpx::r
```

Returns `std::pair` with iterators to the first two non-equivalent elements.

Note

Complexity: At most *last1 - first1* applications of the predicate *f*.

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *mismatch* algorithm returns `std::pair<FwdIter1, FwdIter2>`. The *mismatch* algorithm returns the first mismatching pair of elements from two ranges: one defined by `[first1, last1)` and another defined by `[first2, last2)`.

hpx::ranges::min_element

Defined in header `hpx/algorithm.hpp`⁷⁷⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::max_element`
- `hpx::ranges::minmax_element`

```
template<typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
FwdIter hpx::ranges::min_element(FwdIter first, Sent last, F &&f = F(), Proj &&proj = Proj())
```

Finds the smallest element in the range `[first, last)` using the given comparison function *f*.

⁷⁷⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The comparisons in the parallel *min_element* algorithm execute in sequential order in the calling thread.

Note

Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *min_element* algorithm returns *FwdIter*. The *min_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::min_element(Rng &&rng, F &&f = F(), Proj &&proj = Proj())
```

Finds the smallest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *min_element* algorithm execute in sequential order in the calling thread.

Note

Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *min_element* algorithm returns a *hpx::traits::range_iterator<Rng>::type* otherwise. The *min_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less,  
typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::min_element(ExPolicy  
                                                    &&policy,  
                                                    FwdIter first,  
                                                    Sent last, F &&f  
                                                    = F(), Proj  
                                                    &&proj = Proj())
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *min_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *min_element* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *min_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::min_element(ExPolicy
&&pol-
icy,
Rng
&&rng,
F
&&f
=
F(),
Proj
&&proj
=
Proj())

```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *min_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *min_element* algorithm returns a `hpx::future<hpx::traits::range_iterator<Rng>::type>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *min_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

hpx::ranges::max_element

Defined in header `hpx/algorithm.hpp`⁷⁷⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::min_element`
- `hpx::ranges::minmax_element`

```
template<typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
FwdIter hpx::ranges::max_element(FwdIter first, Sent last, F &&f = F(), Proj &&proj = Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max_element* algorithm execute in sequential order in the calling thread.

Note

Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

⁷⁷⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *max_element* algorithm returns a *FwdIter*. The *max_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::max_element(Rng &&rng, F &&f = F(), Proj &&proj = Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max_element* algorithm execute in sequential order in the calling thread.

Note

Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – The binary predicate which returns true if the *This* argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *max_element* algorithm returns a `hpx::traits::range_iterator<Rng>::type` otherwise. The *max_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less,  
typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::max_element(ExPolicy  
                                                    &&policy,  
                                                    FwdIter first,  
                                                    Sent last, F &&f  
                                                    = F(), Proj  
                                                    &&proj = Proj())
```

Finds the greatest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to *std::less*. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *max_element* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *max_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename Rng, typename F = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::max_element(ExPolicy  
                                                         &&pol-  
                                                         icy,  
                                                         Rng  
                                                         &&rng,  
                                                         F  
                                                         &&f  
                                                         =  
                                                         F(),  
                                                         Proj  
                                                         &&proj  
                                                         =  
                                                         Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to *std::less*. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *max_element* algorithm returns a *hpx::future<hpx::traits::range_iterator<Rng>::type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *max_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

hpx::ranges::minmax_element

Defined in header `hpx/algorithm.hpp`⁷⁷⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::min_element`
- `hpx::ranges::max_element`

```
template<typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
minmax_element_result<FwdIter> hpx::ranges::minmax_element(FwdIter first, Sent last, F &&f = F(), Proj  
                    &&proj = Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The assignments in the parallel *minmax_element* algorithm execute in sequential order in the calling thread.

Note

Complexity: At most $\max(\text{floor}(3/2 * (N-1)), 0)$ applications of the predicate, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

⁷⁷⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *minmax_element* algorithm returns a *minmax_element_result*<*FwdIter*, *FwdIter*>. The *minmax_element* algorithm returns a *min_max_result* consisting of an iterator to the smallest element as the min element and an iterator to the greatest element as the max element. Returns *minmax_element_result*{first, first} if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
minmax_element_result<std::ranges::iterator_t<Rng>> hpx::ranges::minmax_element(Rng &&rng, F &&f =
                                                    F(), Proj &&proj =
                                                    Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The assignments in the parallel *minmax_element* algorithm execute in sequential order in the calling thread.

Note

Complexity: At most $\max(\text{floor}(3/2 * (N-1)), 0)$ applications of the predicate, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *minmax_element* algorithm returns a *minmax_element_result*<*hpx::traits::range_iterator*<*Rng*>::type, *hpx::traits::range_iterator*<*Rng*>::type>. The *minmax_element* algorithm returns a *min_max_result* consisting of an range iterator to the smallest element as the min element and an range iterator to the greatest element as the max element. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less,
        typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, minmax_element_result<FwdIter>> hpx::ranges::minmax_element(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
last,
F
&&f
=
F(),
Proj
&&proj
=
Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $\max(\text{floor}(3/2 * (N-1)), 0)$ applications of the predicate, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *minmax_element* algorithm returns a *minmax_element_result*<*FwdIter*, *FwdIter*>. The *minmax_element* algorithm returns a *min_max_result* consisting of an iterator to the smallest element as the min element and an iterator to the greatest element as the max element. Returns *minmax_element_result*{*first*, *first*} if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename ExPolicy, typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, minmax_element_result<std::ranges::iterator_t<Rng>>> hpx::ranges::minmax_e
```

Finds the greatest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $\max(\text{floor}(3/2 * (N-1)), 0)$ applications of the predicate, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *minmax_element* algorithm returns a *minmax_element_result*`<hpx::traits::range_iterator<Rng>::type, hpx::traits::range_iterator<Rng>::type>`. The *minmax_element* algorithm returns a *min_max_result* consisting of an range iterator to the smallest element as the min element and an range iterator to the greatest element as the max element. If several

elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

hpx::ranges::uninitialized_value_construct

Defined in header [hpx/algorithm.hpp](#)⁷⁷⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::uninitialized_value_construct_n](#)

template<typename **FwdIter**, typename **Sent**>

FwdIter **hpx::ranges::uninitialized_value_construct**(*FwdIter* first, *Sent* last)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **FwdIter**.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_value_construct* algorithm returns a returns *FwdIter*. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**>

⁷⁷⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> *hpx::ranges::uninitialized_value_construct*(*ExPolicy* &&policy, *FwdIter* first, *Sent* last)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_value_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **Rng**>

`hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::uninitialized_value_construct(Rng &&rng)`

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the range to which will be value constructed.

Returns

The *uninitialized_value_construct* algorithm returns a `hpx::traits::range_traits<Rng>::iterator_type`. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **Rng**>

`parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::uninitiali`

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be value constructed

Returns

The `uninitialized_value_construct` algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `typename hpx::traits::range_traits<Rng>::iterator_type` otherwise. The `uninitialized_value_construct` algorithm returns the output iterator to the element in the range, one past the last element constructed.

`hpx::ranges::uninitialized_value_construct_n`

Defined in header `hpx/algorithm.hpp`⁷⁷⁹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_value_construct`

template<typename **FwdIter**, typename **Size**>

FwdIter `hpx::ranges::uninitialized_value_construct_n`(*FwdIter* first, *Size* count)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct_n` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

⁷⁷⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_value_construct_n* algorithm returns a *FwdIter*. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Size>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_value_construct_n(ExPolicy
&&pol-
icy,
FwdIter
first,
Size
count)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_value_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::ranges::set_union

Defined in header [hpx/algorithm.hpp](#)⁷⁸⁰.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename  
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =  
hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<Iter1, Iter2, Iter3>>::type hpx::ranges::set_union(ExPolicy  
    &&pol-  
    icy,  
    Iter1  
    first1,  
    Sent1  
    last1,  
    Iter2  
    first2,  
    Sent2  
    last2,  
    Iter3  
    dest,  
    Pred  
    &&op  
    =  
    Pred(),  
    Proj1  
    &&proj1  
    =  
    Proj1(),  
    Proj2  
    &&proj2  
    =  
    Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or

⁷⁸⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

both sorted ranges `[first1, last1)` and `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in `[first1, last1)` and *n* times in `[first2, last2)`, then all *m* elements will be copied from `[first1, last1)` to *dest*, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from `[first2, last2)` to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

`bool pred(const Type1 &a, const Type1 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_union* algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =  
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

`hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3>>`

Constructs a sorted range beginning at `dest` consisting of all elements present in one or both sorted ranges `[first1, last1)` and `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

If some element is found m times in `[first1, last1)` and n times in `[first2, last2)`, then all m elements will be copied from `[first1, last1)` to `dest`, preserving order, and then exactly $\text{std::max}(n-m, 0)$ elements will be copied from `[first2, last2)` to `dest`, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_union* algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```

set_union_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::set_union(Rng1
&&rng1,
Rng2
&&rng2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())

```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, then all *m* elements will be copied from *[first1, last1)* to *dest*, preserving order, and then exactly $\text{std::max}(n-m, 0)$ elements will be copied from *[first2, last2)* to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The `set_union` algorithm returns `ranges::set_union_result<Iter1, Iter2, Iter3>`. where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>` The `set_union` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

`hpx::ranges::merge`

Defined in header `hpx/algorithm.hpp`⁷⁸¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::inplace_merge`

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Comp =  
hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

⁷⁸¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

hpx::parallel::util::detail::algorithm_result<ExPolicy, hpx::ranges::merge_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$ applications of the comparison *comp* and the each projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.

- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first range of elements the algorithm will be applied to.
- **rng2** – Refers to the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

Returns

The *merge* algorithm returns a `hpx::future<merge_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `merge_result<Iter1, Iter2, Iter3>` otherwise. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,  
typename Comp = hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

hpx::parallel::util::detail::algorithm_result<ExPolicy, hpx::ranges::merge_result<Iter1, Iter2, Iter3>>::type *hpx::ranges::merge*(*ExPolicy*,
*&&pol-
 icy,
 Iter1
 first1,
 Sent1
 last1,
 Iter2
 first2,
 Sent2
 last2,
 Iter3
 dest,
 Comp
 &&comp
 =
 Comp(),
 Proj1
 &&proj1
 =
 Proj1(),
 Proj2
 &&proj2
 =
 Proj2()*

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$ applications of the comparison *comp* and the each projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an random access iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for *Iter2*.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

Returns

The *merge* algorithm returns a `hpx::future<merge_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *merge_result<Iter1, Iter2, Iter3>* otherwise. The *merge* algorithm returns the tuple of

the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Comp = hpx::ranges::less, typename Proj1 =  
hpx::identity, typename Proj2 = hpx::identity>  
hpx::ranges::merge_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::merge(Rng1  
                                                                &&rng1,  
                                                                Rng2  
                                                                &&rng2,  
                                                                Iter3  
                                                                dest,  
                                                                Comp  
                                                                &&comp  
                                                                =  
                                                                Comp(),  
                                                                Proj1  
                                                                &&proj1  
                                                                =  
                                                                Proj1(),  
                                                                Proj2  
                                                                &&proj2  
                                                                =  
                                                                Proj2())
```

Merges two sorted ranges [*first1*, *last1*) and [*first2*, *last2*) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

Note

Complexity: Performs $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$ applications of the comparison *comp* and the each projection.

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to *std::less*<>
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first range of elements the algorithm will be applied to.
- **rng2** – Refers to the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

Returns

The *merge* algorithm returns *merge_result<Iter1, Iter2, Iter3>*. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Comp
= hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::ranges::merge_result<Iter1, Iter2, Iter3> hpx::ranges::merge(Iter1 first1, Sent1 last1, Iter2 first2, Sent2
last2, Iter3 dest, Comp &&comp = Comp(),
Proj1 &&proj1 = Proj1(), Proj2 &&proj2 =
Proj2())
```

Merges two sorted ranges `[first1, last1)` and `[first2, last2)` into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

Note

Complexity: Performs $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$ applications of the comparison *comp* and the each projection.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a random access iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter1*.

- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

Returns

The *merge* algorithm returns *merge_result<Iter1, Iter2, Iter3>*. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

hpx::ranges::inplace_merge

Defined in header [hpx/algorithm.hpp](#)⁷⁸².

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::merge](#)

```
template<typename ExPolicy, typename Rng, typename Iter, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm\_result\_t<ExPolicy, Iter> hpx::ranges::inplace\_merge(ExPolicy  
                                                    &&policy, Rng  
                                                    &&rng, Iter  
                                                    middle, Comp  
                                                    &&comp =  
                                                    Comp\(\), Proj  
                                                    &&proj = Proj\(\))
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

The assignments in the parallel *inplace_merge* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *inplace_merge* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs $O(\text{std::distance}(\text{first}, \text{last}))$ applications of the comparison *comp* and the each projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

⁷⁸² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range of elements the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *inplace_merge* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. The *inplace_merge* algorithm returns the source iterator *last*

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::inplace_merge(ExPolicy
&&policy, Iter
first, Iter middle,
Sent last, Comp
&&comp =
Comp(), Proj
&&proj = Proj())
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

The assignments in the parallel *inplace_merge* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *inplace_merge* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs $O(\text{std::distance}(\text{first}, \text{last}))$ applications of the comparison *comp* and the each projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *inplace_merge* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. The *inplace_merge* algorithm returns the source iterator *last*

```
template<typename Rng, typename Iter, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
```

```
Iter hpx::ranges::inplace_merge(Rng &&rng, Iter middle, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

Note

Complexity: Performs $O(\text{std::distance}(\text{first}, \text{last}))$ applications of the comparison *comp* and the each projection.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the range of elements the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *inplace_merge* algorithm returns *Iter*. The *inplace_merge* algorithm returns the source iterator *last*

```
template<typename Iter, typename Sent, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
```

```
Iter hpx::ranges::inplace_merge(Iter first, Iter middle, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Merges two consecutive sorted ranges `[first, middle)` and `[middle, last)` into one sorted range `[first, last)`. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

Note

Complexity: Performs $O(\text{std::distance}(\text{first}, \text{last}))$ applications of the comparison *comp* and the each projection.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *inplace_merge* algorithm *Iter*. The *inplace_merge* algorithm returns the source iterator *last*

hpx::ranges::partial_sort

Defined in header `hpx/algorithm.hpp`⁷⁸³.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
RandomIt hpx::ranges::partial_sort(RandomIt first, RandomIt middle, Sent last, Comp &&comp = Comp(),
                                   Proj &&proj = Proj())
```

⁷⁸³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Places the first middle - first elements from the range [first, last) as sorted with respect to *comp* into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The assignments in the parallel *partial_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Approximately $(\text{last} - \text{first}) * \log(\text{middle} - \text{first})$ comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator. *Comp* defaults to `detail::less`.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *partial_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type hpx::ranges::partial_sort(ExPolicy  
                                                                 &&policy,  
                                                                 RandomIt first,  
                                                                 RandomIt  
                                                                 middle, Sent  
                                                                 last, Comp  
                                                                 &&comp =  
                                                                 Comp(), Proj  
                                                                 &&proj =  
                                                                 Proj())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Approximately (last - first) * log(middle - first) comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. `Comp` defaults to `detail::less`.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

Returns

The *partial_sort* algorithm returns a `hpx::future<RandomIt>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::partial_sort(Rng &&rng, std::ranges::iterator_t<Rng> middle,
                                                    Comp &&comp = Comp(), Proj &&proj = Proj())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to `comp` into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The assignments in the parallel *partial_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Approximately $(\text{last} - \text{first}) * \log(\text{middle} - \text{first})$ comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced). `Comp` defaults to `detail::less`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. `Comp` defaults to `detail::less`.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *partial_sort* algorithm returns *std::ranges::iterator_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::partial_sort(ExPolicy
                                                                 &&pol-
                                                                 icy,
                                                                 Rng
                                                                 &&rng,
                                                                 std::ranges::iterator_t<Rng>
                                                                 mid-
                                                                 dle,
                                                                 Comp
                                                                 &&comp
                                                                 =
                                                                 Comp(),
                                                                 Proj
                                                                 &&proj
                                                                 =
                                                                 Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object *comp* (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(*comp*, INVOKE(*proj*, *(*i* + *n*)), INVOKE(*proj*, **i*)) == false.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`;
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. Comp defaults to `detail::less`.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

Returns

The *partial_sort* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. It returns *last*.

`hpx::ranges::transform_inclusive_scan`

Defined in header `hpx/algorithm.hpp`⁷⁸⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

`template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp>`

`transform_inclusive_scan_result<InIter, OutIter> hpx::ranges::transform_inclusive_scan(InIter first, Sent last, OutIter dest, BinOp &&binary_op, UnOp &&unary_op)`

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

⁷⁸⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_inclusive_scan* algorithm returns *transform_inclusive_scan_result<InIter, OutIter>*. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp,
typename UnOp>
```

```
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type hpx::ranges::transform_incl
```

Assigns through each iterator *i* in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *conv*(**first*), ..., *conv*(*(*first* + (*i* - *result*))))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges $[\text{first}, \text{last})$ or $[\text{result}, \text{result} + (\text{last} - \text{first}))$.

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be

dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_result<FwdIter1, FwdIter2>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp>
```

```
transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::transform_inclusive_scan(Rng
                                                                &&rng,
                                                                O
                                                                dest,
                                                                BinOp
                                                                &&bi-
                                                                nary_op,
                                                                UnOp
                                                                &&unary_op)
```

Assigns through each iterator *i* in $[result, result + (last - first))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges $[first, last)$ or $[result, result + (last - first))$.

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(last - first)$ applications of the predicates `op` and `conv`.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The `transform_inclusive_scan` algorithm returns a `transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>`. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp>
```

```
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type hpx::ranges::t
```

Assigns through each iterator i in $[result, result + (last - first))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges $[first, last)$ or $[result, result + (last - first))$.

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(last - first)$ applications of the predicates *op* and *conv*.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$ when N is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_inclusive_scan* algorithm returns a `hpx::future<transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>* otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp, typename T =
typename std::iterator_traits<InIter>::value_type>
```

```
transform_inclusive_scan_result<InIter, OutIter> hpx::ranges::transform_inclusive_scan(InIter first, Sent
last, OutIter
dest, BinOp
&&binary_op,
UnOp
&&unary_op, T
init)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

`R fun(const Type &a);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns *transform_inclusive_scan_result<InIter, OutIter>*. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp,  
typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>  
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type hpx::ranges::transform_incl
```

Assigns through each iterator *i* in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges $[\text{first}, \text{last})$ or $[\text{result}, \text{result} + (\text{last} - \text{first}))$.

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aK*), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *aM*, ..., *aN*) where $1 < K+1 = M \leq N$).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns a `hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_result<FwdIter1, FwdIter2>* otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::transform_inclusive_scan(Rng
&&rng,
O
dest,
BinOp
&&bi-
nary_op,
UnOp
&&unary_op,
T
init)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where $1 < K+1 = M \leq N$).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns a *transform_inclusive_scan_result*< std::ranges::iterator_t<Rng>, O>. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T =  
typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>  
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type hpx::ranges::t
```

Assigns through each iterator i in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges $[\text{first}, \text{last})$ or $[\text{result}, \text{result} + (\text{last} - \text{first}))$.

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where $1 < K+1 = M \leq N$).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns

The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::search

Defined in header [hpx/algorithm.hpp](#)⁷⁸⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::search_n](#)

```
template<typename FwdIter, typename Sent, typename FwdIter2, typename Sent2, typename Pred =  
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
FwdIter hpx::ranges::search(FwdIter first, Sent last, FwdIter2 s_first, Sent2 s_last, Pred &&op = Pred(), Proj1  
    &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note

Complexity: at most ($S \cdot N$) comparisons where S = distance(s_first, s_last) and N = distance(first, last).

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

⁷⁸⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename FwdIter2, typename Sent2,
        typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::search(ExPolicy &&policy,
                                                                                   FwdIter first, Sent last,
                                                                                   FwdIter2 s_first, Sent2
                                                                                   s_last, Pred &&op =
                                                                                   Pred(), Proj1 &&proj1 =
                                                                                   Proj1(), Proj2 &&proj2 =
                                                                                   Proj2())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence *[s_first, s_last)* in range *[first, last)*. If the length of the subsequence *[s_first, s_last)* is greater than the length of the range *[first, last)*, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
```

```
std::ranges::iterator_t<Rng1> hpx::ranges::search(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range *[first, last)* for any elements in the range *[s_first, s_last)*. Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note

Complexity: at most $(S*N)$ comparisons where S = distance(*s_first*, *s_last*) and N = distance(*first*, *last*).

Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to<>*
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.

- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [*s_first*, *s_last*) in range [*first*, *last*). If the length of the subsequence [*s_first*, *s_last*) is greater than the length of the range [*first*, *last*), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng1>> hpx::ranges::search(ExPolicy
&&pol-
icy,
Rng1
&&rng1,
Rng2
&&rng2,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Searches the range [*first*, *last*) for any elements in the range [*s_first*, *s_last*). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence $[s_first, s_last)$ in range $[first, last)$.

If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

hpx::ranges::search_n

Defined in header `hpx/algorithm.hpp`⁷⁸⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::search`

```
template<typename FwdIter, typename FwdIter2, typename Sent2, typename Pred = hpx::ranges::equal_to,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
FwdIter hpx::ranges::search_n(FwdIter first, std::size_t count, FwdIter2 s_first, Sent s_last, Pred &&op =
    Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search_n* algorithm execute in sequential order in the calling thread.

Note

Complexity: at most ($S \cdot N$) comparisons where S = distance(s_first, s_last) and N = count.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

⁷⁸⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search_n* algorithm returns *FwdIter*. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [*s_first*, *s_last*) in range [*first*, *first*+*count*). If the length of the subsequence [*s_first*, *s_last*) is greater than the length of the range [*first*, *first*+*count*), *first* is returned. Additionally, if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename ExPolicy, typename FwdIter, typename FwdIter2, typename Sent2, typename Pred =
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::search_n(ExPolicy
&&policy,
FwdIter first,
std::size_t count,
FwdIter2 s_first,
Sent2 s_last, Pred
&&op = Pred(),
Proj1 &&proj1 =
Proj1(), Proj2
&&proj2 =
Proj2())
```

Searches the range [*first*, *last*) for any elements in the range [*s_first*, *s_last*). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{count}$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1*

and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [s_first, s_last) in range [first, first+count). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, first+count), *first* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity,
        typename Proj2 = hpx::identity>
```

```
std::ranges::iterator_t<Rng1> hpx::ranges::search_n(Rng1 &&rng1, std::size_t count, Rng2 &&rng2, Pred
                                                    &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2
                                                    &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note

Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = distance(first, last).

Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to<>*
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng1>> hpx::ranges::search_n(ExPolicy
&&pol-
icy,
Rng1
&&rng1,
std::size_t
count,
Rng2
&&rng2,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a

provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

hpx::ranges::set_symmetric_difference

Defined in header [hpx/algorithm.hpp](#)⁷⁸⁷.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename  
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =  
hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<Iter1, Iter2, Iter3>>::type hpx::ranges::set_symmetric_difference(  
    Iter1 first1, Iter1 last1, Iter2 first2, Iter2 last2, Iter3 dest, Pred pred, Proj1 proj1, Proj2 proj2)
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

⁷⁸⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

If some element is found m times in $[first1, last1)$ and n times in $[first2, last2)$, it will be copied to *dest* exactly $\text{std::abs}(m-n)$ times. If $m > n$, then the last $m-n$ of those elements are copied from $[first1, last1)$, otherwise the last $n-m$ elements are copied from $[first2, last2)$. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

`bool pred(const Type1 &a, const Type1 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The `set_symmetric_difference` algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =  
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly $\text{std::abs}(m-n)$ times. If $m > n$, then the last $m-n$ of those elements are copied from *[first1, last1)*, otherwise the last $n-m$ elements are copied from *[first2, last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

applies user-provided function objects.

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred  
= hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
set_symmetric_difference_result<Iter1, Iter2, Iter3> hpx::ranges::set_symmetric_difference(Iter1 first1,
                                                                                          Sent1 last1,
                                                                                          Iter2 first2,
                                                                                          Sent2 last2,
                                                                                          Iter3 dest,
                                                                                          Pred &&op =
                                                                                          Pred(), Proj1
                                                                                          &&proj1 =
                                                                                          Proj1(), Proj2
                                                                                          &&proj2 =
                                                                                          Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly $\text{std::abs}(m-n)$ times. If $m > n$, then the last $m-n$ of those elements are copied from *[first1, last1)*, otherwise the last $n-m$ elements are copied from *[first2, last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>`. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
set_symmetric_difference_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::set_symmetric_diff
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges $[first1, last1)$ and $[first2, last2)$, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in $[first1, last1)$ and *n* times in $[first2, last2)$, it will be copied to *dest* exactly $\text{std::abs}(m-n)$ times. If $m > n$, then the last $m-n$ of those elements are copied from $[first1, last1)$, otherwise the last $n-m$ elements are copied from $[first2, last2)$. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`

- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

`bool pred(const Type1 &a, const Type1 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The `set_symmetric_difference` algorithm returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>`. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::fold_left

Defined in header `hpx/algorithm.hpp`⁷⁸⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right`
- `hpx::ranges::fold_right_last`
- `hpx::ranges::fold_left_with_iter`
- `hpx::ranges::fold_left_first_with_iter`

template<typename **InIter**, typename **Sent**, typename **T**, typename **F**>

auto `hpx::ranges::fold_left`(*InIter* first, *Sent* last, *T* init, *F* f)

Left-folds a range of elements using a binary operator.

⁷⁸⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Exactly N applications of the binary operator, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **InIter** – The type of the source begin iterator (deduced). This iterator must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns

The result of left-folding the range.

```
template<typename Rng, typename T, typename F>
```

```
auto hpx::ranges::fold_left(Rng &&rng, T init, F f)
```

Left-folds a range of elements using a binary operator.

Note

Complexity: Exactly N applications of the binary operator, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the fold operation.

- **f** – Binary function object that will be applied.

Returns

The result of left-folding the range.

hpx::ranges::fold_left_first

Defined in header [hpx/algorithm.hpp](#)⁷⁸⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- [hpx::ranges::fold_left](#)
- [hpx::ranges::fold_right](#)
- [hpx::ranges::fold_right_last](#)
- [hpx::ranges::fold_left_with_iter](#)
- [hpx::ranges::fold_left_first_with_iter](#)

```
template<typename InIter, typename Sent, typename F>
```

```
auto hpx::ranges::fold\_left\_first(InIter first, Sent last, F f)
```

Left-folds a range using the first element as the initial value.

Note

Complexity: Exactly N-1 applications of the binary operator, where N = `std::distance(first, last)`.

Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

Returns

An optional containing the fold result, or `std::nullopt` if the range is empty.

```
template<typename Rng, typename F>
```

⁷⁸⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
auto hpx::ranges::fold_left_first(Rng &&rng, F f)
```

Left-folds a range using the first element as the initial value.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

Returns

An optional containing the fold result, or `std::nullopt` if the range is empty.

`hpx::ranges::fold_right`

Defined in header `hpx/algorithm.hpp`⁷⁹⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::fold_left`
- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right_last`
- `hpx::ranges::fold_left_with_iter`
- `hpx::ranges::fold_left_first_with_iter`

```
template<typename BidIter, typename Sent, typename T, typename F>
```

```
auto hpx::ranges::fold_right(BidIter first, Sent last, T init, F f)
```

Right-folds a range of elements using a binary operator.

Note

Complexity: Exactly N applications of the binary operator.

Template Parameters

- **BidIter** – The type of the source begin iterator (deduced). This iterator must meet the requirements of a bidirectional iterator.
- **Sent** – The type of the source sentinel (deduced).
- **T** – The type of the initial value.

⁷⁹⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns

The result of right-folding the range.

```
template<typename Rng, typename T, typename F>
```

```
auto hpx::ranges::fold_right(Rng &&rng, T init, F f)
```

Right-folds a range of elements using a binary operator.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns

The result of right-folding the range.

hpx::ranges::fold_right_last

Defined in header `hpx/algorithm.hpp`⁷⁹¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::fold_left*
- *hpx::ranges::fold_left_first*
- *hpx::ranges::fold_right*
- *hpx::ranges::fold_left_with_iter*
- *hpx::ranges::fold_left_first_with_iter*

```
template<typename BidIter, typename Sent, typename F>
```

⁷⁹¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

auto `hpx::ranges::fold_right_last`(*BidIter* first, *Sent* last, *F* f)

Right-folds a range using the last element as the initial value.

Template Parameters

- **BidIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

Returns

An optional containing the fold result, or `std::nullopt` if the range is empty.

template<typename **Rng**, typename **F**>

auto `hpx::ranges::fold_right_last`(*Rng* &&rng, *F* f)

Right-folds a range using the last element as the initial value.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

Returns

An optional containing the fold result, or `std::nullopt` if the range is empty.

`hpx::ranges::fold_left_with_iter`

Defined in header `hpx/algorithm.hpp`⁷⁹².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::fold_left`
- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right`

⁷⁹² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- *hpx::ranges::fold_right_last*
- *hpx::ranges::fold_left_first_with_iter*

template<typename **InIter**, typename **Sent**, typename **T**, typename **F**>

```
auto hpx::ranges::fold_left_with_iter(InIter first, Sent last, T init, F f) ->
    fold_left_with_iter_result<InIter,
    std::decay_t<std::invoke_result_t<F&, T,
    std::iter_reference_t<InIter>>>>
```

Left-folds a range and returns both the result and the end iterator.

Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns

A `fold_left_with_iter_result` containing the end iterator and the fold result.

template<typename **Rng**, typename **T**, typename **F**>

```
auto hpx::ranges::fold_left_with_iter(Rng &&rng, T init, F f) ->
    fold_left_with_iter_result<std::ranges::iterator_t<Rng>,
    std::decay_t<std::invoke_result_t<F&, T,
    std::ranges::range_reference_t<Rng>>>>
```

Left-folds a range and returns both the result and the end iterator.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

Returns

A `fold_left_with_iter_result` containing the end iterator and the fold result.

`hpx::ranges::fold_left_first_with_iter`

Defined in header `hpx/algorithm.hpp`⁷⁹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fold_left`
- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right`
- `hpx::ranges::fold_right_last`
- `hpx::ranges::fold_left_with_iter`

```
template<typename InIter, typename Sent, typename F>
```

```
auto hpx::ranges::fold_left_first_with_iter(InIter first, Sent last, F f) ->
    fold_left_first_with_iter_result<InIter,
    hpx::optional<std::decay_t<std::invoke_result_t<F&,
    std::iter_reference_t<InIter>,
    std::iter_reference_t<InIter>>>>>
```

Left-folds a range using the first element and returns both an optional result and the end iterator.

Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

Returns

A `fold_left_first_with_iter_result` containing the end iterator and an optional with the fold result.

```
template<typename Rng, typename F>
```

```
auto hpx::ranges::fold_left_first_with_iter(Rng &&rng, F f) ->
    fold_left_first_with_iter_result<std::ranges::iterator_t<Rng>,
    hpx::optional<std::decay_t<std::invoke_result_t<F&,
    std::ranges::range_reference_t<Rng>,
    std::ranges::range_reference_t<Rng>>>>>
```

⁷⁹³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Left-folds a range using the first element and returns both an optional result and the end iterator.

Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

Returns

A `fold_left_first_with_iter_result` containing the end iterator and an optional with the fold result.

`hpx::ranges::starts_with`

Defined in header `hpx/algorithm.hpp`⁷⁹⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred =  
ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
bool hpx::ranges::starts_with(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1  
                               &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by `[first1, last1)` matches the prefix of the first range defined by `[first2, last2)`

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear: at most $\min(N1, N2)$ applications of the predicate and both projections.

Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of a sentinel for `Iter1`.
- **Iter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of an input iterator.

⁷⁹⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

Returns

The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::starts_with(ExPolicy &&policy,
                                                                                          FwdIter1 first1, Sent1
                                                                                          last1, FwdIter2 first2,
                                                                                          Sent2 last2, Pred
                                                                                          &&pred = Pred(),
                                                                                          Proj1 &&proj1 =
                                                                                          Proj1(), Proj2
                                                                                          &&proj2 = Proj2())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear: at most $\min(N1, N2)$ applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is of

type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
bool hpx::ranges::starts_with(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 =
    Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

Returns

The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean

with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename  
Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ranges::starts_with(ExPolicy  
                                                    &&policy, Rng1  
                                                    &&rng1, Rng2  
                                                    &&rng2, Pred  
                                                    &&pred =  
                                                    Pred(), Proj1  
                                                    &&proj1 =  
                                                    Proj1(), Proj2  
                                                    &&proj2 =  
                                                    Proj2())
```

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

Returns

The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

hpx::ranges::transform_reduce

Defined in header [hpx/algorithm.hpp](#)⁷⁹⁵.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Warning

doxygenfunction: Cannot find function “hpx::ranges::transform_reduce” in doxygen xml output for project “hpx” from directory: ../hpx_autodoc

hpx::ranges::remove

Defined in header [hpx/algorithm.hpp](#)⁷⁹⁶.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::remove_if](#)

template<typename **Iter**, typename **Sent**, typename **Proj** = *hpx::identity*, typename **T** = typename *hpx::parallel::traits::projected<Iter, Proj>::value_type>*

subrange_t<*Iter*, *Sent*> *hpx::ranges::remove*(*Iter* first, *Sent* last, *T* const &value, *Proj* &&proj = *Proj*())

Removes all elements that are equal to *value* from the range [first, last) and and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

⁷⁹⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

⁷⁹⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator `==()` and the projection *proj*.

Template Parameters

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a *subrange_t<FwdIter, Sent>*. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::remove(Rng &&rng, T const &value, Proj &&proj =
Proj())
```

Removes all elements that are equal to *value* from the range *rng* and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator `==()` and the projection *proj*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a *subrange_t<std::ranges::iterator_t<Rng>>*. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Proj = hpx::identity, typename T =
typename hpx::parallel::traits::projected<FwdIter, Proj>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::remove(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
last, T
const
&value,
Proj
&&proj
=
Proj())
```

Removes all elements that are equal to *value* from the range [first, last) and and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator `==()` and the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a `hpx::future<subrange_t<FwdIter, Sent>>`. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename T = typename  
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>  
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::remove(ExPolicy  
                                                         &&pol-  
                                                         icy,  
                                                         Rng  
                                                         &&rng,  
                                                         T  
                                                         const  
                                                         &value,  
                                                         Proj  
                                                         &&proj  
                                                         =  
                                                         Proj())
```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the *operator==()* and the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a *hpx::future<sub-range_t<std::ranges::iterator_t<Rng>>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove* algorithm returns the iterator to the new end of the range.

hpx::ranges::remove_if

Defined in header `hpx/algorithm.hpp`⁷⁹⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::remove`

```
template<typename Iter, typename Sent, typename Pred, typename Proj = hpx::identity>
```

```
subrange_t<Iter, Sent> hpx::ranges::remove_if(Iter first, Sent sent, Pred &&pred, Proj &&proj = Proj())
```

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred* and the projection *proj*.

Template Parameters

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*..
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

⁷⁹⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a *subrange_t<FwdIter, Sent>*. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::remove_if(Rng &&rng, Pred &&pred, Proj &&proj = Proj())
```

Removes all elements that are equal to *value* from the range *rng* and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the *operator==()* and the projection *proj*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a *subrange_t*<*std::ranges::iterator_t*<*Rng*>>. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =
    hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::remove_if(ExPolicy
    &&pol-
    icy,
    FwdIter
    first,
    Sent
    sent,
    Pred
    &&pred,
    Proj
    &&proj
    =
    Proj())
```

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred* and the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a *hpx::future<subrange_t<FwdIter, Sent>>*. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::remove_if(ExPolicy
&&pol-
icy,
Rng
&&rng,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than `util::end(rng)`

- `util::begin(rng)` assignments, exactly `util::end(rng) - util::begin(rng)` applications of the `operator==()` and the projection `proj`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `remove_if` requires `Pred` to meet the requirements of `CopyConstructible`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns `true` for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type `Type` must be such that an object of type `FwdIter` can be dereferenced and then implicitly converted to `Type`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate `is` is invoked.

Returns

The `remove_if` algorithm returns a `hpx::future<subrange_t<std::ranges::iterator_t<Rng>>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter` otherwise. The `remove_if` algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

⁸⁰⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

hpx::ranges::unique

Defined in header `hpx/algorithm.hpp`⁸⁰⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::unique_copy`

```
template<typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
subrange_t<FwdIter, Sent> hpx::ranges::unique(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj =
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range `[first, last)` and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

⁸⁰⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns *subrange_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename
Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::unique(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
last,
Pred
&&pred
=
Pred(),
Proj
&&proj
=
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

executes the assignments.

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns *subrange_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>> hpx::ranges::unique(Rng &&rng, Pred
&&pred = Pred(),
Proj &&proj =
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs not more than N assignments, exactly $N - 1$ applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns `subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>`. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> hpx::ranges::u
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *N* assignments, exactly *N* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where *N* = `std::distance(begin(rng), end(rng))`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns a `hpx::future <subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced_task_policy*

or *parallel_task_policy* and returns *subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>* otherwise. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

hpx::ranges::unique_copy

Defined in header [hpx/algorithm.hpp](#)⁸⁰⁷.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::unique](#)

```
template<typename InIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename Proj =  
hpx::identity>  
unique_copy_result<InIter, O> hpx::ranges::unique_copy(InIter first, Sent last, O dest, Pred &&pred = Pred(),  
Proj &&proj = Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

⁸⁰⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns a `unique_copy_result<InIter, O>`. The *unique_copy* algorithm returns an `in_out_result` with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename O, typename Pred =  
ranges::equal_to, typename Proj = hpx::identity>  
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<FwdIter, O>>::type hpx::ranges::unique_copy(ExPolicy  
                                                         &&pol-  
                                                         icy,  
                                                         FwdIter  
                                                         first,  
                                                         Sent  
                                                         last,  
                                                         O  
                                                         dest,  
                                                         Pred  
                                                         &&pred  
                                                         =  
                                                         Pred(),  
                                                         Proj  
                                                         &&proj  
                                                         =  
                                                         Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter1`.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns returns a *hpx::future< unique_copy_result<FwdIter, O>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *unique_copy_result<FwdIter, O>* otherwise. The *unique_copy* algorithm returns an *in_out_result* with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
unique_copy_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::unique_copy(Rng &&rng, O dest, Pred
&&pred = Pred(), Proj
&&proj = Proj())
```

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = std::distance(begin(rng), end(rng)).

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns *unique_copy_result*< std::ranges::iterator_t<**Rng**>,

O>. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::unique_copy(ExP  
&&  
icy,  
Rng  
&&  
O  
dest  
Pred  
&&  
=  
Pred  
Proj  
&&  
=  
Proj
```

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = *std::distance*(*begin*(*rng*), *end*(*rng*)).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to*<>

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns a `hpx::future<unique_copy_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *unique_copy_result<std::ranges::iterator_t<Rng>, O>* otherwise. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

hpx::ranges::copy

Defined in header `hpx/algorithm.hpp`⁸⁰⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::copy_n*
- *hpx::ranges::copy_if*

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_result<FwdIter1, FwdIter>>::type hpx::ranges::copy(ExPolicy
&&pol-
icy,
FwdIter1
iter,
Sent1
sent,
FwdIter
dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

⁸⁰⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a `hpx::future<ranges::copy_result<FwdIter1, FwdIter>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::copy_result<FwdIter1, FwdIter>` otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter>>>::typ
```

Copies the elements in the range *rng* to another range beginning at *dest*.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a `hpx::future<ranges::copy_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::copy_result<iterator_t<Rng>, FwdIter2>` otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter>
```

```
ranges::copy_result<FwdIter1, FwdIter> hpx::ranges::copy(FwdIter1 iter, Sent1 sent, FwdIter dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

Note

Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter>
```

```
ranges::copy_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter> hpx::ranges::copy(Rng  
                                                         &&rng,  
                                                         FwdIter  
                                                         dest)
```

Copies the elements in the range *rng* to another range beginning at *dest*.

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::copy_n

Defined in header `hpx/algorithm.hpp`⁸⁰⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::copy`
- `hpx::ranges::copy_if`

template<typename **ExPolicy**, typename **FwdIter1**, typename **Size**, typename **FwdIter2**>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_n_result<FwdIter1, FwdIter2>>::type` `hpx::ranges::copy_n`(*ExPolicy* &&pol-
icy,
FwdIter1
first,
Size
count,
FwdIter2
dest)

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

⁸⁰⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy_n* algorithm returns a `hpx::future<ranges::copy_n_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::copy_n_result<FwdIter1, FwdIter2>` otherwise. The *copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Size, typename FwdIter2>
```

```
ranges::copy_n_result<FwdIter1, FwdIter2> hpx::ranges::copy_n(FwdIter1 first, Size count, FwdIter2 dest)
```

Copies the elements in the range `[first, first + count)`, starting from *first* and proceeding to `first + count - 1`, to another range beginning at *dest*.

Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::copy_if

Defined in header `hpx/algorithm.hpp`⁸¹⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::copy`

&&pol-
icy,
FwdIter
iter,
Sent1
sent,
FwdIter
dest,
Pred
&&pred,
Proj
&&proj)
=
Proj()
```

Copies the elements in the range, defined by [first, last) to another range beginning at *dest*. The order of the elements that are not removed is preserved.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for FwdIter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

⁸¹⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

`bool pred(const Type1 &a, const Type1 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *copy_if* algorithm returns a `hpx::future<ranges::copy_if_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::copy_if_result<iterator_t<Rng>, FwdIter2>` otherwise. The *copy_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

`template<typename ExPolicy, typename Rng, typename FwdIter, typename Pred, typename Proj = hpx::identity>`

`hpx::parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_if_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter`

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns `true` if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The `copy_if` algorithm returns a `hpx::future<ranges::copy_if_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::copy_if_result<iterator_t<Rng>, FwdIter2>` otherwise. The `copy_if` algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter, typename Pred, typename Proj =
hpx::identity>
ranges::copy_if_result<FwdIter1, FwdIter> hpx::ranges::copy_if(FwdIter1 iter, Sent1 sent, FwdIter dest, Pred
&&pred, Proj &&proj = Proj())
```

Copies the elements in the range, defined by [first, last) to another range beginning at *dest*. The order of the elements that are not removed is preserved.

Template Parameters

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `FwdIter1`.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *copy_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter, typename Pred, typename Proj = hpx::identity>
```

```
ranges::copy_if_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter> hpx::ranges::copy_if(Rng  
                                                         &&rng,  
                                                         FwdIter  
                                                         dest,  
                                                         Pred  
                                                         &&pred,  
                                                         Proj  
                                                         &&proj  
                                                         =  
                                                         Proj())
```

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *copy_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::equal

Defined in header `hpx/algorithm.hpp`⁸¹¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Pred = equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::equal(ExPolicy &&policy, Iter1
first1, Sent1 last1, Iter2 first2,
Sent2 last2, Pred &&op =
Pred(), Proj1 &&proj1 =
Proj1(), Proj2 &&proj2 =
Proj2())
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the predicate *f*.

⁸¹¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

The two ranges are considered equal if, for every iterator *i* in the range `[first1,last1)`, `*i` equals `*(first2 + (i - first1))`. This overload of `equal` uses `operator==` to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::equal(ExPolicy &&policy, Rng1
&&rng1, Rng2 &&rng2,
Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most *last1 - first1* applications of the predicate *f*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *equal* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred = equal_to,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
bool hpx::ranges::equal(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&op = Pred(), Proj1 &&proj1
= Proj1(), Proj2 &&proj2 = Proj2())
```

Returns true if the range `[first1, last1)` is equal to the range `[first2, last2)`, and false otherwise.

Note

Complexity: At most `min(last1 - first1, last2 - first2)` applications of the predicate *f*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

Returns

The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 = hpx::identity, typename
Proj2 = hpx::identity>
bool hpx::ranges::equal(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise.

Note

Complexity: At most *last1* - *first1* applications of the predicate *f*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses operator== to determine if two elements are equal.

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to *std::equal_to<>*
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1*

and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate is invoked.

Returns

The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

hpx::ranges::nth_element

Defined in header `hpx/algorithm.hpp`⁸¹².

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Pred = hpx::parallel::detail::less, typename Proj =
hpx::identity>
RandomIt hpx::ranges::nth_element(RandomIt first, RandomIt nth, Sent last, Pred &&pred = Pred(), Proj
&&proj = Proj())
```

nth_element is a partial sorting algorithm that rearranges elements in $[first, last)$ such that the element pointed at by *nth* is changed to whatever element would occur in that position if $[first, last)$ were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth_element* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear in $\text{std::distance}(first, last)$ on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = last - first$.

Template Parameters

- **RandomIt** – The type of the source begin, *nth*, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *RandomIt*.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

⁸¹² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to `hpx::identity`.

Returns

The *nth_element* algorithm returns *RandomIt*. The *nth_element* algorithm returns an iterator equal to *last*.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Pred = hpx::parallel::detail::less,  
typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, RandomIt> hpx::ranges::nth_element(ExPolicy &&policy,  
RandomIt first,  
RandomIt nth, Sent  
last, Pred &&pred =  
Pred(), Proj &&proj  
= Proj())
```

nth_element is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth_element* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *nth_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in `std::distance(first, last)` on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = last - first$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source begin, nth, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to Type. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to *hpx::identity*.

Returns

The *partition* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *parallel_task_policy* and returns *RandomIt* otherwise. The *nth_element* algorithm returns an iterator equal to last.

```
template<typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::nth_element(Rng &&rng, std::ranges::iterator_t<Rng> nth, Pred  
&&pred = Pred(), Proj &&proj = Proj())
```

nth_element is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth_element* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear in `std::distance(first, last)` on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to *hpx::identity*.

Returns

The *nth_element* algorithm returns `std::ranges::iterator_t<Rng>`. The *nth_element* algorithm returns an iterator equal to last.

```
template<typename ExPolicy, typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```

parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::nth_element(ExPolicy
&&pol-
icy,
Rng
&&rng,
std::ranges::iterator_t<Rng>
nth,
Pred
&&pred
=
Pred(),
Proj
&&proj
=
Proj())

```

`nth_element` is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by `nth` is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new `nth` element are less than or equal to the elements after the new `nth` element.

The comparison operations in the parallel `nth_element` invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `nth_element` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in `std::distance(first, last)` on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point

- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to `hpx::identity`.

Returns

The *partition* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *parallel_task_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. The *nth_element* algorithm returns an iterator equal to last.

hpx::ranges::transform_exclusive_scan

Defined in header `hpx/algorithm.hpp`⁸¹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **BinOp**, typename **UnOp**, typename **T** =
typename `std::iterator_traits<InIter>::value_type`>

`transform_exclusive_scan_result<InIter, OutIter> hpx::ranges::transform_exclusive_scan(InIter first, Sent
last, OutIter
dest, T init,
BinOp
&&binary_op,
UnOp
&&unary_op)`

Assigns through each iterator *i* in `[result, result + (last - first))` the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))).

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

⁸¹³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Note

GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where $1 < K+1 = M \leq N$).

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The `transform_exclusive_scan` algorithm returns `transform_exclusive_scan_result<InIter, OutIter>`. The `transform_exclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp,  
typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>  
parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_result<FwdIter1, FwdIter2>>::type hpx::ranges::transform_excl
```

Assigns through each iterator i in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1)))`.

The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges $[\text{first}, \text{last})$ or $[\text{result}, \text{result} + (\text{last} - \text{first}))$.

The behavior of `transform_exclusive_scan` may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates `op` and `conv`.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- a_1 when N is 1
- $\text{op}(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a_1, \dots, a_K), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{op}, a_M, \dots, a_N))$ where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **FwdIter**.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be

dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

Returns

The `transform_exclusive_scan` algorithm returns a `hpx::future<transform_exclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_exclusive_result<FwdIter1, FwdIter2>` otherwise. The `transform_exclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
transform_exclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::transform_exclusive_scan(Rng
&&rng,
O
dest,
T
init,
BinOp
&&binary_op,
UnOp
&&unary_op)
```

Assigns through each iterator `i` in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1)))`.

The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of `transform_exclusive_scan` may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates `op` and `conv`.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_exclusive_scan* algorithm returns a *transform_exclusive_scan_result*< `std::ranges::iterator_t<Rng>`, *O*>. The *transform_exclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T =  
typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

parallel::util::detail::algorithm_result<*ExPolicy*, *transform_exclusive_scan_result*<*std::ranges::iterator_t*<*Rng*>, *O*>>::type *hpx::ranges::t*

Assigns through each iterator *i* in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1)))`.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges $[\text{first}, \text{last})$ or $[\text{result}, \text{result} + (\text{last} - \text{first}))$.

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- a_1 when N is 1
- $op(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(op, a_1, \dots, a_K), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(op, a_M, \dots, a_N))$ where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The `transform_exclusive_scan` algorithm returns a `hpx::future<transform_exclusive_scan_result< std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_exclusive_scan_result< std::ranges::iterator_t<Rng>, O>` otherwise. The `transform_exclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::uninitialized_move

Defined in header `hpx/algorithm.hpp`⁸¹⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_move_n`

template<typename **InIter**, typename **Sent1**, typename **FwdIter**, typename **Sent2**>

`hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_move(InIter first1, Sent1 last1, FwdIter first2, Sent2 last2)`

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

⁸¹⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

Returns

The *uninitialized_move* algorithm returns an *in_out_result<InIter, FwdIter>*. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>>::type hpx::ranges::uninitialized_move
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the *parallel_uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the *parallel_uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `in_out_result<InIter, FwdIter>` otherwise. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Rng1, typename Rng2>
```

```
hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator,
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

Returns

The *uninitialized_move* algorithm returns an *in_out_result*<typename *hpx::traits::range_traits*<*Rng1*>::iterator_type, typename *hpx::traits::range_traits*<*Rng2*>::iterator_type>. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, ty
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

Returns

The *uninitialized_move* algorithm returns a *hpx::future*<*in_out_result*<*InIter*,

FwdIter>>, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result*< type-name *hpx::traits::range_traits*<*Rng1*>::*iterator_type* , typename *hpx::traits::range_traits*<*Rng2*>::*iterator_type*> otherwise. The *uninitialized_move* algorithm returns the input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

hpx::ranges::uninitialized_move_n

Defined in header [hpx/algorithm.hpp](#)⁸¹⁵.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::uninitialized_move](#)

template<typename **InIter**, typename **Size**, typename **FwdIter**, typename **Sent2**>

hpx::parallel::util::in_out_result<*InIter*, *FwdIter*> **hpx::ranges::uninitialized_move_n**(*InIter* first1, *Size* count, *FwdIter* first2, *Sent2* last2)

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *count* movements, if count > 0, no move operations otherwise.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from

⁸¹⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/algorithm.hpp>

- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move_n* algorithm returns *in_out_result<InIter, FwdIter>*. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type hpx::ranges::uninitialized
```

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* movements, if count > 0, no move operations otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.

- **Size** – The type of the argument specifying the number of elements to apply f to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move_n* algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

namespace **hpx**

namespace **assertion**

⁸¹⁶ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/source_location.hpp

⁸¹⁷ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/source_location.hpp

Typedefs

using **assertion_handler** = void (*)(*hpx::source_location* const &loc, char const *expr, *std::string* const &msg)

The signature for an assertion handler.

Functions

assertion_handler **set_assertion_handler**(*assertion_handler* handler)

Set the assertion handler to be used within a program. If the handler has been set already once, the call to this function will be ignored.

Note

This function is not thread safe

async_base

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx::post

Defined in header *hpx/future.hpp*⁸¹⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also

hpx::post (distributed)

```
template<typename F, typename ...Ts>
```

```
bool hpx::post(F &&f, Ts&&... ts)
```

Runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool). This is done in a fire-and-forget manner, meaning there is no return value or way to synchronize with the function execution (it does not return an *hpx::future* that would hold the result of that function call).

hpx::post is particularly useful when synchronization mechanisms as heavyweight as futures are not desired, and instead, more lightweight mechanisms like latches or atomic variables are preferred. Essentially, the post function enables the launch of a new thread without the overhead of creating a future.

⁸¹⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Note

`hpx::post` is similar to `hpx::async` but does not return a future. This is why there is no way of finding out the result/failure of the execution of this function.

```
template<typename Action, typename ...Ts>
```

```
bool hpx::post(hpx::id_type const &id, Ts&&... vs)
```

```
template<typename Action, typename Client, typename Stub, typename Data, typename ...Ts>
```

```
bool hpx::post(components::client_base<Client, Stub, Data> const &c, Ts&&... vs)
```

```
template<typename Action, typename DistPolicy, typename ...Ts>
```

```
bool hpx::post(DistPolicy const &policy, Ts&&... vs)
```

```
template<typename Action, typename Continuation, typename ...Ts>
```

```
bool hpx::post(Continuation &&c, hpx::id_type const &gid, Ts&&... vs)
```

```
template<typename Action, typename Continuation, typename Client, typename Stub, typename Data,  
typename ...Ts>
```

```
bool hpx::post(Continuation &&cont, components::client_base<Client, Stub, Data> const &c, Ts&&... vs)
```

```
template<typename Action, typename Continuation, typename DistPolicy, typename ...Ts>
```

```
bool hpx::post(Continuation &&c, DistPolicy const &policy, Ts&&... vs)
```

```
template<typename Action, typename Target, typename ...Ts>
```

```
bool hpx::post(Action &&action, Target &&target, Ts&&... ts)
```

The distributed implementation of `hpx::post` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID.

Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed

- **Ts** – The type of any additional arguments

Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

Returns

true if the action was successfully posted, false otherwise.

hpx::sync

Defined in header `hpx/future.hpp`⁸¹⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also

hpx::sync (distributed)

```
template<typename Action, typename F, typename ...Ts>
```

```
auto hpx::sync(F &&f, Ts&&... ts) -> decltype(detail::sync_action_dispatch<Action,  
std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *sync* runs the function *f* synchronously and returns a `hpx::future` that will eventually hold the result of that function call.

```
template<typename Action, typename F, typename ...Ts>
```

```
auto hpx::sync(F &&f, Ts&&... ts) -> decltype(detail::sync_action_dispatch<Action,  
std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *sync* runs the function *f* synchronously and returns a `hpx::future` that will eventually hold the result of that function call.

Warning

doxygenfunction: Unable to resolve function “hpx::sync” with arguments (Action&&, Target&&, Ts&&...) in doxygen xml output for project “hpx” from directory: ../hpx_autodoc. Potential matches:

```
- template<typename  
→ Action, typename F, typename ...Ts> auto sync(F &&f, Ts&&...  
→ ts) -> decltype(detail::sync_action_dispatch<Action, std::decay_  
→ t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))  
- template<typename  
→ Action, typename Target, typename ...Ts> decltype(auto)  
→ sync(Action &&action, Target &&target, Ts&&... ts)  
- template<typename  
→ F, typename ...Ts> decltype(auto) sync(F &&f, Ts&&... ts)
```

⁸¹⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

hpx::async

Defined in header `hpx/future.hpp`⁸²⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also

hpx::async (distributed)

```
template<typename Action, typename F, typename ...Ts>
```

```
auto hpx::async(F &&f, Ts&&... ts) -> decltype(detail::async_action_dispatch<Action,  
std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a `hpx::future` that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being `hpx::launch::async` | `hpx::launch::deferred`. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the async flag is set (i.e. (policy & `hpx::launch::async`) != 0), then *async* executes the callable object *f* on a new thread of execution (with all thread-locals initialized) as if spawned by `hpx::thread`(`std::forward<F>(f), std::forward<Ts>(ts)...)`, except that if the function *f* returns a value or throws an exception, it is stored in the shared state accessible through the `hpx::future` that *async* returns to the caller.
- If the deferred flag is set (i.e. (policy & `hpx::launch::deferred`) != 0), then *async* converts *f* and *ts...* the same way as by `hpx::thread` constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the `hpx::future` that *async* returned to the caller will cause the copy of *f* to be invoked (as a rvalue) with the copies of *ts...* (also passed as rvalues) in the current thread (which does not have to be the thread that originally called `hpx::async`). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same `hpx::future` will return the result immediately.
- If neither `hpx::launch::async` nor `hpx::launch::deferred`, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the `hpx::launch::async` and `hpx::launch::deferred` flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to `hpx::async` synchronizes-with (as defined in `std::memory_order`) the call to *f*, and the completion of *f* is sequenced-before making the shared state ready. If the async policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If `std::decay<Function>::type` or each type in `std::decay<Ts>::type` is not constructible from its corresponding argument, the program is ill-formed.

⁸²⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to f

Returns

hpx::future referring to the shared state created by this call to *hpx::async*.

template<typename **Action**, typename **F**, typename ...**Ts**>

```
auto hpx::async(F &&f, Ts&&... ts) -> decltype(detail::async_action_dispatch<Action,  
std::decay_t<F>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a *hpx::future* that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being *hpx::launch::async* | *hpx::launch::deferred*. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the async flag is set (i.e. (policy & *hpx::launch::async*) != 0), then *async* executes the callable object *f* on a new thread of execution (with all thread-locals initialized) as if spawned by *hpx::thread*(std::forward<*F*>(f), std::forward<*Ts*>(ts)...), except that if the function *f* returns a value or throws an exception, it is stored in the shared state accessible through the *hpx::future* that *async* returns to the caller.
- If the deferred flag is set (i.e. (policy & *hpx::launch::deferred*) != 0), then *async* converts *f* and *ts*... the same way as by *hpx::thread* constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the *hpx::future* that *async* returned to the caller will cause the copy of *f* to be invoked (as a rvalue) with the copies of *ts*... (also passed as rvalues) in the current thread (which does not have to be the thread that originally called *hpx::async*). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same *hpx::future* will return the result immediately.
- If neither *hpx::launch::async* nor *hpx::launch::deferred*, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the *hpx::launch::async* and *hpx::launch::deferred* flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to *hpx::async* synchronizes-with (as defined in std::memory_order) the call to *f*, and the completion of *f* is sequenced-before making the shared state ready. If the async policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If std::decay<Function>::type or each type in std::decay<*Ts*>::type is not constructible from its corresponding argument, the program is ill-formed.

Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to f

Returns

hpx::future referring to the shared state created by this call to *hpx::async*.

Warning

doxygenfunction: Unable to resolve function “hpx::async” with arguments (Executor&&, hpx::sycl::experimental::sycl_executor::queue_function_ptr_t<Ts...>&&, Ts&&...) in doxygen xml output for project “hpx” from directory: ../hpx_autodoc.
Potential matches:

```
- template<typename Action,
→ typename F, typename ...Ts> auto async(F &&f, Ts&&... ts)
→-> decltype(detail::async_action_dispatch<Action, std::decay_
→t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
- template<typename Action, typename Target, typename
→...Ts> auto async(Action &&action, Target &&target, Ts&&... ts)
- template<typename Executor, typename ...Ts> decltype(auto)
→async(Executor &&exec, hpx::sycl::experimental::sycl_
→executor::queue_function_ptr_t<Ts...> &&f, Ts&&... ts)
- template<typename
→F, typename ...Ts> decltype(auto) async(F &&f, Ts&&... ts)
```

template<typename **Action**, typename **Target**, typename ...**Ts**>

auto *hpx::async*(*Action* &&action, *Target* &&target, *Ts*&&... ts)

The distributed implementation of `hpx::async` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID. The action executes asynchronously.

Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

Returns

hpx::future referring to the shared state created by this call to `hpx::async`

hpx::launch

Defined in header `hpx/future.hpp`⁸²¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **launch** : public *hpx::detail::policy_holder*<>

Launch policies for *hpx::async* etc.

hpx::dataflow

Defined in header `hpx/future.hpp`⁸²².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

⁸²² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

async_combinators

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/async_combinators/split_future.hpp

Defined in header `hpx/async_combinators/split_future.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename ...Ts>

inline *tuple*<*future*<Ts>...> **split_future**(*future*<*tuple*<Ts...>> &&f)

The function *split_future* is an operator allowing to split a given future of a sequence of values (any tuple, `std::pair`, or `std::array`) into an equivalent container of futures where each future represents one of the values from the original future. In some sense this function provides the inverse operation of *when_all*.

Note

The following cases are special:

```
tuple<future<void> > split_future(future<tuple<> > && f);
array<future<void>, 1> split_future(future<array<T, 0> > && f);
```

here the returned futures are directly representing the futures which were passed to the function.

Parameters

f – [in] A future holding an arbitrary sequence of values stored in a tuple-like container. This facility supports *hpx::tuple*<>, *std::pair*<*T1*, *T2*>, and *std::array*<*T*, *N*>

Returns

Returns an equivalent container (same container type as passed as the argument) of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

template<typename T>

inline *std::vector*<*future*<T>> **split_future**(*future*<*std::vector*<T>> &&f, *std::size_t* size)

The function *split_future* is an operator allowing to split a given future of a sequence of values (any *std::vector*) into a *std::vector* of futures where each future represents one of the values from the original *std::vector*. In some sense this function provides the inverse operation of *when_all*.

Parameters

- **f** – [in] A future holding an arbitrary sequence of values stored in a `std::vector`.
- **size** – [in] The number of elements the vector will hold once the input future has become ready

Returns

Returns a `std::vector` of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

`hpx::when_any`

Defined in header `hpx/future.hpp`⁸²³.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>  
future<when_any_result<Container>>> hpx::when_any(InputIter first, InputIter last)
```

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_any* should wait.

Returns

Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- `future<when_any_result<Container<future<R>>>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
```

```
future<when_any_result<Range>> hpx::when_any(Range &values)
```

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

⁸²³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Parameters

values – [in] A range holding an arbitrary amount of *future*s or *shared_future* objects for which *when_any* should wait.

Returns

Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- `future<when_any_result<Container<future<R>>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename ...T>
```

```
future<when_any_result<tuple<future<T>...>>> hpx::when_any(T&&... futures)
```

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

futures – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_any* should wait.

Returns

Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- `future<when_any_result<tuple<future<T0>, future<T1>...>>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- `future<when_any_result<tuple<>>>` if *when_any* is called with zero arguments. The returned future will be initially ready.

hpx::when_all

Defined in header `hpx/future.hpp`⁸²⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>>
hpx::future<Container> hpx::when_all(InputIter first, InputIter last)
```

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note

⁸²⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Calling this version of *when_all* where `first == last`, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

Returns

Returns a future holding the same list of futures as has been passed to *when_all*.

- `future<Container<future<R>>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
```

```
hpx::future<Range> hpx::when_all(Range &&values)
```

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note

Calling this version of *when_all* where the input container is empty, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

values – [in] A range holding an arbitrary amount of *future* or *shared_future* objects for which *when_all* should wait.

Returns

Returns a future holding the same list of futures as has been passed to *when_all*.

- `future<Container<future<R>>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type.

```
template<typename ...T>
```

```
hpx::future<hpx::tuple<hpx::future<T>...>> hpx::when_all(T&&... futures)
```

function *when_all* creates a future object that becomes ready when all elements in a set

of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note

Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

futures – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_all* should wait.

Returns

Returns a future holding the same list of futures as has been passed to *when_all*.

- `future<tuple<future<T0>, future<T1>, future<T2>...>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- `future<tuple<>>` if *when_all* is called with zero arguments. The returned future will be initially ready.

hpx::wait_all

Defined in header `hpx/future.hpp`⁸²⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_all_nothrow`
- `hpx::wait_all_n`
- `hpx::wait_all_n_nothrow`

```
template<typename InputIter>
```

```
void hpx::wait_all(InputIter first, InputIter last)
```

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note

The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

⁸²⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Note

The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

Note

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until `wait_all` returns and all inspection of the futures is complete.

Parameters

- **first** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which `wait_all` should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or *shared_future* objects for which `wait_all` should wait.

template<typename **R**>

void **hpx::wait_all**(*std::vector<future<R>>* &&futures)

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note

The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

Note

The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

Note

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until `wait_all` returns and all inspection of the futures is complete.

Parameters

futures – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which `wait_all` should wait.

template<typename **R**, *std::size_t N*>

```
void hpx::wait_all(std::array<future<R>, N> &&futures)
```

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note

The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note

The function *wait_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Note

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait_all* returns and all inspection of the futures is complete.

Parameters

futures – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_all* should wait.

```
template<typename T>
```

```
void hpx::wait_all(hpx::future<T> const &f)
```

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note

The function *wait_all* returns after the future has become ready. The input future is still valid after *wait_all* returns.

Note

The function *wait_all* will rethrow any exceptions captured by the future while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters

f – A *future* or *shared_future* for which *wait_all* should wait.

```
template<typename ...T>
```

void `hpx::wait_all`(*T*&&... futures)

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note

The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

Note

The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

Parameters

futures – An arbitrary number of *future* or `shared_future` objects, possibly holding different types for which `wait_all` should wait.

`hpx::wait_all_nothrow`

Defined in header `hpx/future.hpp`⁸²⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::wait_all`
- `hpx::wait_all_n`
- `hpx::wait_all_n_nothrow`

template<typename **InputIter**>

bool `hpx::wait_all_nothrow`(*InputIter* first, *InputIter* last)

The function `wait_all_nothrow` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to `wait_all`. It differs from `wait_all` in that it will not rethrow any exceptions captured by the given futures while they became ready.

Note

The function `wait_all_nothrow` returns after all futures have become ready. All input futures are still valid after `wait_all_nothrow` returns.

⁸²⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Note

Unlike *wait_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

Note

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait_all* returns and all inspection of the futures is complete.

Parameters

- **first** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all_nothrow* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or *shared_future* objects for which *wait_all_nothrow* should wait.

Returns

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

```
template<typename R>
```

```
bool hpx::wait_all_nothrow(std::vector<future<R>> &&futures)
```

The function *wait_all_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all*. It differs from *wait_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

Note

The function *wait_all_nothrow* returns after all futures have become ready. All input futures are still valid after *wait_all_nothrow* returns.

Note

Unlike *wait_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

Parameters

futures – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_all_nothrow* should wait.

Returns

Returns *true* if any of the given futures held an exception once it became ready, and

false otherwise.

```
template<typename R, std::size_t N>
```

```
bool hpx::wait_all_nothrow(std::array<future<R>, N> &&futures)
```

The function *wait_all_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all*. It differs from *wait_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

Note

The function *wait_all_nothrow* returns after all futures have become ready. All input futures are still valid after *wait_all_nothrow* returns.

Note

Unlike *wait_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

Parameters

futures – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_all_nothrow* should wait.

Returns

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

```
template<typename T>
```

```
bool hpx::wait_all_nothrow(hpx::future<T> const &f)
```

The function *wait_all_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all*. It differs from *wait_all* in that it will not rethrow any exceptions captured by the given future while it became ready.

Note

The function *wait_all_nothrow* returns after the future has become ready. The input future is still valid after *wait_all_nothrow* returns.

Note

Unlike *wait_all*, this function will not rethrow any exception captured by the future while becoming ready. Any such exception is silently discarded; the caller can use the returned *bool* to detect its presence.

Parameters

f – A *future* or *shared_future* for which *wait_all_nothrow* should wait.

Returns

Returns *true* if the given future held an exception once it became ready, and *false* otherwise.

```
template<typename ...T>
```

```
bool hpx::wait_all_nothrow(T&&... futures)
```

The function *wait_all_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait_all*. It differs from *wait_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

Note

The function *wait_all_nothrow* returns after all futures have become ready. All input futures are still valid after *wait_all_nothrow* returns.

Note

Unlike *wait_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

Parameters

futures – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_all_nothrow* should wait.

Returns

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

hpx::wait_all_n

Defined in header *hpx/future.hpp*⁸²⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait_all*
- *hpx::wait_all_nothrow*
- *hpx::wait_all_n_nothrow*

```
template<typename InputIter>
```

⁸²⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

```
void hpx::wait_all_n(InputIter begin, std::size_t count)
```

The function *wait_all_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note

The function *wait_all_n* returns after all futures have become ready. All input futures are still valid after *wait_all_n* returns.

Note

The function *wait_all_n* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_n_nothrow* instead.

Note

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait_all* returns and all inspection of the futures is complete.

Parameters

- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

Returns

The function *wait_all_n* will return an iterator referring to the first element in the input sequence after the last processed element.

hpx::wait_all_n_nothrow

Defined in header *hpx/future.hpp*⁸²⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

- *hpx::wait_all_nothrow*
- *hpx::wait_all_n*

```
template<typename InputIter>
```

```
std::pair<InputIter, bool> hpx::wait_all_n_nothrow(InputIter begin, std::size_t count)
```

The function *wait_all_n_nothrow* is an operator allowing to join on the result of all

⁸²⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

given futures. It AND-composes all future objects given and returns after they finished executing, similar to `wait_all_n`. It differs from `wait_all_n` in that it will not rethrow any exceptions captured by the given futures while they became ready.

Note

The function `wait_all_n_nothrow` returns after all futures have become ready. All input futures are still valid after `wait_all_n_nothrow` returns.

Note

Unlike `wait_all_n`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned `bool` to detect their presence.

Note

The caller is responsible for keeping the `futures` container alive, unmoved, and unmodified until `wait_all` returns and all inspection of the futures is complete.

Parameters

- **begin** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all_n_nothrow` should wait.
- **count** – The number of elements in the sequence starting at *first*.

Returns

The function `wait_all_n_nothrow` returns a pair consisting of an iterator referring to the first element in the input sequence after the last processed element, and a `bool` that is `true` if any of the given futures held an exception once it became ready, and `false` otherwise.

hpx::when_each

Defined in header `hpx/future.hpp`⁸²⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename F, typename Future>
```

```
future<void> hpx::when_each(F &&f, std::vector<Future> &&futures)
```

The function `when_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

⁸²⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_each* should wait.

Returns

Returns a future representing the event of all input futures being ready.

```
template<typename F, typename Iterator>
```

```
future<Iterator> hpx::when_each(F &&f, Iterator begin, Iterator end)
```

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.

Returns

Returns a future representing the event of all input futures being ready.

```
template<typename F, typename ...Ts>
```

future<void> **hpx::when_each**(*F* &&*f*, *Ts*&&... futures)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_each* should wait.

Returns

Returns a future representing the event of all input futures being ready.

hpx::wait_some

Defined in header `hpx/future.hpp`⁸³⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait_some_nothrow*
- *hpx::wait_some_n*
- *hpx::wait_some_n_nothrow*

template<typename **InputIter**>

void **hpx::wait_some**(*std::size_t* n, *InputIter* first, *InputIter* last)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note

The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

⁸³⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Note

The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the function to return.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

```
template<typename R>
```

```
void hpx::wait_some(std::size_t n, std::vector<future<R>> &&futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note

The function `wait_some` returns after *n* futures have become ready. All input futures are still valid after `wait_some` returns.

Note

The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A vector holding an arbitrary amount of *future* or *shared_future* objects for which `wait_some` should wait.

```
template<typename R, std::size_t N>
```

```
void hpx::wait_some(std::size_t n, std::array<future<R>, N> &&futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note

The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note

The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_some* should wait.

```
template<typename ...T>
```

```
void hpx::wait_some(std::size_t n, T&&... futures)
```

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note

The function *wait_all* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note

The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_some* should wait.

The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_each* should wait.

```
template<typename F, typename Iterator>
```

```
void hpx::wait_each(F &&f, Iterator begin, Iterator end)
```

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.

```
template<typename F, typename ...T>
```

```
void hpx::wait_each(F &&f, T&&... futures)
```

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_each* should wait.

hpx::wait_each_nothrow

Defined in header `hpx/future.hpp`⁸³⁵.

template<typename **F**, typename **Iterator**>

⁸³⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

⁸³⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

```
void hpx::wait_each_n(F &&f, Iterator begin, std::size_t count)
```

The function *wait_each* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready.

Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

hpx::wait_each_n_nothrow

Defined in header `hpx/future.hpp`⁸³⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait_each*
- *hpx::wait_each_nothrow*
- *hpx::wait_each_n*

Warning

doxygenfunction: Cannot find function “hpx::wait_each_n_nothrow” in doxygen xml output for project “hpx” from directory: ../hpx_autodoc

⁸³⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

hpx::when_some

Defined in header `hpx/future.hpp`⁸³⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>>
future<when_some_result<Container>>> hpx::when_some(std::size_t n, Iterator first, Iterator last)
```

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note

The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note

Calling this version of *when_some* where *first* == *last*, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

Returns

Returns a *when_some_result* holding the same list of futures as has been passed to *when_some* and indices pointing to ready futures.

- *future<when_some_result<Container<future<R>>>>>*: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
```

```
future<when_some_result<Range>>> hpx::when_some(std::size_t n, Range &&futures)
```

The function *when_some* is an operator allowing to join on the result of all given futures.

⁸³⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note

The future returned by the function *when_some* becomes ready when at least n argument futures have become ready.

Note

Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A container holding an arbitrary amount of *future* or *shared_future* objects for which *when_some* should wait.

Returns

Returns a *when_some_result* holding the same list of futures as has been passed to *when_some* and indices pointing to ready futures.

- `future<when_some_result<Container<future<R>>>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename ...Ts>
```

```
future<when_some_result<tuple<future<T>...>>> hpx::when_some(std::size_t n, Ts&&... futures)
```

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note

The future returned by the function *when_some* becomes ready when at least n argument futures have become ready.

Note

Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_some* should wait.

Returns

Returns a *when_some_result* holding the same list of futures as has been passed to *when_some* and an index pointing to a ready future..

- `future<when_some_result<tuple<future<T0>, future<T1>...>>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- `future<when_some_result<tuple<>>>` if *when_some* is called with zero arguments. The returned future will be initially ready.

`hpx::wait_all_for`

Defined in header `hpx/future.hpp`⁸³⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_all_for_nothrow`
- `hpx::wait_all_for_n`
- `hpx::wait_all_for_n_nothrow`

```
template<typename InputIter>
```

```
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, InputIter first, InputIter last)
```

The function *wait_all_for* is an operator allowing to join on the result of all given futures, similar to *wait_all*. It differs from *wait_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

⁸³⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Note

The function `wait_all_for` will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use `wait_all_for_nothrow` instead.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **first** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all_for` should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of `future` or `shared_future` objects for which `wait_all_for` should wait.

Returns

Returns `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise.

```
template<typename R>
```

```
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, std::vector<future<R>>
                                     const &futures)
```

The function `wait_all_for` is an operator allowing to join on the result of all given futures, similar to `wait_all`. It differs from `wait_all` in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function `wait_all_for` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

Note

The function `wait_all_for` will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use `wait_all_for_nothrow` instead.

Note

The function `wait_all_for` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

Note

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmodified, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, *wait_all_for* may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_all_for* should wait.

Returns

Returns *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

```
template<typename R, std::size_t N>
```

```
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, std::array<future<R>, N>  
                                     const &futures)
```

The function *wait_all_for* is an operator allowing to join on the result of all given futures, similar to *wait_all*. It differs from *wait_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

Note

The function *wait_all_for* will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait_all_for_nothrow* instead.

Note

The function *wait_all_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

Note

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, *wait_all_for* may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_all_for* should wait.

Returns

Returns *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

```
template<typename T>
```

```
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, hpx::future<T> const &f)
```

The function *wait_all_for* is an operator allowing to join on the result of the given future, similar to *wait_all*. It differs from *wait_all* in that it will not suspend indefinitely if the given future never becomes ready; instead it returns as soon as either the future has become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for* returns after the future has become ready, or after the given timeout has expired, whichever comes first. The input future is still valid after *wait_all_for* returns, independently of the returned status.

Note

The function *wait_all_for* will rethrow any exceptions captured by the future while becoming ready, as long as the given future became ready before the timeout elapsed. If this behavior is undesirable, use *wait_all_for_nothrow* instead.

Parameters

- **timeout** – The maximum duration to wait for the given future to become ready.
- **f** – A *future* or *shared_future* for which *wait_all_for* should wait.

Returns

Returns *hpx::future_status::ready* if the given future has become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

template<typename ...T>

hpx::future_status *hpx::wait_all_for*(*hpx::chrono::steady_duration* const &timeout, *T* const&... futures)

The function *wait_all_for* is an operator allowing to join on the result of all given futures, similar to *wait_all*. It differs from *wait_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

Note

The function *wait_all_for* will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait_all_for_nothrow* instead.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_all_for* should wait.

Returns

Returns *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

hpx::wait_all_for_nothrow

Defined in header *hpx/future.hpp*⁸⁴⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::wait_all_for*

- *hpx::wait_all_for_n_nothrow*

template<typename **InputIter**>

⁸⁴⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

hpx::wait_all_for_nothrow_result ***hpx::wait_all_for_nothrow***(*hpx::chrono::steady_duration* const &timeout, *InputIter* first, *InputIter* last)

The function *wait_all_for_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait_all_for*. It differs from *wait_all_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for_nothrow* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for_nothrow* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

Note

Unlike *wait_all_for_nothrow*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **first** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all_for_nothrow* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or *shared_future* objects for which *wait_all_for_nothrow* should wait.

Returns

Returns a *wait_all_for_nothrow_result* object whose *status* member is *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise; and whose *has_exceptional_results* member indicates whether any of the futures that became ready had captured an exception.

template<typename R>

hpx::wait_all_for_nothrow_result ***hpx::wait_all_for_nothrow***(*hpx::chrono::steady_duration* const &timeout, *std::vector<future<R>>* const &futures)

The function *wait_all_for_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait_all_for*. It differs from *wait_all_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for_nothrow* returns after all futures have become ready, or after

the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

Note

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

Note

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

Note

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, `wait_all_for` may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which `wait_all_for_nothrow` should wait.

Returns

Returns a `wait_all_for_nothrow_result` object whose `status` member is `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise; and whose `has_exceptional_results` member indicates whether any of the futures that became ready had captured an exception.

```
template<typename R, std::size_t N>
```

```
hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout,
                                                           std::array<future<R>, N> const &futures)
```

The function `wait_all_for_nothrow` is an operator allowing to join on the result of all given futures, similar to `wait_all_for`. It differs from `wait_all_for` in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

Note

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

Note

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

Note

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmodified, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, `wait_all_for` may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which `wait_all_for_nothrow` should wait.

Returns

Returns a `wait_all_for_nothrow_result` object whose `status` member is `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise; and whose `has_exceptional_results` member indicates whether any of the futures that became ready had captured an exception.

template<typename T>

`hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout, hpx::future<T> const &f)`

The function `wait_all_for_nothrow` is an operator allowing to join on the result of the given future, similar to `wait_all_for`. It differs from `wait_all_for` in that it will not

rethrow any exceptions captured by the given future while it became ready; instead it returns as soon as either the future has become ready, or the given timeout has elapsed, whichever happens first.

Note

The function `wait_all_for_nothrow` returns after the future has become ready, or after the given timeout has expired, whichever comes first. The input future is still valid after `wait_all_for_nothrow` returns, independently of the returned status.

Note

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the future while becoming ready. Any such exception is silently discarded.

Parameters

- **timeout** – The maximum duration to wait for the given future to become ready.
- **f** – A *future* or *shared_future* for which `wait_all_for_nothrow` should wait.

Returns

Returns a `wait_all_for_nothrow_result` object whose `status` member is `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise; and whose `has_exceptional_results` member indicates whether any of the futures that became ready had captured an exception.

```
template<typename ...T>
```

```
hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout, T
                                                         const&... futures)
```

The function `wait_all_for_nothrow` is an operator allowing to join on the result of all given futures, similar to `wait_all_for`. It differs from `wait_all_for` in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

Note

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_all_for_nothrow* should wait.

Returns

Returns a *wait_all_for_nothrow_result* object whose *status* member is *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise; and whose *has_exceptional_results* member indicates whether any of the futures that became ready had captured an exception.

`hpx::wait_all_for_n`

Defined in header `hpx/future.hpp`⁸⁴¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

- *hpx::wait_all_for*
- *hpx::wait_all_for_nothrow*
- *hpx::wait_all_for_n_nothrow*

```
template<typename InputIter>
```

```
hpx::future_status hpx::wait_all_for_n(hpx::chrono::steady_duration const &timeout, InputIter begin,  
                                       std::size_t count)
```

The function *wait_all_for_n* is an operator allowing to join on the result of all given futures, similar to *wait_all_n*. It differs from *wait_all_n* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for_n* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for_n* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

Note

The function *wait_all_for_n* will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait_all_for_n_nothrow* instead.

⁸⁴¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all_for_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

Returns

Returns *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise.

`hpx::wait_all_for_n_nothrow`

Defined in header `hpx/future.hpp`⁸⁴².

See *Public API* for a list of names and headers that are part of the public HPX API.

- *hpx::wait_all_for_n*

template<typename **InputIter**>

hpx::wait_all_for_nothrow_result **hpx::wait_all_for_n_nothrow**(*hpx::chrono::steady_duration* const &timeout, *InputIter* begin, *std::size_t* count)

The function *wait_all_for_n_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait_all_n*. It differs from *wait_all_for_n* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

Note

The function *wait_all_for_n_nothrow* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait_all_for_n_nothrow* returns, independently of the returned status, and can be inspected (e.g. using *is_ready()*) to determine which of the given futures have become ready.

Note

Unlike *wait_all_for_n*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

Parameters

⁸⁴² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all_for_n_nothrow* should wait.
- **count** – The number of elements in the sequence starting at *first*.

Returns

Returns a *wait_all_for_nothrow_result* object whose *status* member is *hpx::future_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future_status::timeout* otherwise; and whose *has_exceptional_results* member indicates whether any of the futures that became ready had captured an exception.

hpx::wait_any

Defined in header [hpx/future.hpp](#)⁸⁴³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::wait_any_nothrow](#)
- [hpx::wait_any_n](#)
- [hpx::wait_any_n_nothrow](#)

```
template<typename InputIter>
```

```
void hpx::wait_any(InputIter first, InputIter last)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note

The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note

The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_any* should wait.

⁸⁴³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

```
template<typename R>
```

```
void hpx::wait_any(std::vector<future<R>> &futures)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note

The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note

The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

futures – [in] A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_any* should wait.

```
template<typename R, std::size_t N>
```

```
void hpx::wait_any(std::array<future<R>, N> &futures)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note

The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note

The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

futures – [in] An array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_any* should wait.

```
template<typename ...T>
```

```
void hpx::wait_any(T&&... futures)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note

The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

Note

The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

Parameters

futures – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which `wait_any` should wait.

hpx::wait_any_nothrow

Defined in header `hpx/future.hpp`⁸⁴⁴.

⁸⁴⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

void `hpx::wait_any_n`(*InputIter* first, *std::size_t* count)

The function `wait_any_n` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note

The function `wait_any_n` returns after at least one future has become ready. All input futures are still valid after `wait_any_n` returns.

Note

The function `wait_any_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_n_nothrow` instead.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which `wait_any_n` should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

`hpx::wait_any_n_nothrow`

Defined in header `hpx/future.hpp`⁸⁴⁶.

async_sycl

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/async_sycl/sycl_executor.hpp

Defined in header `hpx/async_sycl/sycl_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

template<typename **Executor**, typename ...**Ts**>

decltype(auto) **async**(*Executor* &&exec, *hpx::sycl::experimental::sycl_executor::queue_function_ptr_t*<*Ts*...> &&f, *Ts*&&... ts)

`hpx::async` overload for launching `sycl` queue member functions with an `sycl` executor

template<typename **Executor**, typename ...**Ts**>

bool **apply**(*Executor* &&exec, *hpx::sycl::experimental::sycl_executor::queue_function_ptr_t*<*Ts*...> &&f, *Ts*&&... ts)

`hpx::apply` overload for launching `sycl` queue member functions with an `sycl` executor

namespace **execution**

namespace **experimental**

namespace **sycl**

namespace **experimental**

struct **sycl_executor**

Public Types

```
using future_type = hpx::future<void>
```

```
template<typename ...Params>
```

```
using queue_function_ptr_t = ::sycl::event  
(::sycl::queue::*)(std::conditional_t<std::is_trivial_v<std::remove_reference_t<Params>>,  
std::decay_t<Params>, Params>...)
```

Default Implementation without the extra intel code_location parameter. Removes the reference for trivial types to make the function matching easier (see `sycl_stream.cpp` test)

Public Functions

```
template<typename sycl_device_selector>
```

```
inline explicit sycl_executor(sycl_device_selector const &selector)
```

Create a SYCL executor (based on a sycl queue)

```
~sycl_executor() = default
```

```
inline future_type get_future()
```

Get future for this command_queue (NOTE will be more efficient if an event is provided — otherwise a dummy kernel must be submitted to get an event)

```
inline future_type get_future(::sycl::event event)
```

Get future for that becomes ready when the given event completes.

```
template<typename ...Params>
```

```
inline void post(queue_function_ptr_t<Params...> &&queue_member_function, Params&&...  
args)
```

Invoke queue member function given queue and parameters — do not use event to return a `hpx::future` (One way)

```
template<typename ...Params>
```

```
inline hpx::future<void> async_execute(queue_function_ptr_t<Params...>  
&&queue_member_function, Params&&... args)
```

Invoke queue member function given queue and parameters — `hpx::future` tied to the sycl event / (two way)

```
inline ::sycl::device get_device() const
```

Return the device used by the underlying SYCL queue.

```
inline ::sycl::context get_context() const
```

Return the context used by the underlying SYCL queue.

```
inline ::sycl::queue &get_queue()
```

Return the underlying queue for direct access.

Protected Attributes

```
::sycl::queue command_queue
```

cache

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/cache/local_cache.hpp

Defined in header `hpx/cache/local_cache.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
template<typename Key, typename Entry, typename UpdatePolicy = std::less<Entry>, typename  
InsertPolicy = policies::always<Entry>, typename CacheStorage = std::map<Key, Entry>,  
typename Statistics = statistics::no_statistics>
```

```
class local_cache
```

#include <hpx/cache/local_cache.hpp> The `local_cache` implements the basic functionality needed for a local (non-distributed) cache.

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache, must model the `CacheEntry` concept
- **UpdatePolicy** – A (optional) type specifying a (binary) function object used to sort the cache entries based on their ‘age’. The ‘oldest’ entries (according to this sorting criteria) will be discarded first if the maximum capacity of the cache is reached. The default is `std::less<Entry>`. The function object will be invoked using 2 entry instances of the type `Entry`. This type must model the `UpdatePolicy` model.

- **InsertPolicy** – A (optional) type specifying a (unary) function object used to allow global decisions whether a particular entry should be added to the cache or not. The default is *policies::always*, imposing no global insert related criteria on the cache. The function object will be invoked using the entry instance to be inserted into the cache. This type must model the InsertPolicy model.
- **CacheStorage** – A (optional) container type used to store the cache items. The container must be an associative and STL compatible container. The default is a `std::map<Key, Entry>`.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type *statistics::no_statistics* which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using **key_type** = *Key*

using **entry_type** = *Entry*

using **update_policy_type** = *UpdatePolicy*

using **insert_policy_type** = *InsertPolicy*

using **storage_type** = *CacheStorage*

using **statistics_type** = *Statistics*

using **value_type** = typename *entry_type*::value_type

using **size_type** = typename *storage_type*::size_type

using **storage_value_type** = typename *storage_type*::value_type

Public Functions

inline explicit **local_cache**(*size_type* max_size = 0, *update_policy_type* const &up = *update_policy_type*(), *insert_policy_type* const &ip = *insert_policy_type*())

Construct an instance of a *local_cache*.

Parameters

- **max_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.
- **up** – [in] An instance of the *UpdatePolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *UpdatePolicy* template parameter.
- **ip** – [in] An instance of the *InsertPolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *InsertPolicy* template parameter.

local_cache(*local_cache* const &other) = default

local_cache(*local_cache* &&other) = default

local_cache &**operator=**(*local_cache* const &other) = default

local_cache &**operator=**(*local_cache* &&other) = default

~local_cache() = default

inline constexpr *size_type* **size**() const noexcept

Return current size of the cache.

Returns

The current size of this cache instance.

inline constexpr *size_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

Note

The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get_size*.

Returns

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

```
inline bool reserve(size_type max_size)
```

Change the maximum size this cache can grow to.

Parameters

max_size – [in] The new maximum size this cache will be allowed to grow to.

Returns

This function returns *true* if successful. It returns *false* if the new *max_size* is smaller than the current limit and the cache could not be shrunk to the new maximum size.

```
inline bool holds_key(key_type const &k) const
```

Check whether the cache currently holds an entry identified by the given key.

Note

This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

Parameters

k – [in] The key for the entry which should be looked up in the cache.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &k, key_type &realkey, entry_type &val)
```

Get a specific entry identified by the given key.

Note

The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &k, entry_type &val)
```

Get a specific entry identified by the given key.

Note

The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache.

- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &k, value_type &val)
```

Get a specific entry identified by the given key.

Note

The function will call the entry's *entry::touch* function if the value corresponding to the provided is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding value.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool insert(key_type const &k, value_type const &val)
```

Insert a new element into this cache.

Note

This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the newly constructed entry instance. If either of these functions returns *false* the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **val** – [in] The value which should be added to the cache.

Returns

This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```
inline bool insert(key_type const &k, value_type &&val)
```

```
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
```

```
inline bool insert(key_type const &k, Entry_ &&e)
```

Insert a new entry into this cache.

Note

This function invokes both, the insert policy as provided to the constructor and the function `entry::insert` of the provided entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the `insert` function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **e** – [in] The entry which should be added to the cache.

Returns

This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```
template<typename Value, std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>, int> = 0>
```

```
inline bool update(key_type const &k, Value &&val)
```

Update an existing element in this cache.

Note

The function will call the entry's `entry::touch` function if the indexed value is found in the cache.

Note

The difference to the other overload of the `insert` function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename F, typename Value, typename = std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>>>
```

```
inline bool update_if(key_type const &k, Value &&val, F &&f)
```

Update an existing element in this cache.

Note

The function will call the entry's `entry::touch` function if the indexed value is found in the cache.

Note

The difference to the other overload of the `insert` function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>,
entry_type>, int> = 0>
```

```
inline bool update(key_type const &k, Entry_ &&e)
```

Update an existing entry in this cache.

Note

The function will call the entry's `entry::touch` function if the indexed value is found in the cache.

Note

The difference to the other overload of the `insert` function is that this overload replaces the whole cache entry, while the other overload replaces the cached value only, leaving the cache entry properties untouched.

Parameters

- **k** – [in] The key for the entry which should be updated in the cache.
- **e** – [in] The entry which should be used as a replacement for the existing entry in the cache. Any existing entry is first removed and then this entry is added.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func = policies::always<storage_value_type>>
```

```
inline size_type erase(Func &&ep = Func())
```

Remove stored entries from the cache for which the supplied function object returns `true`.

Parameters

ep – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is `true`. Even then the entry might not be removed from the cache as its `entry::remove` function might return false.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the `entry::get_size` functions of the removed entries).

inline *size_type* **erase**()

Remove all stored entries from the cache.

Note

All entries are considered for removal, but in the end an entry might not be removed from the cache as its `entry::remove` function might return false. This function is very useful for instance in conjunction with an entry's `entry::remove` function enforcing additional criteria like entry expiration, etc.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the `entry::get_size` functions of the removed entries).

inline void **clear**()

Clear the cache.

Unconditionally removes all stored entries from the cache.

inline constexpr *statistics_type* const &**get_statistics**() const noexcept

Allow to access the embedded statistics instance.

Returns

This function returns a reference to the statistics instance embedded inside this cache

inline *statistics_type* &**get_statistics**() noexcept

hpx/cache/lru_cache.hpp

Defined in header `hpx/cache/lru_cache.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
template<typename Key, typename Entry, typename Statistics = statistics::no_statistics>
```

```
class lru_cache
```

#include `<hpx/cache/lru_cache.hpp>` The `lru_cache` implements the basic functionality needed for a local (non-distributed) LRU cache.

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache

- **Entry** – The type of the items to be held in the cache.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the `CacheStatistics` concept. The default value is the type `statistics::no_statistics` which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using **key_type** = *Key*

using **entry_type** = *Entry*

using **statistics_type** = *Statistics*

using **entry_pair** = *std::pair<key_type, entry_type>*

using **storage_type** = *std::list<entry_pair>*

using **map_type** = *std::map<Key, typename storage_type::iterator>*

using **size_type** = *std::size_t*

Public Functions

inline explicit **lru_cache**(*size_type* max_size = 0)

Construct an instance of a *lru_cache*.

Parameters

max_size – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.

lru_cache(*lru_cache* const &other) = default

lru_cache(*lru_cache* &&other) = default

lru_cache &operator=(*lru_cache* const &other) = default

lru_cache &operator=(*lru_cache* &&other) = default

~*lru_cache*() = default

inline constexpr *size_type* **size**() const noexcept

Return current size of the cache.

Returns

The current size of this cache instance.

inline constexpr *size_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

Note

The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get_size*.

Returns

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline void **reserve**(*size_type* max_size)

Change the maximum size this cache can grow to.

Parameters

max_size – [in] The new maximum size this cache will be allowed to grow to.

inline bool **holds_key**(*key_type* const &key) const

Check whether the cache currently holds an entry identified by the given key.

Note

This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

Parameters

key – [in] The key for the entry which should be looked up in the cache.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &key, *key_type* &realkey, *entry_type* &entry)

Get a specific entry identified by the given key.

Note

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Parameters

- **key** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &key, entry_type const &entry)
```

Get a specific entry identified by the given key.

Note

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Parameters

- **key** – [in] The key for the entry which should be retrieved from the cache.
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
template<typename Entry_, typename =  
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>  
inline bool insert(key_type const &key, Entry_ &&entry)
```

Insert a new entry into this cache.

Note

This function assumes that the entry is not in the cache already. Inserting an already existing entry is considered undefined behavior

Parameters

- **key** – [in] The key for the entry which should be added to the cache.
- **entry** – [in] The entry which should be added to the cache.

```
template<typename Entry_, typename =  
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>  
inline void update(key_type const &key, Entry_ &&entry)
```

Update an existing element in this cache.

Note

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Note

The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The entry which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

```
template<typename F, typename Entry_,
        std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
inline bool update_if(key_type const &key, Entry_ &&entry, F &&f)
```

Update an existing element in this cache.

Note

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Note

The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func>
```

```
inline size_type erase(Func const &ep)
```

Remove stored entries from the cache for which the supplied function object returns true.

Parameters

ep – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

```
inline size_type erase()
```

Remove all stored entries from the cache.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

```
inline size_type clear()
```

Clear the cache.

Unconditionally removes all stored entries from the cache.

```
inline constexpr statistics_type const &get_statistics() const noexcept
```

Allow to access the embedded statistics instance.

Returns

This function returns a reference to the statistics instance embedded inside this cache

```
inline statistics_type &get_statistics() noexcept
```

Private Types

hpx/cache/entries/lru_entry.hpp

Defined in header `hpx/cache/entries/lru_entry.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **lru_entry** : public *hpx::util::cache::entries::entry<Value>*

#include `<hpx/cache/entries/lru_entry.hpp>` The `lru_entry` type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently used entries are discarded from the cache first.

Note

The `lru_entry` conforms to the `CacheEntry` concept.

Note

This type can be used to model a ‘most recently used’ cache policy if it is used with a `std::greater` as the caches’ `UpdatePolicy` (instead of the default `std::less`).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

Public Functions

inline **lru_entry**()

Any cache entry has to be default constructible.

inline explicit **lru_entry**(*Value* const &val)
noexcept(*std::is_nothrow_constructible_v*<*base_type*, *Value*
const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **lru_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline bool **touch**()

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LRU entry we store the time of the last access which will be used to compare the age of an entry during the invocation of the *operator<()*.

Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache’s `UpdatePolicy`

inline constexpr *time_point* const &**get_access_time**() const noexcept

Returns the last access time of the entry.

Private Types

```
using base_type = entry<Value>
```

```
using time_point = std::chrono::steady_clock::time_point
```

Private Members

```
time_point access_time_
```

Friends

```
inline friend auto operator<(lru_entry const &lhs, lru_entry const &rhs)
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been accessed less recently (LRU).

```
inline friend auto operator>(lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator<=(lru_entry const &lhs, lru_entry const &rhs)
```

```

```

```
inline friend auto operator==(lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator!=(lru_entry const &lhs, lru_entry const &rhs)
```

hpx/cache/entries/size_entry.hpp

Defined in header `hpx/cache/entries/size_entry.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **size_entry** : public *hpx::util::cache::entries::entry<Value>*

#include <hpx/cache/entries/size_entry.hpp> The *size_entry* type can be used to store values in a cache which have a size associated (such as files, etc.). Using this type as the cache's entry type makes sure that the entries with the biggest size are discarded from the cache first.

Note

The *size_entry* conforms to the CacheEntry concept.

Note

This type can be used to model a 'discard smallest first' cache policy if it is used with a *std::greater* as the caches' UpdatePolicy (instead of the default *std::less*).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and *less_than_comparable*.

Public Functions

size_entry() = default

Any cache entry has to be default constructible.

```
inline explicit size_entry(Value const &val, std::size_t size = 0)
    noexcept(std::is_nothrow_constructible_v<base_type, Value
    const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit size_entry(Value &&val, std::size_t size = 0) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline constexpr std::size_t get_size() const noexcept
```

Return the 'size' of this entry.

Private Types

```
using base_type = entry<Value>
```

Private Members

```
std::size_t size_ = 0
```

Friends

```
inline friend auto operator<(size_entry const &lhs, size_entry const &rhs) noexcept
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has a bigger size.

```
inline friend auto operator>(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator<=(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator>=(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator==(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator!=(size_entry const &lhs, size_entry const &rhs) noexcept
```

hpx/cache/entries/fifo_entry.hpp

Defined in header `hpx/cache/entries/fifo_entry.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

namespace **cache**

namespace **entries**

template<typename **Value**>

class **fifo_entry** : public *hpx::util::cache::entries::entry<Value>*

#include <hpx/cache/entries/fifo_entry.hpp> The **fifo_entry** type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently inserted entries are discarded from the cache first.

Note

The **fifo_entry** conforms to the CacheEntry concept.

Note

This type can be used to model a 'last in first out' cache policy if it is used with a `std::greater` as the caches' UpdatePolicy (instead of the default `std::less`).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

Public Functions

fifo_entry() = default

Any cache entry has to be default constructible.

inline explicit **fifo_entry**(*Value* const &val)
noexcept(*std::is_nothrow_constructible_v<base_type, Value>*, *Value*
const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **fifo_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline constexpr bool **insert**()

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

Note

This function is part of the CacheEntry concept

Returns

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

```
inline constexpr time_point const &get_creation_time() const noexcept
```

Private Types

```
using base_type = entry<Value>
```

```
using time_point = std::chrono::steady_clock::time_point
```

Private Members

```
time_point insertion_time_
```

Friends

```
inline friend auto operator<(fifo_entry const &lhs, fifo_entry const &rhs)
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been created earlier (FIFO).

```
inline friend auto operator>(fifo_entry const &lhs, fifo_entry const &rhs)
```

```
inline friend auto operator<=(fifo_entry const &lhs, fifo_entry const &rhs)
```

```
inline friend auto operator>=(fifo_entry const &lhs, fifo_entry const &rhs)
```

```
inline friend auto operator==(fifo_entry const &lhs, fifo_entry const &rhs)
```

```
inline friend auto operator!=(fifo_entry const &lhs, fifo_entry const &rhs)
```

hpx/cache/entries/entry.hpp

Defined in header `hpx/cache/entries/entry.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
namespace entries
```

```
template<typename Value>
```

```
class entry
```

```
    #include <hpx/cache/entries/entry.hpp>
```

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Subclassed by `hpx::util::cache::entries::fifo_entry< Value >`,
`hpx::util::cache::entries::lru_entry< Value >`, `hpx::util::cache::entries::lru_entry< Value >`, `hpx::util::cache::entries::size_entry< Value >`

Public Types

```
using value_type = Value
```

Public Functions

entry() = default

Any cache entry has to be default constructible.

```
inline explicit entry(value_type const &val)
    noexcept(std::is_nothrow_copy_constructible_v<value_type>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit entry(value_type &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline value_type &get() noexcept
```

Get a reference to the stored data value.

Note

This function is part of the CacheEntry concept

```
inline constexpr value_type const &get() const noexcept
```

Public Static Functions

```
static inline constexpr bool touch() noexcept
```

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

Note

It is possible to change the entry in a way influencing the sort criteria mandated by the UpdatePolicy. In this case the function should return *true* to indicate this to the cache, forcing to reorder the cache entries.

Note

This function is part of the CacheEntry concept

Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

static inline constexpr bool **insert**() noexcept

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

Note

This function is part of the CacheEntry concept

Returns

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

static inline constexpr bool **remove**() noexcept

The function *remove* is called by a cache holding this instance whenever it is about to be removed from the cache.

Note

This function is part of the CacheEntry concept

Returns

The return value can be used to avoid removing this instance from the cache. If the value is *true* it is ok to remove the entry, otherwise it will stay in the cache.

static inline constexpr *std::size_t* **get_size**() noexcept

Return the ‘size’ of this entry. By default, the size of each entry is just one (1), which is sensible if the cache has a limit (capacity) measured in number of entries.

Private Members

value_type **value_**

Friends

friend auto **operator<=>**(*entry* const&, *entry* const&) = default

Forwarding operator<=> allowing to compare entries instead of the values.

hpx/cache/entries/lfu_entry.hpp

Defined in header `hpx/cache/entries/lfu_entry.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
namespace entries
```

```
template<typename Value>
```

```
class lfu_entry : public hpx::util::cache::entries::entry<Value>
```

#include `<hpx/cache/entries/lfu_entry.hpp>` The `lfu_entry` type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least frequently used entries are discarded from the cache first.

Note

The `lfu_entry` conforms to the `CacheEntry` concept.

Note

This type can be used to model a 'most frequently used' cache policy if it is used with a `std::greater` as the caches' `UpdatePolicy` (instead of the default `std::less`).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

Public Functions

```
lfu_entry() = default
```

Any cache entry has to be default constructible.

```
inline explicit lfu_entry(Value const &val)
    noexcept(std::is_nothrow_constructible_v<base_type, Value>
             const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit lfu_entry(Value &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline bool touch() noexcept
```

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LFU entry we store the reference count tracking the number of times this entry has been requested. This which will be used to compare the age of an entry during the invocation of the *operator<()*.

Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

```
inline constexpr unsigned long const &get_access_count() const noexcept
```

Private Types

```
using base_type = entry<Value>
```

Private Members

```
unsigned long ref_count_ = 0
```

Friends

```
inline friend auto operator<(lfu_entry const &lhs, lfu_entry const &rhs)
```

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been accessed less frequently (LFU).

```
inline friend auto operator>(lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator<=(lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator>=(lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator==(lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator!=(lfu_entry const &lhs, lfu_entry const &rhs)
```

hpx/cache/statistics/no_statistics.hpp

Defined in header `hpx/cache/statistics/no_statistics.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
namespace statistics
```

Enums

```
enum class method
```

Values:

```
enumerator get_entry
```

```
enumerator insert_entry
```

```
enumerator update_entry
```

```
enumerator erase_entry
```

```
class no_statistics
```

Subclassed by `hpx::util::cache::statistics::local_statistics`

Public Static Functions

static inline constexpr void **got_hit**() noexcept

The function *got_hit* will be called by a cache instance whenever an entry got touched.

static inline constexpr void **got_miss**() noexcept

The function *got_miss* will be called by a cache instance whenever a requested entry has not been found in the cache.

static inline constexpr void **got_insertion**() noexcept

The function *got_insertion* will be called by a cache instance whenever a new entry has been inserted.

static inline constexpr void **got_eviction**() noexcept

The function *got_eviction* will be called by a cache instance whenever an entry has been removed from the cache because a new inserted entry let the cache grow beyond its capacity.

static inline constexpr void **clear**() noexcept

Reset all statistics.

static inline constexpr *std::int64_t* **get_get_entry_count**(bool) noexcept

The function *get_get_entry_count* returns the number of invocations of the *get_entry*() API function of the cache.

static inline constexpr *std::int64_t* **get_insert_entry_count**(bool) noexcept

The function *get_insert_entry_count* returns the number of invocations of the *insert_entry*() API function of the cache.

static inline constexpr *std::int64_t* **get_update_entry_count**(bool) noexcept

The function *get_update_entry_count* returns the number of invocations of the *update_entry*() API function of the cache.

static inline constexpr *std::int64_t* **get_erase_entry_count**(bool) noexcept

The function *get_erase_entry_count* returns the number of invocations of the *erase*() API function of the cache.

static inline constexpr *std::int64_t* **get_get_entry_time**(bool) noexcept

The function *get_get_entry_time* returns the overall time spent executing of the *get_entry*() API function of the cache.

static inline constexpr *std::int64_t* **get_insert_entry_time**(bool) noexcept

The function *get_insert_entry_time* returns the overall time spent executing of the *insert_entry*() API function of the cache.

```
static inline constexpr std::int64_t get_update_entry_time(bool) noexcept
```

The function *get_update_entry_time* returns the overall time spent executing of the *update_entry()* API function of the cache.

```
static inline constexpr std::int64_t get_erase_entry_time(bool) noexcept
```

The function *get_erase_entry_time* returns the overall time spent executing of the *erase()* API function of the cache.

```
struct update_on_exit
```

#include <no_statistics.hpp> Helper class to update timings and counts on function exit.

Public Functions

checkpoint_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/checkpoint_base/checkpoint_data.hpp

Defined in header `hpx/checkpoint_base/checkpoint_data.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

template<typename **Container**, typename ...**Ts**>

void **save_checkpoint_data**(*Container* &data, *Ts*&&... ts)

save_checkpoint_data

Save_checkpoint_data takes any number of objects which a user may wish to store in the given container.

Template Parameters

- **Container** – Container used to store the check-pointed data.
- **Ts** – Types of variables to checkpoint

Parameters

- **data** – Container instance used to store the checkpoint data
- **ts** – Variable instances to be inserted into the checkpoint.

template<typename ...**Ts**>

std::size_t **prepare_checkpoint_data**(*Ts* const&... ts)

prepare_checkpoint_data

prepare_checkpoint_data takes any number of objects which a user may wish to store in a subsequent save_checkpoint_data operation. The function will return the number of bytes necessary to store the data that will be produced.

Template Parameters

Ts – Types of variables to checkpoint

Parameters

ts – Variable instances to be inserted into the checkpoint.

```
template<typename Container, typename ...Ts>
```

```
void restore_checkpoint_data(Container const &cont, Ts&... ts)
```

```
    restore_checkpoint_data
```

`restore_checkpoint_data` takes any number of objects which a user may wish to restore from the given container. The sequence of objects has to correspond to the sequence of objects for the corresponding call to `save_checkpoint_data` that had used the given container instance.

Template Parameters

- **Container** – Container used to restore the check-pointed data.
- **Ts** – Types of variables to restore

Parameters

- **cont** – Container instance used to restore the checkpoint data
- **ts** – Variable instances to be restored from the container

```
struct checkpointing_tag
```

```
template<>
```

```
struct extra_data_helper<checkpointing_tag>
```

```

Returns the allocator associated with the container.

```
inline reference at(size_type pos)
```

```
inline const_reference at(size_type pos) const
```

```
inline reference operator[]( size_type pos)
```

```
inline const_reference operator[]( size_type pos) const
```

inline *reference* **front**()

Returns a reference to the first element in the container. Calling front on an empty container is undefined.

inline *const_reference* **front**() const

Returns a reference to the first element in the container. Calling front on an empty container is undefined.

inline *reference* **back**()

Returns a reference to the last element in the container. Calling back on an empty container is undefined.

inline *const_reference* **back**() const

Returns a reference to the last element in the container. Calling back on an empty container is undefined.

inline *pointer* **data**() noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data*(); *data*() + size()) is always a valid range, even if the container is empty (*data*() is not dereference-able in that case).

inline *const_pointer* **data**() const noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data*(); *data*() + size()) is always a valid range, even if the container is empty (*data*() is not dereference-able in that case).

inline *T* ***device_data**() const noexcept

Returns a raw pointer corresponding to the address of the data allocated on the device.

inline *std::size_t* **size**() const noexcept

inline *std::size_t* **capacity**() const noexcept

inline bool **empty**() const noexcept

Returns: size() == 0.

inline void **resize**(*size_type*)

Effects: If size <= size(), equivalent to calling pop_back() size()

- size times. If size() < size, appends size - size() default-inserted elements to the sequence.

Requires: T shall be MoveInsertable and DefaultInsertable into *this.

Remarks: If an exception is thrown other than by the move constructor of a non-CopyInsertable T there are no effects.

inline void **resize**(*size_type*, *T* const&)

Effects: If size <= size(), equivalent to calling pop_back() size() - size times. If size() < size, appends size - size() copies of val to the sequence.

Requires: T shall be CopyInsertable into *this.

Remarks: If an exception is thrown there are no effects.

inline *iterator* **begin**() noexcept

inline *iterator* **end**() noexcept

inline *const_iterator* **cbegin**() const noexcept

inline *const_iterator* **cend**() const noexcept

inline *const_iterator* **begin**() const noexcept

inline *const_iterator* **end**() const noexcept

inline *reverse_iterator* **rbegin**() noexcept

inline *reverse_iterator* **rend**() noexcept

inline *const_reverse_iterator* **crbegin**() const noexcept

inline *const_reverse_iterator* **crend**() const noexcept

inline *const_reverse_iterator* **rbegin**() const noexcept

inline *const_reverse_iterator* **rend**() const noexcept

inline void **swap**(*vector* &other) noexcept

Effects: Exchanges the contents and capacity() of *this with that of x.

Complexity: Constant time.

inline void **clear**() noexcept

Effects: Erases all elements in the range [begin(),end()). Destroys all elements in 'a'. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.

Post: a.empty() returns true.

Complexity: Linear.

```

```
template<class U>
```

```
inline void destroy(U *const p)
```

```
inline void initialize_pages(pointer p, size_t n) const
```

Touches every page of the allocation starting at *p* so that each page is physically bound to the NUMA domain assigned to it by *binding_helper_*. One first-touch task per NUMA domain is dispatched and the call blocks until all of them complete.

Parameters

- **p** – pointer to the start of the allocation to initialize.
- **n** – number of elements to initialize.

Pre

Must be called from an HPX thread. `init_mutex` serializes concurrent calls to this function and is intentionally held across `hpx::wait_all()` below, which is a suspension point that may resume the calling HPX thread on a different OS worker thread. `hpx::mutex` (unlike `std::mutex`) supports this safely, and `ignore_while_checking` silences the HPX lock-checking layer's warning about a lock spanning a suspension point.

```
inline std::string display_binding(pointer p, numa_binding_helper_ptr helper)
```

Builds a human-readable, page-by-page description of how the allocation starting at *p* is bound across NUMA domains, suitable for debug output. `init_mutex` is held only for the duration of this synchronous call; unlike *initialize_pages()*, no suspension point is crossed while it is held.

Parameters

- **p** – pointer to the start of the allocation to describe.
- **helper** – binding helper describing the array layout used to compute per-page offsets.

Returns

a formatted string describing the domain binding of each page in the allocation.

```
template<typename Binder>
```

```
inline std::shared_ptr<Binder> get_binding_helper_cast() const
```

Public Members

```
std::shared_ptr<numa_binding_helper<T>> binding_helper_

hpx/compute_local/host/block_fork_join_executor.hpp

Defined in header `hpx/compute_local/host/block_fork_join_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

class **block_fork_join_executor**

#include <block_fork_join_executor.hpp> An executor with fork-join (blocking) semantics.

The *block_fork_join_executor* creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a *fork_join_executor* hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of *bulk_(a)sync_execute*.

This behaviour is similar to the plain *fork_join_executor* except that the *block_fork_join_executor* creates a hierarchy of *fork_join_executors*, one for each target used to initialize it.

Public Functions

```
inline explicit block_fork_join_executor(threads::thread_priority const priority =  
    threads::thread_priority::bound,  
    threads::thread_stacksize const stacksize =  
    threads::thread_stacksize::small_,  
    fork_join_executor::loop_schedule const  
    schedule =  
    fork_join_executor::loop_schedule::static_,  
    std::chrono::nanoseconds const yield_delay =  
    std::chrono::milliseconds(1))
```

Construct a *block_fork_join_executor*.

Note

This constructor will create one *fork_join_executor* for each numa domain

Parameters

- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be *nostack*.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

```
inline explicit block_fork_join_executor(std::vector<compute::host::target> const
                                         &targets, threads::thread_priority const priority
                                         = threads::thread_priority::bound,
                                         threads::thread_stacksize const stacksize =
                                         threads::thread_stacksize::small_,
                                         fork_join_executor::loop_schedule const
                                         schedule =
                                         fork_join_executor::loop_schedule::static_,
                                         std::chrono::nanoseconds const yield_delay =
                                         std::chrono::milliseconds(1))
```

Construct a *block_fork_join_executor*.

Note

This constructor will create one *fork_join_executor* for each given target

Parameters

- **targets** – The list of targets to use for thread placement
- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be nostack.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

is_bulk_two_way_executor<Executor>
```

config

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/config.hpp

Defined in header hpx/config.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Defines

HPX_INITIAL_IP_PORT

This is the default ip/port number used by the parcel subsystem.

HPX_CONNECTING_IP_PORT

HPX_INITIAL_IP_ADDRESS

HPX_RUNTIME_INSTANCE_LIMIT

This defines the maximum number of possible runtime instances in one executable

HPX_PARCEL_BOOTSTRAP

This defines the type of the parcelport to be used during application bootstrap. This value can be changed at runtime by the configuration parameter:

`hpx.parcel.bootstrap = ...`

(or by setting the corresponding environment variable `HPX_PARCEL_BOOTSTRAP`).

HPX_PARCEL_MAX_CONNECTIONS

This defines the number of outgoing (parcel-) connections kept alive (to all other localities). This value can be changed at runtime by setting the configuration parameter:

`hpx.parcel.max_connections = ...`

(or by setting the corresponding environment variable `HPX_PARCEL_MAX_CONNECTIONS`).

HPX_PARCEL_IPC_DATA_BUFFER_CACHE_SIZE

This defines the number of outgoing ipc (parcel-) connections kept alive (to each of the other localities on the same node). This value can be changed at runtime by setting the configuration parameter:

`hpx.parcel.ipc.data_buffer_cache_size = ...`

(or by setting the corresponding environment variable `HPX_PARCEL_IPC_DATA_BUFFER_CACHE_SIZE`).

HPX_PARCEL_MPI_MAX_REQUESTS

This defines the number of MPI requests in flight. This value can be changed at runtime by setting the configuration parameter:

`hpx.parcel.mpi.max_requests = ...`

(or by setting the corresponding environment variable `HPX_PARCEL_MPI_MAX_REQUESTS`).

HPX_HAVE_PARCELPOR_MPI_BACKGROUND_THREADS

This defines the number of cores that perform background work for the MPI parcelport. This value can be changed at runtime by setting the configuration parameter:

`hpx.parcel.mpi.background_threads = ...`

(or by setting the corresponding environment variable `HPX_HAVE_PARCELPOR_MPI_BACKGROUND_THREADS`).

HPX_PARCEL_MAX_CONNECTIONS_PER_LOCALITY

This defines the number of outgoing (parcel-) connections kept alive (to each of the other localities). This value can be changed at runtime by setting the configuration parameter:

`hpx.parcel.max_connections_per_locality = ...`

(or by setting the corresponding environment variable `HPX_PARCEL_MAX_CONNECTIONS_PER_LOCALITY`).

HPX_PARCEL_MAX_MESSAGE_SIZE

This defines the maximally allowed message size for messages transferred between localities. This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.max_message_size = ...
```

(or by setting the corresponding environment variable HPX_PARCEL_MAX_MESSAGE_SIZE).

HPX_PARCEL_MAX_OUTBOUND_MESSAGE_SIZE

This defines the maximally allowed outbound message size for coalescing messages transferred between localities. This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.max_outbound_message_size = ...
```

(or by setting the corresponding environment variable HPX_PARCEL_MAX_OUTBOUND_MESSAGE_SIZE).

HPX_PARCEL_SERIALIZATION_OVERHEAD**HPX_AGAS_LOCAL_CACHE_SIZE**

This defines the number of AGAS address translations kept in the local cache. This is just the initial size which may be adjusted depending on the load of the system (not implemented yet), etc. It must be a minimum of 3 for AGAS v3 bootstrapping.

This value can be changes at runtime by setting the configuration parameter:

```
hpx.agas.local_cache_size = ...
```

(or by setting the corresponding environment variable HPX_AGAS_LOCAL_CACHE_SIZE)

HPX_AGAS_RPC_TIMEOUT

This defines the default AGAS RPC timeout in milliseconds.

This value can be changed at runtime by setting the configuration parameter:

```
hpx.agas.rpc_timeout = val
```

(or by setting the corresponding environment variable HPX_AGAS_RPC_TIMEOUT)

HPX_INITIAL_AGAS_MAX_PENDING_REFCNT_REQUESTS**HPX_GLOBALCREDIT_INITIAL**

This defines the initial global reference count associated with any created object.

HPX_NUM_IO_POOL_SIZE

This defines the default number of OS-threads created for the different internal thread pools

HPX_NUM_PARCEL_POOL_SIZE

HPX_NUM_TIMER_POOL_SIZE

HPX_SPINLOCK_DEADLOCK_DETECTION_LIMIT

By default, enable minimal thread deadlock detection in debug builds only.

HPX_HAVE_THREAD_BACKTRACE_DEPTH

By default we capture only 20 levels of stack back trace on suspension.

By default we do not maintain stack back-traces on suspension. This is a pure debugging aid to be able to see in the debugger where a suspended thread got stuck.

HPX_MAX_NETWORK_RETRIES

HPX_NETWORK_RETRIES_SLEEP

HPX_INI_PATH_DELIMITER

HPX_PATH_DELIMITERS

HPX_SHARED_LIB_EXTENSION

HPX_EXECUTABLE_EXTENSION

HPX_DEBUG_POSTFIX_STR

namespace **hpx**

namespace **threads**

Enums

enum class **thread_schedule_state** : *std::int8_t*

The *thread_schedule_state* enumerator encodes the current state of a *thread* instance

Task Lifecycle State Transitions:

```
stateDiagram-v2
    %% Creation Phase
    [*] --> Staged : task_staged
    [*] --> Pending : task_created
    [*] --> Suspended : task_created
    Staged --> Pending : task_created

    %% Execution Loop
    Pending --> Active : task_executing
    Active --> Pending : task_yielded

    %% Sleep / Wake Cycle
    Active --> Suspended : task_suspended
    Suspended --> Pending : task_resumed

    %% Termination Paths
    Active --> Terminated : task_completed
    Active --> Deleted : task_completed (Inline fast-path)
    Pending --> Terminated : task_completed (Aborted)
    Suspended --> Terminated : task_completed (Aborted)

    %% Cleanup (Destruction / Recycling)
    Terminated --> Deleted : task_deleted
    Deleted --> [*]
```

Values:

enumerator **unknown**

enumerator **active**

thread is currently active (running, has resources)

enumerator **pending**

thread is pending (ready to run, but no hardware resource available)

enumerator **suspended**

thread has been suspended (waiting for synchronization event, but still known and under control of the thread-manager)

enumerator **depleted**

thread has been depleted (deeply suspended, it is not known to the thread-manager)

enumerator `terminated`

thread has been stopped and may be garbage collected

enumerator `staged`

this is not a real thread state, but allows to reference staged task descriptions, which eventually will be converted into thread objects

enumerator `pending_do_not_schedule`

this is not a real thread state, but allows to create a thread in pending state without scheduling it (internal, do not use)

enumerator `pending_boost`

this is not a real thread state, but allows to suspend a thread in pending state without high priority rescheduling

enumerator `deleted`

thread has been stopped and was deleted

enum class `thread_priority` : `std::int8_t`

This enumeration lists all possible thread-priorities for HPX threads.

Values:

enumerator `unknown`**enumerator `default_`**

Will assign the priority of the task to the default (normal) priority.

enumerator `low`

Task goes onto a special low priority queue and will not be executed until all high/normal priority tasks are done, even if they are added after the low priority task.

enumerator `normal`

Task will be executed when it is taken from the normal priority queue, this is usually a first in-first-out ordering of tasks (depending on scheduler choice). This is the default priority.

enumerator `high_recursive`

The task is a high priority task and any child tasks spawned by this task will be made high priority as well - unless they are specifically flagged as non default priority.

enumerator `boost`

Same as `thread_priority_high` except that the thread will fall back to `thread_priority_normal` if resumed after being suspended.

enumerator **high**

Task goes onto a special high priority queue and will be executed before normal/low priority tasks are taken (some schedulers modify the behavior slightly and the documentation for those should be consulted).

enumerator **bound**

Task goes onto a special high priority queue and will never be stolen by another thread after initial assignment. This should be used for thread placement tasks such as OpenMP type for loops.

enumerator **initially_bound**

Task initially goes onto a special high priority queue and will never be stolen by another thread after initial assignment. If the thread is rescheduled later, it will use normal priority.

enum class **thread_restart_state** : *std::int8_t*

The *thread_restart_state* enumerator encodes the reason why a thread is being restarted

Values:

enumerator **unknown**enumerator **signaled**

The thread has been signaled.

enumerator **timeout**

The thread has been reactivated after a timeout.

enumerator **terminate**

The thread needs to be terminated.

enumerator **abort**

The thread needs to be aborted.

enum class **thread_stacksize** : *std::int8_t*

A *thread_stacksize* references any of the possible stack-sizes for HPX threads.

Values:

enumerator **unknown**enumerator **small_**

use small stack size (the underscore is to work around 'small' being defined to char on Windows)

enumerator **medium**

use medium sized stack size

enumerator **large**

use large stack size

enumerator **huge**

use very large stack size

enumerator **nostack**

this thread does not suspend (does not need a stack)

enumerator **current**

use size of current thread's stack

enumerator **default_**

use default stack size

enumerator **minimal**

use minimally stack size

enumerator **maximal**

use maximally stack size

enum class **thread_schedule_hint_mode** : *std::int8_t*

The type of hint given when creating new tasks.

Values:

enumerator **none**

A hint that leaves the choice of scheduling entirely up to the scheduler.

enumerator **thread**

A hint that tells the scheduler to prefer scheduling a task on the local thread number associated with this hint. Local thread numbers are indexed from zero. It is up to the scheduler to decide how to interpret thread numbers that are larger than the number of threads available to the scheduler. Typically, thread numbers will wrap around when too large.

enumerator **numa**

A hint that tells the scheduler to prefer scheduling a task on the NUMA domain associated with this hint. NUMA domains are indexed from zero. It is up to the scheduler to decide how to interpret NUMA domain indices that are larger than the number of available NUMA domains to the scheduler. Typically, indices will wrap around when too large.

enum class **thread_placement_hint** : *std::int8_t*

The type of hint given to the scheduler related to thread placement

The type of hint given to the scheduler related running a thread as a child directly in the context of the parent thread

Values:

enumerator **none**

No hint is specified. The implementation is free to chose what placement methods to use.

enumerator **depth_first**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core).

enumerator **breadth_first**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores).

enumerator **depth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core). Threads are being scheduled in reverse order.

enumerator **breadth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores). Threads are being scheduled in reverse order.

enum class **thread_sharing_hint** : *std::int8_t*

The type of hint given to the scheduler related to whether it is ok to share the invoked function object between threads

Values:

enumerator **none**

No hint is specified. The implementation is free to chose what sharing methods to use.

enumerator **do_not_share_function**

A hint that tells the scheduler to avoid sharing the given function (object) between threads.

enumerator **do_not_combine_tasks**

A hint that tells the scheduler to avoid combining tasks on the same thread. This is important for tasks that may synchronize between each other, which could lead to deadlocks if those tasks are combined running by the same thread.

enum class **thread_execution_hint** : *std::int8_t*

Values:

enumerator **none**

No hint is specified. Always run the thread in its own execution environment.

enumerator **run_as_child**

Attempt to run the thread in the execution context of the parent thread.

Functions

std::ostream &**operator**<<(*std::ostream* &os, *thread_schedule_state* t)

char const ***get_thread_state_name**(*thread_schedule_state* state) noexcept

Returns the name of the given state.

Get the readable string representing the name of the given thread_state constant.

Parameters

state – this represents the thread state.

std::ostream &**operator**<<(*std::ostream* &os, *thread_priority* t)

char const ***get_thread_priority_name**(*thread_priority* priority) noexcept

Return the thread priority name.

Get the readable string representing the name of the given thread_priority constant.

Parameters

priority – this represents the thread priority.

std::ostream &**operator**<<(*std::ostream* &os, *thread_restart_state* t)

char const ***get_thread_state_ex_name**(*thread_restart_state* state) noexcept

Get the readable string representing the name of the given thread_restart_state constant.

char const ***get_thread_state_name**(thread_state state) noexcept

Get the readable string representing the name of the given thread_state constant.

std::ostream &**operator**<<(*std::ostream* &os, *thread_stacksize* t)

char const ***get_stack_size_enum_name**(*thread_stacksize* size) noexcept

Returns the stack size name.

Get the readable string representing the given stack size constant.

Parameters

size – this represents the stack size

constexpr bool **do_not_share_function**(*thread_sharing_hint* hint) noexcept

constexpr bool **do_not_combine_tasks**(*thread_sharing_hint* hint) noexcept

constexpr *thread_sharing_hint* **operator|**(*thread_sharing_hint* lhs, *thread_sharing_hint* rhs) noexcept

constexpr bool **run_as_child**(*thread_execution_hint* hint) noexcept

Variables

constexpr *thread_execution_hint* **default_runs_as_child_hint** = *thread_execution_hint::none*

Default value to use for runs-as-child mode (if *true*, then futures will attempt to execute associated threads directly if they have not started running).

struct **thread_schedule_hint**

#include <thread_enums.hpp> A hint given to a scheduler to guide where a task should be scheduled.

A scheduler is free to ignore the hint, or modify the hint to suit the resources available to the scheduler.

Public Functions

inline constexpr **thread_schedule_hint**() noexcept

Construct a default hint with mode *thread_schedule_hint_mode::none*.

```
inline explicit constexpr thread_schedule_hint(std::int16_t const thread_hint,
                                                thread_placement_hint placement =
                                                thread_placement_hint::none,
                                                thread_execution_hint runs_as_child =
                                                default_runs_as_child_hint,
                                                thread_sharing_hint sharing =
                                                thread_sharing_hint::none) noexcept
```

Construct a hint with mode *thread_schedule_hint_mode::thread* and the given hint as the local thread number.

```
inline constexpr thread_schedule_hint(thread_schedule_hint_mode const mode, std::int16_t
                                         const hint, thread_placement_hint placement =
                                         thread_placement_hint::none, thread_execution_hint
                                         runs_as_child = default_runs_as_child_hint,
                                         thread_sharing_hint sharing =
                                         thread_sharing_hint::none) noexcept
```

Construct a hint with the given mode and hint. The numerical hint is unused when the mode is *thread_schedule_hint_mode::none*.

```
inline explicit constexpr thread_schedule_hint(thread_placement_hint placement) noexcept
```

Construct a hint with the given placement hint.

```
inline explicit constexpr thread_schedule_hint(thread_execution_hint runs_as_child) noexcept
```

Construct a hint with the given execution hint.

```
inline explicit constexpr thread_schedule_hint(thread_sharing_hint sharing) noexcept
```

Construct a hint with the given sharing hint.

```
inline constexpr thread_placement_hint placement_mode() const noexcept
```

```
inline constexpr void placement_mode(thread_placement_hint bits) noexcept
```

```
inline constexpr thread_sharing_hint sharing_mode() const noexcept
```

```
inline constexpr void sharing_mode(thread_sharing_hint bits) noexcept
```

```
inline constexpr thread_execution_hint runs_as_child_mode() const noexcept
```

```
inline constexpr void runs_as_child_mode(thread_execution_hint bits) noexcept
```

```
inline constexpr void schedule_hint(std::int16_t core) noexcept
```

Public Members

std::int16_t **hint** = -1

The hint associated with the mode. The interpretation of this hint depends on the given mode.

thread_schedule_hint_mode **mode** = *thread_schedule_hint_mode::none*

The mode of the scheduling hint.

std::uint8_t **placement_mode_bits**

The mode of the desired thread placement.

std::uint8_t **sharing_mode_bits**

The mode of the desired sharing hint.

std::uint8_t **runs_as_child_mode_bits**

The thread will run as a child directly in the context of the current thread

datastructures

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::ignore

Defined in header [hpx/tuple.hpp](#)⁸⁴⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::tuple*
- *hpx::tuple_size*

- *hpx::tie*
- *hpx::forward_as_tuple*
- *hpx::tuple_cat*
- *hpx::get*

constexpr *hpx::detail::ignore_type* *hpx::ignore* = { }

An object of unspecified type such that any value can be assigned to it with no effect. Intended for use with *hpx::tie* when unpacking a *hpx::tuple*, as a placeholder for the arguments that are not used. While the behavior of *hpx::ignore* outside of *hpx::tie* is not

⁸⁴⁷ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/tuple.hpp

formally specified, some code guides recommend using *hpx::ignore* to avoid warnings from unused return values of `[[nodiscard]]` functions.

hpx::tuple

Defined in header `hpx/tuple.hpp`⁸⁴⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ignore*
- *hpx::tuple_size*

- *hpx::tuple_cat*
- *hpx::get*

```
template<typename ...Ts>
```

```
class tuple
```

Class template *hpx::tuple* is a fixed-size collection of heterogeneous values. It is a generalization of *hpx::pair*. If *std::is_trivially_destructible<Ti>::value* is true for every *Ti* in *Ts*, the destructor of tuple is trivial.

Param Ts...

the types of the elements that the tuple stores.

hpx::tuple_size

Defined in header `hpx/tuple.hpp`⁸⁴⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ignore*

⁸⁴⁸ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/tuple.hpp

⁸⁴⁹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/tuple.hpp

- [*hpx::get*](#)

template<typename **T**, typename **Enable** = void>

struct **tuple_size**

Provides access to the number of elements in a tuple-like type as a compile-time constant expression.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like. The **Enable** parameter allows constraining partial specializations via SFINAE (mirroring [*hpx::tuple_element*](#)).

hpx::tuple_element

Defined in header [hpx/tuple.hpp](#)⁸⁵⁰.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [*hpx::ignore*](#)
- [*hpx::tuple*](#)
- [*hpx::tuple_size*](#)
- [*hpx::make_tuple*](#)
- [*hpx::tie*](#)
- [*hpx::forward_as_tuple*](#)
- [*hpx::tuple_cat*](#)
- [*hpx::get*](#)

template<std::size_t **I**, typename **T**, typename **Enable** = void>

struct **tuple_element**

Provides compile-time indexed access to the types of the elements of a tuple-like type.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

hpx::make_tuple

Defined in header [hpx/tuple.hpp](#)⁸⁵¹.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [*hpx::ignore*](#)
- [*hpx::tuple*](#)
- [*hpx::tuple_size*](#)

⁸⁵¹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/tuple.hpp

- `hpx::tuple_element`
- `hpx::tie`
- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

template<typename ...Ts>

constexpr `tuple<util::decay_unwrap_t<Ts>...>` `hpx::make_tuple`(Ts&&... ts)

Provides compile-time indexed access to the types of the elements of the tuple.

hpx::tie

Defined in header `hpx/tuple.hpp`⁸⁵².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ignore`
- `hpx::tuple`
- `hpx::tuple_size`
- `hpx::tuple_element`
- `hpx::make_tuple`
- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

template<typename ...Ts>

constexpr `tuple<Ts&...>` `hpx::tie`(Ts&... ts)

Creates a tuple of lvalue references to its arguments or instances of `hpx::ignore`.

Parameters

ts – zero or more lvalue arguments to construct the tuple from.

Returns

`hpx::tuple` object containing lvalue references.

⁸⁵² http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/tuple.hpp

hpx::forward_as_tuple

Defined in header [hpx/tuple.hpp](#)⁸⁵³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- [hpx::ignore](#)
- [hpx::tuple](#)
- [hpx::tuple_size](#)
- [hpx::tuple_element](#)
- [hpx::make_tuple](#)
- [hpx::tie](#)
- [hpx::tuple_cat](#)
- [hpx::get](#)

template<typename ...Ts>

constexpr [tuple](#)<Ts&&...> [hpx::forward_as_tuple](#)(Ts&&... ts)

Constructs a tuple of references to the arguments in args suitable for forwarding as an argument to a function. The tuple has rvalue reference data members when rvalues are used as arguments, and otherwise has lvalue reference data members.

Parameters

ts – zero or more arguments to construct the tuple from

Returns

[hpx::tuple](#) object created as if by

`hpx::tuple<Ts&&...>(HPX_FORWARD(Ts, ts)...)`

hpx::tuple_cat

Defined in header [hpx/tuple.hpp](#)⁸⁵⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

⁸⁵⁴ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/tuple.hpp

- `hpx::get`

template<typename ...**Tuples**>

constexpr auto `hpx::tuple_cat`(*Tuples*&&... tuples)

Constructs a tuple that is a concatenation of all tuples in `tuples`. The behavior is undefined if any type in `std::decay_t<Tuples>...` is not a specialization of `hpx::tuple`. However, an implementation may choose to support types (such as `std::array` and `std::pair`) that follow the tuple-like protocol.

Parameters

tuples – - zero or more tuples to concatenate

Returns

`hpx::tuple` object composed of all elements of all argument tuples constructed from `hpx::get<Is>`(HPX_FORWARD(UTuple,t) for each individual element.

`hpx::get`

Defined in header `hpx/tuple.hpp`⁸⁵⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

⁸⁵⁶ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/any.hpp

⁸⁵⁷ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/any.hpp

⁸⁵⁸ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/any.hpp

```
template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
```

```
T *hpx::any_cast(util::basic_any<IArch, OArch, Char, Copyable> *operand) noexcept
```

Performs type-safe access to the contained object.

Parameters

operand – target any object

Returns

If operand is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

```
template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
```

```
T const *hpx::any_cast(util::basic_any<IArch, OArch, Char, Copyable> const *operand) noexcept
```

Performs type-safe access to the contained object.

Parameters

operand – target any object

Returns

If operand is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

```
template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
```

```
T hpx::any_cast(util::basic_any<IArch, OArch, Char, Copyable> &operand)
```

Performs type-safe access to the contained object. Let *U* be `std::remove_cv_t<std::remove_reference_t<T>>`. The program is ill-formed if `std::is_constructible_v<T, U&>` is false.

Parameters

operand – target any object

Returns

`static_cast<T>(*std::any_cast<U>(&operand))`

```
template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
```

```
T const &hpx::any_cast(util::basic_any<IArch, OArch, Char, Copyable> const &operand)
```

Performs type-safe access to the contained object. Let *U* be `std::remove_cv_t<std::remove_reference_t<T>>`. The program is ill-formed if `std::is_constructible_v<T, const U&>` is false.

Parameters

operand – target any object

Returns

`static_cast<T>(*std::any_cast<U>(&operand))`

hpx::make_any_nonser

Defined in header `hpx/any.hpp`⁸⁵⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
util::basic_any<void, void, void, std::false_type> hpx::make_unique_any_nonser(
    std::initializer_list<U> il,
    Ts&&... ts)
```

```
template<typename T>
```

```
util::basic_any<void, void, void, std::false_type> hpx::make_unique_any_nonser(T &&t)
```

hpx::any

Defined in header `hpx/any.hpp`⁸⁶¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::make_any`

```
using hpx::any = util::basic_any<serialization::input_archive, serialization::output_archive, char, std::true_type>
```

hpx::make_any

Defined in header `hpx/any.hpp`⁸⁶².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::any`

```
template<typename T, typename Char>
```

```
util::basic_any<serialization::input_archive, serialization::output_archive, Char> hpx::make_any(T &&t)
```

Constructs an any object containing an object of type *T*, passing the provided arguments to *T*'s constructor. Equivalent to:

```
return
    std::any(std::in_place_type<T>, std::forward<Args>(args) ...);
```

hpx/errors/error.hpp

Defined in header `hpx/errors/error.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_ERROR_UNSCOPED_ENUM_DEPRECATION_MSG

namespace **hpx**

Enums

enum class **error** : *std::int16_t*

Possible error conditions.

This enumeration lists all possible error conditions which can be reported from any of the API functions.

Values:

enumerator **success**

The operation was successful.

enumerator **no_success**

The operation did failed, but not in an unexpected manner.

enumerator **not_implemented**

The operation is not implemented.

enumerator **out_of_memory**

The operation caused an out of memory condition.

enumerator **bad_action_code**

enumerator **bad_component_type**

The specified component type is not known or otherwise invalid.

enumerator **network_error**

A generic network error occurred.

enumerator **version_too_new**

The version of the network representation for this object is too new.

enumerator **version_too_old**

The version of the network representation for this object is too old.

enumerator **version_unknown**

The version of the network representation for this object is unknown.

enumerator **unknown_component_address**

enumerator **duplicate_component_address**

The given global id has already been registered.

enumerator **invalid_status**

The operation was executed in an invalid status.

enumerator **bad_parameter**

One of the supplied parameters is invalid.

enumerator **internal_server_error**

enumerator **service_unavailable**

enumerator **bad_request**

enumerator **repeated_request**

enumerator **lock_error**

enumerator **duplicate_console**

There is more than one console locality.

enumerator **no_registered_console**

There is no registered console locality available.

enumerator **startup_timed_out**

enumerator **uninitialized_value**

enumerator **bad_response_type**

enumerator **deadlock**

enumerator **assertion_failure**

enumerator **null_thread_id**

Attempt to invoke an API function from a non-HPX thread.

enumerator **invalid_data**

enumerator **yield_aborted**

The yield operation was aborted.

enumerator **dynamic_link_failure**

enumerator **commandline_option_error**

One of the options given on the command line is erroneous.

enumerator **serialization_error**

There was an error during serialization of this object.

enumerator **unhandled_exception**

An unhandled exception has been caught.

enumerator **kernel_error**

The OS kernel reported an error.

enumerator **broken_task**

The task associated with this future object is not available anymore.

enumerator **task_moved**

The task associated with this future object has been moved.

enumerator **task_already_started**

The task associated with this future object has already been started.

enumerator **future_already_retrieved**

The future object has already been retrieved.

enumerator **promise_already_satisfied**

The value for this future object has already been set.

enumerator **future_does_not_support_cancellation**

The future object does not support cancellation.

enumerator **future_can_not_be_cancelled**

The future can't be canceled at this time.

enumerator **no_state**

The future object has no valid shared state.

enumerator **broken_promise**

The promise has been deleted.

enumerator **thread_resource_error**

enumerator **future_cancelled**

enumerator **thread_cancelled**

enumerator **thread_not_interruptable**

enumerator **duplicate_component_id**

The component type has already been registered.

enumerator **unknown_error**

An unknown error occurred.

enumerator **bad_plugin_type**

The specified plugin type is not known or otherwise invalid.

enumerator **filesystem_error**

The specified file does not exist or other filesystem related error.

enumerator **bad_function_call**

equivalent of `std::bad_function_call`

enumerator **task_canceled_exception**

`parallel::task_canceled_exception`

enumerator **task_block_not_active**

`task_region` is not active

enumerator **out_of_range**

Equivalent to `std::out_of_range`.

enumerator **length_error**

Equivalent to `std::length_error`.

enumerator **migration_needs_retry**

migration failed because of global race, retry

enumerator **stale_state**

The queried state may be stale, e.g. because no state has been recorded yet or a preceding notification has not yet been delivered

enumerator **target_fenced**

A dispatch was deliberately and correctly refused because the target had already latched a terminal lifecycle event; this is a final rejection, not a staleness signal, and should not be retried

enumerator **future_wait_timed_out**

future wait timed out

enumerator **locality_was_disconnected**

the requested target locality was disconnected

enumerator **future_uncompleted**

future was resumed while being empty

```

```
constexpr error length_error = error::length_error
```

```
constexpr error migration_needs_retry = error::migration_needs_retry
```

hpx::error_code

Defined in header `hpx/system_error.hpp`⁸⁶³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
class error_code : public std::error_code
```

A *hpx::error_code* represents an arbitrary error condition.

The class *hpx::error_code* describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.

Note

Class *hpx::error_code* is an adjunct to error reporting by exception

hpx/errors/macros.hpp

Defined in header `hpx/errors/macros.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

⁸⁶³ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/system_error.hpp

Defines

HPX_THROW_EXCEPTION(errcode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX_THROW_EXCEPTION* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter *errcode* holds the *hpx::error* code the new exception should encapsulate. The parameter *f* is expected to hold the name of the function exception is thrown from and the parameter *msg* holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    ↪ // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_EXCEPTION(hpx::error::no_success, "raise_exception",
        "simulated error");
}
```

Example:

HPX_THROW_EXCEPTION_MODE(errcode, mode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX_THROW_EXCEPTION_MODE* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter *errcode* holds the *hpx::error* code the new exception should encapsulate. The parameter *f* is expected to hold the name of the function exception is thrown from and the parameter *msg* holds the error message the new exception should encapsulate. The *throwmode* parameter allows to specify the type of the thrown exception.

```
void raise_exception() {
    ↪ // Throw a hpx::exception initialized from the given parameters.
    HPX_THROW_EXCEPTION_MODE(hpx::error::no_success,
        hpx::throwmode::lightweight, "raise_exception",
        "simulated error");
}
```

Example:**HPX_THROW_BAD_ALLOC(f)**

Throw a `hpx::bad_alloc_exception` initialized from the given parameters.

The macro `HPX_THROW_BAD_ALLOC` can be used to throw a `hpx::exception`. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the `hpx::error_code` the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    ↪ // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_BAD_ALLOC("raise_exception", "simulated error");
}
```

Example:**HPX_THROWS_IF(ec, errcode, f, ...)**

Either throw a `hpx::exception` or initialize `hpx::error_code` from the given parameters.

The macro `HPX_THROWS_IF` can be used to either throw a `hpx::exception` or to initialize a `hpx::error_code` from the given parameters. If `&ec == &hpx::throws`, the semantics of this macro are equivalent to `HPX_THROW_EXCEPTION`. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

The parameter `errcode` holds the `hpx::error_code` from which the new exception should be initialized. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

HPX_THROWS_BAD_ALLOC_IF(ec, f)

Either throw a `hpx::bad_alloc_exception` or `hpx::error_code` to `out_of_memory`.

The macro `HPX_THROWS_BAD_ALLOC_IF` can be used to either throw a `hpx::bad_alloc_exception` or to initialize a `hpx::error_code` to `hpx::error::out_of_memory`. If `&ec == &hpx::throws`, the semantics of this macro are equivalent to `HPX_THROW_BAD_ALLOC`. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

HPX_DEFINE_ERROR_INFO(NAME, TYPE)

hpx/errors/exception_list.hpp

Defined in header `hpx/errors/exception_list.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **exception_list** : public *hpx::exception*

#include <exception_list.hpp> The class *exception_list* is a container of *exception_ptr* objects parallel algorithms may use to communicate uncaught exceptions encountered during parallel execution to the caller of the algorithm

The type `exception_list::const_iterator` fulfills the requirements of a forward iterator.

Public Types

using **iterator** = `exception_list_type::const_iterator`

bidirectional iterator

Public Functions

inline *std::size_t* **size**() const noexcept

The number of *exception_ptr* objects contained within the *exception_list*.

Note

Complexity: Constant time.

inline `exception_list_type::const_iterator` **begin**() const noexcept

An iterator referring to the first *exception_ptr* object contained within the *exception_list*.

inline `exception_list_type::const_iterator` **end**() const noexcept

An iterator which is the past-the-end value for the *exception_list*.

hpx/errors/define_error_info.hpp

Defined in header `hpx/errors/define_error_info.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

HPX_THROW_EXCEPTION

Defined in header `hpx/exception.hpp`⁸⁶⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *HPX_THROW_BAD_ALLOC*
- *HPX_THROWS_IF*

Warning

doxygenfunction: Cannot find function “HPX_THROW_EXCEPTION” in doxygen xml output for project “hpx” from directory: ../hpx_autodoc

HPX_THROW_BAD_ALLOC

Defined in header `hpx/exception.hpp`⁸⁶⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *HPX_THROW_EXCEPTION*
- *HPX_THROWS_IF*

Warning

doxygenfunction: Cannot find function “HPX_THROW_BAD_ALLOC” in doxygen xml output for project “hpx” from directory: ../hpx_autodoc

⁸⁶⁴ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/exception.hpp

⁸⁶⁵ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/exception.hpp

HPX_THROWS_IF

Defined in header `hpx/exception.hpp`⁸⁶⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *HPX_THROW_EXCEPTION*
- *HPX_THROW_BAD_ALLOC*

Warning

doxygenfunction: Cannot find function “HPX_THROWS_IF” in doxygen xml output for project “hpx” from directory: ../hpx_autodoc

hpx/errors/exception_fwd.hpp

Defined in header `hpx/errors/exception_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Enums

enum class **throwmode** : *std::uint8_t*

Encode error category for new *error_code*.

Values:

enumerator **plain**

enumerator **rethrow**

enumerator **lightweight**

⁸⁶⁶ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/exception.hpp

Functions

constexpr bool **operator&**(*throwmode* lhs, *throwmode* rhs) noexcept

Variables

error_code throws

Predefined *error_code* object used as “throw on error” tag.

The predefined *hpx::error_code* object *hpx::throws* is supplied for use as a “throw on error” tag.

Functions that specify an argument in the form ‘*error_code*& ec=throws’ (with appropriate namespace qualifiers), have the following error handling semantics:

If &ec != &throws and an error occurred: *ec.value()* returns the implementation specific error number for the particular error that occurred and *ec.category()* returns the *error_category* for *ec.value()*.

If &ec != &throws and an error did not occur, *ec.clear()*.

If an error occurs and &ec == &throws, the function throws an exception of type *hpx::exception* or of a type derived from it. The exception’s *get_errorcode()* member function returns a reference to a *hpx::error_code* object with the behavior as specified above.

hpx::exception

Defined in header *hpx/exception.hpp*⁸⁶⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **exception** : public *std::system_error*

A *hpx::exception* is the main exception type used by HPX to report errors.

The *hpx::exception* type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by *hpx::bad_alloc_exception*, *hpx::cuda::experimental::cuda_exception*, *hpx::exception_list*, *hpx::experimental::task_canceled_exception*, *hpx::mpi::experimental::mpi_exception*

⁸⁶⁷ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/exception.hpp

execution

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/execution/traits/policy_traits.hpp

Defined in header `hpx/execution/traits/policy_traits.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

hpx/execution/traits/is_execution_policy.hpp

Defined in header `hpx/execution/traits/is_execution_policy.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Variables

    #include <is_execution_policy.hpp> Extension: Detect whether given execution policy
    makes algorithms asynchronous
```

- i. The type *is_async_execution_policy* can be used to detect asynchronous execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.
- ii. If *T* is the type of the standard or implementation-defined execution policy, *is_async_execution_policy*<*T*> shall be publicly derived from *integral_constant*<bool, true>, otherwise from *integral_constant*<bool, false>.
- iii. The behavior of a program that adds specializations for *is_async_execution_policy* is undefined.

hpx::execution::experimental::persistent_auto_chunk_size

Defined in header *hpx/execution.hpp*⁸⁶⁸.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
struct persistent_auto_chunk_size
```

Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

hpx::execution::experimental::num_cores

Defined in header *hpx/execution.hpp*⁸⁶⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
struct num_cores
```

Control number of cores in executors which need a functionality for setting the number of cores to be used by an algorithm directly

⁸⁶⁸ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/execution.hpp

⁸⁶⁹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/execution.hpp

hpx::execution::experimental::max_num_chunks

Defined in header [hpx/execution.hpp](#)⁸⁷⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **max_num_chunks**

Loop iterations are divided into not more than *num_chunks* partitions that are assigned to threads. If *num_chunks* is not specified, the number of chunks is determined based on the number of available cores.

hpx/execution/executors/polymorphic_executor.hpp

hpx/execution/executors/adaptive_static_chunk_size.hpp

Defined in header `hpx/execution/executors/adaptive_static_chunk_size.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace execution
```

```
namespace experimental
```

```
struct adaptive_static_chunk_size
```

#include `<adaptive_static_chunk_size.hpp>` Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note

This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

adaptive_static_chunk_size() = default

Construct a `adaptive_static_chunk_size` executor parameters object

Note

By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

```
inline explicit constexpr adaptive_static_chunk_size(std::size_t const chunk_size)
                                                    noexcept
```

Construct a `adaptive_static_chunk_size` executor parameters object

Parameters

chunk_size – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

hpx::execution::experimental::static_chunk_size

Defined in header `hpx/execution.hpp`⁸⁷¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

struct **static_chunk_size**

Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note

This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

⁸⁷¹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/execution.hpp

hpx/execution/executors/rebind_policy.hpp

Defined in header `hpx/execution/executors/rebind_policy.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Orthogonal customization points for rebinding an execution policy's executor and executor parameters independently of one another.

`hpx::execution::detail::execution_policy` is the CRTP base class that CRTP-based built-in execution policies derive from; not every built-in policy uses it (`thrust_task_policy` is one example that does not). It exposes a single, combined rebind operation: given a new Executor and a new Parameters type, it produces `Derived<Executor, Parameters>`, where `Derived` is the template `<typename, typename>` class the concrete policy is written as. `hpx::execution::experimental::rebind_executor_t` builds on top of that combined operation and is what `hpx::execution::detail::execution_policy` itself uses internally for `on()`, `with()`, and `query()`.

That combined operation requires every execution policy to be shaped exactly as `Derived<Executor, Parameters>`, which is awkward for a policy that needs to carry additional state, expose additional template parameters, or simply is not naturally expressed as a two-parameter class template. This header adds two smaller, independently specializable customization points, one per axis, so a policy can opt in to rebinding along either axis without being forced into that shape at all. This is purely additive: nothing here replaces or is called by the existing combined `rebind_executor_t`, `on()`, `with()`, or `query()` machinery.

namespace **hpx**

namespace **execution**

hpx/execution/executors/default_parameters.hpp

Defined in header `hpx/execution/executors/default_parameters.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **default_parameters**

`#include <default_parameters.hpp>` Loop iterations are divided into pieces of size

chunk_size and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note

This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

default_parameters() = default

Construct a `default_parameters` executor parameters object

Note

By default, the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

hpx::execution::experimental::guided_chunk_size

Defined in header `hpx/execution.hpp`⁸⁷².

See *Public API* for a list of names and headers that are part of the public HPX API.

struct **guided_chunk_size**

Iterations are dynamically assigned to threads in blocks as threads request those until no blocks remain to be assigned. Similar to `dynamic_chunk_size` except that the block size decreases each time a number of loop iterations is given to a thread. The size of the initial block is proportional to $\text{number_of_iterations} / \text{number_of_cores}$. Subsequent blocks are proportional to $\text{number_of_iterations_remaining} / \text{number_of_cores}$. The optional chunk size parameter defines the minimum block size. The default chunk size is 1.

Note

This executor parameters type is equivalent to OpenMP's GUIDED scheduling directive.

⁸⁷² http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/execution.hpp

hpx/execution/executors/rebind_executor.hpp

Defined in header `hpx/execution/executors/rebind_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
struct auto_chunk_size
```

Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

⁸⁷³ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/execution.hpp

#include <execution_parameters_fwd.hpp> Return the number of invocations of the given function *f* which should be combined into a single task

Param params

[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num_tasks*.

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param iteration_duration

[in] The time one of the tasks require to be executed.

Param cores

[in] The number of cores the number of chunks should be determined for.

Param num_tasks

[in] The number of tasks the chunk size should be determined for

Return

The size of the chunks (number of iterations per chunk) that should be used for parallel execution.

Public Functions

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec,  
                                     hpx::chrono::steady_duration const &iteration_duration,  
                                     std::size_t cores, std::size_t num_tasks) const
```

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec, std::size_t cores,  
                                     std::size_t num_tasks) const
```

```
struct measure_iteration_t
```

```
#include <execution_parameters_fwd.hpp> Return the measured execution time for  
one iteration based on running the given function.
```

Note

The parameter *f* is expected to be a nullary function returning a `std::size_t` representing the number of iteration the function has already executed (i.e. which don't have to be scheduled anymore).

Param params

[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num_tasks*.

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param f

[in] The function which will be optionally scheduled using the given executor.

Param num_tasks

[in] The number of tasks the chunk size should be determined for

Return

The execution time for one of the tasks.

Public Functions

```
template<typename Parameters, typename Executor, typename F>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec, F &&f,  
                                     std::size_t num_tasks) const
```

```
struct maximal_number_of_chunks_t
```

```
#include <execution_parameters_fwd.hpp> Return the largest reasonable number of  
chunks to create for a single algorithm invocation.
```

Param params

[in] The executor parameters object to use for determining the number of chunks for the given number of *cores*.

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param cores

[in] The number of cores the number of chunks should be determined for.

Param num_tasks

[in] The number of tasks the chunk size should be determined for

Public Functions

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec, std::size_t cores,  
                                   std::size_t num_tasks) const
```

```
struct reset_thread_distribution_t
```

#include <execution_parameters_fwd.hpp> Reset the internal round robin thread distribution scheme for the given executor.

Note

This calls `params.reset_thread_distribution(exec)` if it exists; otherwise it does nothing.

Param params

[in] The executor parameters object to use for resetting the thread distribution scheme.

Param exec

[in] The executor object to use.

Public Functions

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec) const
```

```
struct processing_units_count_t
```

#include <execution_parameters_fwd.hpp> Retrieve the number of (kernel-)threads used by the associated executor.

Note

This calls `params.processing_units_count(Executor&&)` if it exists; otherwise it forwards the request to the executor parameters object.

Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param iteration_duration

[in] The time one of the tasks require to be executed.

Param num_tasks

[in] The number of tasks the number of cores should be determined for

Return

The number of cores to use

Public Functions

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec,  
                                   hpx::chrono::steady_duration const &iteration_duration,

```

```
#include <execution_parameters_fwd.hpp> Mark custom point in parallel algorithm
execution
```

Note

This calls `params.mark_partition(exec, partition, args...)` if it exists; otherwise it does nothing.

Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Public Functions

```
template<typename Parameters, typename Executor, typename ...Args>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec, std::size_t
partition, Args&&... args) const
```

```
struct collect_execution_parameters_t
```

```
#include <execution_parameters_fwd.hpp> Collect various parameters of the chunking
for this parallel algorithm execution
```

Note

This calls `params.mark_begin_execution(exec)` if it exists; otherwise it does nothing.

Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param num_elements

[in] The overall number of elements for the algorithm.

Param num_cores

[in] The overall number of cores to utilize for the algorithm.

Param num_chunks

[in] The overall number of chunks for the algorithm.

Param chunk_size

[in] The size of the chunks created for the algorithm.

Public Functions

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec, std::size_t  
    num_elements, std::size_t num_cores, std::size_t  
    num_chunks, std::size_t chunk_size) const
```

```
template<>
```

```
struct is_scheduling_property<with_processing_units_count_t> : public std::true_type
```

hpx::execution::experimental::dynamic_chunk_size

Defined in header [hpx/execution.hpp](#)⁸⁷⁴.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
struct dynamic_chunk_size
```

Loop iterations are divided into pieces of size *chunk_size* and then dynamically scheduled among the threads; when a thread finishes one chunk, it is dynamically assigned another. If *chunk_size* is not specified, the default chunk size is 1.

Note

This executor parameters type is equivalent to OpenMP's DYNAMIC scheduling directive.

hpx::execution::experimental::collect_chunking_parameters

Defined in header [hpx/execution.hpp](#)⁸⁷⁵.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
struct collect_chunking_parameters
```

Collect various parameters used for running a parallel algorithm.

⁸⁷⁴ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/execution.

⁸⁷⁵ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/execution.

hpp

hpx/execution/algorithms/future_sender.hpp

Defined in header `hpx/execution/algorithms/future_sender.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Implementation details for adapting HPX futures as P2300 senders.

Usage:

```

hpx::future<int> f = hpx::async([]{ return 42; });
auto
↳ result = hpx::execution::experimental::as_sender(std::move(f))
↳ | hpx::execution::experimental::then([](int x){ return x * 2; })
  | hpx::execution::experimental::sync_wait();

```

namespace **hpx**

namespace **execution**

namespace **experimental**

hpx/execution/algorithms/sender_future.hpp

Defined in header `hpx/execution/algorithms/sender_future.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Converts any P2300 `stdexec` sender into an `hpx::future<T>`.

Usage:

```

// Explicit T:
auto sender
↳ = stdexec::just(42) | stdexec::then([](int x){ return x; });
hpx::future<int> f =
↳ hpx::execution::experimental::as_future<int>(std::move(sender));
int val = f.get(); // == 42

```

namespace **hpx**

namespace **execution**

```
namespace experimental
```

Variables

```
template<typename T>
```

```
constexpr as_future_t<T> as_future = {}
```

```
template<typename T>
```

```
struct as_future_t
```

Public Functions

```
template<typename Sender, typename =  
std::enable_if_t<hpx::execution::experimental::is_sender_v<std::decay_t<Sender>>>>  
inline constexpr hpx::future<T> operator() (Sender &&sender) const
```

execution_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/execution_base/execution.hpp

Defined in header `hpx/execution_base/execution.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace execution
```

```
struct sequenced_execution_tag
```

#include `<execution.hpp>` Function invocations executed by a group of sequential execution agents execute in sequential order.

struct `parallel_execution_tag`

#include <execution.hpp> Function invocations executed by a group of parallel execution agents execute in unordered fashion. Any such invocations executing in the same thread are indeterminately sequenced with respect to each other.

Note

`parallel_execution_tag` is weaker than `sequenced_execution_tag`.

struct `unsequenced_execution_tag`

#include <execution.hpp> Function invocations executed by a group of vector execution agents are permitted to execute in unordered fashion when executed in different threads, and un-sequenced with respect to one another when executed in the same thread.

Note

`unsequenced_execution_tag` is weaker than `parallel_execution_tag`.

namespace `parallel`**namespace `execution`****Variables**

constexpr struct `hpx::parallel::execution::sync_execute_t` **`sync_execute`**

constexpr struct `hpx::parallel::execution::async_execute_t` **`async_execute`**

```

```
constexpr struct hpx::parallel::execution::sync_invoke_t sync_invoke
```

```
struct sync_execute_t
```

#include <execution.hpp> Customization point for synchronous execution agent creation.

This synchronously creates a single function invocation *f()* using the associated executor. The execution of the supplied function synchronizes with the caller

Note

It will call `exec.sync_execute(f, ts...)` if the executor exposes a corresponding member function. For two-way executors it will invoke `async_execute` and wait for the task's completion before returning.

Param *exec*

[in] The executor object to use for scheduling of the function *f*.

Param *f*

[in] The function which will be scheduled using the given executor.

Param *ts*

[in] Additional arguments to use to invoke *f*.

Return

f(ts...)'s result

Public Functions

```
template<typename Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<typename Executor, typename F, typename...  
Ts> HPX_DEPRECATED_V(2, 0,

inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

Public Members

F &&f

```
F Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(sync_execute_t{},
std::forward< Executor >( exec ), std::forward< F >( f ),
std::forward< Ts >( ts )...)
```

struct **async_execute_t**

#include <execution.hpp> Customization point for asynchronous execution agent creation.

This asynchronously creates a single function invocation *f()* using the associated executor.

Note

Executors have to implement only `async_execute()`. All other functions will be emulated by this or other customization points in terms of this single basic primitive. However, some executors will naturally specialize all operations for maximum efficiency.

Note

This is valid for one way executors (calls `make_ready_future(exec.sync_execute(f, ts...))` if it exists) and for two-way executors (calls `exec.async_execute(f, ts...)` if it exists).

Param *exec*

[in] The executor object to use for scheduling of the function *f*.

Param *f*

[in] The function which will be scheduled using the given executor.

Param *ts*

[in] Additional arguments to use to invoke *f*.

Return

f(ts...)'s result through a future

Public Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<typename Executor, typename F, typename...
Ts> HPX_DEPRECATED_V(2, 0,
"tag_invoke overloads for async_execute are deprecated. " "Define an .
async_execute() member function instead.
") decltype(auto) operator()(Executor &&exec
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

Public Members

F &&f

```
F Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(async_execute_t{}),
std::forward< Executor >( exec ), std::forward< F >( f ),
std::forward< Ts >( ts )...}
```

struct **then_execute_t**

#include <execution.hpp> Customization point for execution agent creation depending on a given future.

This creates a single function invocation `f()` using the associated executor after the given future object has become ready.

Note

This is valid for two-way executors (calls `exec.then_execute(f, predecessor, ts...)` if it exists) and for one way executors (calls `predecessor.then(bind(f, ts...))`).

Param **exec**

[in] The executor object to use for scheduling of the function *f*.

Param **f**

[in] The function which will be scheduled using the given executor.

Param **predecessor**

[in] The future object the execution of the given function depends on.

Params

[in] Additional arguments to use to invoke *f*.

Return

f(*ts...*)'s result through a future

Public Functions

```
template<typename Executor, typename F, typename Future, typename ...Ts>
```

```
inline decltype(auto) operator()(Executor &&exec, F &&f, Future &&predecessor, Ts&&...  
ts) const
```

```
template<typename Executor, typename F, typename Future, typename...  
Ts> HPX_DEPRECATED_V(2, 0,  
"tag_invoke overloads for then_execute are deprecated. " "Define a .  
then_execute() member function instead."  
) decltype(auto) operator()(Executor &&exec
```

```

inline decltype(auto) operator()(Executor &&exec, F &&f, Future &&predecessor, Ts&&...  
ts) const
```

Public Members

F &&*f*

F *Future* && predecessor

```
F Future Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(then_execute_t{}  
std::forward< Executor >( exec ), std::forward< F >( f ),  
std::forward< Future >( predecessor ), std::forward< Ts >( ts )..  
.)
```

```
struct post_t
```

#include <execution.hpp> Customization point for asynchronous fire & forget execution agent creation.

This asynchronously (fire & forget) creates a single function invocation *f*() using the associated executor.

Note

This is valid for two-way executors (calls `exec.post(f, ts...)`, if available, otherwise it calls `exec.async_execute(f, ts...)` while discarding the returned future), and for non-blocking two-way executors (calls `exec.post(f, ts...)` if it exists).

Param `exec`

[in] The executor object to use for scheduling of the function *f*.

Param `f`

[in] The function which will be scheduled using the given executor.

Param `ts`

[in] Additional arguments to use to invoke *f*.

Public Functions

```

```

Public Members

```
F &&f
```

```
F Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(post_t{},  
std::forward< Executor >( exec ), std::forward< F >( f ),  
std::forward< Ts >( ts )...)
```

```
struct bulk_sync_execute_t
```

```
#include <execution.hpp> Bulk form of synchronous execution agent creation.
```

This synchronously creates a group of function invocations $f(i)$ whose ordering is given by the `execution_category` associated with the executor. The function synchronizes the execution of all scheduled functions with the caller.

Here i takes on all values in the index space implied by `shape`. All exceptions thrown by invocations of $f(i)$ are reported in a manner consistent with parallel algorithm execution through the returned future.

Note

This is deliberately different from the `bulk_sync_execute` customization points specified in P0443. The `bulk_sync_execute` customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note

This calls `exec.bulk_sync_execute(f, shape, ts...)` if it exists; otherwise it executes `sync_execute(f, shape, ts...)` as often as needed.

Param `exec`

[in] The executor object to use for scheduling of the function f .

Param `f`

[in] The function which will be scheduled using the given executor.

Param `shape`

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to f .

Param `ts`

[in] Additional arguments to use to invoke f .

Return

The return type of `executor_type::bulk_sync_execute` if defined by `executor_type`. Otherwise, a vector holding the returned values of each invocation of f except when f returns void, which case void is returned.

Public Functions

std::forward< Executor >( exec ),std::forward< F >( f ), shape,  
std::forward< Ts >( ts )...)}
```

struct **bulk_then_execute_t**

#include <execution.hpp> Bulk form of execution agent creation depending on a given future.

This creates a group of function invocations $f(i)$ whose ordering is given by the execution_category associated with the executor.

Here i takes on all values in the index space implied by shape. All exceptions thrown by invocations of $f(i)$ are reported in a manner consistent with parallel algorithm execution through the returned future.

Note

This is deliberately different from the then_sync_execute customization points specified in P0443. The bulk_then_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note

This calls `exec.bulk_then_execute(f, shape, pred, ts...)` if it exists; otherwise it executes `sync_execute(f, shape, pred.share(), ts...)` (if this executor is also an `OneWayExecutor`), or `async_execute(f, shape, pred.share(), ts...)` (if this executor is also a `TwoWayExecutor`) - as often as needed.

Param exec

[in] The executor object to use for scheduling of the function f .

Param f

[in] The function which will be scheduled using the given executor.

Param shape

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to f .

Param predecessor

[in] The future object the execution of the given function depends on.

Param ts

[in] Additional arguments to use to invoke f .

Return

The return type of *executor_type::bulk_then_execute* if defined by *executor_type*. Otherwise, a vector holding the returned values of each invocation of *f*.

namespace **hpx**

namespace **parallel**

hpx::execution::experimental::get_parallel_scheduler

Defined in header `hpx/executors.hpp`⁸⁷⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::execution::experimental::parallel_scheduler`
- `hpx::execution::experimental::parallel_scheduler_domain`

`parallel_scheduler` `hpx::execution::experimental::get_parallel_scheduler()`

Return a `parallel_scheduler` that schedules on the default HPX thread pool.

This is HPX's implementation of the P2079 `std::execution::get_parallel_scheduler()` entry point. Work started on the returned scheduler uses the same worker threads as the default pool rather than a separate system thread pool.

Note

For a named resource-partitioner pool, use the overload that takes `hpx::threads::thread_pool_base&`.

Returns

A scheduler bound to HPX's default thread pool.

`parallel_scheduler` `hpx::execution::experimental::get_parallel_scheduler(hpx::threads::thread_pool_base &pool)`

⁸⁷⁶ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/executors.hpp

Return a `parallel_scheduler` that runs work on `pool`.

Look named pools up with `hpx::resource::get_thread_pool`. A misspelled or unknown name throws `hpx::exception`; it does not produce undefined behavior.

Parameters

pool – HPX thread pool that should execute scheduled work.

Pre

`pool` must outlive the returned scheduler and every operation started on it. The scheduler stores a non-owning pointer; it does not extend the pool's lifetime. This precondition is not enforced at runtime (caller responsibility). Debug builds assert that `pool` currently reports at least one OS thread.

Returns

A scheduler bound to `pool`.

`hpx::execution::experimental::parallel_scheduler`

Defined in header `hpx/execution.hpp`⁸⁷⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::execution::experimental::get_parallel_scheduler`
- `hpx::execution::experimental::parallel_scheduler_domain`

class `parallel_scheduler`

P2079 parallel scheduler.

A replaceable `std::execution` scheduler that schedules work on an HPX thread pool through a `parallel_scheduler_backend`. The default backend wraps HPX's `thread_pool_policy_scheduler` so callers can use `get_parallel_scheduler` without managing pools themselves.

Schedulers compare equal when they share the same backend instance (P2079 pointer equality). Forward-progress guarantee is `parallel`.

Obtain instances with `get_parallel_scheduler` (default pool) or `get_parallel_scheduler(pool)` (named resource-partitioner pool).

⁸⁷⁷ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/execution.hpp

hpx::execution::experimental::parallel_scheduler_domain

Defined in header `hpx/execution.hpp`⁸⁷⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::execution::experimental::get_parallel_scheduler`
- `hpx::execution::experimental::parallel_scheduler`

struct **parallel_scheduler_domain** : public `hpx::execution::experimental::detail::sync_wait_domain`

Domain associated with `parallel_scheduler`.

Implements P2079 sender transformations for bulk algorithms that complete on a `parallel_scheduler`. Fast-path bulk work is forwarded to HPX's optimized `thread_pool_bulk_sender`; custom backends go through the virtual `parallel_scheduler_backend` interface.

hpx/executors/thread_pool_scheduler.hpp

Defined in header `hpx/executors/thread_pool_scheduler.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

Defined in header `hpx/executors/current_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace parallel
```

```
namespace execution
```

```
namespace this_thread
```

Functions

hpx::execution::parallel_executor **get_executor**(*error_code* &ec = *throws*)

Returns a reference to the executor that was used to create the current thread.

Throws

If – &ec != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw a *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

namespace **threads**

Functions

hpx::execution::parallel_executor **get_executor**(thread_id_type const &id, *error_code* &ec = *throws*)

Returns a reference to the executor that was used to create the given thread.

Throws

If – &ec != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw a *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

hpx/executors/execution_policy_annotation.hpp

Defined in header `hpx/executors/execution_policy_annotation.hpp`.

hpx/executors/service_executors.hpp

Defined in header `hpx/executors/service_executors.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **execution**

hpx/executors/fork_join_executor.hpp

Defined in header `hpx/executors/fork_join_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/executors/thread_pool_continues_on_sender.hpp

Defined in header `hpx/executors/thread_pool_continues_on_sender.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Domain-optimized `continues_on` sender for HPX thread pool schedulers.

When `stdexec::continues_on` is applied with an HPX `thread_pool_scheduler`, the generic `stdexec` implementation creates two operation states: one for the source sender and one for the scheduler hop (`schedule_from`). This double-state overhead adds ~1 us per task in microbenchmarks.

This header provides a custom sender that replaces the generic path by:

1. Connecting the source sender to a lightweight receiver that captures the downstream receiver and the scheduler.
2. On `set_value`: if we are already on the same HPX thread pool, forwarding inline; otherwise, posting a single HPX task to forward the values.

This eliminates the intermediate `__storage_for_t`, the second operation state, and the `run_loop` overhead.

namespace **hpx**

namespace **execution**

namespace **experimental**

hpx/executors/annotating_executor.hpp

Defined in header `hpx/executors/annotating_executor.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

template<executor_any **BaseExecutor**>

struct **annotating_executor**

#include <annotating_executor.hpp> An `annotating_executor` wraps any other executor and adds the capability to add annotations to the launched threads.

Public Functions

template<executor_any **Executor**>

hpp

- `hpx::execution::parallel_task_policy`

using `hpx::execution::sequenced_task_policy` = detail::sequenced_task_policy_shim<`sequenced_executor`,
`hpx::traits::executor_parameters_type_t<sequenced_executor>>`

Extension: The class `sequenced_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may not be parallelized (has to run sequentially).

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the `sequenced_policy`.

`hpx::execution::parallel_task_policy`

Defined in header `hpx/execution.hpp`⁸⁸⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::execution::seq`
- `hpx::execution::par`
- `hpx::execution::par_unseq`
- `hpx::execution::task`
- `hpx::execution::sequenced_policy`
- `hpx::execution::parallel_policy`
- `hpx::execution::parallel_unsequenced_policy`
- `hpx::execution::sequenced_task_policy`

using `hpx::execution::parallel_task_policy` = detail::parallel_task_policy_shim<`parallel_executor`,
`hpx::traits::executor_parameters_type_t<parallel_executor>>`

Extension: The class `parallel_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the `parallel_policy`.

`hpx/executors/scheduler_executor.hpp`

Defined in header `hpx/executors/scheduler_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace experimental

namespace parallel

namespace execution
```

hpx/executors/datapar/execution_policy_mappings.hpp

Defined in header `hpx/executors/datapar/execution_policy_mappings.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/executors/datapar/execution_policy.hpp

Defined in header `hpx/executors/datapar/execution_policy.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

filesystem

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/filesystem/api.hpp

Defined in header `hpx/filesystem/api.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

This file provides a compatibility layer using Boost.Filesystem for the C++17 filesystem library. It is *not* intended to be a complete compatibility layer. It only contains functions required by the HPX codebase. It also provides some functions only available in Boost.Filesystem when using C++17 filesystem.

```
namespace hpx
```

namespace **filesystem**

Functions

inline path **initial_path**()

inline *std::string* **to_string**(path const &p)

inline *std::string* **basename**(path const &p)

inline path **canonical**(path const &p, path const &base)

inline path **canonical**(path const &p, path const &base, *std::error_code* &ec)

namespace **filesystem**

functional

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::reference_wrapper

Defined in header *hpx/functional.hpp*⁸⁸⁸.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ref*
- *hpx::cref*

template<typename T>

hpx::reference_wrapper(T&) -> *reference_wrapper*<T>

```

⁸⁸⁹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

⁸⁹⁰ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

```
template<typename T>
```

```
void hpx::cref(T const&&) = delete
```

```
template<typename T>
```

```
constexpr reference_wrapper<T const> hpx::cref(reference_wrapper<T> val) noexcept
```

***hpx*::function_ref**

Defined in header `hpx/functional.hpp`⁸⁹¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Sig>
```

```
class function_ref
```

function_ref class is a vocabulary type with reference semantics for passing entities to call.

An example use case that benefits from higher-order functions is `retry(n, f)` which attempts to call `f` up to `n` times synchronously until success. This example might model the real-world scenario of repeatedly querying a flaky web service.

```
using payload = std::optional< /* ... */ >;
// Repeatedly invokes `action` up to `times` repetitions.
// Immediately returns if `action` returns a valid `payload`.
// Returns `std::nullopt` otherwise.
payload retry(size_t times, /* ????? */ action);
```

The passed-in action should be a callable entity that takes no arguments and returns a payload. This can be done with function pointers, *hpx::function* or a template but it is much simpler with *function_ref* as seen below:

```
payload retry(size_t times, function_ref<payload()> action);
```

***hpx*::invoke_fused**

Defined in header `hpx/functional.hpp`⁸⁹².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::invoke_fused_r*

⁸⁹¹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

⁸⁹² http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

```
template<typename F, typename Tuple>
```

```
constexpr detail::invoke_fused_result_t<F, Tuple> hpx::invoke_fused(F &&f, Tuple &&t) noexcept(
    noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{ },
        std::forward<F>(f),
        std::forward<Tuple>(t))))
```

Invokes the given callable object *f* with the content of the sequenced type *t* (tuples, pairs).

Note

This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

Parameters

- **f** – Must be a callable object. If *f* is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to `hpx::get`.

Throws

`std::exception` – like objects thrown by call to object *f* with the arguments contained in the sequenceable type *t*.

Returns

The result of the callable object when it's called with the content of the given sequenced type.

`hpx::invoke_fused_r`

Defined in header `hpx/functional.hpp`⁸⁹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::invoke_fused`

```
template<typename R, typename F, typename Tuple>
```

```
constexpr R hpx::invoke_fused_r(F &&f, Tuple &&t) noexcept(
    noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{ },
        std::forward<F>(f), std::forward<Tuple>(t))))
```

Invokes the given callable object *f* with the content of the sequenced type *t* (tuples, pairs).

⁸⁹³ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

Note

This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

Note

The difference between `hpx::invoke_fused` and `hpx::invoke_fused_r` is that the later allows to specify the return type as well.

Parameters

- **f** – Must be a callable object. If **f** is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to `hpx::get`.

Throws

`std::exception` – like objects thrown by call to object **f** with the arguments contained in the sequenceable type **t**.

Template Parameters

R – The result type of the function when it's called with the content of the given sequenced type.

Returns

The result of the callable object when it's called with the content of the given sequenced type.

hpx::bind

Defined in header `hpx/functional.hpp`⁸⁹⁴.

hpx::move_only_function

Defined in header [hpx/functional.hpp](#)⁹⁰¹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

template<typename **Sig**, bool **Serializable** = false>

class move_only_function

Class template [hpx::move_only_function](#) is a general-purpose polymorphic function wrapper. [hpx::move_only_function](#) objects can store and invoke any constructible (not required to be move constructible) Callable target [function](#), lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to member objects.

The stored callable object is called the target of [hpx::move_only_function](#). If an [hpx::move_only_function](#) contains no target, it is called empty. Unlike [hpx::function](#), invoking an empty [hpx::move_only_function](#) results in undefined behavior.

⁹⁰⁰ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

⁹⁰¹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

`hpx::move_only_functions` supports every possible combination of cv-qualifiers, ref-qualifiers, and noexcept-specifiers not including volatile provided in its template parameter. These qualifiers and specifier (if any) are added to its operator(). `hpx::move_only_function` satisfies the requirements of `MoveConstructible` and `MoveAssignable`, but does not satisfy `CopyConstructible` or `CopyAssignable`.

hpx::function

Defined in header `hpx/functional.hpp`⁹⁰².

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Sig, bool Serializable = false>
```

class **function**

Class template `hpx::function` is a general-purpose polymorphic function wrapper. Instances of `hpx::function` can store, copy, and invoke any `CopyConstructible Callable` target `—` functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to data members. The stored callable object is called the target of `hpx::function`. If an `hpx::function` contains no target, it is called empty. Invoking the target of an empty `hpx::function` results in `hpx::error::bad_function_call` exception being thrown. `hpx::function` satisfies the requirements of `CopyConstructible` and `CopyAssignable`.

hpx::bind_back

Defined in header `hpx/functional.hpp`⁹⁰³.

See *Public API* for a list of names and headers that are part of the public HPX API.

Warning

doxygenfunction: Unable to resolve function “hpx::bind_back” with arguments (F&&, Ts&&...) in doxygen xml output for project “hpx” from directory: ../hpx_autodoc. Potential matches:

```
- template
  ↳<typename F, typename ...Ts> constexpr hpx::detail::bound_
  ↳back<std::decay_t<F>, util::make_index_pack_t<sizeof...
  ↳(Ts)>, util::decay_unwrap_t<Ts>...> bind_back(F &&f, Ts&&... vs)
- template<typename F> constexpr std::decay_t<F> bind_back(F &&f)
```

```
template<typename F>
```

```
constexpr std::decay_t<F> hpx::bind_back(F &&f)
```

⁹⁰² http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

⁹⁰³ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

hpx::experimental::scope_fail

Defined in header `hpx/experimental/scope.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
template<typename F>
```

```
auto hpx::experimental::scope_fail(F &&f)
```

The class template `scope_fail` is a general-purpose scope guard intended to call its exit function when a scope is exited via an exception.

Template Parameters

F – type of stored exit function

Parameters

f – stored exit function

hpx::experimental::scope_exit

Defined in header `hpx/experimental/scope.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
template<typename F>
```

```
auto hpx::experimental::scope_exit(F &&f)
```

The class template `scope_exit` is a general-purpose scope guard intended to call its exit function when a scope is exited.

Template Parameters

F – type of stored exit function

Parameters

f – stored exit function

hpx::experimental::scope_success

Defined in header `hpx/experimental/scope.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
template<typename F>
```

```
auto hpx::experimental::scope_success(F &&f)
```

The class template `scope_success` is a general-purpose scope guard intended to call its exit function when a scope is normally exited.

Template Parameters

F – type of stored exit function

Parameters

f – stored exit function

hpx::is_placeholder

Defined in header [hpx/functional.hpp](#)⁹⁰⁴.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename T>
```

```
struct is_placeholder
```

If T is a standard, Boost, or HPX placeholder (`_1`, `_2`, `_3`, ...) then this template is derived from `std::integral_constant<int, 1>`, `std::integral_constant<int, 2>`, `std::integral_constant<int, 3>`, respectively. Otherwise, it is derived from `std::integral_constant<int, 0>`.

The template may be specialized for any user-defined T type: the specialization must satisfy *UnaryTypeTrait* with base characteristic of `std::integral_constant<int, N>` with N>0 to indicate that T should be treated as N'th placeholder type. `hpx::bind` uses [hpx::is_placeholder](#) to detect placeholders for unbound arguments.

hpx::is_bind_expression

Defined in header [hpx/functional.hpp](#)⁹⁰⁵.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename T>
```

```
struct is_bind_expression : public std::is_bind_expression<T>
```

If T is the type produced by a call to `hpx::bind`, this template is derived from `std::true_type`. For any other type, this template is derived from `std::false_type`.

This template may be specialized for a user-defined type T to implement *UnaryTypeTrait* with base characteristic of `std::true_type` to indicate that T should be treated by `hpx::bind` as if it were the type of a bind subexpression: when a bind-generated function object is invoked, a bound argument of this type will be invoked as a function object and will be given all the unbound arguments passed to the bind-generated object.

Subclassed by `hpx::is_bind_expression< T const >`

⁹⁰⁴ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.

hpp

⁹⁰⁵ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.

hpp

futures

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx::promise

Defined in header `hpx/future.hpp`⁹⁰⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename R>

class **promise** : public `hpx::detail::promise_base<R>`

The class template `hpx::promise` provides a facility to store a value or an exception that is later acquired asynchronously via a `hpx::future` object created by the `hpx::promise` object. Note that the `hpx::promise` object is meant to be used only once. Each promise is associated with a shared state, which contains some state information and a result which may be not yet evaluated, evaluated to a value (possibly void) or evaluated to an exception. A promise may do three things with the shared state:

- make ready: the promise stores the result or the exception in the shared state. Marks the state ready and unblocks any thread waiting on a future associated with the shared state.
- release: the promise gives up its reference to the shared state. If this was the last such reference, the shared state is destroyed. Unless this was a shared state created by `hpx::async` which is not yet ready, this operation does not block.
- abandon: the promise stores the exception of type `hpx::future_error` with error code `hpx::error::broken_promise`, makes the shared state ready, and then releases it. The promise is the “push” end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in `hpx::memory_order`) the successful return from any function that is waiting on the shared state (such as `hpx::future::get`). Concurrent access to the same shared state may conflict otherwise: for example multiple callers of `hpx::shared_future::get` must either all be read-only or provide external synchronization.

hpx::future

Defined in header `hpx/future.hpp`⁹⁰⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::shared_future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_at`

⁹⁰⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

⁹⁰⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

- `hpx::make_ready_future_after`
- `hpx::make_exceptional_future`

template<typename R>

class **future** : public `hpx::lcos::detail::future_base<future<R>, R>`

The class template `hpx::future` provides a mechanism to access the result of asynchronous operations:

- An asynchronous operation (created via `hpx::async`, `hpx::packaged_task`, or `hpx::promise`) can provide a `hpx::future` object to the creator of that asynchronous operation.
- The creator of the asynchronous operation can then use a variety of methods to query, wait for, or extract a value from the `hpx::future`. These methods may block if the asynchronous operation has not yet provided a value.
- When the asynchronous operation is ready to send a result to the creator, it can do so by modifying shared state (e.g. `hpx::promise::set_value`) that is linked to the creator's `hpx::future`. Note that `hpx::future` references shared state that is not shared with any other asynchronous return objects (as opposed to `hpx::shared_future`).

`hpx::shared_future`

Defined in header `hpx/future.hpp`⁹⁰⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`
- `hpx::make_exceptional_future`

template<typename R>

class **shared_future** : public `hpx::lcos::detail::future_base<shared_future<R>, R>`

The class template `hpx::shared_future` provides a mechanism to access the result of asynchronous operations, similar to `hpx::future`, except that multiple threads are allowed to wait for the same shared state. Unlike `hpx::future`, which is only moveable (so only one instance can refer to any particular asynchronous result), `hpx::shared_future` is copyable and multiple shared future objects may refer to the same shared state. Access to the same shared state from multiple threads is safe if each thread does it through its own copy of a `shared_future` object.

⁹⁰⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

hpx::make_future

Defined in header `hpx/future.hpp`⁹⁰⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::future`
- `hpx::shared_future`
- `hpx::make_shared_future`

template<typename T>

`future<T> hpx::make_exceptional_future(std::exception_ptr const &e)`

Creates a pre-initialized future object which holds the given error (extension)

template<typename T, typename E>

`future<T> hpx::make_exceptional_future(E e)`

Creates a pre-initialized future object which holds the given error (extension)

hpx/futures/future_fwd.hpp

Defined in header `hpx/futures/future_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **lcos**

namespace **lcos**

hpx::packaged_task

Defined in header `hpx/future.hpp`⁹¹⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename Sig>

class **packaged_task**

⁹¹⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/future.hpp>

The class template `hpx::packaged_task` wraps any Callable` target (function, lambda expression, bind expression, or another function object) so that it can be invoked asynchronously. Its return value or exception thrown is stored in a shared state which can be accessed through `hpx::future` objects. Just like `hpx::function`, `hpx::packaged_task` is a polymorphic, allocator-aware container: the stored callable target may be allocated on heap or with a provided allocator.

include_local

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx::experimental::sandbox

Defined in header `hpx/experimental/sandbox.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Warning

doxygenfunction: Cannot find function “hpx::experimental::sandbox” in doxygen xml output for project “hpx” from directory: ../hpx_autodoc

io_service

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/io_service/io_service_pool.hpp

Defined in header `hpx/io_service/io_service_pool.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

class **io_service_pool**

`#include <io_service_pool.hpp>` A pool of `io_service` objects.

Public Functions

```
explicit io_service_pool(std::size_t pool_size = 2, threads::policies::callback_notifier const  
    &notifier = threads::policies::callback_notifier(), char const  
    *pool_name = "", char const *name_postfix = "")
```

Construct the `io_service` pool.

Parameters

- **pool_size** – [in] The number of threads to run to serve incoming requests
- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

```
explicit io_service_pool(threads::policies::callback_notifier const &notifier, char const  
    *pool_name = "", char const *name_postfix = "")
```

Construct the `io_service` pool.

Parameters

- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

```
io_service_pool(io_service_pool const&) = delete
```

```
io_service_pool(io_service_pool&&) = delete
```

```
io_service_pool &operator=(io_service_pool const&) = delete
```

```
io_service_pool &operator=(io_service_pool&&) = delete
```

```
~io_service_pool()
```

```
bool run(bool join_threads = true, std::shared_ptr<barrier> startup = {}) const
```

Run all `io_service` objects in the pool. If `join_threads` is true this will also wait for all threads to complete.

Parameters

- **join_threads** – [in] If true, wait for all pool threads to join before returning.
- **startup** – [in] Optional startup barrier used to synchronize pool worker thread startup with the caller. Its participant count must equal the number of pool worker threads plus one for the caller. The caller must call `startup->wait()` after invoking `run()`.

```
bool run(std::size_t num_threads, bool join_threads = true, std::shared_ptr<barrier> startup = {}) const
```

Run `num_threads` `io_service` objects in the pool. If `join_threads` is true this will also wait for all threads to complete.

Parameters

- **num_threads** – [in] The number of worker threads to start.
- **join_threads** – [in] If true, wait for all pool threads to join before returning.
- **startup** – [in] Optional startup barrier used to synchronize pool worker thread startup with the caller. Its participant count must equal `num_threads` plus one for the caller. The caller must call `startup->wait()` after invoking `run()`.

void **stop()** const

Stop all `io_service` objects in the pool.

void **join()** const

Join all `io_service` threads in the pool.

void **clear()** const

Clear all internal data structures.

void **wait()** const

Wait for all work to be done.

bool **stopped()** const

`::asio::io_context &`**get_io_service**(int index = -1) const

Get an `io_service` to use.

`std::thread &`**get_os_thread_handle**(`std::size_t` thread_num) const

access underlying thread handle

`std::size_t` **size**() const noexcept

Get number of threads associated with this I/O service.

void **thread_run**(`std::size_t` index, `std::shared_ptr<barrier>` startup = {}) const

Activate the thread *index* for this thread pool.

char const ***get_name**() const noexcept

Return name of this pool.

void **init**(`std::size_t` pool_size) const

Private Members

detail::io_service_pool_base ***pool_**

lcos_local

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx::lcos::local::and_gate

Defined in header `hpx/modules/lcos_local.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
struct and_gate : public hpx::lcos::local::base_and_gate<hpx::no_mutex>
```

An AND-gate synchronization primitive that fires once all of its expected inputs have been received.

Note

This type is not thread-safe. It has to be protected from concurrent access by different threads by the code using instances of this type.

hpx/lcos_local/trigger.hpp

Defined in header `hpx/lcos_local/trigger.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace lcos
```

```
namespace local
```

```
template<typename Mutex = hpx::spinlock>
```

```
struct base_trigger
```

Public Functions

inline **base_trigger**() noexcept

inline **base_trigger**(*base_trigger* &&rhs) noexcept

inline *base_trigger* &**operator**=(*base_trigger* &&rhs) noexcept

inline *hpx::future*<void> **get_future**(*std::size_t* *generation_value = nullptr, *error_code* &ec = *hpx::throws*)

get a future allowing to wait for the trigger to fire

inline bool **set**(*error_code* &ec = *throws*)

Trigger this object.

inline void **synchronize**(*std::size_t* generation_value, char const *function_name = "trigger::synchronize", *error_code* &ec = *throws*)

Wait for the generational counter to reach the requested stage.

inline *std::size_t* **next_generation**()

inline *std::size_t* **generation**() const

Protected Types

pack_traversal

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/pack_traversal/pack_traversal_async.hpp

Defined in header `hpx/pack_traversal/pack_traversal_async.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

Functions

```
template<typename Visitor, typename ...T>
```

```
auto traverse_pack_async(Visitor &&visitor, T&&... pack) -> de-  
    cltype(detail::apply_pack_transform_async(std::forward<Visitor>(visitor),  
    std::forward<T>(pack)...))
```

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus, we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
struct my_async_visitor {  
    // The synchronous overload is called for each object. It may  
    ↪ // return false to suspend the current control. In that case the  
    // overload below is called.  
    template <typename T>  
    bool operator()(async_traverse_visit_tag, T&& element)  
    {  
        return true;  
    }  
  
    // The asynchronous overload is called when the synchronous  
    // overload returned false. In addition to the current visited  
    ↪ // element, the overload is called with a continuation callable
```

(continues on next page)

(continued from previous page)

```

// object which resumes the traversal when called later.
template <typename T, typename N>
void_
operator()(async_traverse_detach_tag, T&& element, N&& next)
{
}

// The overload is called when the traversal was finished. The
// whole pack which was traversed asynchronously is passed.
template <typename T>
void operator()(async_traverse_complete_tag, T&& pack)
{
}
};

```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally, the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.

Returns

A `hpx::intrusive_ptr` that references an instance of the given visitor object.

```
template<typename Allocator, typename Visitor, typename ...T>
```

```

auto traverse_pack_async_allocator(Allocator const &alloc, Visitor &&visitor, T&&... pack) ->
    de-
    cltype(detail::apply_pack_transform_async_allocator(alloc,
        std::forward<Visitor>(visitor), std::forward<T>(pack)...))

```

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus, we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```

struct my_async_visitor {
    // The synchronous overload is called for each object. It may
    // return false to suspend the current control. In that case the
    // overload below is called.
    template <typename T>
    bool operator()(async_traverse_visit_tag, T&& element)
    {
        return true;
    }

    // The asynchronous overload is called when the synchronous

```

(continues on next page)

(continued from previous page)

```

    // overload returned false. In addition to the current visited
    /
    ↪ / element, this overload receives a continuation callable object
    //
    ↪ which resumes the traversal when called later. The continuation
    ↪
    ↪ // may be stored and called later or dropped completely to abort
    ↪ // the traversal early.
    template <typename T, typename N>
    void_
    ↪ operator()(async_traverse_detach_tag, T&& element, N&& next)
    {
    }

    // This overload is called when the traversal is finished. The
    // complete pack that was traversed asynchronously is passed.
    template <typename T>
    void operator()(async_traverse_complete_tag, T&& pack)
    {
    }
};

```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally, the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.
- **alloc** – Allocator instance to use to create the traversal frame.

Returns

A `hpx::intrusive_ptr` that references an instance of the given visitor object.

`hpx::functional::unwrap`

Defined in header `hpx/unwrap.hpp`⁹¹⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **unwrap_all**

A helper function object for functionally invoking `hpx::unwrap_all`. For more information please refer to its documentation.

hpx::unwrap

Defined in header `hpx/unwrap.hpp`⁹²⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_n`
- `hpx::unwrapping_all`

template<typename ...**Args**>

```
auto hpx::unwrap(Args&&... args) ->  
    decltype(util::detail::unwrap_depth_impl<1U>(std::forward<Args>(args)...))
```

A helper function for retrieving the actual result of any `hpx::future` like type which is wrapped in an arbitrary way.

Unwraps the given pack of arguments, so that any `hpx::future` object is replaced by its future result type in the argument pack:

- `hpx::future<int> -> int`
- `hpx::future<std::vector<float>> -> std::vector<float>`
- `std::vector<future<float>> -> std::vector<float>`

The function is capable of unwrapping `hpx::future` like objects that are wrapped inside any container or tuple like type, see `hpx::util::map_pack()` for a detailed description about which surrounding types are supported. Non `hpx::future` like types are permitted as arguments and passed through.

⁹²⁰ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/unwrap.hpp

```

hpx::unwrap(hpx::make_ready_future(0));

// Multiple arguments hpx::tuple<int, int> i2 =
    hpx::unwrap(hpx::make_ready_future(1),
                hpx::make_ready_future(2));

```

Note

This function unwraps the given arguments until the first traversed nested *hpx::future* which corresponds to an unwrapping depth of one. See *hpx::unwrap_n()* for a function which unwraps the given arguments to a particular depth or *hpx::unwrap_all()* that unwraps all future like objects recursively which are contained in the arguments.

Parameters

args – the arguments that are unwrapped which may contain any arbitrary future or non-future type.

Throws

std::exception – like objects in case any of the given wrapped *hpx::future* objects were resolved through an exception. See *hpx::future::get()* for details.

Returns

Depending on the count of arguments this function returns a *hpx::tuple* containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

hpx::unwrap_n

Defined in header *hpx/unwrap.hpp*⁹²¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::functional::unwrap*
- *hpx::functional::unwrap_n*

- *hpx::unwrapping_n*
- *hpx::unwrapping_all*

template<*std::size_t* **Depth**, typename ...**Args**>

auto *hpx::unwrap_n*(*Args*&&... args) ->

decltype(util::detail::unwrap_depth_impl<Depth>(std::forward<Args>(args)...))

⁹²¹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/unwrap.hpp

An alternative version of `hpx::unwrap()`, which unwraps the given arguments to a certain depth of `hpx::future` like objects.

See `unwrap` for a detailed description.

Template Parameters

Depth – The count of `hpx::future` like objects which are unwrapped maximally.

`hpx::unwrap_all`

Defined in header `hpx/unwrap.hpp`⁹²².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`

- `hpx::unwrapping_all`

template<typename ...**Args**>

```
auto hpx::unwrap_all(Args&&... args) ->  
    decltype(util::detail::unwrap_depth_impl<0U>(std::forward<Args>(args)...))
```

An alternative version of `hpx::unwrap()`, which unwraps the given arguments recursively so that all contained `hpx::future` like objects are replaced by their actual value.

See `hpx::unwrap()` for a detailed description.

`hpx::unwrapping`

Defined in header `hpx/unwrap.hpp`⁹²³.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename T>

```
auto hpx::unwrapping(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<1U>(std::forward<T>(callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap()` function and then passes the result to the given callable object.

```
    return left + right;
});

int i1 = callable(hpx::make_ready_future(1),
                  hpx::make_ready_future(2));
```

See `hpx::unwrap()` for a detailed description.

Parameters

callable – the callable object which is called with the result of the corresponding unwrap function.

`hpx::unwrapping_n`

Defined in header `hpx/unwrap.hpp`⁹²⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_all`

template<std::size_t Depth, typename T>

```
auto hpx::unwrapping_n(T &&callable) -> de-
    cltype(util::detail::functional_unwrap_depth_impl<Depth>(std::forward<T>(callable)))
```

⁹²⁴ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/unwrap.hpp

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_n()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

hpx::unwrapping_all

Defined in header `hpx/unwrap.hpp`⁹²⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_n`

template<typename T>

```
auto hpx::unwrapping_all(T &&callable) -> de-  
                                         ctype(util::detail::functional_unwrap_depth_impl<0U>(std::forward<T>(callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_all()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

hpx/pack_traversal/pack_traversal.hpp

Defined in header `hpx/pack_traversal/pack_traversal.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

⁹²⁵ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/unwrap.hpp

Functions

```
template<typename Mapper, typename...
T> < unspecified > map_pack (Mapper &&mapper, T &&... pack)
```

Maps the pack with the given mapper.

This function tries to visit all plain elements which may be wrapped in:

- homogeneous containers (`std::vector`, `std::list`)
- heterogeneous containers (`hpx::tuple`, `std::pair`, `std::array`) and re-assembles the pack with the result of the mapper. Mapping from one type to a different one is supported.

Elements that aren't accepted by the mapper are routed through and preserved through the hierarchy.

```
// Maps all integers to floats
map_pack([](int value) {
    return float(value);
},
1, hpx::make_tuple(2, std::vector<int>{3, 4}), 5);
```

Throws

`std::exception` – like objects which are thrown by an invocation to the mapper.

Parameters

- **mapper** – A callable object, which accept an arbitrary type and maps it to another type or the same one.
- **pack** – An arbitrary variadic pack which may contain any type.

Returns

The mapped element or in case the pack contains multiple elements, the pack is wrapped into a `hpx::tuple`.

preprocessor

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/preprocessor/expand.hpp

Defined in header `hpx/preprocessor/expand.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_EXPAND(X)

The `HPX_PP_EXPAND` macro performs a double macro-expansion on its argument.

This macro can be used to produce a delayed preprocessor expansion.

Example:

```
#define MACRO(a, b, c) (a)(b)(c)
#define ARGS() (1, 2, 3)

HPX_PP_EXPAND(MACRO ARGS()) // expands to (1)(2)(3)
```

Parameters

- **X** – Token to be expanded twice

hpx/preprocessor/strip_parens.hpp

Defined in header `hpx/preprocessor/strip_parens.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_STRIP_PARENS(X)

For any symbol **X**, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to **X** itself without error.

The original implementation of this macro is from Steven Watanbe as shown in <http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-td2591973.html#a2591976>

```
HPX_PP_STRIP_PARENS(no_parens)
HPX_PP_STRIP_PARENS((with_parens))
```

Example Usage:

This produces the following output

```
no_parens
with_parens
```

Parameters

- **X** – Symbol to strip parens from

hpx/preprocessor/stringize.hpp

Defined in header `hpx/preprocessor/stringize.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_STRINGIZE(X)

The *HPX_PP_STRINGIZE* macro stringizes its argument after it has been expanded.

The passed argument *X* will expand to "*X*". Note that the stringizing operator (#) prevents arguments from expanding. This macro circumvents this shortcoming.

Parameters

- **X** – The text to be converted to a string literal

hpx/preprocessor/cat.hpp

Defined in header `hpx/preprocessor/cat.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_CAT(A, B)

Concatenates the tokens *A* and *B* into a single token. Evaluates to *AB*

Parameters

- **A** – First token
- **B** – Second token

hpx/preprocessor/nargs.hpp

Defined in header `hpx/preprocessor/nargs.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_NARGS(...)

Expands to the number of arguments passed in

Example Usage:

```
HPX_PP_NARGS(hpx, pp, nargs)
HPX_PP_NARGS(hpx, pp)
HPX_PP_NARGS(hpx)
```

Expands to:

```
3
2
1
```

Parameters

- ... – The variadic number of arguments

resiliency

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/resiliency/resiliency_cpos.hpp

Defined in header `hpx/resiliency/resiliency_cpos.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```

hpx/resiliency/async_replay_executor.hpp

Defined in header `hpx/resiliency/async_replay_executor.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace resiliency
```

```
namespace experimental
```

Functions

```
template<typename Executor, typename Pred, typename F, typename ...Ts>
decltype(auto) hpx_invoke(async_replay_validate_t, Executor &&exec, std::size_t n, Pred
    &&pred, F &&f, Ts&&... ts)
```

ADL hook for `async_replay_validate` CPO with executor.

Asynchronously launches *f* on *exec*, validating results with *pred*. Repeats on error up to *n* times (aborts on `abort_replay_exception`).

Parameters

- **tag** – CPO tag (*async_replay_validate_t*).
- **exec** – Executor to run *f* on.
- **n** – Maximum number of retry attempts.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first valid result of *f*.

```
template<typename Executor, typename F, typename ...Ts>
decltype(auto) hpx_invoke(async_replay_t, Executor &&exec, std::size_t n, F &&f, Ts&&... ts)
```

ADL hook for `async_replay` CPO with executor.

Asynchronously launches *f* on *exec*, repeating on error up to *n* times (aborts on `abort_replay_exception`).

Parameters

- **tag** – CPO tag (*async_replay_t*).
- **exec** – Executor to run *f* on.
- **n** – Maximum number of retry attempts.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first successful result of *f*.

hpx/resiliency/async_replay.hpp

Defined in header `hpx/resiliency/async_replay.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resiliency**

namespace **experimental**

Functions

template<typename **Pred**, typename **F**, typename ...**Ts**>

hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> **hpx_invoke**(*async_replay_validate_t*,
std::size_t n, *Pred*
 &&pred, *F* &&f,
Ts&&... ts)

ADL hook for `async_replay_validate` CPO.

Asynchronously launches *f*, validating results with *pred*. Repeats on error up to *n* times (aborts on `abort_replay_exception`).

Parameters

- **tag** – CPO tag (*async_replay_validate_t*).
- **n** – Maximum number of retry attempts.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first valid result of *f*.

template<typename **F**, typename ...**Ts**>

hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> **hpx_invoke**(*async_replay_t*,
std::size_t n, *F*
 &&f, *Ts*&&... ts)

ADL hook for `async_replay` CPO.

Asynchronously launches *f*, repeating on error up to *n* times (aborts on `abort_replay_exception`).

Parameters

- **tag** – CPO tag (*async_replay_t*).
- **n** – Maximum number of retry attempts.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first successful result of *f*.

hpx/resiliency/async_replicate_executor.hpp

Defined in header `hpx/resiliency/async_replicate_executor.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resiliency**

namespace **experimental**

Functions

template<typename **Executor**, typename **Vote**, typename **Pred**, typename **F**, typename ...**Ts**>

decltype(auto) **hpx_invoke**(*async_replicate_vote_validate_t*, *Executor* &&exec, *std::size_t* n, *Vote* &&vote, *Pred* &&pred, *F* &&f, *Ts*&&... ts)

ADL hook for `async_replicate_vote_validate` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, validates results with *pred*, then runs valid results through *vote*.

Parameters

- **tag** – CPO tag (*async_replicate_vote_validate_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the voted-upon result.

template<typename **Executor**, typename **Vote**, typename **F**, typename ...**Ts**>

decltype(auto) **hpx_invoke**(*async_replicate_vote_t*, *Executor* &&exec, *std::size_t* n, *Vote* &&vote, *F* &&f, *Ts*&&... ts)

ADL hook for `async_replicate_vote` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, runs valid results through *vote*. Validation uses the default exception check.

Parameters

- **tag** – CPO tag (*async_replicate_vote_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the voted-upon result.

template<typename **Executor**, typename **Pred**, typename **F**, typename ...**Ts**>

decltype(auto) **hpx_invoke**(*async_replicate_validate_t*, *Executor* &&exec, *std::size_t* n, *Pred* &&pred, *F* &&f, *Ts*&&... ts)

ADL hook for `async_replicate_validate` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, validates results with *pred*. Returns the first valid result.

Parameters

- **tag** – CPO tag (*async_replicate_validate_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first valid result.

```
template<typename Executor, typename F, typename ...Ts>
```

```
decltype(auto) hpx_invoke(async_replicate_t, Executor &&exec, std::size_t n, F &&f, Ts&&... ts)
```

ADL hook for *async_replicate* CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*. Validates by checking for exceptions. Returns the first valid result.

Parameters

- **tag** – CPO tag (*async_replicate_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first non-throwing result.

hpx/resiliency/async_replicate.hpp

Defined in header `hpx/resiliency/async_replicate.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace resiliency
```

```
namespace experimental
```

Functions

template<typename **Vote**, typename **Pred**, typename **F**, typename ...**Ts**>

hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> **hpx_invoke**(*async_replicate_vote_validate_t*,
std::size_t n, *Vote*
&&vote, *Pred*
&&pred, *F* &&f,
Ts&&... ts)

ADL hook for `async_replicate_vote_validate` CPO.

Asynchronously launches *f* exactly *n* times, validates results with *pred*, then runs valid results through *vote*.

Parameters

- **tag** – CPO tag (*async_replicate_vote_validate_t*).
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the voted-upon result.

template<typename **Vote**, typename **F**, typename ...**Ts**>

hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> **hpx_invoke**(*async_replicate_vote_t*,
std::size_t n, *Vote*
&&vote, *F* &&f,
Ts&&... ts)

ADL hook for `async_replicate_vote` CPO.

Asynchronously launches *f* exactly *n* times, runs valid results through *vote*. Validation uses the default exception check.

Parameters

- **tag** – CPO tag (*async_replicate_vote_t*).
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the voted-upon result.

template<typename **Pred**, typename **F**, typename ...**Ts**>

hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> **hpx_invoke**(*async_replicate_validate_t*,
std::size_t n, *Pred*
&&pred, *F* &&f,
Ts&&... ts)

ADL hook for `async_replicate_validate` CPO.

Asynchronously launches *f* exactly *n* times, validates results with *pred*. Returns the first valid result.

Parameters

- **tag** – CPO tag (*async_replicate_t*).
- **n** – Number of replicated invocations.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first valid result.

```
template<typename F, typename ...Ts>
```

```
hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> hpx_invoke(async_replicate_t,
                                                                    std::size_t n, F
                                                                    &&f, Ts&&... ts)
```

ADL hook for *async_replicate* CPO.

Asynchronously launches *f* exactly *n* times. Validates by checking for exceptions. Returns the first valid result.

Parameters

- **tag** – CPO tag (*async_replicate_t*).
- **n** – Number of replicated invocations.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

Returns

future with the first non-throwing result.

runtime_configuration

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_configuration/plugin_registry_base.hpp

Defined in header `hpx/runtime_configuration/plugin_registry_base.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **plugins**

struct **plugin_registry_base**

#include <plugin_registry_base.hpp> The `plugin_registry_base` has to be used as a base class for all plugin registries.

Public Functions

virtual **~plugin_registry_base**() = default

virtual bool **get_plugin_info**(*std::vector<std::string>* &fillini) = 0

Return the configuration information for any plugin implemented by this module

Parameters

fillini – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all plugins implemented in this module.

Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

inline virtual void **init**(int*, char***, *util::runtime_configuration*&)

hpx/runtime_configuration/runtime_configuration.hpp

Defined in header `hpx/runtime_configuration/runtime_configuration.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

```

```
inline std::map<std::string, hpx::util::plugin::dll> &modules()
```

```
bool tolerate_node_faults()
```

Check whether fault tolerance for node/locality faults is enabled via the “enable_fault_tolerance” configuration entry in the “hpx” section.

Returns

true if fault tolerance is enabled, false otherwise.

```
inline void tolerate_node_faults(bool const value) const
```

Set whether this runtime instance should tolerate node faults.

This controls whether the runtime is configured to continue operating in the presence of locality failures (e.g. forced or unexpected disconnection of remote localities) rather than treating such failures as fatal errors.

Parameters

value – Set to true to enable fault tolerance for node failures, or false to require all localities to remain connected for normal operation.

HPX_REGISTER_COMPONENT_MODULE

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Warning

doxygenfunction: Cannot find function “HPX_REGISTER_COMPONENT_MODULE” in doxygen xml output for project “hpx” from directory: ../hpx_autodoc

hpx/runtime_configuration/component_registry_base.hpp

Defined in header `hpx/runtime_configuration/component_registry_base.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

struct **component_registry_base**

#include <component_registry_base.hpp> The `component_registry_base` has to be used as a base class for all component registries.

Public Functions

virtual **~component_registry_base**() = default

virtual bool **get_component_info**(`std::vector<std::string> &fillini`, `std::string const &filepath`, `bool is_static = false`) = 0

Return the ini-information for all contained components.

Parameters

- **fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** – [in]

- **is_static** – [in]

Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

virtual void **register_component_type**() = 0

Register the component type represented by this component.

hpx::runtime_mode

Defined in header [hpx/init.hpp](#)⁹²⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

enum class **hpx::runtime_mode** : *std::int8_t*

A HPX runtime can be executed in two different modes: console mode and worker mode.

Values:

enumerator **invalid**

enumerator **console**

The runtime is the console locality.

enumerator **worker**

The runtime is a worker locality.

enumerator **connect**

The runtime is a worker locality connecting late

enumerator **local**

The runtime is fully local.

enumerator **default_**

The runtime mode will be determined based on the command line arguments

enumerator **last**

⁹²⁶ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/init_runtime/include/hpx/init.hpp

hpx::components::component_commandline_base

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

struct **component_commandline_base**

The `component_commandline_base` has to be used as a base class for all component command-line line handling registries.

Subclassed by `hpx::components::component_commandline`

runtime_local

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_local/component_startup_shutdown_base.hpp

Defined in header `hpx/runtime_local/component_startup_shutdown_base.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

struct **component_startup_shutdown_base**

`#include <component_startup_shutdown_base.hpp>` The `component_startup_shutdown_base` has to be used as a base class for all component startup/shutdown registries.

Public Functions

virtual `~component_startup_shutdown_base()` = default

virtual bool **get_startup_function**(*startup_function_type* &startup, bool &pre_startup) = 0

Return any startup function for this component.

Parameters

- **startup** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_startup** – [in, out] Will be set to true if the returned startup function is executed during the first round of calls.

Returns

Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

virtual bool **get_shutdown_function**(*shutdown_function_type* &shutdown, bool &pre_shutdown) = 0

Return any startup function for this component.

Parameters

- **shutdown** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_shutdown** – [in, out] Will be set to true if the returned shutdown function is executed during the first round of calls.

Returns

Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

hpx::get_locality_id

Defined in header `hpx/runtime.hpp`⁹²⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

`std::uint32_t hpx::get_locality_id(error_code &ec = throws)`

Return the number of the locality this function is being called from.

This function returns the id of the current locality.

Note

The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by `get_num_localities()`).

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

⁹²⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx/runtime_local/report_error.hpp

Defined in header `hpx/runtime_local/report_error.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

void **report_error**(*std::size_t* num_thread, *std::exception_ptr* const &e)

The function `report_error` reports the given exception to the console.

void **report_error**(*std::exception_ptr* const &e)

The function `report_error` reports the given exception to the console.

hpx/runtime_local/get_worker_thread_num.hpp

Defined in header `hpx/runtime_local/get_worker_thread_num.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_local/termination_detection.hpp

Defined in header `hpx/runtime_local/termination_detection.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **local**

Functions

void **termination_detection()**

Wait for all local HPX threads to complete execution.

This function blocks the calling thread until all HPX worker threads on the current locality have completed their work and become idle. It performs local termination detection by waiting for the thread manager to drain all pending tasks.

Example:

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>

int hpx_main()
{
    // Launch some asynchronous work
    for (int i = 0; i < 100; ++i)
    {
        hpx::post([]{ /* do work */ });
    }

    // Wait for all local threads to complete
    hpx::local::termination_detection();

    return hpx::finalize();
}
```

Note

This function should be called from an HPX thread or after the HPX runtime has been initialized.

Throws

hpx::exception – if called when the runtime is not in a valid state (e.g., before initialization or after shutdown).

bool **termination_detection**(*hpx::chrono::steady_duration* const &timeout)

Wait for all local HPX threads to complete with a timeout.

This function blocks the calling thread until either all HPX worker threads have completed their work, or the specified timeout duration has elapsed.

See also

termination_detection()

Example:

```

#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <chrono>

int hpx_main()
{
    // Launch some work
    hpx::post([]{ /* long running task */ });

    // Wait up to 5 seconds
    if (!hpx::local::termination_detection(std::chrono::seconds(5)))
    {
        std::cerr << "Warning: Work did not complete within timeout\n";
        // Implement fallback strategy
    }

    return hpx::finalize();
}

```

Parameters

timeout – Maximum duration to wait for termination. The function will return false if this duration elapses before all threads complete.

Throws

hpx::exception – if called when the runtime is not in a valid state.

Returns

true if all threads completed before the timeout, false if the timeout elapsed.

bool **termination_detection**(*hpx::chrono::steady_time_point* const &deadline)

Wait for all local HPX threads to complete until a deadline.

This function blocks the calling thread until either all HPX worker threads have completed their work, or the specified deadline time point is reached.

See also

termination_detection(std::chrono::duration<double>)

Example:

```

#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <chrono>

int hpx_main()
{
    auto deadline = std::chrono::steady_clock::now() +
        std::chrono::seconds(10);
}

```

(continues on next page)

(continued from previous page)

```

hpx::post([]{ /* work */ });

if (!hpx::local::termination_detection(deadline))
{
    std::cerr << "Deadline reached\n";
}

return hpx::finalize();
}

```

Parameters

deadline – Absolute time point when waiting should stop. The function will return false if this time is reached before all threads complete.

Throws

hpx::exception – if called when the runtime is not in a valid state.

Returns

true if all threads completed before the deadline, false if the deadline was reached.

```

bool termination_detection(hpx::stop_token stop_token, hpx::chrono::steady_duration const
    &timeout =
    hpx::chrono::steady_duration((hpx::chrono::steady_clock::duration::max)()))

```

Wait for all local HPX threads with cancellation support.

This function blocks the calling thread until all HPX worker threads have completed, the timeout elapses, or a stop is requested via the stop_token. This enables cooperative cancellation of the wait operation.

See also

termination_detection(std::chrono::duration<double>)

Example:

```

#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <hpx/stop_token.hpp>
#include <chrono>

int hpx_main()
{
    hpx::stop_source stop_src;

    // In shutdown handler
    hpx::thread shutdown_thread([&stop_src]() {
        hpx::this_thread::sleep_for(std::chrono::seconds(30));
        stop_src.request_stop();
    });

    hpx::post([]{ /* work */ });
}

```

(continues on next page)

(continued from previous page)

```

// Wait with cancellation support
bool completed = hpx::local::termination_detection(
    stop_src.get_token(),
    std::chrono::minutes(1)
);

if (!completed)
{
    std::cerr << "Cancelled or timed out\n";
}

shutdown_thread.join();
return hpx::finalize();
}

```

Parameters

- **stop_token** – Token that can be used to request cancellation of the wait operation.
- **timeout** – Maximum duration to wait. Defaults to maximum duration (effectively infinite).

Throws

`hpx::exception` – if called when the runtime is not in a valid state.

Returns

true if all threads completed, false if timeout elapsed or stop was requested.

`hpx::get_thread_name`

Defined in header `hpx/runtime.hpp`⁹²⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

`std::string hpx::get_thread_name()`

Return the name of the calling thread.

This function returns the name of the calling thread. This name uniquely identifies the thread in the context of HPX. If the function is called while no HPX runtime system is active, the result will be “<unknown>”.

`hpx::get_locality_name`

Defined in header `hpx/runtime.hpp`⁹²⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

`std::string hpx::get_locality_name()`

Return the name of the locality this function is called on.

This function returns the name for the locality on which this function is called.

⁹²⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

⁹²⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

See also

```
future<std::string> get_locality_name(hpx::id_type const& id)
```

Returns

This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

```
future<std::string> hpx::get_locality_name(hpx::id_type const &id)
```

Return the name of the referenced locality.

This function returns a future referring to the name for the locality of the given id.

See also

```
std::string get_locality_name()
```

Parameters

id – [in] The global id of the locality for which the name should be retrieved

Returns

This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

hpx/runtime_local/thread_mapper.hpp

hpx/runtime_local/service_executors.hpp

Defined in header `hpx/runtime_local/service_executors.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

Enums

enum class **service_executor_type** : *std::*uint8_t

Values:

enumerator **io_thread_pool**

Selects creating a service executor using the I/O pool of threads

enumerator **parcel_thread_pool**

Selects creating a service executor using the parcel pool of threads

enumerator **timer_thread_pool**

Selects creating a service executor using the timer pool of threads

enumerator **main_thread**

Selects creating a service executor using the main thread

```
struct service_executor : public parallel::execution::detail::service_executor
    Subclassed      by      hpx::execution::experimental::io_pool_executor,
    hpx::execution::experimental::main_pool_executor, hpx::execution::experimental::parcel_pool_executor,
    hpx::execution::experimental::timer_pool_executor
```

Public Functions

```
explicit service_executor(service_executor_type t, char const *name_suffix = "")
```

```
struct io_pool_executor : public hpx::execution::experimental::service_executor
```

Public Functions

```
io_pool_executor()
```

```
struct parcel_pool_executor : public hpx::execution::experimental::service_executor
```

Public Functions

```
explicit parcel_pool_executor(char const *name_suffix = "-tcp")
```

```
struct timer_pool_executor : public hpx::execution::experimental::service_executor
```

Public Functions

```
timer_pool_executor()
```

```
struct main_pool_executor : public hpx::execution::experimental::service_executor
```

Public Functions

`main_pool_executor()`

`hpx/runtime_local/thread_hooks.hpp`

Defined in header `hpx/runtime_local/thread_hooks.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

`threads::policies::callback_notifier::on_startstop_type` **get_thread_on_start_func()**

Retrieve the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *register_thread_on_start_func*).

Note

This function can be called before the HPX runtime is initialized.

Returns

The currently installed error handler function.

`threads::policies::callback_notifier::on_startstop_type` **get_thread_on_stop_func()**

Retrieve the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *register_thread_on_stop_func*).

Note

This function can be called before the HPX runtime is initialized.

Returns

The currently installed error handler function.

threads::policies::callback_notifier::on_error_type **get_thread_on_error_func()**

Retrieve the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *register_thread_on_error_func*).

Note

This function can be called before the HPX runtime is initialized.

Returns

The currently installed error handler function.

threads::policies::callback_notifier::on_startstop_type **register_thread_on_start_func**(*threads::policies::callback_notifier::on_startstop_type* f)

Set the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *get_thread_on_start_func*).

Note

This function can be called before the HPX runtime is initialized.

Parameters

f – The function to install as the new start handler.

Returns

The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

threads::policies::callback_notifier::on_startstop_type **register_thread_on_stop_func**(*threads::policies::callback_notifier::on_startstop_type* f)

Set the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *get_thread_on_stop_func*).

Note

This function can be called before the HPX runtime is initialized.

Parameters

f – The function to install as the new stop handler.

Returns

The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

threads::policies::callback_notifier::on_error_type **register_thread_on_error_func**(*threads::policies::callback_notifier::on_error_type* &&f)

Set the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *get_thread_on_error_func*).

Note

This function can be called before the HPX runtime is initialized.

Parameters

f – The function to install as the new error handler.

Returns

The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

hpx::get_initial_num_localities

Defined in header [hpx/runtime.hpp](#)⁹³⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::get_num_localities*

std::uint32_t **hpx::get_initial_num_localities**()

Return the number of localities which were registered at startup for the running application.

The function *get_initial_num_localities* returns the number of localities which were connected to the console at application startup.

See also

[hpx::find_all_localities](#), [hpx::get_num_localities](#)

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

⁹³⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

hpx::get_num_localities

Defined in header `hpx/runtime.hpp`⁹³¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::get_initial_num_localities`

`hpx::future<std::uint32_t> hpx::get_num_localities()`

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console. The returned future represents the actual result.

See also

`hpx::find_all_localities`, `hpx::get_num_localities`

Note

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

`std::uint32_t hpx::get_num_localities(launch::sync_policy, error_code &ec = throws)`

Return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console.

See also

`hpx::find_all_localities`, `hpx::get_num_localities`

Note

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

⁹³¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

`std::uint32_t hpx::get_num_localities(hpx::launch::sync_policy, error_code &ec)`

Return the number of localities which are currently registered for the running application.

`hpx::future<std::uint32_t> hpx::get_num_localities(components::component_type t)`

Asynchronously return the number of localities which are currently registered for the running application.

The function *get_num_localities* asynchronously returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also

[hpx::find_all_localities](#), [hpx::get_num_localities](#)

Note

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Parameters

t – The component type for which the number of connected localities should be retrieved.

`std::uint32_t hpx::get_num_localities(launch::sync_policy, components::component_type t, error_code &ec = throws)`

Synchronously return the number of localities which are currently registered for the running application.

The function *get_num_localities* returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also

`hpx::find_all_localities`, `hpx::get_num_localities`

Note

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

Parameters

- **t** – The component type for which the number of connected localities should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`std::uint32_t` **hpx::get_num_localities**(*hpx::launch::sync_policy*, *components::component_type* type, *error_code* &ec)

hpx::shutdown_function_type

Defined in header `hpx/runtime.hpp`⁹³².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::register_pre_shutdown_function`
- `hpx::register_shutdown_function`

using **hpx::shutdown_function_type** = `hpx::move_only_function<void()>`

The type of the function which is registered to be executed as a shutdown or pre-shutdown function.

hpx::register_pre_shutdown_function

Defined in header `hpx/runtime.hpp`⁹³³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::shutdown_function_type`
- `hpx::register_shutdown_function`

⁹³² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

⁹³³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

void `hpx::register_pre_shutdown_function`(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during `hpx::finalize()` but guaranteed before any shutdown function is executed (system-wide)

Any of the functions registered with `register_pre_shutdown_function` are guaranteed to be executed by an HPX thread during the execution of `hpx::finalize()` before any of the registered shutdown functions are executed (see: `hpx::register_shutdown_function()`).

See also

`hpx::register_shutdown_function()`

Note

If this function is called while the pre-shutdown functions are being executed, or after that point, it will raise an `invalid_status` exception.

Parameters

f – [in] The function to be registered to run by an HPX thread as a pre-shutdown function.

`hpx::register_shutdown_function`

Defined in header `hpx/runtime.hpp`⁹³⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::shutdown_function_type`
- `hpx::register_pre_shutdown_function`

void `hpx::register_shutdown_function`(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during `hpx::finalize()` but guaranteed after any pre-shutdown function is executed (system-wide)

Any of the functions registered with `register_shutdown_function` are guaranteed to be executed by an HPX thread during the execution of `hpx::finalize()` after any of the registered pre-shutdown functions are executed (see: `hpx::register_pre_shutdown_function()`).

See also

`hpx::register_pre_shutdown_function()`

⁹³⁴ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

Note

If this function is called while the shutdown functions are being executed, or after that point, it will raise an `invalid_status` exception.

Parameters

f – [in] The function to be registered to run by an HPX thread as a shutdown function.

hpx::register_thread

Defined in header `hpx/runtime.hpp`⁹³⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::unregister_thread`
- `hpx::get_os_thread_data`
- `hpx::enumerate_os_threads`
- `hpx::get_runtime_instance_number`
- `hpx::register_on_exit`
- `hpx::is_starting`
- `hpx::tolerate_node_faults`
- `hpx::is_running`
- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

bool `hpx::register_thread(runtime *rt, char const *name, error_code &ec = throws)`

Register the current kernel thread with HPX, this should be done once for each external OS-thread intended to invoke HPX functionality. Calling this function more than once will return false.

hpx::unregister_thread

Defined in header `hpx/runtime.hpp`⁹³⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::register_thread`
- `hpx::get_os_thread_data`

⁹³⁵ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

⁹³⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

void `hpx::unregister_thread(runtime *rt)`

Unregister the thread from HPX, this should be done once in the end before the external thread exists.

`hpx::get_os_thread_data`

Defined in header `hpx/runtime.hpp`⁹³⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::register_thread`
- `hpx::unregister_thread`
- `hpx::enumerate_os_threads`
- `hpx::get_runtime_instance_number`

- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

`runtime_local::os_thread_data` `hpx::get_os_thread_data(std::string const &label)`

Access data for a given OS thread that was previously registered by `register_thread`. This function must be called from a thread that was previously registered with the runtime.

⁹³⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

hpx::enumerate_os_threads

Defined in header [hpx/runtime.hpp](#)⁹³⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::register_thread](#)
- [hpx::unregister_thread](#)

⁹³⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

`std::size_t hpx::get_runtime_instance_number()`

Return the runtime instance number associated with the runtime instance the current thread is running in.

hpx::register_on_exit

Defined in header `hpx/runtime.hpp`⁹⁴⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::register_thread`
- `hpx::unregister_thread`

- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

`bool hpx::register_on_exit(hpx::function<void()> const&)`

Register a function to be called during system shutdown.

hpx::is_starting

Defined in header `hpx/runtime.hpp`⁹⁴¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::register_thread`
- `hpx::unregister_thread`
- `hpx::get_os_thread_data`
- `hpx::enumerate_os_threads`

⁹⁴⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

⁹⁴¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

bool `hpx::is_starting()`

Test whether the runtime system is currently being started.

This function returns whether the runtime system is currently being started or not, e.g. whether the current state of the runtime system is `hpx::state::startup`

Note

This function needs to be executed on a HPX-thread. It will return false otherwise.

`hpx::tolerate_node_faults`

Defined in header `hpx/runtime.hpp`⁹⁴².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::register_thread`

bool `hpx::tolerate_node_faults()`

Test if HPX runs in fault-tolerant mode.

This function returns whether the runtime system is running in fault-tolerant mode

`hpx::is_running`

Defined in header `hpx/runtime.hpp`⁹⁴³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::register_thread`
- `hpx::unregister_thread`

- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

bool `hpx::is_running()`

Test whether the runtime system is currently running.

This function returns whether the runtime system is currently running or not, e.g. whether the current state of the runtime system is `hpx::state::running`

Note

This function needs to be executed on a HPX-thread. It will return false otherwise.

⁹⁴³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

hpx::is_stopped

Defined in header [hpx/runtime.hpp](#)⁹⁴⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::get_num_worker_threads](#)
- [hpx::get_system_uptime](#)

bool [hpx::is_stopped\(\)](#)

Test whether the runtime system is currently stopped.

This function returns whether the runtime system is currently stopped or not, e.g. whether the current state of the runtime system is *hpx::state::stopped*

Note

This function needs to be executed on a HPX-thread. It will return false otherwise.

hpx::is_stopped_or_shutting_down

Defined in header [hpx/runtime.hpp](#)⁹⁴⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

- *hpx::get_system_uptime*

bool ***hpx::is_stopped_or_shutting_down()***

Test whether the runtime system is currently being shut down.

This function returns whether the runtime system is currently being shut down or not, e.g. whether the current state of the runtime system is *hpx::state::stopped* or *hpx::state::shutdown*

Note

This function needs to be executed on a HPX-thread. It will return false otherwise.

hpx::get_num_worker_threads

Defined in header *hpx/runtime.hpp*⁹⁴⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register_thread*
- *hpx::unregister_thread*

⁹⁴⁶ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

`std::size_t hpx::get_num_worker_threads()`

Return the number of worker OS- threads used to execute HPX threads.

This function returns the number of OS-threads used to execute HPX threads. If the function is called while no HPX runtime system is active, it will return zero.

hpx::get_system_uptime

Defined in header `hpx/runtime.hpp`⁹⁴⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::register_thread`
- `hpx::unregister_thread`
- `hpx::get_os_thread_data`
- `hpx::enumerate_os_threads`
- `hpx::get_runtime_instance_number`

- `hpx::is_running`
- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`

`std::uint64_t hpx::get_system_uptime()`

Return the system uptime measure on the thread executing this call.

This function returns the system uptime measured in nanoseconds for the thread executing this call. If the function is called while no HPX runtime system is active, it will return zero.

hpx/runtime_local/custom_exception_info.hpp

Defined in header `hpx/runtime_local/custom_exception_info.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁹⁴⁷ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

Functions

`std::string diagnostic_information(exception_info const &xi)`

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function `hpx::diagnostic_information` can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

See also

<code>hpx::get_error_locality_id(),</code>	<code>hpx::get_error_host_name(),</code>	
<code>hpx::get_error_process_id(),</code>	<code>hpx::get_error_function_name(),</code>	
<code>hpx::get_error_file_name(),</code>	<code>hpx::get_error_line_number(),</code>	
<code>hpx::get_error_os_thread(),</code>	<code>hpx::get_error_thread_id(),</code>	
<code>hpx::get_error_thread_description(),</code>	<code>hpx::get_error(),</code>	<code>hpx::get_error_backtrace(),</code>
<code>hpx::get_error_env(),</code>	<code>hpx::get_error_what(),</code>	<code>hpx::get_error_config(),</code>
<code>hpx::get_error_state()</code>		

Parameters

xi – The parameter `e` will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if any of the required allocation operations fail)

Returns

The formatted string holding all the available diagnostic information stored in the given exception instance.

`std::string default_diagnostic_information(std::exception_ptr const &e)`

`std::uint32_t get_error_locality_id(hpx::exception_info const &xi) noexcept`

Return the locality id where the exception was thrown.

The function `hpx::get_error_locality_id` can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

See also

```

hpx::diagnostic_information(),          hpx::get_error_host_name(),
hpx::get_error_process_id(),           hpx::get_error_function_name(),
hpx::get_error_file_name(),            hpx::get_error_line_number(),
hpx::get_error_os_thread(),            hpx::get_error_thread_id(),
hpx::get_error_thread_description(),    hpx::get_error(),    hpx::get_error_backtrace(),
hpx::get_error_env(),                  hpx::get_error_what(),    hpx::get_error_config(),
hpx::get_error_state()

```

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

nothing –

Returns

The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return *hpx::naming::invalid_locality_id*.

std::string **get_error_host_name**(*hpx::exception_info* const &xi)

Return the hostname of the locality where the exception was thrown.

The function *hpx::get_error_host_name* can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

See also

```

hpx::diagnostic_information()          hpx::get_error_process_id(),
hpx::get_error_function_name(),        hpx::get_error_file_name(),
hpx::get_error_line_number(),          hpx::get_error_os_thread(),
hpx::get_error_thread_id(),    hpx::get_error_thread_description(),    hpx::get_error()
hpx::get_error_backtrace(),    hpx::get_error_env(),    hpx::get_error_what(),
hpx::get_error_config(), hpx::get_error_state()

```

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

std::bad_alloc – (if one of the required allocations fails)

Returns

The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::int64_t get_error_process_id(hpx::exception_info const &xi) noexcept`

Return the (operating system) process id of the locality where the exception was thrown.

The function `hpx::get_error_process_id` can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.

See also

<code>hpx::diagnostic_information(),</code>	<code>hpx::get_error_host_name(),</code>

<code>hpx::get_error_backtrace(),</code>	<code>hpx::get_error_env(),</code>
<code>hpx::get_error_config(),</code>	<code>hpx::get_error_state(),</code>
<code>hpx::get_error(),</code>	<code>hpx::get_error_what(),</code>

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

nothing –

Returns

The process id of the OS-process which threw the exception. If the exception instance does not hold this information, the function will return 0.

`std::string get_error_env(hpx::exception_info const &xi)`

Return the environment of the OS-process at the point the exception was thrown.

The function `hpx::get_error_env` can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

See also

<code>hpx::diagnostic_information(),</code>	<code>hpx::get_error_host_name(),</code>
<code>hpx::get_error_process_id(),</code>	<code>hpx::get_error_function_name(),</code>
<code>hpx::get_error_file_name(),</code>	<code>hpx::get_error_line_number(),</code>
<code>hpx::get_error_os_thread(),</code>	<code>hpx::get_error_thread_id(),</code>

<code>hpx::get_error_what(),</code>	<code>hpx::get_error_backtrace(),</code>
<code>hpx::get_error_config(),</code>	<code>hpx::get_error_state(),</code>

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This

parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

std::bad_alloc – (if one of the required allocations fails)

Returns

The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::string **get_error_backtrace**(*hpx::exception_info* const &xi)

Return the stack backtrace from the point the exception was thrown.

The function *hpx::get_error_backtrace* can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

<i>hpx::get_error_config()</i> ,	<i>hpx::get_error_state()</i>

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

std::bad_alloc – (if one of the required allocations fails)

Returns

The stack back trace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::size_t **get_error_os_thread**(*hpx::exception_info* const &xi) noexcept

Return the sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

The function *hpx::get_error_os_thread* can be used to extract the diagnostic information element representing the sequence number of the OS-thread as stored in the given exception instance.

hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(),
hpx::get_error_config(), hpx::get_error_state()

```

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

nothing –

Returns

The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size(-1)`.

`std::size_t` **get_error_thread_id**(*hpx::exception_info* const &xi) noexcept

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function *hpx::get_error_thread_id* can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

See also

```

hpx::get_error_os_thread() hpx::get_error_thread_description(), hpx::get_error(),
hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(),
hpx::get_error_config(), hpx::get_error_state()

```

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

nothing –

Returns

The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size_t(0)`.

`std::string` **get_error_thread_description**(*hpx::exception_info* const &xi)

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_description` can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.

<code>hpx::get_error_state(),</code>	<code>hpx::get_error_what(),</code>
<code>hpx::get_error_what(),</code>	
<code>hpx::get_error_config()</code>	

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

Any additionally available thread description of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string` **get_error_config**(`hpx::exception_info` const &xi)

Return the HPX configuration information point from which the exception was thrown.

The function `hpx::get_error_config` can be used to extract the HPX configuration information element representing the full HPX configuration information as stored in the given exception instance.

<code>hpx::get_error_thread_description()</code>	

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

Any additionally available HPX configuration information the point from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string` **get_error_state**(`hpx::exception_info` const &xi)

Return the HPX runtime state information at which the exception was thrown.

The function `hpx::get_error_state` can be used to extract the HPX runtime state information element representing the state the runtime system is currently in as stored in the given exception instance.

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception_ptr`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The point runtime state at the point at which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

hpx/runtime_local/runtime_local.hpp

Defined in header `hpx/runtime_local/runtime_local.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

void **set_error_handlers**(*hpx::util::runtime_configuration* const &cfg)

class **runtime**

Public Types

using **notification_policy_type** = *threads::policies::callback_notifier*

Generate a new notification policy instance for the given thread name prefix

using **hpx_main_function_type** = int()

The *hpx_main_function_type* is the default function type usable as the main HPX thread function.

using **hpx_errorsink_function_type** = void(*std::uint32_t*, *std::string* const&)

Public Functions

virtual *notification_policy_type* **get_notification_policy**(char const *prefix,
runtime_local::os_thread_type type)

state **get_state**() const

void **set_state**(state s)

explicit **runtime**(*hpx::util::runtime_configuration* rtcfg, bool initialize)

Construct a new HPX runtime instance.

virtual **~runtime**()

The destructor makes sure all HPX runtime services are properly shut down before exiting.

void **on_exit**(*hpx::function*<void()> const &f)

Manage list of functions to call on exit.

void **starting**()

Manage runtime ‘stopped’ state.

void **stopping**()

Call all registered on_exit functions.

bool **stopped**() const

This accessor returns whether the runtime instance has been stopped.

hpx::util::runtime_configuration &**get_config**()

access configuration information

hpx::util::runtime_configuration const &**get_config**() const

std::size_t **get_instance_number**() const

util::thread_mapper &**get_thread_mapper**() const

Return a reference to the internal PAPI thread manager.

threads::topology const &**get_topology**() const

virtual int **run**(*hpx::function<hpx_main_function_type>* const &func)

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

Note

The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

Parameters

func – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

Returns

This function will return the value as returned as the result of the invocation of the function object given by the parameter *func*.

virtual int **run**()

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

Returns

This function will always return 0 (zero).

virtual void **rethrow_exception**()

Rethrow any stored exception (to be called after *stop()*)

virtual int **start**(*hpx::function<hpx_main_function_type>* const &func, bool blocking = false)

Start the runtime system.

Parameters

- **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*.
- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally.

Returns

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter *func*. Otherwise, it will return zero.

virtual int **start**(bool blocking = false)

Start the runtime system.

Parameters

blocking – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally .

Returns

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter *func*. Otherwise, it will return zero.

virtual int **wait**()

Wait for the shutdown action to be executed.

Returns

This function will return the value as returned as the result of the invocation of the function object given by the parameter *func*.

virtual void **stop**(bool blocking = true)

Initiate termination of the runtime system.

Parameters

blocking – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

virtual int **suspend**()

Suspend the runtime system.

virtual int **resume**()

Resume the runtime system.

virtual int **finalize**(double)

virtual bool **is_networking_enabled**()

Return true if networking is enabled.

virtual *hpx::threads::threadmanager* &**get_thread_manager**()

Allow access to the thread manager instance used by the HPX runtime.

virtual *std::string* **here**() const

Returns a string of the locality endpoints (usable in debug output)

virtual bool **report_error**(*std::size_t* num_thread, *std::exception_ptr* const &e, bool terminate_all = true)

Report a non-recoverable error to the runtime system.

Parameters

- **num_thread** – [in] The number of the operating system thread the error has been detected in.
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] signal whether all localities should be terminated

virtual bool **report_error**(*std::exception_ptr* const &e, bool terminate_all = true)

Report a non-recoverable error to the runtime system.

Note

This function will retrieve the number of the current shepherd thread and forward to the `report_error` function above.

Parameters

- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] signal whether all localities should be terminated

virtual void **add_pre_startup_function**(*startup_function_type* f)

Add a function to be executed inside a HPX thread before `hpx_main` but guaranteed to be executed before any startup function registered with `add_startup_function`.

Note

The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

Parameters

f – The function ‘f’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add_startup_function**(*startup_function_type* f)

Add a function to be executed inside a HPX thread before `hpx_main`

Parameters

f – The function ‘f’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add_pre_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed inside a HPX thread during `hpx::finalize`, but guaranteed before any of the shutdown functions is executed.

Note

The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

Parameters

f – The function ‘f’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual void **add_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed inside a HPX thread during `hpx::finalize`

Parameters

f – The function ‘f’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual *hpx::util::io_service_pool* ***get_thread_pool**(char const *name)

Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument `name` are “main_pool”, “io_pool”, “parcel_pool”, and “timer_pool”. For any other argument value the function will return zero.

virtual bool **register_thread**(char const *name, *std::size_t* num = 0, bool service_thread = true, *error_code* &ec = *throws*)

Register an external OS-thread with HPX.

This function should be called from any OS-thread which is external to HPX (not created by HPX), but which needs to access HPX functionality, such as setting a value on a promise or similar.

‘main’, ‘io’, ‘timer’, ‘parcel’, ‘worker’

Note

The function will compose a thread name of the form ‘<name>-thread#<num>’ which is used to register the thread. It is the user’s responsibility to ensure that each (composed) thread name is unique. HPX internally uses the following names for the threads it creates, do not reuse those:

Note

This function should be called for each thread exactly once. It will fail if it is called more than once.

Parameters

- **name** – [in] The name to use for thread registration.
- **num** – [in] The sequence number to use for thread registration. The default for this parameter is zero.
- **service_thread** – [in] The thread should be registered as a service thread. The default for this parameter is ‘true’. Any service threads will be pinned to cores not currently used by any of the HPX worker threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function will return whether the requested operation succeeded or not.

virtual bool **unregister_thread()**

Unregister an external OS-thread with HPX.

This function will unregister any external OS-thread from HPX.

Note

This function should be called for each thread exactly once. It will fail if it is called more than once. It will fail as well if the thread has not been registered before (see *register_thread*).

Returns

This function will return whether the requested operation succeeded or not.

virtual runtime_local::os_thread_data **get_os_thread_data**(*std::string* const &label) const

Access data for a given OS thread that was previously registered by *register_thread*.

virtual bool **enumerate_os_threads**(*hpx::function*<bool(runtime_local::os_thread_data const&)> const &f) const

Enumerate all OS threads that have registered with the runtime.

notification_policy_type::on_startstop_type **on_start_func**() const

notification_policy_type::on_startstop_type **on_stop_func**() const

notification_policy_type::on_error_type **on_error_func**() const

notification_policy_type::on_startstop_type **on_start_func**(*notification_policy_type::on_startstop_type*&&)

notification_policy_type::on_startstop_type **on_stop_func**(*notification_policy_type::on_startstop_type*&&)

notification_policy_type::on_error_type **on_error_func**(*notification_policy_type::on_error_type*&&)

virtual *std::uint32_t* **get_locality_id**(*error_code* &ec) const

virtual *std::size_t* **get_num_worker_threads**() const

virtual *std::uint32_t* **get_num_localities**(*hpx::launch::sync_policy*, *error_code* &ec) const

virtual *std::uint32_t* **get_initial_num_localities**() const

virtual *hpx::future<std::uint32_t>* **get_num_localities**() const

virtual *std::string* **get_locality_name**() const

virtual *std::uint32_t* **assign_cores**(*std::string* const&, *std::uint32_t*)

virtual *std::uint32_t* **assign_cores**()

inline *hpx::program_options::options_description* const &**get_app_options**() const

inline void **set_app_options**(*hpx::program_options::options_description* const &app_options)

Public Static Functions

static *std::uint64_t* **get_system_uptime**()

Return the system uptime measure on the thread executing this call.

Protected Types

Functions

char const ***get_stack_size_name**(*std::ptrdiff_t* size)

Returns the stack size name.

Get the readable string representing the given stack size constant.

Parameters

size – this represents the stack size

std::ptrdiff_t **get_default_stack_size**()

Returns the default stack size.

Get the default stack size in bytes.

`std::ptrdiff_t get_stack_size(thread_stacksize size)`

Returns the stack size corresponding to the given stack size enumeration.

Get the stack size corresponding to the given stack size enumeration.

Parameters

size – this represents the stack size

namespace **util**

Functions

`bool retrieve_commandline_arguments(hpx::program_options::options_description const
&app_options, hpx::program_options::variables_map
&vm)`

`bool retrieve_commandline_arguments(std::string const &app_name,
hpx::program_options::variables_map &vm)`

hpx::startup_function_type

Defined in header `hpx/runtime.hpp`⁹⁴⁸.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::register_pre_startup_function`
- `hpx::register_startup_function`

using `hpx::startup_function_type = hpx::move_only_function<void()>`

The type of the function which is registered to be executed as a startup or pre-startup function.

hpx::register_pre_startup_function

Defined in header `hpx/runtime.hpp`⁹⁴⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::startup_function_type`
- `hpx::register_startup_function`

⁹⁴⁸ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

⁹⁴⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

void `hpx::register_pre_startup_function`(*startup_function_type* f)

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed before any startup function is executed (system-wide).

Any of the functions registered with `register_pre_startup_function` are guaranteed to be executed by an HPX thread before any of the registered startup functions are executed (see `hpx::register_startup_function()`).

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also

`hpx::register_startup_function()`

Note

If this function is called while the pre-startup functions are being executed or after that point, it will raise `aninvalid_status` exception.

Parameters

f – [in] The function to be registered to run by an HPX thread as a pre-startup function.

`hpx::register_startup_function`

Defined in header `hpx/runtime.hpp`⁹⁵⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::startup_function_type`
- `hpx::register_pre_startup_function`

void `hpx::register_startup_function`(*startup_function_type* f)

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed after any pre-startup function is executed (system-wide).

Any of the functions registered with `register_startup_function` are guaranteed to be executed by an HPX thread after any of the registered pre-startup functions are executed (see: `hpx::register_pre_startup_function()`), but before `hpx_main` is being called.

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

⁹⁵⁰ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

See also[hpx::register_pre_startup_function\(\)](#)**Note**

If this function is called while the startup functions are being executed or after that point, it will raise an `invalid_status` exception.

Parameters

f – [in] The function to be registered to run by an HPX thread as a startup function.

`hpx/runtime_local/get_os_thread_count.hpp`

Defined in header `hpx/runtime_local/get_os_thread_count.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

`std::size_t` **get_os_thread_count**()

Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

`std::size_t` **get_os_thread_count**(*threads::*executor const &exec)

Return the number of worker OS- threads used by the given executor to execute HPX threads.

This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

Parameters

exec – [in] The executor to be used.

namespace **threads**

hpx/runtime_local/thread_pool_helpers.hpp

Defined in header `hpx/runtime_local/thread_pool_helpers.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resource**

Functions

std::size_t **get_num_thread_pools()**

Return the number of thread pools currently managed by the *resource_partitioner*

std::size_t **get_num_threads()**

Return the number of threads in all thread pools currently managed by the *resource_partitioner*

std::size_t **get_num_threads**(*std::string* const &pool_name)

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

std::size_t **get_num_threads**(*std::size_t* pool_index)

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

std::size_t **get_pool_index**(*std::string* const &pool_name)

Return the internal index of the pool given its name.

std::string const &**get_pool_name**(*std::size_t* pool_index)

Return the name of the pool given its internal index.

threads::thread_pool_base &**get_thread_pool**(*std::string* const &pool_name)

Return the name of the pool given its name.

threads::thread_pool_base &**get_thread_pool**(*std::size_t* pool_index)

Return the thread pool given its internal index.

bool **pool_exists**(*std::string* const &pool_name)

Return true if the pool with the given name exists.

```
bool pool_exists(std::size_t pool_index)
```

Return true if the pool with the given index exists.

namespace **threads**

Functions

```
std::int64_t get_thread_count(thread_schedule_state state = thread_schedule_state::unknown)
```

The function *get_thread_count* returns the number of currently known threads.

Note

If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters

state – [in] This specifies the thread-state for which the number of threads should be retrieved.

```
std::int64_t get_thread_count(thread_priority priority, thread_schedule_state state =  
                                thread_schedule_state::unknown)
```

The function *get_thread_count* returns the number of currently known threads.

Note

If state == unknown this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters

- **priority** – [in] This specifies the thread-priority for which the number of threads should be retrieved.
- **state** – [in] This specifies the thread-state for which the number of threads should be retrieved.

```
std::int64_t get_idle_core_count()
```

The function *get_idle_core_count* returns the number of currently idling threads (cores).

```
mask_type get_idle_core_mask()
```

The function *get_idle_core_mask* returns a bit-mask representing the currently idling threads (cores).

```
bool enumerate_threads(hpx::function<bool(thread_id_type)> const &f, thread_schedule_state state  
                        = thread_schedule_state::unknown)
```

The function *enumerate_threads* will invoke the given function *f* for each thread with a matching thread state.

Parameters

- **f** – [in] The function which should be called for each matching thread. Returning ‘false’ from this function will stop the enumeration process.
- **state** – [in] This specifies the thread-state for which the threads should be enumerated.

serialization

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/serialization/base_object.hpp

Defined in header `hpx/serialization/base_object.hpp`.

class **stop_callback** : private *hpx::detail::stop_callback_base*

⁹⁵³ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/mutex.hpp

⁹⁵⁴ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/stop_token.hpp

⁹⁵⁵ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/stop_token.hpp

hpx::stop_source

Defined in header `hpx/stop_token.hpp`⁹⁵⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::nostopstate`
- `hpx::stop_callback`
- `hpx::stop_token`
- `hpx::nostopstate_t`

class `stop_source`

The `stop_source` class provides the means to issue a stop request, such as for `hpx::jthread` cancellation. A stop request made for one `stop_source` object is visible to all `stop_sources` and `hpx::stop_tokens` of the same associated stop-state; any `hpx::stop_callback(s)` registered for associated `hpx::stop_token(s)` will be invoked, and any `hpx::condition_variable_any` objects waiting on associated `hpx::stop_token(s)` will be awoken. Once a stop is requested, it cannot be withdrawn. Additional stop requests have no effect.

Note

For the purposes of `hpx::jthread` cancellation the `stop_source` object should be retrieved from the `hpx::jthread` object using `get_stop_source()`; or stop should be requested directly from the `hpx::jthread` object using `request_stop()`. This will then use the same associated stop-state as that passed into the `hpx::jthread`'s invoked function argument (i.e., the function being executed on its thread). For other uses, however, a `stop_source` can be constructed separately using the default constructor, which creates new stop-state.

hpx::stop_token

Defined in header `hpx/stop_token.hpp`⁹⁵⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::nostopstate`
- `hpx::stop_callback`
- `hpx::stop_source`
- `hpx::nostopstate_t`

⁹⁵⁶ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/stop_token.hpp

⁹⁵⁷ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/stop_token.hpp

class `stop_token`

The `stop_token` class provides the means to check if a stop request has been made or can be made, for its associated `hpx::stop_source` object. It is essentially a thread-safe “view” of the associated stop-state. The `stop_token` can also be passed to the constructor of `hpx::stop_callback`, such that the callback will be invoked if the `stop_token`’s associated `hpx::stop_source` is requested to stop. And `stop_token` can be passed to the interruptible waiting functions of `hpx::condition_variable_any`, to interrupt the condition variable’s wait if stop is requested.

Note

A `stop_token` object is not generally constructed independently, but rather retrieved from a `hpx::jthread` or `hpx::stop_source`. This makes it share the same associated stop-state as the `hpx::jthread` or `hpx::stop_source`.

`hpx::nostopstate_t`

Defined in header `hpx/stop_token.hpp`⁹⁵⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::nostopstate`
- `hpx::stop_callback`
- `hpx::stop_source`
- `hpx::stop_token`

struct `nostopstate_t`

Unit type intended for use as a placeholder in `hpx::stop_source` non-default constructor, that makes the constructed `hpx::stop_source` empty with no associated stop-state.

`hpx/synchronization/event.hpp`

Defined in header `hpx/synchronization/event.hpp`.

hpx::mutex

Defined in header [hpx/mutex.hpp](#)⁹⁵⁹.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [hpx::timed_mutex](#)

class **mutex**

mutex class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. *mutex* offers exclusive, non-recursive ownership semantics:

- A calling thread owns a mutex from the time that it successfully calls either *lock* or *try_lock* until it calls *unlock*.
- When a thread owns a *mutex*, all other threads will block (for calls to *lock*) or receive a *false* return value (for *try_lock*) if they attempt to claim ownership of the *mutex*.
- A calling thread must not own the *mutex* prior to calling *lock* or *try_lock*.

The behavior of a program is undefined if a *mutex* is destroyed while still owned by any threads, or a thread terminates while owning a *mutex*. The *mutex* class satisfies all requirements of and [hpx::mutex](#) is neither copyable nor movable.

Subclassed by [hpx::timed_mutex](#)

hpx::timed_mutex

Defined in header [hpx/mutex.hpp](#)⁹⁶⁰.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [hpx::mutex](#)

⁹⁵⁹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/mutex.hpp

⁹⁶⁰ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/mutex.hpp

class **timed_mutex** : private *hpx::mutex*

The *timed_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In a manner similar to *mutex*, *timed_mutex* offers exclusive, non-recursive ownership semantics. In addition, *timed_mutex* provides the ability to attempt to claim ownership of a *timed_mutex* with a timeout via the member functions *try_lock_for()* and *try_lock_until()*. The *timed_mutex* class satisfies all requirements of and

hpx::timed_mutex is neither copyable nor movable.

hpx::recursive_mutex

Defined in header *hpx/mutex.hpp*⁹⁶¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

using *hpx::recursive_mutex* = detail::recursive_mutex_impl<>

hpx::shared_mutex

Defined in header *hpx/shared_mutex.hpp*⁹⁶².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

using *hpx::shared_mutex* = detail::shared_mutex<>

The *shared_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In contrast to other mutex types which facilitate exclusive access, a *shared_mutex* has two levels of access:

- *shared* - several threads can share ownership of the same mutex.
- *exclusive* - only one thread can own the mutex.

If one thread has acquired the exclusive lock (through *lock*, *try_lock*), no other threads can acquire the lock (including the shared). If one thread has acquired the shared lock (through *lock_shared*, *try_lock_shared*), no other thread can acquire the exclusive lock, but can acquire the shared lock. Only when the exclusive lock has not been acquired by any thread, the shared lock can be acquired by multiple threads. Within one thread, only one lock (shared or exclusive) can be acquired at the same time. Shared mutexes are especially useful when shared data can be safely read by any number of threads simultaneously, but a thread may only write the same data when no other thread is reading or writing at the same time. The *shared_mutex* class satisfies all requirements of *Shared-Mutex* and *StandardLayoutType*.

⁹⁶¹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/mutex.hpp

⁹⁶² http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/shared_mutex.hpp

hpx::once_flag

Defined in header `hpx/mutex.hpp`⁹⁶³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::call_once`

struct once_flag

The class `hpx::once_flag` is a helper structure for `hpx::call_once`. An object of type `hpx::once_flag` that is passed to multiple calls to `hpx::call_once` allows those calls to coordinate with each other such that only one of the calls will actually run to completion. `hpx::once_flag` is neither copyable nor movable.

hpx::call_once

Defined in header `hpx/mutex.hpp`⁹⁶⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::once_flag`

template<typename **F**, typename ...**Args**>

void `hpx::call_once`(`once_flag` &flag, *F* &&*f*, *Args*&&... args)

Executes the Callable object *f* exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time `call_once` is called, flag indicates that *f* was already called, `call_once` returns right away (such a call to `call_once` is known as passive).
- Otherwise, `call_once` invokes `std::forward<Callable>(f)` with the arguments `std::forward<Args>(args)...` (as if by `hpx::invoke`). Unlike the `hpx::thread` constructor or `hpx::async`, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. (such a call to `call_once` is known as active).
- If that invocation throws an exception, it is propagated to the caller of `call_once`, and the flag is not flipped so that another call will be attempted (such a call to `call_once` is known as exceptional).
- If that invocation returns normally (such a call to `call_once` is known as returning), the flag is flipped, and all other calls to `call_once` with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to `call_once` are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

⁹⁶³ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/mutex.hpp

⁹⁶⁴ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/mutex.hpp

Note

If concurrent calls to `call_once` pass different functions `f`, it is unspecified which `f` will be called. The selected function runs in the same thread as the `call_once` invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using `hpx::call_once`. The POSIX equivalent of this function is `pthread_once`.

Parameters

- **flag** – an object, for which exactly one function gets executed
- **f** – Callable object to invoke
- **args** – arguments to pass to the function

Throws

`std::system_error` – if any condition prevents calls to `call_once` from executing as specified or any exception thrown by `f`

hpx::counting_semaphore

Defined in header `hpx/semaphore.hpp`⁹⁶⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<std::ptrdiff_t LeastMaxValue = PTRDIFF_MAX>
```

class counting_semaphore

A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike `hpx::mutex` a `counting_semaphore` is not tied to threads of execution; acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on `counting_semaphore` can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization

⁹⁶⁵ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/semaphore.hpp

primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of `hpx::counting_semaphore` are not `, , ,` or `.`

Note

`counting_semaphore`'s `try_acquire()` can spuriously fail.

Template Parameters

LeastMaxValue – `counting_semaphore` allows more than one concurrent access to the same resource, for at least *LeastMaxValue* concurrent accessors. As its name indicates, the *LeastMaxValue* is the minimum max value, not the actual max value. Thus `max()` can yield a number larger than *LeastMaxValue*.

`hpx::condition_variable`

Defined in header `hpx/condition_variable.hpp`⁹⁶⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::condition_variable_any`
- `hpx::cv_status`

class `condition_variable`

The `condition_variable` class is a synchronization primitive that can be used to block a thread, or multiple threads at the same time, until another thread both modifies a shared variable (the condition), and notifies the `condition_variable`.

The thread that intends to modify the shared variable has to

- acquire a `hpx::mutex` (typically via `std::lock_guard`)
- perform the modification while the lock is held
- execute `notify_one` or `notify_all` on the `condition_variable` (the lock does not need to be held for notification)

Even if the shared variable is atomic, it must be modified under the mutex in order to correctly publish the modification to the waiting thread. Any thread that intends to wait on `condition_variable` has to

- acquire a `std::unique_lock<hpx::mutex>`, on the same mutex as used to protect the shared variable

⁹⁶⁶ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/condition_variable.hpp

- b. either
 - i. check the condition, in case it was already updated and notified
 - ii. execute *wait*, *await_for*, or *wait_until*. The wait operations atomically release the mutex and suspend the execution of the thread.
 - iii. When the condition variable is notified, a timeout expires, or a spurious wakeup occurs, the thread is awakened, and the mutex is atomically reacquired. The thread should then check the condition and resume waiting if the wake-up was spurious. or
- i. use the predicated overload of *wait*, *wait_for*, and *wait_until*, which takes care of the three steps above.

`hpx::condition_variable` works only with `std::unique_lock<hpx::mutex>`. This restriction allows for maximal efficiency on some platforms. `hpx::condition_variable_any` provides a condition variable that works with any object, such as `std::shared_lock`.

Condition variables permit concurrent invocation of the *wait*, *wait_for*, *wait_until*, *notify_one* and *notify_all* member functions.

The class `hpx::condition_variable` is aIt is not , , , or

`hpx::condition_variable_any`

Defined in header `hpx/condition_variable.hpp`⁹⁶⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::condition_variable`
- `hpx::cv_status`

class `condition_variable_any`

The `condition_variable_any` class is a generalization of `hpx::condition_variable`. Whereas `hpx::condition_variable` works only on `std::unique_lock<std::mutex>`, a `condition_variable_any` can operate on any lock that meets the requirements.

See `hpx::condition_variable` for the description of the semantics of condition variables. It is not , , , or

`hpx::cv_status`

Defined in header `hpx/condition_variable.hpp`⁹⁶⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::condition_variable`
- `hpx::condition_variable_any`

⁹⁶⁷ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/condition_variable.hpp

⁹⁶⁸ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/condition_variable.hpp

enum class **hpx::cv_status**

The scoped enumeration `hpx::cv_status` describes whether a timed wait returned because of timeout or not. `hpx::cv_status` is used by the `wait_for` and `wait_until` member functions of `hpx::condition_variable` and `hpx::condition_variable_any`.

Values:

enumerator **no_timeout**

The condition variable was awakened with `notify_all`, `notify_one`, or spuriously

enumerator **timeout**

the condition variable was awakened by timeout expiration

enumerator **error**

there was an error

hpx::barrier

Defined in header `hpx/barrier.hpp`⁹⁶⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **OnCompletion** = detail::empty_oncompletion>

class **barrier**

A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier. [Note: A barrier is useful for managing repeated tasks that are handled by multiple threads. - end note] Each barrier phase consists of the following steps:

- The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
- When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the `CompletionFunction` template parameter, the completion step is run as part of the call to `arrive` or `arrive_and_drop` that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.
- When the completion step finishes, the expected count is reset to what was specified by the expected argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run. The phase completion step that is executed at the end of each phase has the following effects:

⁹⁶⁹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/barrier.hpp>

- Invokes the completion function, equivalent to `completion()`.
- Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object's member functions other than `wait` are called while the completion step is in progress.

Concurrent invocations of the member functions of barrier, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.

`CompletionFunction` shall meet the `Cpp17MoveConstructible` (Table 28) and `Cpp17Destructible` (Table 32) requirements. `std::is_nothrow_invocable_v<CompletionFunction&>` shall be true.

The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the `Cpp17DefaultConstructible` requirements (Table 27) and `completion()` has no effects.

`barrier::arrival_token` is an unspecified type, such that it meets the `Cpp17MoveConstructible` (Table 28), `Cpp17MoveAssignable` (Table 30), and `Cpp17Destructible` (Table 32) requirements.

hpx/synchronization/sliding_semaphore.hpp

Defined in header `hpx/synchronization/sliding_semaphore.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Typedefs

using **sliding_semaphore** = *sliding_semaphore_var*<>

template<typename **Mutex** = *hpx::spinlock*>

class **sliding_semaphore_var**

#include <sliding_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Sliding semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. The difference to a counting semaphore is that a sliding semaphore will not limit the number of threads which are allowed to proceed, but will make sure that the difference between the (arbitrary) number passed to set and wait does not exceed a given threshold.

Public Functions

sliding_semaphore_var(*sliding_semaphore_var* const&) = delete

sliding_semaphore_var &**operator**=(*sliding_semaphore_var* const&) = delete

sliding_semaphore_var(*sliding_semaphore_var*&&) = delete

sliding_semaphore_var &**operator**=(*sliding_semaphore_var*&&) = delete

inline explicit **sliding_semaphore_var**(*std::int64_t* max_difference, *std::int64_t* lower_limit = 0)
noexcept

Construct a new sliding semaphore.

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

inline void **set_max_difference**(*std::int64_t* max_difference, *std::int64_t* lower_limit = 0) noexcept

Set/Change the difference that will cause the semaphore to trigger

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

inline void **wait**(*std::int64_t* upper_limit)

Wait for the semaphore to be signaled.

Parameters

upper_limit – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

```
inline bool try_wait(std::int64_t upper_limit = 1)
```

Try to wait for the semaphore to be signaled.

Parameters

upper_limit – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

Returns

The function returns true if the calling thread would not block if it was calling *wait()*.

```
inline void signal(std::int64_t lower_limit)
```

Signal the semaphore.

Parameters

lower_limit – [in] The new lower limit. This will update the current lower limit of this semaphore. It will also re-schedule all suspended threads for which their associated upper limit is not larger than the lower limit plus the max_difference.

```
inline std::int64_t signal_all()
```

Private Types

hpx::binary_semaphore

Defined in header *hpx/semaphore.hpp*⁹⁷⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
class binary_semaphore
```

A binary semaphore is a semaphore object that has only two states. *binary_semaphore* is an alias for specialization of *hpx::counting_semaphore* with *LeastMaxValue* being 1. HPX's implementation of *binary_semaphore* is more efficient than the default implementation of a counting semaphore with a unit resource count (*hpx::counting_semaphore*).

⁹⁷⁰ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/semaphore.hpp

tag_invoke

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::invoke

Defined in header `hpx/functional.hpp`⁹⁷¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

template<typename **F**, typename ...**Ts**>

```
constexpr util::invoke_result_t<F, Ts&&...> hpx::invoke(F &&f, Ts&&... vs)  
noexcept(noexcept(HPX_INVOKE(std::forward<F>(f),  
istd::forward<Ts>(vs)...)))
```

Invokes the given callable object *f* with the content of the argument pack *vs*

Note

This function is similar to `std::invoke` (C++17)

Parameters

- **f** – Requires to be a callable object. If *f* is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- **vs** – An arbitrary pack of arguments

Throws

std::exception – like objects thrown by call to object *f* with the argument types *vs*.

Returns

The result of the callable object when it's called with the given argument types.

hpx::is_invocable

Defined in header `hpx/type_traits.hpp`⁹⁷².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::is_invocable_r*

template<typename **F**, typename ...**Ts**>

```
struct is_invocable : public hpx::detail::is_invocable_impl<F&&(Ts&&...)>
```

Determines whether *F* can be invoked with the arguments *Ts*... Formally, determines whether

⁹⁷¹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

⁹⁷² http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/type_traits.hpp

```
INVOKE(std::declval<F>(), std::declval<Ts>()...)
```

is well-formed when treated as an unevaluated operand, where *INVOKE* is the operation defined in *Callable*.

F, R and all types in the parameter pack Ts shall each be a complete type, (possibly cv-qualified) void, or an array of unknown bound. Otherwise, the behavior is undefined. If an instantiation of a template above depends, directly or indirectly, on an incomplete type, and that instantiation could yield a different result if that type were hypothetically completed, the behavior is undefined.

hpx::is_invocable_r

Defined in header `hpx/type_traits.hpp`⁹⁷³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::is_invocable`

```
template<typename R, typename F, typename ...Ts>
```

```
struct is_invocable_r : public hpx::detail::is_invocable_r_impl<F&&(Ts&&...), R>
```

Determines whether *F* can be invoked with the arguments *Ts...* to yield a result that is convertible to *R* and the implicit conversion does not bind a reference to a temporary object (since C++23). If *R* is cv void, the result can be any type. Formally, determines whether

```
INVOKE<R>(std::declval<F>(), std::declval<Ts>()...)
```

is well-formed when treated as an unevaluated operand, where *INVOKE* is the operation defined in *Callable*. Determines whether *F* can be invoked with the arguments *Ts...*. Formally, determines whether

```
INVOKE(std::declval<F>(), std::declval<Ts>()...)
```

is well-formed when treated as an unevaluated operand, where *INVOKE* is the operation defined in *Callable*.

F, R and all types in the parameter pack Ts shall each be a complete type, (possibly cv-qualified) void, or an array of unknown bound. Otherwise, the behavior is undefined. If an instantiation of a template above depends, directly or indirectly, on an incomplete type, and that instantiation could yield a different result if that type were hypothetically completed, the behavior is undefined.

⁹⁷³ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/type_traits.hpp

thread_pool_util

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/thread_pool_util/thread_pool_suspension_helpers.hpp

Defined in header `hpx/thread_pool_util/thread_pool_suspension_helpers.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

hpx::future<void> **resume_processing_unit**(*thread_pool_base* &pool, *std::size_t* virt_core)

Resumes the given processing unit. When the processing unit has been resumed the returned future will be ready.

Note

Can only be called from an HPX thread. Use `resume_processing_unit_cb` or to resume the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **virt_core** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.

Returns

A `future<void>` which is ready when the given processing unit has been resumed.

void **resume_processing_unit_cb**(*thread_pool_base* &pool, *hpx::function*<void()> callback, *std::size_t* virt_core, *error_code* &ec = *throws*)

Resumes the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been resumed.

Note

Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **callback** – [in] Callback which is called when the processing unit has been suspended.

- **virt_core** – [in] The processing unit to resume.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`hpx::future<void> suspend_processing_unit(thread_pool_base &pool, std::size_t virt_core)`

Suspends the given processing unit. When the processing unit has been suspended the returned future will be ready.

Note

Can only be called from an HPX thread. Use `suspend_processing_unit_cb` or `to_suspend` the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to suspend a processing unit from.
- **virt_core** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.

Throws

`hpx::exception` – if called from outside the HPX runtime.

Returns

A `future<void>` which is ready when the given processing unit has been suspended.

`void suspend_processing_unit_cb(hpx::function<void()> callback, thread_pool_base &pool, std::size_t virt_core, error_code &ec = throws)`

Suspends the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been suspended.

Note

Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to suspend a processing unit from.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to suspend.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`hpx::future<void> resume_pool(thread_pool_base &pool)`

Resumes the thread pool. When the all OS threads on the thread pool have been resumed the returned future will be ready.

Note

Can only be called from an HPX thread. Use `resume_cb` or `resume_direct` to suspend the pool from outside HPX.

Parameters

pool – [in] The thread pool to resume.

Throws

hpx::exception – if called from outside the HPX runtime.

Returns

A `future<void>` which is ready when the thread pool has been resumed.

```
void resume_pool_cb(thread_pool_base &pool, hpx::function<void()> callback, error_code &ec =  
    throws)
```

Resumes the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been resumed.

Parameters

- **pool** – [in] The thread pool to resume.
- **callback** – [in] called when the thread pool has been resumed.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
hpx::future<void> suspend_pool(thread_pool_base &pool)
```

Suspends the thread pool. When the all OS threads on the thread pool have been suspended the returned future will be ready.

Note

Can only be called from an HPX thread. Use `suspend_cb` or `suspend_direct` to suspend the pool from outside HPX. A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

pool – [in] The thread pool to suspend.

Throws

hpx::exception – if called from outside the HPX runtime.

Returns

A `future<void>` which is ready when the thread pool has been suspended.

```
void suspend_pool_cb(thread_pool_base &pool, hpx::function<void()> callback, error_code &ec =  
    throws)
```

Suspends the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been suspended.

Note

A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

- **pool** – [in] The thread pool to suspend.
- **callback** – [in] called when the thread pool has been suspended.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

hpx::exception – if called from an HPX thread which is running on the pool itself.

thread_support

namespace **hpx**

namespace **util**

hpx::unlock_guard

Defined in header `hpx/mutex.hpp`⁹⁷⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **Lock**>

class **unlock_guard**

The class `unlock_guard` is a mutex wrapper that provides a convenient mechanism for releasing a mutex for the duration of a scoped block.

`unlock_guard` performs the opposite functionality of `lock_guard`.

When a `lock_guard` object is created, it attempts to take ownership of the mutex it is given. When control leaves the scope in which the `lock_guard` object was created, the `lock_guard` is destructed and the mutex is released. Accordingly, when an `unlock_guard` object is created, it attempts to release the ownership of the mutex it is given. So, when control leaves the scope in which the `unlock_guard` object was created, the `unlock_guard` is destructed and the mutex is owned again. In this way, the mutex is unlocked in the constructor and locked in the destructor, so that one can have an unlocked section within a locked one.

Note

`unlock_guard` is non-copyable and non-movable.

Template Parameters

Lock – The type of the lockable object managed by the `unlock_guard`.

⁹⁷⁴ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/mutex.hpp

threading

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::jthread

Defined in header `hpx/jthread.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **jthread**

The class *jthread* represents a single thread of execution. It has the same general behavior as `hpx::thread`, except that *jthread* automatically rejoins on destruction, and can be cancelled/stopped in certain situations. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, `hpx::terminate` is called. The top-level function may communicate its return value or an exception to the caller via `hpx::promise` or by modifying shared variables (which may require synchronization, see `hpx::mutex` and `hpx::atomic`). Unlike `hpx::thread`, the *jthread* logically holds an internal private member of type `hpx::stop_source`, which maintains a shared stop-state. The *jthread* constructor accepts a function that takes a `hpx::stop_token` as its first argument, which will be passed in by the *jthread* from its internal `stop_source`. This allows the function to check if stop has been requested during its execution, and return if it has. `hpx::jthread` objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may be not associated with any *jthread* objects (after detach). No two `hpx::jthread` objects may represent the same thread of execution; `hpx::jthread` is not *CopyConstructible* or *CopyAssignable*, although it is *MoveConstructible* and *MoveAssignable*.

hpx::thread

Defined in header `hpx/thread.hpp`⁹⁷⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::this_thread::yield`
- `hpx::this_thread::get_id`
- `hpx::this_thread::sleep_for`
- `hpx::this_thread::sleep_until`

class **thread**

The class *thread* represents a single thread of execution. Threads allow multiple functions to execute concurrently. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, `hpx::terminate` is called. The top-level function may communicate its return value or an exception

⁹⁷⁵ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/thread.hpp

to the caller via `hpx::promise` or by modifying shared variables (which may require synchronization, see `hpx::mutex` and `hpx::atomic`) `hpx::thread` objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may not be associated with any thread objects (after detach). No two `hpx::thread` objects may represent the same thread of execution; `hpx::thread` is not *CopyConstructible* or *CopyAssignable*, although it is *MoveConstructible* and *MoveAssignable*.

`hpx::this_thread::yield`

Defined in header `hpx/thread.hpp`⁹⁷⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::thread`
- `hpx::this_thread::get_id`
- `hpx::this_thread::sleep_for`
- `hpx::this_thread::sleep_until`

void `hpx::this_thread::yield()` noexcept

Provides a hint to the implementation to reschedule the execution of threads, allowing other threads to run.

Note

The exact behavior of this function depends on the implementation, in particular on the mechanics of the OS scheduler in use and the state of the system. For example, a first-in-first-out realtime scheduler (SCHED_FIFO in Linux) would suspend the current thread and put it on the back of the queue of the same-priority threads that are ready to run (and if there are no other threads at the same priority, yield has no effect).

`hpx::this_thread::get_id`

Defined in header `hpx/thread.hpp`⁹⁷⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::thread`
- `hpx::this_thread::yield`
- `hpx::this_thread::sleep_for`
- `hpx::this_thread::sleep_until`

`thread::id` `hpx::this_thread::get_id()` noexcept

Returns the id of the current thread.

⁹⁷⁶ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/thread.hpp

⁹⁷⁷ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/thread.hpp

`hpx::this_thread::sleep_for`

Defined in header `hpx/thread.hpp`⁹⁷⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::thread`
- `hpx::this_thread::yield`
- `hpx::this_thread::get_id`
- `hpx::this_thread::sleep_until`

inline void `hpx::this_thread::sleep_for`(`hpx::chrono::steady_duration` const &rel_time)

Blocks the execution of the current thread for at least the specified *rel_time*. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

It is recommended to use a steady clock to measure the duration. If an implementation uses a system clock instead, the wait time may also be sensitive to clock adjustments.

Parameters

rel_time – time duration to sleep

`hpx::this_thread::sleep_until`

Defined in header `hpx/thread.hpp`⁹⁷⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::thread`
- `hpx::this_thread::yield`
- `hpx::this_thread::get_id`
- `hpx::this_thread::sleep_for`

void `hpx::this_thread::sleep_until`(`hpx::chrono::steady_time_point` const &abs_time)

Blocks the execution of the current thread until specified *abs_time* has been reached.

It is recommended to use the clock tied to *abs_time*, in which case adjustments of the clock may be taken into account. Thus, the duration of the block might be more or less than `abs_time - Clock::now()` at the time of the call, depending on the direction of the adjustment and whether it is honored by the implementation. The function also may block until after *abs_time* has been reached due to process scheduling or resource contention delays.

Parameters

abs_time – absolute time to block until

⁹⁷⁸ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/thread.hpp

⁹⁷⁹ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/thread.hpp

threading_base

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx/threading_base/thread_data.hpp

Defined in header `hpx/threading_base/thread_data.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **threads**

Functions

```
constexpr thread_data *get_thread_id_data(thread_id_ref_type const &tid) noexcept
```

```
constexpr thread_data *get_thread_id_data(thread_id_type const &tid) noexcept
```

```
constexpr tracing::region_init_data get_region_init_data(thread_data const*) noexcept
```

```
constexpr tracing::fiber_region_init_data get_fiber_region_init_data(thread_data const*)  
noexcept
```

```
class thread_data : public detail::thread_data_reference_counting
```

#include <thread_data.hpp> A *thread* is the representation of a HPX thread. It's a first class object in HPX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the *thread-manager*.

A *thread* encapsulates:

- A thread status word (see the functions *thread::get_state* and *thread::set_state*)
- A function to execute (the thread function)
- A frame (in this implementation this is a block of memory used as the threads stack)
- A block of registers (not implemented yet)

Generally, *threads* are not created or executed directly. All functionality related to the management of *threads* is implemented by the thread-manager.

Public Types

using **mutex_type** = *util::detail::spinlock_no_backoff*

Public Functions

thread_data(*thread_data* const&) = delete

thread_data(*thread_data*&&) = delete

thread_data &**operator**=(*thread_data* const&) = delete

thread_data &**operator**=(*thread_data*&&) = delete

inline thread_state **get_state**(*std::memory_order* const order = *std::memory_order_acquire*) const
noexcept

The `get_state` function queries the state of this thread instance.

Note

This function will seldom be used directly. Most of the time the state of a thread will be retrieved by using the function *threadmanager::get_state*.

Returns

This function returns the current state of this thread. It will return one of the values as defined by the *thread_state* enumeration.

inline thread_state **set_state**(*thread_schedule_state* const state, *thread_restart_state* state_ex = *thread_restart_state::unknown*, *std::memory_order* const load_order = *std::memory_order_acquire*, *std::memory_order* const exchange_order = *std::memory_order_acq_rel*) const noexcept

The `set_state` function changes the state of this thread instance.

Note

This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the thread-manager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status *threadmanager::set_state* should be used.

Parameters

- **state** – [in] The new state to be set for the thread.
- **state_ex** – [in]
- **load_order** – [in]
- **exchange_order** – [in]

```
inline bool set_state_tagged(thread_schedule_state const newstate, thread_state const
                             &prev_state, thread_state &new_tagged_state, std::memory_order
                             const exchange_order = std::memory_order_acq_rel) const
                             noexcept
```

```
inline bool restore_state(thread_state const new_state, thread_state const old_state,
                           std::memory_order const load_order = std::memory_order_relaxed,
                           std::memory_order const load_exchange =
                           std::memory_order_acq_rel) const noexcept
```

The `restore_state` function changes the state of this thread instance depending on its current state. It will change the state atomically only if the current state is still the same as passed as the second parameter. Otherwise, it won't touch the thread state of this instance.

Note

This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the `threadmanager`. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status `threadmanager::set_state` should be used.

Parameters

- **new_state** – [in] The new state to be set for the thread.
- **old_state** – [in] The old state of the thread which still has to be the current state.
- **load_order** – [in]
- **load_exchange** – [in]

Returns

This function returns `true` if the state has been changed successfully

```
inline bool restore_state(thread_schedule_state const new_state, thread_restart_state const
                           state_ex, thread_state old_state, std::memory_order const
                           load_exchange = std::memory_order_acq_rel) const noexcept
```

```
char const *get_fiber_name() const noexcept
```

```
inline constexpr thread_priority get_priority() const noexcept
```

```
inline void set_priority(thread_priority const priority) noexcept
```

```
inline bool is_background() const noexcept
```

```
inline void set_is_background() noexcept
```

```
inline constexpr bool should_emit_lifecycle() const noexcept
```

True if this task's lifecycle events should be emitted.

On Tracy, reflects the 1/N sample decision made once at ctor and *rebind_base*; the read is unlocked because no other code path ever writes *emit_lifecycle_* (unlike *state_* bits, which are mutated concurrently by *interrupt()*). On other backends, always true (their hooks are constexpr no-ops).

Returns

true if lifecycle events should be emitted for this task.

```
inline bool interruption_requested() const noexcept
```

```
inline bool interruption_enabled() const noexcept
```

```
inline bool set_interruption_enabled(bool const enable) noexcept
```

```
inline void interrupt(bool const flag = true)
```

```
bool interruption_point(bool throw_on_interrupt = true)
```

inline constexpr *ThreadQueue* &**get_queue**() noexcept

inline coroutine_type::result_type **operator**() (*hpx::execution_base::this_thread::detail::agent_storage*
*agent_storage)

Execute the thread function.

Returns

This function returns the thread state the thread should be scheduled from this point on.

The thread manager will use the returned value to set the thread's scheduling status.

inline coroutine_type::result_type **invoke_directly**()

Directly execute the thread function (inline)

Returns

This function returns the thread state the thread should be scheduled from this point on.

The thread manager will use the returned value to set the thread's scheduling status.

inline virtual thread_id_type **get_thread_id**() const

inline virtual *std::size_t* **get_thread_phase**() const noexcept

virtual *std::size_t* **get_thread_data**() const = 0

```

```

```
~thread_data() override
```

```
virtual void destroy() noexcept = 0
```

Public Static Functions

```
static inline constexpr std::uint64_t get_component_id() noexcept
```

Return the id of the component this thread is running in.

```
static inline constexpr threads::thread_description get_description() noexcept
```

```
static inline constexpr threads::thread_description set_description(threads::thread_description)  
    noexcept
```

```
static inline constexpr threads::thread_description get_lco_description() noexcept
```

```
static inline constexpr threads::thread_description set_lco_description(threads::thread_description)  
    noexcept
```

```
static char const *get_safe_description(threads::thread_description const &description, char
                                       const *fallback = "<unknown>") noexcept
```

```
static inline constexpr std::uint32_t get_parent_locality_id() noexcept
```

Return the locality of the parent thread.

```
static inline constexpr thread_id_type get_parent_thread_id() noexcept
```

Return the thread id of the parent thread.

```
static inline constexpr std::size_t get_parent_thread_phase() noexcept
```

Return the phase of the parent thread.

```
static inline constexpr util::backtrace const *get_backtrace() noexcept
```

```
static inline constexpr util::backtrace const *set_backtrace(util::backtrace const*) noexcept
```

Protected Functions

```
inline thread_restart_state set_state_ex(thread_restart_state const new_state,
                                         std::memory_order const load_order =
                                         std::memory_order_acquire, std::memory_order const
                                         load_exchange = std::memory_order_acq_rel) const
                                         noexcept
```

The set_state function changes the extended state of this thread instance.

Note

This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the threadmanager.

Parameters

- **new_state** – [in] The new extended state to be set for the thread.
- **load_order** – [in]
- **load_exchange** – [in]

```
void rebind_base(thread_init_data &init_data)
```

hpx::annotated_function

Defined in header `hpx/functional.hpp`⁹⁸⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename F>
```

```
constexpr F &&hpx::annotated_function(F &&f, char const* = nullptr) noexcept
```

Returns a function annotated with the given annotation.

Annotating includes setting the thread description per thread id.

Parameters

f – Function to annotate

```
template<typename F>
```

```
constexpr F &&hpx::annotated_function(F &&f, std::string const&) noexcept
```

hpx/threading_base/thread_description.hpp

Defined in header `hpx/threading_base/thread_description.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
namespace threads
```

Functions

```
std::ostream &operator<<(std::ostream&, thread_description const&)
```

```
std::string as_string(thread_description const &desc)
```

```
threads::thread_description get_thread_description(thread_id_type const &id, error_code &ec =  
throws)
```

The function `get_thread_description` is part of the thread related API allows to query the description of one of the threads known to the thread-manager.

⁹⁸⁰ http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/core/include_local/include/hpx/functional.hpp

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the description of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the string “<unknown>”.

```
threads::thread_description set_thread_description(thread_id_type const &id,  
                                                    threads::thread_description const &desc =  
                                                    threads::thread_description(), error_code &ec  
                                                    = throws)
```

```
threads::thread_description get_thread_lco_description(thread_id_type const &id, error_code  
                                                         &ec = throws)
```

```
threads::thread_description set_thread_lco_description(thread_id_type const &id,  
                                                         threads::thread_description const &desc  
                                                         = threads::thread_description(),  
                                                         error_code &ec = throws)
```

```
struct thread_description
```

Public Types

```
enum class data_type : std::uint8_t
```

Values:

enumerator **description**

enumerator **address**

Public Functions

thread_description() noexcept = default

inline constexpr **thread_description**(char const*) noexcept

inline explicit constexpr **thread_description**(std::string const&) noexcept

template<typename **F**, typename = std::enable_if_t<!std::is_same_v<**F**, *thread_description*> &&

Private Functions

```
void init_from_alternative_name(char const *altname)
```

```
namespace util
```

Typedefs

```
using instead = hpx::threads::thread_description
```

hpx/threading_base/thread_helpers.hpp

Defined in header `hpx/threading_base/thread_helpers.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace this_thread
```

Functions

```
threads::thread_restart_state suspend(threads::thread_schedule_state state, threads::thread_id_type  
nextid, threads::thread_description const &description =  
threads::thread_description("this_thread::suspend"),  
hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note

Must be called from within a HPX-thread.

Throws

If `- &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(threads::thread_schedule_state state =
                                           threads::thread_schedule_state::pending,
                                           threads::thread_description const &description =
                                           threads::thread_description("this_thread::suspend"),
                                           hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note

Must be called from within a HPX-thread.

Throws

If `!&ec` != `&throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
                                     threads::thread_id_type id, threads::thread_description const
                                     &description =
                                     threads::thread_description("this_thread::suspend"),
                                     hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

Note

Must be called from within a HPX-thread.

Throws

If `!&ec` != `&throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
                                           threads::thread_description const &description =
                                           threads::thread_description("this_thread::suspend"),
                                           hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

Note

Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,  
                                             threads::thread_description const &description =  
                                             threads::thread_description("this_thread::suspend"),  
                                             hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

Note

Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,  
                                             threads::thread_id_type const &id,  
                                             threads::thread_description const &description =  
                                             threads::thread_description("this_thread::suspend"),  
                                             hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

Note

Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(std::uint64_t ms, threads::thread_description const  
                                             &description =  
                                             threads::thread_description("this_thread::suspend"),  
                                             hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given time (specified in milliseconds).

Note

Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

threads::thread_pool_base ***get_pool**(*hpx::error_code* &ec = *hpx::throws*)

Returns a pointer to the pool that was used to run the current thread

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

namespace **threads**

Functions

thread_state **set_thread_state**(thread_id_type const &id, *thread_schedule_state* state = *thread_schedule_state::pending*, *thread_restart_state* stateex = *thread_restart_state::signaled*, *thread_priority* priority = *thread_priority::normal*, bool retry_on_active = true, *hpx::error_code* &ec = *hpx::throws*)

Set the thread state of the *thread* referenced by the thread_id *id*.

Note

If the thread referenced by the parameter *id* is in *thread_state::active* state this function schedules a new thread which will set the state of the thread as soon as it is not active anymore. The function returns *thread_state::active* in this case.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the previous state of the thread referenced by the *id* parameter. It will return one of the values as defined by the *thread_state* enumeration. If the thread is not known to the thread-manager the return value will be *thread_state::unknown*.

```
thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_time_point
                                     const &abs_time, std::atomic<bool> *started,
                                     thread_schedule_state state = thread_schedule_state::pending,
                                     thread_restart_state stateex = thread_restart_state::timeout,
                                     thread_priority priority = thread_priority::normal, bool
                                     retry_on_active = true, hpx::error_code &ec = hpx::throws)
```

Set the thread state of the *thread* referenced by the thread_id *id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (at the given time)

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **abs_time** – [in] Absolute point in time for the new thread to be run
- **started** – [in,out] A helper variable allowing to track the state of the timer helper thread
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

```
inline thread_id_ref_type set_thread_state(thread_id_type const &id,
                                           hpx::chrono::steady_time_point const &abs_time,
                                           thread_schedule_state state =
                                           thread_schedule_state::pending, thread_restart_state
stateex = thread_restart_state::timeout, thread_priority
priority = thread_priority::normal, bool retry_on_active
= true, hpx::error_code& = throws)
```

```
inline thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_duration
const &rel_time, thread_schedule_state state =
thread_schedule_state::pending, thread_restart_state
stateex = thread_restart_state::timeout, thread_priority
priority = thread_priority::normal, bool retry_on_active
= true, hpx::error_code &ec = hpx::throws)
```

Set the thread state of the *thread* referenced by the thread_id *id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (after the given duration)

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **rel_time** – [in] Time duration after which the new thread should be run
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

```
thread_state get_thread_state(thread_id_type const &id, hpx::error_code &ec = hpx::throws)
noexcept
```

The function `get_thread_backtrace` is part of the thread related API allows to query the currently stored thread back trace (which is captured during thread suspension).

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*. The function `get_thread_state` is part of the thread related API. It queries the state of one of the threads known to the thread-manager.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.
- **id** – [in] The thread id of the thread the state should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the currently captured stack back trace of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the zero.

Returns

This function returns the thread state of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be *terminated*.

`std::size_t get_thread_phase(thread_id_type const &id, hpx::error_code &ec = hpx::throws) noexcept`

The function `get_thread_phase` is part of the thread related API. It queries the phase of one of the threads known to the thread-manager.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread the phase should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the thread phase of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be *~0*.

`bool get_thread_interruption_enabled(thread_id_type const &id, hpx::error_code &ec = hpx::throws)`

Returns whether the given thread can be interrupted at this point.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns *true* if the given thread can be interrupted at this point in time. It will return *false* otherwise.

```
bool set_thread_interruption_enabled(thread_id_type const &id, bool enable, hpx::error_code
                                     &ec = hpx::throws)
```

Set whether the given thread can be interrupted at this point.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should receive the new value.
- **enable** – [in] This value will determine the new interruption enabled status for the given thread.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the previous value of whether the given thread could have been interrupted.

```
bool get_thread_interruption_requested(thread_id_type const &id, hpx::error_code &ec =
                                     hpx::throws)
```

Returns whether the given thread has been flagged for interruption.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns *true* if the given thread was flagged for interruption. It will return *false* otherwise.

```
void interrupt_thread(thread_id_type const &id, bool flag, hpx::error_code &ec = hpx::throws)
```

Flag the given thread for interruption.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **flag** – [in] The flag encodes whether the thread should be interrupted (if it is *true*), or 'uninterrupted' (if it is *false*).
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline void **interrupt_thread**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*)

void **interruption_point**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*)

Interrupt the current thread at this point if it was canceled. This will throw a *thread_interrupted* exception, which will cancel the thread.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::thread_priority **get_thread_priority**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*) noexcept

Return priority of the given thread

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::ptrdiff_t **get_stack_size**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*) noexcept

Return stack size of the given thread

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::thread_pool_base ***get_pool**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*)

Returns a pointer to the pool that was used to run the current thread

Throws

If *ec* != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

hpx::get_worker_thread_num

Defined in header *hpx/runtime.hpp*⁹⁸¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::get_local_worker_thread_num*
- *hpx::get_thread_pool_num*

std::size_t **hpx::get_worker_thread_num**() noexcept

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

Note

The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by *get_os_thread_count()*).

⁹⁸¹ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t hpx::get_worker_thread_num(error_code &ec) noexcept`

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

Note

The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by `get_os_thread_count()`). It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters

ec – [in,out] this represents the error status on exit (obsolete, ignored).

hpx::get_local_worker_thread_num

Defined in header `hpx/runtime.hpp`⁹⁸².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::get_worker_thread_num`
- `hpx::get_thread_pool_num`

`std::size_t hpx::get_local_worker_thread_num() noexcept`

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note

⁹⁸² <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t hpx::get_local_worker_thread_num(error_code &ec) noexcept`

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note

The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters

ec – [in,out] this represents the error status on exit (obsolete, ignored).

hpx::get_thread_pool_num

Defined in header `hpx/runtime.hpp`⁹⁸³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::get_worker_thread_num`
- `hpx::get_local_worker_thread_num`

`std::size_t hpx::get_thread_pool_num()` noexcept

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

⁹⁸³ <http://github.com/TheHPXProject/hpx/blob/95c58b92b97c6b31f3964ef5ac78918ca828094e/libs/full/include/include/hpx/runtime.hpp>

Note

The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t hpx::get_thread_pool_num(error_code &ec) noexcept`

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

Note

The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters

ec – [in,out] this represents the error status on exit (obsolete, ignored).

`hpx/threading_base/register_thread.hpp`

Defined in header `hpx/threading_base/register_thread.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

template<typename **F**>

thread_function_type **make_thread_function**(*F* &&*f*)

template<typename **F**, typename ...**Ts**>

thread_function_type **make_thread_function_nullary**(*F* &&*f*, *Ts*&&... *ts*)

void **register_thread**(*threads::thread_init_data* &*data*, *threads::thread_pool_base* **pool*,
threads::thread_id_ref_type &*id*, *error_code* &*ec* = *hpx::throws*)

Create a new *thread* using the given data.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

invalid_status – if the runtime system has not been started yet.

Returns

This function will return the internal id of the newly created HPX-thread.

threads::thread_id_ref_type **register_thread**(*threads::thread_init_data* &*data*,
threads::thread_pool_base **pool*, *error_code* &*ec* =
hpx::throws)

void **register_thread**(*threads::thread_init_data* &*data*, *threads::thread_id_ref_type* &*id*, *error_code*
&*ec* = *throws*)

Create a new *thread* using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

invalid_status – if the runtime system has not been started yet.

Returns

This function will return the internal id of the newly created HPX-thread.

threads::thread_id_ref_type **register_thread**(*threads::thread_init_data* &data, *error_code* &ec = *throws*)

thread_id_ref_type **register_work**(*threads::thread_init_data* &data, *threads::thread_pool_base* *pool, *error_code* &ec = *hpx::throws*)

Create a new work item using the given data.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

invalid_status – if the runtime system has not been started yet.

thread_id_ref_type **register_work**(*threads::thread_init_data* &data, *error_code* &ec = *throws*)

Create a new work item using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

invalid_status – if the runtime system has not been started yet.

hpx::scoped_annotation

Defined in header `hpx/functional.hpp`⁹⁸⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

struct **scoped_annotation**

scoped_annotation associates a name with a section of code (scope). It can be used to visualize code execution in profiling tools like *Intel VTune*, *Apex Profiler*, etc. That allows analyzing performance to figure out which part(s) of code is (are) responsible for performance degradation, etc.

hpx/threading_base/thread_pool_base.hpp

Defined in header `hpx/threading_base/thread_pool_base.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

class **thread_pool_base**

#include <thread_pool_base.hpp> The base class used to manage a pool of OS threads.

Public Functions

virtual void **suspend_processing_unit_direct**(`std::size_t` virt_core, `error_code` &ec = *throws*)
= 0

Suspends the given processing unit. Blocks until the processing unit has been suspended.

Parameters

- **virt_core** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **resume_processing_unit_direct**(`std::size_t` virt_core, `error_code` &ec = *throws*)
= 0

Resumes the given processing unit. Blocks until the processing unit has been resumed.

Parameters

- **virt_core** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **resume_direct**(`error_code` &ec = *throws*) = 0

Resumes the thread pool. Blocks until all OS threads on the thread pool have been resumed.

Parameters

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **suspend_direct**(`error_code` &ec = *throws*) = 0

Suspends the thread pool. Blocks until all OS threads on the thread pool have been suspended.

Note

A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

hpx::exception – if called from an HPX thread which is running on the pool itself.

hpx/threading_base/print.hpp

Defined in header `hpx/threading_base/print.hpp`.

namespace **hpx**

namespace **threads**

Functions

thread_data ***get_self_id_data()** noexcept

The function *get_self_id_data* returns the data of the HPX thread id associated with the current thread (or nullptr if the current thread is not a HPX thread).

thread_self &**get_self()**

The function *get_self* returns a reference to the (OS thread specific) self reference to the current HPX thread.

thread_self ***get_self_ptr()** noexcept

The function *get_self_ptr* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

`thread_self_impl_type *get_ctx_ptr()`

The function *get_ctx_ptr* returns a pointer to the internal data associated with each coroutine.

`thread_self *get_self_ptr_checked(error_code &ec = throws)`

The function *get_self_ptr_checked* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

`thread_id_type get_self_id() noexcept`

The function *get_self_id* returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

HPX_DEPRECATED_V (2, 0, "hpx::threads::get_outer_self_id is deprecated, use " "hpx::threads::get_self_id instead") inline thread_id_type get_outer_self_id() noexcept

The function *get_outer_self_id* returns the HPX thread id of the current outer thread (or zero if the current thread is not a HPX thread). This now always returns the same as *get_self_id*, even for directly executed threads.

`thread_id_type get_parent_id() noexcept`

The function *get_parent_id* returns the HPX thread id of the current thread's parent (or zero if the current thread is not a HPX thread).

Note

This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::size_t get_parent_phase() noexcept`

The function *get_parent_phase* returns the HPX phase of the current thread's parent (or zero if the current thread is not a HPX thread).

Note

This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::ptrdiff_t get_self_stacksize() noexcept`

The function *get_self_stacksize* returns the stack size of the current thread (or zero if the current thread is not a HPX thread).

`thread_stacksize get_self_stacksize_enum() noexcept`

The function *get_self_stacksize_enum* returns the stack size of the *l*.

`std::uint32_t get_parent_locality_id() noexcept`

The function *get_parent_locality_id* returns the id of the locality of the current thread's parent (or zero if the current thread is not a HPX thread).

Note

This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::uint64_t get_self_component_id()` noexcept

The function *get_self_component_id* returns the lva of the component the current thread is acting on

Note

This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_TARGET_ADDRESS` being defined.

namespace **tracing**

threadmanager

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/threadmanager/threadmanager.hpp

Defined in header `hpx/threadmanager/threadmanager.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

class **threadmanager**

#include <threadmanager.hpp> The *thread-manager* class is the central instance of management for all (non-depleted) threads

Public Types

using **notification_policy_type** = *threads::policies::callback_notifier*

using **pool_type** = *std::unique_ptr<thread_pool_base>*

using **pool_vector** = *std::vector<pool_type>*

Public Functions

threadmanager(*hpx::util::runtime_configuration* &rtcfg_, *notification_policy_type* ¬ifier,
detail::network_background_callback_type network_background_callback =
detail::network_background_callback_type())

threadmanager(*threadmanager* const&) = delete

threadmanager(*threadmanager*&&) = delete

threadmanager &**operator**=(*threadmanager* const&) = delete

threadmanager &**operator**=(*threadmanager*&&) = delete

~threadmanager()

void **init**() const

void **create_pools**()

void **print_pools**(*std::ostream*&) const

FIXME move to private and add —hpx:printpools cmd line option.

thread_pool_base &**default_pool**() const

thread_pool_base &**get_pool**(*std::string* const &pool_name) const

thread_pool_base &**get_pool**(pool_id_type const &pool_id) const

thread_pool_base &**get_pool**(*std::size_t* thread_index) const

bool **pool_exists**(*std::string* const &pool_name) const

bool **pool_exists**(*std::size_t* pool_index) const

thread_id_ref_type **register_work**(thread_init_data &data, *error_code* &ec = *throws*) const

The function *register_work* adds a new work item to the thread manager. It doesn't immediately create a new *thread*, it just adds the task parameters (function, initial state and description) to the internal management data structures. The thread itself will be created when the number of existing threads drops below the number of threads specified by the constructors *max_count* parameter.

Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **ec** –

void **register_thread**(thread_init_data &data, thread_id_ref_type &id, *error_code* &ec = *throws*) const

The function *register_thread* adds a new work item to the thread manager. It creates a new *thread*, adds it to the internal management data structures, and schedules the new thread, if appropriate.

Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **id** – [out] This parameter will hold the id of the created thread. This id is guaranteed to be validly initialized before the thread function is executed.
- **ec** –

bool **run**() const

Run the thread manager's work queue. This function instantiates the specified number of OS threads in each pool. All OS threads are started to execute the function *tfunc*.

Returns

The function returns *true* if the thread manager has been started successfully, otherwise it returns *false*.

void **stop**(bool blocking = true) const

Forcefully stop the thread-manager.

Parameters

blocking –

bool **is_busy**() const

bool **is_idle**() const

void **wait**() const

bool **wait_for**(*hpx::chrono::steady_duration* const &rel_time) const

template<typename **StopToken**>

inline bool **wait_for**(*StopToken* &&stop_token, *hpx::chrono::steady_duration* const &rel_time)
const

void **suspend**() const

void **resume**() const

hpx::state **status**() const

Return whether the thread manager is still running This returns the “minimal state”, i.e. the state of the least advanced thread pool

std::int64_t **get_thread_count**(*thread_schedule_state* state = *thread_schedule_state::unknown*,
thread_priority priority = *thread_priority::default_*, *std::size_t*
num_thread = static_cast<*std::size_t*>(-1), bool reset = false)
const

return the number of HPX-threads with the given state

Note

This function locks the internal OS lock in the thread manager

std::int64_t **get_idle_core_count**() const

mask_type **get_idle_core_mask**() const

std::int64_t **get_background_thread_count**() const

bool **enumerate_threads**(*hpx::function*<bool(thread_id_type)> const &f, *thread_schedule_state*
state = *thread_schedule_state::unknown*) const

void **abort_all_suspended_threads**() const

bool **cleanup_terminated**(bool delete_all) const

std::size_t **get_os_thread_count**() const

Return the number of OS threads running in this thread-manager.

This function will return correct results only if the thread-manager is running.

std::thread &**get_os_thread_handle**(*std::size_t* num_thread) const

void **report_error**(*std::size_t* num_thread, *std::exception_ptr* const &e) const

API functions forwarding to notification policy.

This notifies the thread manager that the passed exception has been raised. The exception will be routed through the notifier and the scheduler (which will result in it being passed to the runtime object, which in turn will report it to the console, etc.).

mask_type **get_used_processing_units**() const

Returns the mask identifying all processing units used by this thread manager.

hwloc_bitmap_ptr **get_pool_numa_bitmap**(*std::string* const &pool_name) const

void **set_scheduler_mode**(*threads::policies::scheduler_mode* mode,

thrust

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/thrust/algorithms.hpp

Defined in header `hpx/thrust/algorithms.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **thrust**

Functions

template<typename **Tag**, typename **ThrustPolicy**, typename ...**Args**>

decltype(auto) **hpx_invoke**(*Tag* tag, *ThrustPolicy* &&policy, *Args*&&... args)

ADL hook dispatching HPX algorithm CPOs to Thrust backends.

When a Thrust execution policy is passed to an HPX algorithm CPO, this hook maps the call to the corresponding Thrust implementation. Async policies wrap the result in a future.

Template Parameters

- **Tag** – The algorithm CPO tag type.
- **ThrustPolicy** – A Thrust execution policy satisfying `is_thrust_execution_policy`.
- **Args** – Arguments forwarded to the Thrust algorithm.

Parameters

- **tag** – The algorithm CPO tag instance.
- **policy** – Thrust execution policy controlling dispatch.
- **args** – Arguments forwarded to the mapped algorithm.

Returns

The algorithm result, or a future thereof for async policies.

timed_execution

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

hpx/timed_execution/timed_execution_fwd.hpp

Defined in header `hpx/timed_execution/timed_execution_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

constexpr struct `hpx::parallel::execution::sync_execute_at_t` **sync_execute_at**

constexpr struct `hpx::parallel::execution::sync_execute_after_t` **sync_execute_after**

struct **post_at_t**

#include `<timed_execution_fwd.hpp>` Customization point of asynchronous fire & forget execution agent creation supporting timed execution.

This asynchronously (fire & forget) creates a single function invocation `f()` using the associated executor at the given point in time.

Note

This calls `exec.post_at(abs_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::post()` on the underlying non-time-scheduled execution agent.

Param exec

[in] The executor object to use for scheduling of the function *f*.

Param abs_time

[in] The point in time the given function should be scheduled at to run.

Param f

[in] The function which will be scheduled using the given executor.

Param ts...

[in] Additional arguments to use to invoke *f*.

Public Functions

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const  
    &abs_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const  
    &abs_time, F &&f, Ts&&... ts) const
```

struct post_after_t

#include <timed_execution_fwd.hpp> Customization point of asynchronous fire & forget execution agent creation supporting timed execution.

This asynchronously (fire & forget) creates a single function invocation *f()* using the associated executor at the given point in time.

Note

This calls `exec.post_after(rel_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::post()` on the underlying non-time-scheduled execution agent.

Param exec

[in] The executor object to use for scheduling of the function *f*.

Param rel_time

[in] The duration of time after which the given function should be scheduled to run.

Param f

[in] The function which will be scheduled using the given executor.

Param ts...

[in] Additional arguments to use to invoke *f*.

Public Functions

```

```

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const  
    &rel_time, F &&f, Ts&&... ts) const
```

```
struct async_execute_at_t
```

#include <timed_execution_fwd.hpp> Customization point of asynchronous execution agent creation supporting timed execution.

This asynchronously creates a single function invocation *f*() using the associated executor at the given point in time.

Note

This calls `exec.async_execute_at(abs_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::async_execute()` on the underlying non-time-scheduled execution agent.

Param *exec*

[in] The executor object to use for scheduling of the function *f*.

Param *abs_time*

[in] The point in time the given function should be scheduled at to run.

Param *f*

[in] The function which will be scheduled using the given executor.

Param *ts...*

[in] Additional arguments to use to invoke *f*.

Return

f(*ts...*)'s result through a future

Public Functions

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const  
    &abs_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const  
    &abs_time, F &&f, Ts&&... ts) const
```

struct **async_execute_after_t**

#include <timed_execution_fwd.hpp> Customization point of asynchronous execution agent creation supporting timed execution.

This asynchronously creates a single function invocation *f*() using the associated executor at the given point in time.

Note

This calls `exec.async_execute_after(rel_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::async_execute()` on the underlying non-time-scheduled execution agent.

Param *exec*

[in] The executor object to use for scheduling of the function *f*.

Param *rel_time*

[in] The duration of time after which the given function should be scheduled to run.

Param *f*

[in] The function which will be scheduled using the given executor.

Param *ts...*

[in] Additional arguments to use to invoke *f*.

Return

f(*ts...*)'s result through a future

Public Functions

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const  
    &rel_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const  
    &rel_time, F &&f, Ts&&... ts) const
```

struct **sync_execute_at_t**

#include <timed_execution_fwd.hpp> Customization point of synchronous execution agent creation supporting timed execution.

This synchronously creates a single function invocation *f*() using the associated executor at the given point in time.

Note

This calls `exec.sync_execute_at(abs_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::sync_execute()` on the underlying non-time-scheduled execution agent.

Param exec

[in] The executor object to use for scheduling of the function *f*.

Param abs_time

[in] The point in time the given function should be scheduled at to run.

Param f

[in] The function which will be scheduled using the given executor.

Param ts...

[in] Additional arguments to use to invoke *f*.

Return

f(*ts...*)'s result

Public Functions

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const  
    &abs_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const  
    &abs_time, F &&f, Ts&&... ts) const
```

```
struct sync_execute_after_t
```

#include <timed_execution_fwd.hpp> Customization point of synchronous execution agent creation supporting timed execution.

This synchronously creates a single function invocation *f*() using the associated executor at the given point in time.

Note

This calls `exec.sync_execute_after(rel_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::sync_execute()` on the underlying non-time-scheduled execution agent.

Param exec

[in] The executor object to use for scheduling of the function *f*.

Param rel_time

[in] The duration of time after which the given function should be scheduled to run.

Param f

[in] The function which will be scheduled using the given executor.

Param ts...

[in] Additional arguments to use to invoke *f*.

Return

f(*ts...*)'s result

Public Functions

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const
                                     &rel_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const
                                     &rel_time, F &&f, Ts&&... ts) const
```

timing

See *Public API* for a list of names and headers that are part of the public *HPX* API.

`hpx::chrono::high_resolution_clock`

Defined in header `hpx/chrono.hpp`⁹⁸⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **high_resolution_clock**

Class `hpx::chrono::high_resolution_clock` represents the clock with the smallest tick period provided by the implementation. It may be an alias of `std::chrono::system_clock` or `std::chrono::steady_clock`, or a third, independent clock. `hpx::chrono::high_resolution_clock` meets the requirements of *TrivialClock*.

`hpx::chrono::high_resolution_timer`

Defined in header `hpx/chrono.hpp`⁹⁸⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **high_resolution_timer**

`high_resolution_timer` is a timer object which measures the elapsed time

topology

See *Public API* for a list of names and headers that are part of the public *HPX* API.

`hpx/topology/topology.hpp`

~topology()

inline *std::size_t* **get_socket_number**(*std::size_t* num_thread, [[maybe_unused]] *error_code* &ec
= *throws*) const noexcept

Return the Socket number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
inline std::size_t get_numa_node_number(std::size_t num_thread, [[maybe_unused]] error_code
&ec = throws) const noexcept
```

Return the NUMA node number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
inline std::size_t get_numa_distance(std::size_t node_a, std::size_t node_b) const noexcept
```

Return the hardware latency distance between two NUMA nodes. Values are sourced from hwloc's distance matrix when available; otherwise a standard default (10 = local, 20 = remote) is returned.

Parameters

- **node_a** – [in] logical index of the first NUMA node
- **node_b** – [in] logical index of the second NUMA node

```
mask_cref_type get_machine_affinity_mask(error_code &ec = throws) const noexcept
```

Return a bit mask where each set bit corresponds to a processing unit available to the application.

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_type get_service_affinity_mask(mask_cref_type used_processing_units, error_code
&ec = throws) const
```

Return a bit mask where each set bit corresponds to a processing unit available to the service threads in the application.

Parameters

- **used_processing_units** – [in] This is the mask of processing units which are not available for service threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_cref_type get_socket_affinity_mask(std::size_t num_thread, error_code &ec = throws)
const
```

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the socket it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_cref_type get_numa_node_affinity_mask(std::size_t num_thread, error_code &ec =
throws) const
```

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the NUMA domain it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_core_affinity_mask**(*std::size_t* num_thread, *error_code* &ec = *throws*)
const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the core it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_thread_affinity_mask**(*std::size_t* num_thread, *error_code* &ec = *throws*)
const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **set_thread_affinity_mask**(mask_cref_type mask, *error_code* &ec = *throws*) const

Use the given bit mask to set the affinity of the given thread. Each set bit corresponds to a processing unit the thread will be allowed to run on.

Note

Use this function on systems where the affinity must be set from inside the thread itself.

Parameters

- **mask** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_type **get_thread_affinity_mask_from_lva**(void const *lva, *error_code* &ec = *throws*)
const

Return a bit mask where each set bit corresponds to a processing unit co-located with the memory the given address is currently allocated on.

Parameters

- **lva** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **print_affinity_mask**(*std::ostream* &os, *std::size_t* num_thread, mask_cref_type m, *std::string* const &pool_name) const

Prints the given mask *m* to os in a human-readable form.

bool **reduce_thread_priority**(*error_code* &ec = *throws*) const

Reduce thread priority of the current thread.

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::size_t **get_number_of_sockets**() const

Return the number of available NUMA domains.

std::size_t **get_number_of_numa_nodes**() const

Return the number of available NUMA domains.

std::size_t **get_number_of_cores**() const

Return the number of available cores.

std::size_t **get_number_of_pus**() const noexcept

Return the number of available hardware processing units.

std::size_t **get_number_of_numa_node_cores**(*std::size_t* numa) const

Return number of cores in given numa domain.

std::size_t **get_number_of_numa_node_pus**(*std::size_t* numa) const

Return number of processing units in a given numa domain.

std::size_t **get_number_of_socket_pus**(*std::size_t* socket) const

Return number of processing units in a given socket.

std::size_t **get_number_of_core_pus**(*std::size_t* core) const

Return number of processing units in given core.

std::size_t **get_number_of_socket_cores**(*std::size_t* socket) const

Return number of cores units in given socket.

inline *std::size_t* **get_core_number**(*std::size_t* num_thread, *error_code*& = *throws*) const

std::size_t **get_pu_number**(*std::size_t* num_core, *std::size_t* num_pu, *error_code* &ec = *throws*)
const

std::size_t **get_cache_size**(mask_cref_type mask, int level) const

Return the size of the cache associated with the given mask.

mask_type **get_cpubind_mask**(*error_code* &ec = *throws*) const

mask_type **get_cpubind_mask**(*std::thread* &handle, *error_code* &ec = *throws*) const

hwloc_bitmap_ptr **cpuset_to_nodese**t(mask_cref_type mask) const

convert a cpu mask into a numa node mask in hwloc bitmap form

void **write_to_log**() const

void ***allocate**(*std::size_t* len) const

This is equivalent to malloc(), except that it tries to allocate page-aligned memory from the OS.

void ***allocate_membind**(*std::size_t* len, *hwloc_bitmap_ptr* const &bitmap, *hpx_hwloc_membind_policy* policy, int flags) const

allocate memory with binding to a numa node set as specified by the policy and flags (see hwloc docs)

threads::mask_type **get_area_membind_nodese**t(void const *addr, *std::size_t* len) const

bool **set_area_membind_nodese**t(void const *addr, *std::size_t* len, void *nodese)t const

int **get_numa_domain**(void const *addr) const

void **deallocate**(void *addr, *std::size_t* len) const noexcept

Free memory that was previously allocated by allocate.

void **print_hwloc**(*std::ostream*&) const

mask_type **init_socket_affinity_mask_from_socket**(*std::size_t* num_socket) const

mask_type **init_numa_node_affinity_mask_from_numa_node**(*std::size_t* num_numa_node) const

mask_type **init_core_affinity_mask_from_core**(*std::size_t* num_core, mask_cref_type default_mask = *empty_mask*) const

mask_type **init_thread_affinity_mask**(*std::size_t* num_thread) const

mask_type **init_thread_affinity_mask**(*std::size_t* num_core, *std::size_t* num_pu) const

hwloc_bitmap_t **mask_to_bitmap**(mask_cref_type mask, hwloc_obj_type_t htype, unsigned
*count = nullptr) const

mask_type **bitmap_to_mask**(hwloc_bitmap_t bitmap, hwloc_obj_type_t htype) const

```
struct lock_context
```

#include <tracing.hpp> Context for annotating lock acquisitions and releases.

This struct is used to provide tracing annotations for synchronization primitives such as spinlocks and mutexes. It registers the creation, acquisition, and release of locks to the active tracing backend.

Public Functions

explicit **lock_context**(char const *name = nullptr, void const *addr = nullptr) noexcept

Constructs a lock context.

Parameters

- **name** – The name or description of the lock.
- **addr** – The memory address of the lock, used to track it uniquely.

explicit **lock_context**(char const *prefix, char const *suffix, void const *addr = nullptr) noexcept

Constructs a lock context with a dynamic name.

Parameters

- **prefix** – The prefix for the lock name.
- **suffix** – The suffix for the lock name.
- **addr** – The memory address of the lock, used to track it uniquely.

bool **before_lock**() const noexcept

Called immediately before attempting to acquire the lock.

Returns

true if the prepare event was recorded and `after_lock` should be called.

void **after_lock**() const noexcept

Called immediately after the lock is successfully acquired.

void **after_try_lock**(bool success) const noexcept

Called after a try-lock operation completes.

Parameters

success – true if the lock was acquired, false if it failed.

void **before_unlock**() const noexcept

Called immediately before releasing the lock.

void **after_unlock**() const noexcept

Called immediately after releasing the lock.

namespace **util**

namespace **external_timer**

hpx/tracing/backends/apex.hpp

Defined in header `hpx/tracing/backends/apex.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **tracing**

Typedefs

bool(*)() **enable_parent_task_handler_type**

typedef char const ***annotation_handle**

Functions

inline constexpr *annotation_handle* **create_annotation_handle**(char const *name) noexcept

inline constexpr void **set_thread_name**(char const *name) noexcept

Set the OS thread name in the profiler timeline.

inline constexpr char const ***rename_region**(char const *name) noexcept

Rename the currently active region on this thread; returns the previous name, or the caller's input if no rename occurred.

constexpr void **task_staged**(char const*, void const* = nullptr) noexcept

constexpr void **task_created**(char const*, void const*, void const* = nullptr) noexcept

constexpr void **task_executing**(void const*, char const*, *std::size_t*) noexcept

constexpr void **task_yielded**(void const*, char const*) noexcept

constexpr void **task_suspended**(void const*, char const*, char const* = nullptr) noexcept

constexpr void **task_resumed**(void const*, char const*, char const* = nullptr) noexcept

constexpr void **task_completed**(void const*, char const*) noexcept

constexpr void **task_deleted**(void const*) noexcept

constexpr void **future_fulfilled**(void const*, char const* = nullptr) noexcept

Producer-side signal: future state fulfilled (no-op stub for APEX).

Producer-side signal: future state fulfilled (no-op stub for ITTNotify).

Producer-side signal: future state fulfilled (no-op stub).

constexpr void **future_exception_set**(void const*, char const* = nullptr) noexcept

Producer-side signal: future exception set (no-op stub for APEX).

Producer-side signal: future exception set (no-op stub for ITTNotify).

Producer-side signal: future exception set (no-op stub).

constexpr void **continuation_run**(void const* = nullptr) noexcept

Consumer-side signal: continuation started (no-op stub for APEX).

Consumer-side signal: continuation started (no-op stub for ITTNotify).

Consumer-side signal: continuation started (no-op stub).

constexpr void **continuation_finished**(void const* = nullptr) noexcept

Consumer-side signal: continuation finished (no-op stub for APEX).

Consumer-side signal: continuation finished (no-op stub for ITTNotify).

Consumer-side signal: continuation finished (no-op stub).

constexpr void **handle_on_completed_fired**(void const* = nullptr) noexcept

Consumer-side signal: handle_on_completed fired (no-op stub for APEX).

Consumer-side signal: handle_on_completed fired (no-op stub for ITTNotify).

Consumer-side signal: handle_on_completed fired (no-op stub).

constexpr void **work_stolen**(std::size_t, std::size_t, void const*, char const* = nullptr) noexcept

Signal emitted when a worker thread steals a task from another worker.

inline constexpr void **frame_mark**(char const* = nullptr) noexcept

Frame boundary marker (no-op stub for APEX).

Frame boundary marker (no-op stub for ITTNotify).

Emit a frame/stage boundary marker in Tracy timeline.

Frame boundary marker (no-op stub).

Parameters

name – Optional name for the frame/stage.

inline constexpr void **os_thread_sleep**(*std::size_t* num_thread) noexcept

Point message emitted just before an OS worker thread suspends on its condition variable.

Parameters

num_thread – Index of the worker thread entering sleep.

struct **lock_context**

namespace **hpx**

namespace **tracing**

Functions

task_timer_data **create_task_timer**(*threads::thread_description* const &description, *std::uint32_t* parent_locality_id, *threads::thread_id* const &parent_task)

void **update_task_timer**(*task_timer_data* &timer, char const *new_name)

```
void tracing_init(char const *name, int argc, char **argv, std::uint32_t rank = 0, std::uint32_t size = 1)
```

```
void tracing_finalize()
```

```
void register_thread(char const *name)
```

```
void create_counter(std::string const &full_name, std::string const &short_name) noexcept
```

```
void sample_counter(std::string const &name, std::string const &short_name, double value) noexcept
```

```
inline void send_parcel(std::uint64_t tag_msb, std::uint64_t tag_lsb, std::uint64_t size, std::uint64_t target_locality_id) noexcept
```

Parcel-send signal: parcel handed to parcelport (APEX shim).

Parcel-send signal: parcel handed to parcelport (no-op stub for ITTNotify).

Parcel-send signal: a parcel has been handed to the parcelport for transmission.

Parcel-send signal: parcel handed to parcelport (no-op stub).

Parameters

- **tag_msb** – High 64 bits of the parcel id.
- **tag_lsb** – Low 64 bits of the parcel id. Together with tag_msb they form the full 128-bit id used to pair events across localities; lsb alone restarts per locality and would produce false matches.
- **size** – Wire size of the parcel in bytes.
- **target_locality_id** – Destination locality id, or `naming::invalid_locality_id` if unknown.

```
inline void recv_parcel(std::uint64_t tag_msb, std::uint64_t tag_lsb, std::uint64_t source_locality_id) noexcept
```

Parcel-receive signal: parcel arrived (APEX shim).

Parcel-receive signal: parcel arrived (no-op stub for ITTNotify).

Parcel-receive signal: a parcel has arrived and its header has been deserialized.

Parcel-receive signal: parcel arrived (no-op stub).

Parameters

- **tag_msb** – High 64 bits of the parcel id.
- **tag_lsb** – Low 64 bits of the parcel id.
- **source_locality_id** – Sending locality id, or `naming::invalid_locality_id` when the parcel has no source id yet (pre-AGAS handshake parcels).

```
inline void parcel_scheduled(std::uint64_t tag_msb, std::uint64_t tag_lsb, std::uint64_t source_locality_id, std::uint64_t source_thread_id) noexcept
```

Parcel-scheduled signal: action entered local scheduler (no-op stub for APEX).

Parcel-scheduled signal: action entered local scheduler (no-op stub for ITTNotify).

Parcel-scheduled signal: an action carried by a parcel has been placed onto the local scheduler. Fires for deferred receives (zero-copy or multi-parcel message), for AGAS-routed parcels, and for parcels the AGAS re-route chain delivered after a migration detection. Does not fire for the non-deferred path where `load_schedule` schedules inline.

Parcel-scheduled signal: action entered local scheduler (no-op stub).

Parameters

- **tag_msb** – High 64 bits of the parcel id.
- **tag_lsb** – Low 64 bits of the parcel id.
- **source_locality_id** – Sending locality id (see `recv_parcel`).
- **source_thread_id** – Parent HPX thread id captured on the sender; may be 0 when unavailable.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/util/insert_checked.hpp

Defined in header `hpx/util/insert_checked.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

```
template<typename Iterator>
```

```
constexpr bool insert_checked(std::pair<Iterator, bool> const &r) noexcept
```

Helper function for writing predicates that test whether an `std::map` insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy `std::pair<Iterator, bool>` type.

Parameters

r – [in] The return value of a `std::map` insert operation.

Returns

This function returns **r.second**.

```
template<typename Iterator>
```

```
bool insert_checked(std::pair<Iterator, bool> const &r, Iterator &it)
```

Helper function for writing predicates that test whether an `std::map` insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy `std::pair<Iterator, bool>` type.

Parameters

- **r** – [in] The return value of a `std::map` insert operation.
- **r** – [out] A reference to an `Iterator`, which is set to **r.first**.
- **it** – [out] on exit, will hold the iterator referring to the inserted element

Returns

This function returns **r.second**.

hpx/util/sed_transform.hpp

Defined in header `hpx/util/sed_transform.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

Functions

```
bool parse_sed_expression(std::string const &input, std::string &search, std::string &replace)
```

Parse a sed command.

Note

Currently, only supports search and replace syntax (`s/search/replace/`)

Parameters

- **input** – [in] The content to parse.
- **search** – [out] If the parsing is successful, this string is set to the search expression.
- **replace** – [out] If the parsing is successful, this string is set to the replace expression.

Returns

true if the parsing was successful, false otherwise.

struct **sed_transform**

#include <sed_transform.hpp> An unary function object which applies a sed command to its subject and returns the resulting string.

Note

Currently, only supports search and replace syntax (s/search/replace/)

Public Functions

sed_transform(*std::string* const &search, *std::string* replace)

explicit **sed_transform**(*std::string* const &expression)

std::string **operator()** (*std::string* const &input) const

inline explicit **operator bool**() const noexcept

component_storage

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx/components/component_storage/migrate_to_storage.hpp

Defined in header `hpx/components/component_storage/migrate_to_storage.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **components**

Functions

template<typename **Component**>

future<*hpx::id_type*> **migrate_to_storage**(*hpx::id_type* const &to_migrate, *hpx::id_type* const &target_storage)

Migrate the component with the given id to the specified target storage

The function *migrate_to_storage*<*Component*> will migrate the component referenced by *to_migrate* to the storage facility specified with *target_storage*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The global id of the component to migrate.
- **target_storage** – [in] The id of the storage facility to migrate this object to.

Template Parameters

The – only template argument specifies the component type of the component to migrate to the given storage facility.

Returns

A future representing the global id of the migrated component instance. This should be the same as *migrate_to*.

template<typename **Derived**, typename **Stub**, typename **Data**>

inline *Derived* **migrate_to_storage**(*client_base*<*Derived*, *Stub*, *Data*> const &to_migrate, *hpx::components::component_storage* const &target_storage)

Migrate the given component to the specified target storage

The function *migrate_to_storage* will migrate the component referenced by *to_migrate* to the storage facility specified with *target_storage*. It returns a future referring to the migrated component instance.

Parameters

- **to_migrate** – [in] The client side representation of the component to migrate.
- **target_storage** – [in] The id of the storage facility to migrate this object to.

Returns

A client side representation of representing of the migrated component instance. This should be the same as *migrate_to*.

hpx/components/component_storage/migrate_from_storage.hpp

Defined in header `hpx/components/component_storage/migrate_from_storage.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

Functions

template<typename **Component**>

future<*hpx::id_type*> **migrate_from_storage**(*hpx::id_type* const &to_resurrect, *hpx::id_type* const &target = *hpx::invalid_id*)

Migrate the component with the given id from the specified target storage (resurrect the object)

The function *migrate_from_storage*<*Component*> will migrate the component referenced by *to_resurrect* from the storage facility specified where the object is currently stored on. It returns a future referring to the migrated component instance. The component instance is resurrected on the locality specified by *target_locality*.

Parameters

- **to_resurrect** – [in] The global id of the component to migrate.
- **target** – [in] The optional locality to resurrect the object on. By default the object is resurrected on the locality it was located on last.

Template Parameters

The – only template argument specifies the component type of the component to migrate from the given storage facility.

Returns

A future representing the global id of the migrated component instance. This should be the same as *to_resurrect*.

process

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/components/process/process.hpp

Defined in header `hpx/components/process/process.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

namespace **process**

Functions

template<typename ...Ts>

child **execute**(*hpx::id_type* const &id, *Ts*&&... ts)

HPX_PROCESS_EXPORT child launch_connecting_locality (std::string const &to_launch, std::vector< std::string > const &outer_args={}, std::vector< std::string > const &outer_env={}, std::optional< std::uint64_t > spawn_id=nullopt)

Launch an executable as a new HPX locality that connects to the currently running (bootstrap) locality via TCP.

This function spawns `to_launch` as a child process configured to join the calling HPX runtime as an additional, connecting locality. It forces the TCP parcelport for bootstrapping, forwards AGAS server address/port information from the current runtime's configuration, lets the operating system pick an ephemeral parcel port for the new locality, and blocks the caller until the spawned locality signals that it has finished starting up (via a named latch derived from the executable name and, optionally, `spawn_id`).

Note

The following environment variables are set (overriding any inherited values) before launching:

- `HPX_AGAS_SERVER_ADDRESS` / `HPX_AGAS_SERVER_PORT` ? taken from the current runtime's `hpx.agas.address` / `hpx.agas.port` configuration entries.
- `HPX_PARCEL_SERVER_ADDRESS` ? same address as the AGAS server.

- `HPX_PARCEL_SERVER_PORT` ? set to "0" so the OS assigns an ephemeral port.
- `HPX_ON_STARTUP_WAIT_ON_LATCH` ? the startup latch name described above, used to synchronize with the caller.

Parameters

- **to_launch** – Path to the executable to launch as the connecting locality.
- **outer_args** – Additional command-line arguments appended after the mandatory HPX bootstrap arguments (`--hpx:ignore-batch-env`, `--hpx:ini=hpx.parcel.tcp.priority=1000`, `--hpx:ini=hpx.parcel.bootstrap=tcp`). Defaults to an empty list.
- **outer_env** – Additional environment variable entries in "NAME=value" form (or just "NAME" to set an empty value) that are merged into (and override) the inherited environment before launching the child process. Defaults to an empty list.
- **spawn_id** – Optional identifier used to disambiguate the startup latch name when multiple instances of the same executable are launched concurrently. When present, the latch name is "<exe-stem>/<spawn_id>"; otherwise it is just "<exe-stem>".

Throws

`hpx::exception` – (or a derived type) if the child process could not be started (`process::throw_on_error()` is used).

Returns

A child object representing the launched connecting-locality process, once it has signaled startup completion.

supervision_dispatch

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx::supervision::testing::local_snapshot_peers

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing`
- `hpx::supervision::testing::last_join_locality`
- `hpx::supervision::testing::suspend_heartbeat_for_testing`
- `hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing`
- `hpx::supervision::testing::stop_background_loops`

`std::vector<server::peer_snapshot> hpx::supervision::testing::local_snapshot_peers()`

Returns a snapshot of this locality's currently-joined, ready peers, as tracked by the local registry. Not part of the public dispatch API - exists so tests can inspect registry state directly.

hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::supervision::testing::local_snapshot_peers`
- `hpx::supervision::testing::last_join_locality`
- `hpx::supervision::testing::suspend_heartbeat_for_testing`
- `hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing`
- `hpx::supervision::testing::stop_background_loops`

```
void hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing(hpx::chrono::steady_duration
                                                                              const
                                                                              &timeout)
```

Overrides the timeout `failure_detection_loop()` passes to `await_terminal()` on each sweep. Must be called before `init()` starts the loop to take effect for that lifecycle; has no effect on a sweep already in flight. Not part of the public dispatch API - exists only to make failure-detection tests deterministic and fast instead of bound by the real 60s `default_discovery_timeout`.

Parameters

timeout – The new poll timeout.

hpx::supervision::testing::last_join_locality

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::supervision::testing::local_snapshot_peers`
- `hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing`
- `hpx::supervision::testing::suspend_heartbeat_for_testing`
- `hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing`
- `hpx::supervision::testing::stop_background_loops`

```
hpx::id_type hpx::supervision::testing::last_join_locality()
```

Returns the locality most recently returned by `join()`, regardless of whether the `register_observers()` call that followed it went on to succeed or fail. Lets tests verify that a failed `join()` does not leak that locality's local supervision state (see `registry::register_observers()`'s catch block).

hpx::supervision::testing::suspend_heartbeat_for_testing

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::testing::local_snapshot_peers*
- *hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing*
- *hpx::supervision::testing::last_join_locality*
- *hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing*
- *hpx::supervision::testing::stop_background_loops*

void **hpx::supervision::testing::suspend_heartbeat_for_testing()**

Stops this locality's own `heartbeat_loop()` without finalizing the dispatcher, simulating a hard crash (all lifecycle activity ceases, including the periodic `event::running` pulse) while staying joined in peers' registries. Idempotent; no-op if *init()* was never called or the loop is already stopped. Not part of the public dispatch API - exists only so failure-detection tests can deterministically simulate silence instead of relying on the absence of explicit calls, which no longer implies silence now that heartbeats are mirrored onto observers' local supervision state.

hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::testing::local_snapshot_peers*
- *hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing*
- *hpx::supervision::testing::last_join_locality*
- *hpx::supervision::testing::suspend_heartbeat_for_testing*
- *hpx::supervision::testing::stop_background_loops*

bool **hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing()**

Reports whether `failure_detection_loop()` currently has one or more *await_terminal()* calls outstanding against unresponsive peers (i.e. a sweep is mid-flight). Returns false before *init()* is called, between sweeps, and after *finalize()*. Not part of the public dispatch API - exists only so tests can deterministically synchronize on a real in-flight sweep instead of sleeping and hoping the loop got there first.

hpx::supervision::testing::stop_background_loops

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::supervision::testing::local_snapshot_peers`
- `hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing`
- `hpx::supervision::testing::last_join_locality`
- `hpx::supervision::testing::suspend_heartbeat_for_testing`
- `hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing`

void `hpx::supervision::testing::stop_background_loops()`

Stops this locality's `failure_detection_loop()` and `heartbeat_loop()` background tasks (joining both) without otherwise finalizing the dispatcher: unlike `finalize()`, this never publishes `event::completed`, never unregisters the registry symbol name, and never resets the lifecycle state back to `uninitialized`, so the sentinel's last published event stays stale and peers' `failure_detection_loop()` still eventually times out and observes `target_fenced/rejected_fenced` against this locality. Lets a caller depart the HPX runtime cleanly (e.g. via `hpx::disconnect()`) afterwards without leaving either background `hpx::async` task still running - simulating a worker that dies mid-epoch without corrupting AGAS or hanging runtime shutdown, as opposed to a true crash (no call at all) or a fully graceful departure (`finalize()`). Idempotent; no-op if `init()` was never called or the loops are already stopped. Not part of the public dispatch API - exists only for examples/tests that need to simulate this exact scenario deterministically.

hpx::supervision::init

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::supervision::finalize`
- `hpx::supervision::is_initialized`

`hpx::shared_future<registry> hpx::supervision::init(hpx::chrono::steady_duration const &discovery_timeout = default_discovery_timeout)`

Performs one-shot, idempotent initialization of the supervision-dispatch runtime for this locality. On the first successful call, this function atomically transitions the internal lifecycle state from `uninitialized` to `initializing`, after incrementing the internal epoch, then owns the entire startup sequence: it creates a local `registry` for `hpx::find_here()`, publishes `event::started` for this locality *before* the registry's symbol name is registered (so that no peer can discover and join a not-yet-started locality), registers that symbol name, and finally performs a single `discover_and_join()` pass to join every currently reachable peer registry. On success the state transitions to `active`; if any step throws, all partial state is rolled back and the lifecycle reverts to `uninitialized` so that a subsequent call can retry from scratch.

Calling `init()` while already *active* is a no-op that resolves immediately without repeating any side effect. Calling it while another call is still *initializing* attaches the caller to the in-flight operation's outcome rather than racing it, so concurrent callers never create more than one registry. Calling it while *finalizing* is in progress is rejected; callers should wait for `finalize()` to complete before re-initializing.

Note

This function has no effect on any state that has not yet been created by a successful call - in particular, no symbol name is ever registered and no event is ever published unless this function (or a concurrent call it is attached to) actually runs the initialization sequence.

Parameters

discovery_timeout – The maximum duration to wait, across all discovery candidates combined, for peer registry symbol names to resolve during the `discover_and_join()` step (see `discover_peers()`).

Returns

A shared future that becomes ready, holding the *registry* owned by this `init()` cycle, once the supervision runtime has reached the *active* state, or that becomes exceptional if initialization fails.

```
registry hpx::supervision::init(hpx::launch::sync_policy policy, hpx::chrono::steady_duration const
                                &discovery_timeout = default_discovery_timeout)
```

Performs one-shot, idempotent initialization of the supervision-dispatch runtime for this locality, blocking the calling thread until the operation completes. This is the synchronous counterpart of `init(hpx::chrono::steady_duration const&)`: it carries out the exact same lifecycle transition and startup sequence (registry creation, `event::started` publication, symbol name registration, and a single `discover_and_join()` pass), but waits for the resulting future to become ready (or exceptional) before returning, rather than handing the future back to the caller.

Note

As with the asynchronous overload, no symbol name is registered and no event is published unless this call (or a concurrent call it attaches to) actually performs the initialization sequence.

Parameters

- **policy** – Tag selecting the blocking overload of `init()`.
- **discovery_timeout** – The maximum duration to wait, across all discovery candidates combined, for peer registry symbol names to resolve during the `discover_and_join()` step (see `discover_peers()`).

Throws

`hpx::exception` – if initialization could not complete (e.g. due to a concurrent `finalize()` still in progress). Calling this while already *active* is a no-op that returns immediately.

Returns

The *registry* owned by this *init()* cycle.

hpx::supervision::finalize

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::supervision::init*
- *hpx::supervision::is_initialized*

void **hpx::supervision::finalize()**

Performs one-shot, idempotent teardown of the supervision-dispatch runtime previously started by *init()*. On the first call observing the *active* state, this function atomically transitions the lifecycle to *finalizing*, publishes *event::completed* for the local locality at the current epoch, unregisters the registry's symbol name, and then releases ownership of the registry (relying on *client_base*'s default lifetime management to destroy it once no other references remain) before resetting the lifecycle back to *uninitialized*, allowing a subsequent *init()* call to re-arm the runtime from scratch.

Calling *finalize()* when the runtime is *uninitialized*, still *initializing*, or already *finalizing* is a documented no-op: it resolves immediately without publishing any event, unregistering any symbol name, or otherwise touching component state.

Note

Because *finalize()* is a no-op unless the runtime is currently *active*, it is always safe to call speculatively, e.g. during shutdown, without first checking *is_initialized()*.

hpx::supervision::is_initialized

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::supervision::init*
- *hpx::supervision::finalize*

bool **hpx::supervision::is_initialized()** noexcept

Returns whether the supervision-dispatch runtime for this locality is currently *active*, i.e. has completed *init()* and has not yet been torn down by *finalize()*.

Note

This function never blocks and performs a single atomic load; it is safe to call from any thread, including while *init()* or *finalize()* is concurrently in flight.

Returns

true if the lifecycle state is *active*, *false* if it is *uninitialized*, *initializing*, or *finalizing*.

hpx::supervision::registry

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

class **registry** : public `hpx::components::client_base<registry, server::registry>`

A registry is a lightweight, self-supervising handle for pairing with peer localities. It mirrors a peer's lifecycle state locally via `join()`, and can itself be discovered by name in AGAS like other `supervision_dispatch` components.

hpx::supervision::dispatch_work

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

hpx::supervision::invoke_fenced_action

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::supervision::dispatch_work](#)

template<typename **Action**, typename **IdType**, typename **Epoch**, typename ...**Ts**>

decltype(auto) **hpx::supervision::invoke_fenced_action**(*Action* act, *IdType* target, *Epoch* const epoch, *Ts...* ts)

Remote dispatch point that performs the authoritative admission re-check and invokes the wrapped action.

This is the function body that actually runs as the action on the *destination* locality (the target’s own locality, reached via `hpx::colocated` in `dispatch_work()`). It is invoked by `fenced_action` once the action has been dispatched.

The admission check performed here runs on the same locality/thread that owns the target’s *supervision_manager* state, so there is no suspension point between this check and the actual invocation below. This is what closes the client-side/dispatch race: even if the client’s own (non-authoritative) *check_admission()* in `dispatch_work()` returned `admitted`, the target may have latched a terminal event for this epoch in the meantime, and this re-check will catch it.

This re-check is authoritative only because a joining registry (see `components/supervision_dispatch/src/server/registry_server.cpp`) dual-publishes lifecycle mirrors for a joined peer onto that peer’s own locality, in addition to the joining registry’s local copy: *target* must resolve to that same peer locality for this guarantee to hold. Dispatching *target* against an unrelated third locality - one that never received the dual-published mirror for this target - remains out of contract; the re-check performed there consults a *supervision_manager* state that was never seeded for *target* and so cannot detect fencing.

Template Parameters

- **Action** – The wrapped HPX action type to invoke on admission.
- **IdType** – Type of the target identifier forwarded to `act` (this type is always `hpx::id_type`).
- **Epoch** – Type of the fencing epoch value (this type is always `std::uint64_t`).
- **Ts** – Types of the additional arguments forwarded to `act`.

Parameters

- **act** – The action instance to invoke once admission succeeds.
- **target** – Identifier of the component instance being dispatched to; forwarded to `act` (the epoch is fencing metadata only and is not part of `act`'s argument list).
- **epoch** – The fencing epoch to check admission for.
- **ts** – Additional arguments forwarded to `act`.

Throws

`hpx::exception` – with `hpx::error::target_fenced` if the target has latched a terminal event for `epoch` since the client's own admission check, in which case the wrapped action is not invoked.

Returns

The result of invoking `act`, obtained via `hpx::sync` (run directly/locally, without an extra parcel hop, since this function already executes on the target's locality).

`hpx::supervision::discover_peers`

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::supervision::fan_out_join`
- `hpx::supervision::discover_and_join`

```
std::vector<discovered_peer> hpx::supervision::discover_peers(chrono::steady_duration const &timeout =  
                           default_discovery_timeout)
```

Performs a one-time discovery pull for `supervision_dispatch` peers: concurrently resolves the pinned registry name (see `register_name()`) of every remote locality (`hpx::find_remote_localities()`, which already excludes this locality), bounded by a single wait for `timeout` across all candidates.

Because constructing a registry client from a symbolic name (see `client_base`'s symbolic-name constructor) waits/resolves once the symbol is bound rather than failing fast on one that is not (yet) registered, localities that never called `register_name()` (e.g. because they have not run `init_supervision()` yet) would otherwise hang this call indefinitely. Instead, once `timeout` elapses, only the candidates whose registry client was resolved by then (checked via the non-blocking `is_ready()`) are returned; every other candidate is simply excluded as not currently participating in supervision - `discover_peers()` itself never fails or throws on their account.

Parameters

timeout – The maximum duration to wait, across all candidates combined, for their registry names to resolve.

Returns

The peers whose registry client was resolved within *timeout*, as discovered_peer values carrying the `hpx::id_type` locality it is pinned to.

hpx::supervision::fan_out_join

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::supervision::discover_peers](#)
- [hpx::supervision::discover_and_join](#)

```
std::vector<discovered_peer> hpx::supervision::fan_out_join(
    registry const &local_registry,
    std::vector<discovered_peer> const &peers,
    chrono::steady_duration const &timeout =
    default_discovery_timeout)
```

Reactively fans out `join()` calls from *local_registry* to every peer in *peers* (typically the result of a prior [discover_peers\(\)](#) call): for each entry, this calls `local_registry.join(peer.locality)`.

This reuses `registry::join()`'s existing reservation/idempotency machinery unchanged (see `server::registry::reserve_ownership()`) rather than duplicating any of it, so calling [fan_out_join\(\)](#) more than once with (partially) overlapping peer lists - or racing with an inbound `join()` call from one of those same peers, e.g. because that peer is concurrently running its own [fan_out_join\(\)](#) against this locality - is safe and never creates more than one registry entry per peer locality.

[fan_out_join\(\)](#) itself is reactive only: it performs exactly one round of `join()` calls for the given *peers* and starts no background/polling activity of its own.

Parameters

- **local_registry** – The registry to join every peer in *peers* to.
- **peers** – The peers to join, typically returned by a prior [discover_peers\(\)](#) call.
- **timeout** – The maximum duration to wait, across all peers combined, for their `join()` calls to settle. Peers whose `join()` has not settled (or failed) within this bound are silently dropped from the result, rather than hanging or throwing.

Returns

The `discovered_peer` values (locality + `join_epoch`) for peers whose `join()` calls settled successfully within *timeout*, in the same relative order as *peers* (with unsuccessful/ timed-out peers omitted, rather than left as gaps). Each returned `discovered_peer::join_epoch` is populated from the corresponding `join()` call, so callers can dispatch against `{peer.locality, peer.join_epoch}` directly, without needing a separate `join()` call to obtain it.

hpx::supervision::discover_and_join

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [hpx::supervision::discover_peers](#)
- [hpx::supervision::fan_out_join](#)

```
std::vector<discovered_peer> hpx::supervision::discover_and_join(registry const &local_registry,
                                                                chrono::steady_duration const
                                                                &timeout =
                                                                default_discovery_timeout)
```

Composes a single reactive discovery-and-join pass for `supervision_dispatch` peers: performs exactly one [discover_peers\(\)](#) pull to resolve the pinned registry name of every remote locality ([hpx::find_remote_localities\(\)](#) already excludes this locality, so no separate self-exclusion is needed here), then fans the resulting peer list out to `local_registry` via a single [fan_out_join\(\)](#) pass.

[discover_and_join\(\)](#) introduces no state, polling thread, timer, or repeated broadcast of its own - it is a pure composition of [discover_peers\(\)](#) and [fan_out_join\(\)](#), each of which is itself bounded to a single round of resolution/join calls. Because [fan_out_join\(\)](#) reuses `registry::join()`'s existing reservation/idempotency machinery unchanged (see `server::registry::reserve_ownership()`), calling [discover_and_join\(\)](#) more than once - whether to pick up newly started peers or purely by accident - is safe and never creates more than one registry entry per peer locality; repeated invocations simply return the (stable) join epochs already owned for peers that were previously joined.

Parameters

- **local_registry** – The registry to join every discovered peer to.
- **timeout** – The maximum duration to wait, across all discovery candidates combined, for their registry name to resolve (see [discover_peers\(\)](#)).

Returns

The `discovered_peer` value that `local_registry` created (or already had) for each peer discovered and successfully joined within *timeout*, in the same relative order as returned by [discover_peers\(\)](#).

hpx/supervision_dispatch/server/registry.hpp

Defined in header `hpx/supervision_dispatch/server/registry.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **supervision**

Fenced action dispatch for the supervision subsystem.

This header provides the machinery to dispatch an HPX action to a target component while enforcing supervision “fencing” semantics: once a target has latched a terminal event for a given epoch, no further actions for that epoch may execute against it. Dispatch performs a cheap, non-authoritative admission check on the caller’s locality and an authoritative re-check on the target’s own locality (via `hpx::colocated`), immediately before invoking the wrapped action, closing the race between admission and invocation.

Types and functions implementing HPX’s supervision and fenced dispatch facilities.

Functions

```
inline bool operator==(joined_peer const &lhs, joined_peer const &rhs) noexcept
```

```
inline bool operator!=(joined_peer const &lhs, joined_peer const &rhs) noexcept
```

```
std::ostream &operator<<(std::ostream &strm, joined_peer const &peer)
```

```
struct joined_peer
```

#include <registry.hpp> Pairs the two values a caller obtains from a successful `registry::join()` and needs to perform a fenced dispatch.

See also

`dispatch_work()`

See also

`server::registry::join()`

Public Members

`hpx::id_type` **target**

The real, colocatable destination for the wrapped action.

The peer’s locality id (i.e. `peer_locality`, the value originally passed into `registry::join()`). Forwarded to `hpx::colocated()` and used as the destination of `hpx::sync(act, target, ts...)` inside `dispatch_work()`.

`std::uint64_t` **join_epoch** = 0

The epoch at which this peer was joined.

Recorded by `registry::join()` and used to identify which registry entry a later `registry::leave()` call refers to - so that a racing re-join of the same peer locality (which mints a fresh `join_epoch` of its own) cannot be mistaken for the join this *joined_peer* was returned from.

namespace **server**

struct **peer_snapshot**

#include <registry.hpp> Plain-data view of a single joined peer, safe to hand out to callers outside the registry (unlike `peer_entry`, does not expose the `ready/evict_pending` bookkeeping used internally to coordinate concurrent `join()/evict_peer()` calls).

Public Members

hpx::id_type **peer_locality**

The peer locality this entry was joined against.

std::uint64_t **join_epoch**

The epoch at which `peer_locality` was joined.

class **registry** : public *hpx::components::component_base<registry>*

Public Functions

registry()

joined_peer **join**(*hpx::id_type* const &peer_locality)

Joins a peer locality and creates or reuses its local supervision state.

Parameters

peer_locality – The peer locality to observe.

std::vector<peer_snapshot> **snapshot_peers()** const

Returns a point-in-time snapshot of all fully joined, non-evicting peers.

Intended for a future failure-detection poller (or other local consumers) that needs a stable, lock-safe list of peers to iterate over without reaching into `peers_` directly. Entries mid-join (`ready == false`) or already scheduled for eviction (`evict_pending == true`) are excluded, so a poller never observes a half-registered or torn-down peer.

Returns

A snapshot of every peer entry with `ready == true` and `evict_pending == false` at the time of the call.

```
void leave(hpx::id_type const &peer_locality, std::uint64_t join_epoch)
```

Removes a previously joined peer.

Parameters

- **peer_locality** – The peer locality to leave.
- **join_epoch** – Must match the join epoch currently recorded for **peer_locality** (i.e. the epoch returned by the corresponding *join()*). If **peer_locality** has since been re-joined (fresh epoch) or already evicted, this call is a no-op.

Protected Functions

```
std::tuple<hpx::id_type, std::uint64_t, bool> reserve_ownership(hpx::id_type const  
                                                                &peer_locality)
```

```
std::pair<hpx::id_type, hpx::id_type> register_observers(hpx::id_type const  
                                                         &peer_locality, std::uint64_t  
                                                         join_epoch)
```

```
void evict_peer(hpx::id_type const &peer_locality, std::uint64_t join_epoch, hpx::id_type  
               keep_alive, bool preserve_terminal_state)
```

Protected Static Functions

```
static void cleanup_peer(hpx::id_type const &peer_locality, hpx::id_type const  
                       &lifecycle_observer, hpx::id_type const &activity_observer, bool  
                       preserve_terminal_state)
```

Unregisters a peer's observers and, unless **preserve_terminal_state** is set, removes its locally tracked supervision state.

Performs the actual peer teardown deferred by *evict_peer()*: unregisters *lifecycle_observer* and *activity_observer* on *peer_locality*, and removes *peer_locality*'s locally tracked supervision state unless **preserve_terminal_state** is true, in which case that state - which was last set to the peer's terminal event by *register_observers()*'s lifecycle callback - is left in place as a tombstone rather than reset to "unknown". This lets any admission check still in flight against *peer_locality* (e.g. *check_admission()*) keep observing the fenced/terminal outcome after eviction has run, instead of racing against it. A subsequent *join()* re-seeding this locality with a fresh epoch naturally overwrites the tombstone. Kept separate from *evict_peer()* because *evict_peer()* only posts this work as a task (via *hpx::post()*) rather than performing it inline.

Parameters

- **peer_locality** – The locality that owns the observers, and whose local supervision state is removed.
- **lifecycle_observer** – The lifecycle observer id to unregister.
- **activity_observer** – The activity observer id to unregister.
- **preserve_terminal_state** – If true, leave *peer_locality*'s local supervision state in place instead of removing it.

Private Members

mutable *hpx::spinlock* **mtx_**

hpx::lcos::local::detail::condition_variable **cond_**

std::map<*hpx::id_type*, *peer_entry*> **peers_**

struct **peer_entry**

Internal bookkeeping for a single joined (or joining) peer.

Not exposed outside the registry; see *peer_snapshot* for the plain-data subset safe to hand to external callers.

Public Functions

inline explicit **peer_entry**(*hpx::id_type* const &peer_locality)

Public Members

hpx::id_type const **peer_locality**

The locality that owns this peer's. Surfaced read-only via *peer_snapshot::peer_locality*.

hpx::id_type **lifecycle_observer**

The observer id registered on *peer_locality* to receive this peer's terminal lifecycle notification (drives *evict_peer()* via *hpx::post()*).

hpx::id_type **activity_observer**

The observer id registered on *peer_locality* to receive this peer's activity notifications (used to keep *peer_locality*'s local state current between terminal events).

std::uint64_t **join_epoch** = 0

The epoch at which this peer was joined, recorded by *join()* and used by *evict_peer()* (instead of *shadow*) to identify and used by *evict_peer()* to identify which entry a deferred eviction refers to.

bool **ready** = false

False while a *join()* call has reserved ownership of this peer's locality (i.e. is in the process of performing the remote observer registrations) but has not yet filled in the rest of the entry. Concurrent *join()* calls for the same peer wait on *cond_* instead of racing to register duplicate observers.

bool **evict_pending** = false

True once a terminal notification has been observed for this peer but eviction has not yet completed (deferred via `hpx::post()` to `evict_peer()`). Ensures a terminal notification racing ahead of `join()` completion is deferred instead of dropped, and lets `snapshot_peers()` exclude a peer that is already tearing down.

bool **evict_preserve_terminal_state** = false

The `preserve_terminal_state` argument `evict_peer()` was called with when it set `evict_pending` above, remembered so that `join()`'s deferred `cleanup_peer()` call (once the join in progress completes) preserves or drops `peer_locality`'s local supervision state consistently with what the racing terminal notification requested.

2.10 Contributing to HPX

HPX development happens on Github. The following sections are a collection of useful information related to HPX development.

2.10.1 Contributing to HPX

The main source of information to understand the process of how to contribute to HPX can be found in [this document](#)⁹⁸⁷. This is a living document that is constantly updated with relevant information.

2.10.2 HPX governance model

The HPX project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. [This document](#)⁹⁸⁸ describes how that participation takes place and how to set about earning merit within the project community.

2.10.3 Release procedure for HPX

Below is a step by step procedure for making an HPX release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an HPX release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.
2. For minor and major releases: create and check out a new branch at an appropriate point on master with the name `release-major.minor.X`. `major` and `minor` should be the major and minor versions of the release. For patch releases: check out the corresponding `release-major.minor.X` branch.

⁹⁸⁷ <https://github.com/TheHPXProject/hpx/blob/master/.github/CONTRIBUTING.md>

⁹⁸⁸ <http://hpx.dev/documents/governance/>

3. Write release notes in `docs/sphinx/releases/whats_new_$VERSION.rst`. Keep adding merged PRs and closed issues to this until just before the release is made. Use `tools/generate_pr_issue_list.sh` to generate the lists. Add the new release notes to the table of contents in `docs/sphinx/releases.rst`.
4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:
 - `$HPX_SOURCE/README.rst`
 - Update grant information
 - `docs/sphinx/releases/whats_new_$VERSION.rst`
 - `docs/sphinx/about_hpx/people.rst`
 - Update collaborators
 - Update grant information
5. This step does not apply to patch releases. For APEX:
 - Change the release branch to be the most current release tag available in the APEX `git_external` section in the main `CMakeLists.txt`. Please contact the maintainers of the respective packages to generate a new release to synchronize with the *HPX* release (APEX⁹⁸⁹).
6. Make sure `HPX_VERSION_MAJOR/MINOR/SUBMINOR` in `CMakeLists.txt` contain the correct values. Change them if needed.
7. Change version references in `CITATION.cff`. There are two occurrences. Change year in the copyright file under `/libs/core/version/src/version.cpp`.
8. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main `CMakeLists.txt` and also deleting all related code and tests from the main source tree.

The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:

 - a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.
 - b. Second release cycle: turn this build option OFF by default.
 - c. Third release cycle: completely remove the old code.

The main `CMakeLists.txt` contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don't have a replacement yet, we keep them around in case (like `Vc` for example).
9. Update the minimum required versions if necessary (compilers, dependencies, etc.) in `prerequisites.rst`. Update latest tested versions.
10. Verify that the Jenkins setups for the release branch on Rostam are running and do not display any errors.
11. Repeat the following steps until satisfied with the release.
 1. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to `-rcN`, where `N` is the current iteration of this step. Start with `-rc1`.

⁹⁸⁹ <http://github.com/UO-OACISS/xpress-apex>

2. Create a pre-release on GitHub using the script `tools/roll_release.sh`. This script automatically tag with the corresponding release number. The script requires that you have the STE||AR Group signing key.
3. This step is not necessary for patch releases. Notify hpx-users@stellar-group.org of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.
4. Allow at least a week for testing of the release candidate.
 - Use `git merge` when possible, and fall back to `git cherry-pick` when needed. For patch releases `git cherry-pick` is most likely your only choice if there have been significant unrelated changes on master since the previous release.
 - Go back to the first step when enough patches have been added.
 - If there are no more patches, continue to make the final release.
12. Update any occurrences of the latest stable release to refer to the version about to be released. For example, `quickstart.rst` contains instructions to check out the latest stable tag. Make sure that refers to the new version.
13. Add a new entry to the RPM changelog (`cmake/packaging/rpm/Changelog.txt`) with the new version number and a link to the corresponding changelog.
14. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to an empty string.
15. Add the release date to the caption of the current “What’s New” section in the docs, and change the value of `HPX_VERSION_DATE` in `CMakeLists.txt`.
16. Create a release on GitHub using the script `tools/roll_release.sh`. This script automatically tag the with the corresponding release number. The script requires that you have the STE||AR Group signing key.
17. Update the website (hpx.dev⁹⁹⁰). You can login on wordpress through *this page* `<https://hpx.dev/wp-login.php>`. You can update the pages with the following:
 - Update links on the downloads page. Link to the release on GitHub.
 - Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
 - A new blog post announcing the release, which links to downloads and the “What’s New” section in the documentation (see previous releases for examples).
18. Merge release branch into master.
19. Post-release cleanup. Create a new pull request against master with the following changes:
 1. Modify the release procedure if necessary.
 2. Change `HPX_VERSION_TAG` in `CMakeLists.txt` back to `-trunk`.
 3. Increment `HPX_VERSION_MINOR` in `CMakeLists.txt`.
20. Update Vcpkg (<https://github.com/Microsoft/vcpkg>) to pull from latest release.
 - Update version number in `CONTROL`
 - Update tag and SHA512 to that of the new release
21. Update spack (<https://github.com/spack/spack>) with the latest HPX package.

⁹⁹⁰ <https://hpx.dev>

- Update version number in `hpx/package.py` and SHA256 to that of the new release
22. Announce the release on hpx-users@stellar-group.org, stellar@cct.lsu.edu, all-cct@cct.lsu.edu, faculty@csc.lsu.edu, faculty@ece.lsu.edu, the *HPX* Slack channel, the STELLAR-GROUP Discord channel, our list of external collaborators, isocpp.org, reddit.com, [HPC Wire](http://hpcwire.com), [Inside HPC](http://insidehpc.com), [Heise Online](http://heiseonline.com), and a CCT press release.
 23. Beer and pizza.

2.10.4 Testing *HPX*

To ensure correctness of *HPX*, we ship a large variety of unit and regression tests. The tests are driven by the *CTest*⁹⁹¹ tool and are executed automatically on each commit to the *HPX* [Github](#)⁹⁹² repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our *HPX* [Issues](#)⁹⁹³ tracker with detailed information about the target system.

Running tests manually

Running the tests manually is as easy as typing `make tests && make test`. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the `ctest` command. You can list all available test targets using `make help | grep tests`. Please see the *CTest* [Documentation](#)⁹⁹⁴ for further details.

Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under `tools/perftests_ci/local_run.sh` (to be run in the build directory specifying the *HPX* source directory as the argument to the script, default is `$HOME/projects/hpx_perftests_ci`).

Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with `hpx::util::perftests_report`, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call `hpx::util::perftests_print_times`. To see an example of use, see `future_overhead_report.cpp`. Finally, you can add the test to the CI report editing the `hpx_targets` variable for the executable name and the `hpx_test_options` variable for the corresponding options to use for the run in the performance test script `.jenkins/cscs-perftests/launch_perftests.sh`. And then run the `tools/perftests_ci/local_run.sh` script to get a reference json run (use the name of the test) to be added in the `tools/perftests_ci/perftest/references/daint_default` directory.

⁹⁹¹ <https://gitlab.kitware.com/cmake/community/wikis/doc/ctest/Testing-With-CTest>

⁹⁹² <https://github.com/TheHPXProject/hpx/>

⁹⁹³ <https://github.com/TheHPXProject/hpx/issues>

⁹⁹⁴ <https://www.cmake.org/cmake/help/latest/manual/ctest.1.html>

Issue tracker

If you stumble over a bug or missing feature in *HPX*, please submit an issue to our [HPX Issues](https://github.com/TheHPXProject/hpx/issues)⁹⁹⁵ page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the [Support Website](https://stellar.cct.lsu.edu/support/)⁹⁹⁶ page.

Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both [github](https://github.com)_. You can see the dashboards [CDash HPX dashboard](https://cdash.rostam.cct.lsu.edu/index.php?project=HPX)⁹⁹⁷.

2.10.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, [Docker](https://www.docker.com)⁹⁹⁸ provides a convenient alternative to quickly get all the dependencies needed to start development of *HPX*. Our testing setup on [github](https://github.com)_ uses a docker image to run all tests.

To get started you need to install [Docker](https://www.docker.com)⁹⁹⁹ using whatever means is most convenient on your system. Once you have [Docker](https://www.docker.com)¹⁰⁰⁰ installed, you can pull or directly run the docker image. The image is based on Debian and Clang, and can be found on [Docker Hub](https://hub.docker.com/r/stellargroup/build_env/)¹⁰⁰¹. To start a container using the *HPX* build environment, run:

```
$ docker_
➔run --interactive --tty stellargroup/build_env:latest bash
```

You are now in an environment where all the *HPX* build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the [Docker Documentation](https://docs.docker.com/storage/bind-mounts/)¹⁰⁰² for more information on using [Docker](https://www.docker.com)¹⁰⁰³.

Warning

All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the *HPX* source tree) after closing the container, you can bind directories from the host system into the container (see [Docker Documentation \(Bind mounts\)](https://docs.docker.com/storage/bind-mounts/)¹⁰⁰⁴).

2.10.6 Documentation

This documentation is built using [Sphinx](#)¹⁰⁰⁵, and an automatically generated API reference using [Doxygen](#)¹⁰⁰⁶ and [Breathe](#)¹⁰⁰⁷.

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

Prerequisites

To build the *HPX* documentation, you need recent versions of the following packages:

- python3 (3.9 or later)
- sphinx 7.2 or later (Python package)
- sphinx-book-theme (Python package)
- breathe 4.36.0 or later (Python package)
- doxygen
- sphinxcontrib-bibtex
- sphinx-copybutton

If the [Python](#)¹⁰⁰⁸ dependencies are not available through your system package manager, you can install them using the Python package manager `pip`. We recommend using a virtual environment:

```
mkdir -p build
python3 -m venv build/.venv
source build/.venv/bin/activate
pip install \
    "sphinx>=7.2" "breathe>=4.36.0" \
    sphinx-book-theme sphinxcontrib-bibtex \
    sphinx-copybutton
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

Doxygen_ROOT:PATH

Specifies where to look for the installation of the [Doxygen](#)¹⁰⁰⁹ tool.

Sphinx_ROOT:PATH

Specifies where to look for the installation of the [Sphinx](#)¹⁰¹⁰ tool.

Breathe_APIDOC_ROOT:PATH

Specifies where to look for the installation of the [Breathe](#)¹⁰¹¹ tool.

¹⁰⁰⁵ <http://www.sphinx-doc.org>

¹⁰⁰⁶ <https://www.doxygen.org>

¹⁰⁰⁷ <https://breathe.readthedocs.io/en/latest>

¹⁰⁰⁸ <https://www.python.org>

¹⁰⁰⁹ <https://www.doxygen.org>

¹⁰¹⁰ <http://www.sphinx-doc.org>

¹⁰¹¹ <https://breathe.readthedocs.io/en/latest>

Building documentation

Enable building of the documentation by setting `HPX_WITH_DOCUMENTATION=ON` during CMake¹⁰¹² configuration. To build the documentation, build the `docs` target using your build tool. The default output format is HTML documentation. You can choose alternative output formats (single-page HTML, PDF, and man) with the `HPX_WITH_DOCUMENTATION_OUTPUT_FORMATS` CMake option.

Note

If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

Style guide

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with `=`.
- Sub-headings use only underlines with characters in decreasing level of importance: `=`, `-` and `..`
- Use sentence case in headings.
- Refer to common terminology using `:term: `Component``.
- Indent content of directives (`.. directive::`) by three spaces.
- For C++ code samples at the end of paragraphs, use `::` and indent the code sample by 4 spaces.
- For other languages (or if you don't want a colon at the end of the paragraph), use `.. code-block:: language` and indent by three spaces as with other directives.
- Use `.. list-table::` to wrap tables with a lot of text in cells.

API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the `doxygen_dependencies` variable in `docs/CMakeLists.txt`.

¹⁰¹² <https://www.cmake.org>

Adding new API documentation

When you add new public APIs to *HPX*, follow these guidelines to ensure the documentation is correctly generated and easy to use.

Documenting headers

At the top of a new header file, include the standard Doxygen documentation block. For example, if the new feature is called *my_new_feature*, you should:

- List the name of the new file under `\file`.
- Specify the page name with `\page` (e.g., `hpx::my_new_feature`).
- Reference the existing header that will include your new file under `\headerfile`.

```
/// \file my_new_feature.hpp
/// \page hpx::my_new_feature
/// \headerfile hpx/existing_header_of_new_feature.hpp
```

Adding to the public API reference

For the documentation to appear in the generated API reference, add your new API to `docs/sphinx/api/public_api.rst` under the appropriate table (usually “Functions”) for the relevant header (for example, `hpx/existing_header_of_new_feature.hpp`).

Including examples

Do **not** inline examples in the API reference. If you want to provide an example of how to use the new API, there are two recommended options:

1. **Documentation page option** Edit an existing relevant manual page to explain the new functionality and include a code example. Use this option if you want to provide additional context about how the API works.
2. **Standalone examples option** Create a separate example under `docs/sphinx/examples/`. Examples in this directory are typically more comprehensive and executable, making them suitable for richer or more complex scenarios.

2.10.7 Module structure

This section explains the structure of an *HPX* module.

The tool `create_library_skeleton.py`¹⁰¹³ can be used to generate a basic skeleton. To create a library skeleton, run the tool in the `libs` subdirectory with the module name as an argument:

```
$ ./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an *HPX* module. It will not create any actual source files. The structure of this skeleton is as follows:

¹⁰¹³ https://github.com/TheHPXProject/hpx/blob/master/libs/create_module_skeleton.py

```

• <lib_name>/
- README.rst
- CMakeLists.txt
- cmake
- docs/
* index.rst
- examples/
* CMakeLists.txt
- include/
* hpx/
  · <lib_name>
- src/
* CMakeLists.txt
- tests/
* CMakeLists.txt
* unit/
  · CMakeLists.txt
* regressions/
  · CMakeLists.txt
* performance/
  · CMakeLists.txt

```

A `README.rst` should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main `CMakeLists.txt` is created in the root directory of the module. By default it contains a call to `add_hpx_module` which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

`add_hpx_module` requires a module name. Optional flags are:

Optional single-value arguments are:

- `INSTALL_BINARIES`: Install the resulting library.

Optional multi-value arguments are:

- `SOURCES`: List of source files.
- `HEADERS`: List of header files.
- `COMPAT_HEADERS`: List of compatibility header files.
- `DEPENDENCIES`: Libraries that this module depends on, such as other modules.
- `CMAKE_SUBDIRS`: List of subdirectories to add to the module.

The `include` directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the `src` directory. This allows for clear separation. The `cmake` subdirectory may include additional [CMake](https://www.cmake.org)¹⁰¹⁴ scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an `include_compatibility` directory. This directory is not created by default.

Documentation is placed in the `docs` folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the `include` directory will automatically be processed by Doxygen and included into the documentation.

Tests are placed in suitable subdirectories of `tests`.

When in doubt, consult existing modules for examples on how to structure the module.

Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it's not clear what is causing the circular dependency, running the `cpp-dependencies`¹⁰¹⁵ tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the `cpp-dependencies` tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See [Using docker for development](#) for details on how to use the docker image.

To produce the graph produced by CI run the following command (`HPX_SOURCE` is assumed to hold the path to the *HPX* source directory):

```
$ cpp-dependencies_
↪ --dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a `dot` file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have `graphviz` installed:

```
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an `svg` file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on `config`, the following should give you a long list of paths from `algorithms` to `config`:

```
$ cpp-
↪ dependencies --dir $HPX_SOURCE/libs --shortest algorithms config
```

The following should report that it can't find a path between the two modules:

¹⁰¹⁴ <https://www.cmake.org>

¹⁰¹⁵ <https://github.com/tomtom-international/cpp-dependencies>

```
$ cpp-
↳dependencies --dir $HPX_SOURCE/libs --shortest config algorithms
```

2.11 Releases

2.11.1 List of supported releases

HPX V2.0.0 (TBD)

General changes

Breaking changes

Closed issues

Closed pull requests

HPX V1.11.0 (Jun 30, 2025)

This release is the last version of HPX that supports C++17. Future versions of HPX will require compilation using C++20 or above.

General changes

- Added synchronous versions of all collective operations. Added global predefined communicator objects that are accessible through new APIs: `hpx::collectives::get_world_communicator()` refers to all localities and `hpx::collectives::get_local_communicator()` refers to all threads on the calling locality. We unified the interfaces of the different communicator objects.
- Added `hpx::experimental::run_on_all` allowing to run a given function (possibly concurrently) using a given execution policy.
- Added a helper object `hpx::runtime_manager` that simplifies the initialization of HPX without needing to modify the main function of the application.
- We improved the compatibility with various accelerator frameworks (SYCL, OneAPI).
- Applied build system changes that allow building HPX without any prerequisites. This requires to pass `-DHPX_WITH_FETCH_HWLOC=On` and `-DHPX_WITH_FETCH_BOOST=On` to the `CMake`¹⁰¹⁶ configuration.
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- Added the `hpx::contains` and `hpx::contains_subrange` parallel algorithms.
- Adapted many of HPX' parallel algorithms to be usable with senders/receivers.

¹⁰¹⁶ <https://www.cmake.org>

Breaking changes

- We have moved most of the APIs that were defined in the namespace `hpx::parallel::execution` to the namespace `hpx::execution::experimental`. It was not possible to add compatibility facilities that will allow to continue using the old APIs, applications will have to be changed in order to continue functioning correctly.
- The CMake configuration parameter `HPX_WITH_RUN_MAIN_EVERYWHERE` is now deprecated and will be removed in the future. Use the preprocessor macro `HPX_HAVE_RUN_MAIN_EVERYWHERE` on a target-by-target case instead.
- Removed the dysfunctional libfabric parcelport.
- Removed features that were long deprecated (starting V1.8):
 - `hpx::flush`, `hpx::endl`, `hpx::async_flush`, `hpx::async_endl` - Various enumerator types are now only available as `class enum` requiring explicit scoped use of the enumerator values
 - Various non-conforming overloads of parallel algorithms - `hpx::for_loop` and friends (now only available as `hpx::experimental::for_loop`)
- `hpx::parallel::induction` is now only available as `hpx::experimental::induction`
- `hpx::parallel::reduction` and friends are now only available as `hpx::experimental::reduction`
- `hpx::assertion::source_location` is now only available as `hpx::source_location`
- `hpx::lcos::split_future` is now only available as `hpx::split_future`
- `hpx::lcos::wait` and friends have been removed altogether
- `hpx::lcos::wait_any` and friends are now only available as `hpx::wait_any`
- `hpx::lcos::wait_some` and friends are now only available as `hpx::wait_some`
- `hpx::lcos::wait_each` and friends are now only available as `hpx::wait_each`
- `hpx::lcos::wait_all` and friends are now only available as `hpx::wait_all`
- `hpx::lcos::when_all` and friends are now only available as `hpx::when_all`
- `hpx::lcos::when_any` and friends are now only available as `hpx::when_any`
- `hpx::lcos::when_each` and friends are now only available as `hpx::when_each`
- `hpx::lcos::when_some` and friends are now only available as `hpx::when_some`
- `hpx::util::optional` and related facilities are now only available as `hpx::optional`
- `hpx::util::bind` and related facilities are now only available as `hpx::bind`
- `hpx::util::function` and friends are now only available as `hpx::function`
- `hpx::traits::is_bound_action` and related facilities are now only available as `hpx::is_bound_action`
- `hpx::traits::is_bind_expression` and related facilities are now only available as `hpx::is_bind_expression`

- `hpx::traits::is_placeholder` and related facilities are now only available as `hpx::is_placeholder`
- `hpx::lcos::future` and related facilities are now only available as `hpx::future`
- `hpx::memory::intrusive_ptr` is now only available as `hpx::intrusive_ptr`
- `hpx::lcos::local::barrier` is now only available as `hpx::barrier`
- `hpx::lcos::barrier` is now only available as `hpx::distributed::barrier`
- `hpx::lcos::local::cpp20_binary_semaphore` is now only available as `hpx::detail::binary_semaphore`
- `hpx::lcos::local::condition_variable` and friends are now only available as `hpx::condition_variable`
- `hpx::lcos::local::counting_semaphore` and friends are now only available as `hpx::counting_semaphore`
- `hpx::lcos::local::cpp20_latch` and is now only available as `hpx::latch`
- `hpx::lcos::latch` and is now only available as `hpx::distributed::latch`
- `hpx::lcos::local::upgrade_lock` and friends are now only available as `hpx::upgrade_lock`
- `hpx::lcos::local::mutex` and friends are now only available as `hpx::mutex`
- `hpx::lcos::local::spinlock` and friends are now only available as `hpx::spinlock`
- `hpx::lcos::local::call_once` and friends are now only available as `hpx::call_once`
- `hpx::util::annotated_function` and is now only available as `hpx::annotated_function`
- `hpx::components::abstract_simple_component_base` and is now only available as `hpx::components::abstract_component_base`
- `hpx::naming::id_type` and is now only available as `hpx::id_type`

- [PR #6089](#)¹¹⁶⁵ - Implementing p2079

2.11.2 List of older releases

HPX V1.10.0 (May 29, 2024)

General changes

- The HPX documentation has seen a major overhaul for this release. We finished documenting the public local HPX API, we have added migration guides from widely used parallelization platforms to HPX (OpenMP, TBB, and MPI).
- We have added facilities enabling optimizations for trivially-relocatable types (see [P1144](#)¹¹⁶⁶ for more details).
- We have added (and use) the `scope_xxx` helper facilities as specified by the C++ library fundamentals TS v3 (see: [N4948](#)¹¹⁶⁷).
- We have added configuration options that allow to build HPX without pre-installing any prerequisites. Use `HPX_WITH_FETCH_HWLOC=On` to have [Portable Hardware Locality \(HWLOC\)](#)¹¹⁶⁸ installed for you. Similarly, setting `HPX_WITH_FETCH_BOOST=On` during configuration time will install the necessary [Boost](#)¹¹⁶⁹ libraries (currently V1.84.0).
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- The collective operations APIs have seen an unification, we have fixed issues and performance problems for the collectives.

¹¹⁶⁷ <http://wg21.link/n4948>

¹¹⁶⁸ <https://www.open-mpi.org/projects/hwloc/>

¹¹⁶⁹ <https://www.boost.org/>

- The HPX executors have seen a streamlining and some consistency changes. We have applied many performance improvements to the executor implementations that directly positively impact the performance of our parallel algorithms.
- We have added a new parcelport allowing to use Gasnet as a communication platform.
- We have added optimizations to various parcelports improving overall communication performance. This includes - amongst other things - send immediate optimizations and receiver-side zero-copy optimizations.
- Futures will now execute the associated task eagerly and inline on any wait operation if the task has not started running yet. This feature can be enabled using the `HPX_COROUTINES_WITH_THREAD_SCHEDULE_HINT_RUNS_AS_CHILD=On` configuration setting (which is *Off* by default).
- We have enabled using json files to supply configuration information through the command line. This feature can be enabled with the configuration option `HPX_COMMAND_LINE_HANDLING_WITH_JSON_CONFIGURATION_FILES=On`. This functionality depends on the external [JSoN library](#)¹¹⁷⁰, which can be built at configuration time by supplying `HPX_WITH_FETCH_JSON=On` to [CMake](#)¹¹⁷¹.
- We have applied many fixes to our CUDA, ROCm, and SYCL build environments.

Breaking changes

- The [CMake](#)¹¹⁷² configuration keys `SOMELIB_ROOT` (e.g., `BOOST_ROOT`) have been renamed to `Somelib_ROOT` (e.g., `Boost_ROOT`) to avoid warnings when using newer versions of [CMake](#)¹¹⁷³. Please update your scripts accordingly. For now, the old variable names are re-assigned to the new names and unset in the [CMake](#)¹¹⁷⁴ cache.

HPX V1.9.1 (August 4, 2023)

General changes

This point release fixes a couple of problems reported for the V1.9.0 release. Most importantly, we fixed various occasional hanging during startup and shutdown in distributed scenarios. We also added support for zero-copy serialization on the receiving side to the TCP, MPI, and LCI parcelports. Last but not least, we have added support for Visual Studio 2019 and gcc using MINGW on Windows, and also support for gcc V13 and clang V15.

HPX headers are now made consistently named the same as their standard library counterparts, e.g. `#include <thread>` now corresponds to `#include <hpx/thread.hpp>`. This significantly simplifies porting existing standards conforming codes to HPX.

A lot of work has been done to improve and optimize our network communication layers. Primary focus of this work was on the LCI parcelport, but we have also cleaned up and improved the MPI parcelport.

Additionally, we have continued working on our documentation. The main focus here was on completing the API documentation of the most important API functions. We have started adding migration guides for people interested in moving their codes away from other, commonplace parallelization frameworks like OpenMP.

HPX V1.9.0 (May 2, 2023)

General changes

- Added RISC-V 64bit support. HPX is now compatible with RISC-V architectures which have revolutionized the HPC world.
- LCI parcelport has been optimized to transfer parcels with fewer messages and use the HPX resource partitioner for its progress thread allocation. It should generally provide better performance than before. It also removes its dependency on the MPI library.

¹⁴⁰⁴ <https://github.com/TheHPXProject/hpx/pull/6281>

¹⁴⁰⁵ <https://github.com/TheHPXProject/hpx/pull/6283>

- HPX dependency on Boost was further relaxed by replacing headers from Boost.Range, Boost.Tokenizer and Boost.Lockfree.
- Improvements took place on our parallel algorithms implementation.
- Our Senders/Receivers (P2300) integration was extended:
 - Coroutines were integrated with senders/receivers.
- `get_completion_signatures` now works with awaitable senders. -
 - `with_awaitable_senders` allows the passed senders to retrieve the value i.e. senders are transparently awaitable from within a coroutine. -
 - `when_all_vector` was added.
- `sync_wait` and `sync_wait_with_variant` sender consumers were added. The user can now initiate the execution of their asynchronous pipeline by blocking the current thread that executes the `main()` function until the result is retrieved.
- The combinators for futures (a.k.a. `async_combinators`) `when_*`, `wait_*`, `wait_*_nothrow` were turned into CPOs allowing for end-user customization. For more information on the `async_combinators` refer to the documentation, https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators.
- The new datapar backend SVE allows `simd` and `par_simd` execution policies to exploit dataparallelism in the processors that have SVE vector registers like A64FX and Neoverse V1.
- The documentation for parallel algorithms, container algorithms was further improved. The Public API page was vastly enriched.
- Copy button shortkey was added at the top-right of code-blocks.
- Pragma directive that reports warnings as errors on MSVC was fixed.
- Command line argument `--hpx:loopback_network` was added to facilitate debugging with networks.
- We added an HPX-SYCL integration, allowing users to obtain HPX futures for SYCL events. This effectively enables the integration of arbitrary asynchronous SYCL operations into the HPX task graph. Bolted on top of this integration, we further added an HPX-SYCL executor for ease of use.

Breaking changes

- Stopped supporting Clang V8, the minimal version supported is now Clang V10.
- Stopped supporting gcc V8, the minimal version supported is now gcc V9.
- Stopped supporting Visual Studio 2015, the minimal version supported is now Visual Studio 2019.
- `tag_policy_tag` et.al. were re-added after HPX V1.8.1 deprecation.
- `get_chunk_size` and `processing_units_count` API is now expecting the time for one iteration as an argument.
- The list of all the namespace changes can be found here: [HPX V1.9.0 Namespace changes](#).

HPX V1.8.1 (Aug 5, 2022)

This is a bugfix release with a few minor additions and resolved problems.

General changes

This patch release adds a number of small new features and fixes a handful of problems discovered since the last release, in particular:

- A lot of work has been done to improve vectorization support for our parallel algorithms. HPX now supports using EVE - the Expressive Vector Engine as a vectorization backend.
- Added a simple average power consumption performance counter.
- Added performance counters related to the use of zero-copy chunks in the networking layer.
- More work was done towards full compatibility with the sender/receivers proposal P2300.
- Fixing sync_wait to decay the result types
- Fixed collective operations to properly avoid overlapping consecutive operations on the same communicator.
- Simplified the implementation of our execution policies and added mapping functions between those.
- Fixed performance issues with our implementation of *small_vector*.
- Serialization now works with buffers of unsigned characters.
- Fixing dangling reference in serialization of non-default constructible types
- Fixed static linking on Windows.
- Fixed support for M1/MacOS based architectures.
- Fixed support for gentoo/musl.
- Fixed *hpx::counting_semaphore_var*.
- Properly check start and end bounds for *hpx::for_loop*

HPX V1.8.0 (May 18, 2022)

With HPX parallel algorithms been fully adapted to C++20 the new release achieves full conformance with C++20 concurrency and parallelism facilities. HPX now supports all of the algorithms as specified by C++20. We have added support for vectorization to more of our algorithms. Much work has been done towards implementing P2300 (“std::execution”) and implementing the underlying senders/receivers facilities. Finally, The new release comes with a brand new documentation interface!

General changes

- The new documentation can now be found on our webpage: <https://hpx-docs.stellar-group.org>. This includes a completely new and user-friendly interface environment along with restructuring of certain components. The content in the “Quick start”, “Manual” and “Examples” was improved, while the “Build system” page was adapted to include necessary information for newcomers.
- With the vectorization support available in modern hardware architectures HPX now provides new data-parallel vector execution policies `hpx::execution::simd` and `hpx::execution::par_simd` that enable significant speed-up of our parallel algorithm implementations. The following algorithms now support SIMD execution:
 - `copy`, `copy_n`
 - `generate`
 - `adjacent_difference`, `adjacent_find`
 - `all_of`, `any_of`, `none_of`
 - `equal`, `mismatch`,
 - `inner_product`
 - `count`, `count_if`
 - `fill`, `fill_n`

¹⁶⁸⁹ <https://github.com/TheHPXProject/hpx/pull/5895>

¹⁶⁹⁰ <https://github.com/TheHPXProject/hpx/pull/5894>

¹⁶⁹¹ <https://github.com/TheHPXProject/hpx/pull/5890>

¹⁶⁹² <https://github.com/TheHPXProject/hpx/pull/5889>

¹⁶⁹³ <https://github.com/TheHPXProject/hpx/pull/5888>

¹⁶⁹⁴ <https://github.com/TheHPXProject/hpx/pull/5887>

¹⁶⁹⁵ <https://github.com/TheHPXProject/hpx/pull/5879>

- `find`, `find_end`, `find_first_of`, `find_if`, `find_if_not`
- `for_each`, `for_each_n`
- `generate`, `generate_n`.
- Based on top of P2300 the HPX parallel algorithms now support the pipeline syntax towards an effort to unify their usage along with senders/receivers. The HPX parallel algorithms can now bind with senders/receivers using the pipeline operator.
- Several changes took place on the executors provided by HPX:
- The executors now support the `num_cores` options in order for the user to be able to specify the desired number of cores to be used in the corresponding execution.
- The `scheduler` executor was implemented on top of senders/receivers and can be used with all HPX facilities that schedule new work, such as parallel algorithms, `hpx::async`, `hpx::dataflow`, etc.
- The performance of `fork_join_executor` was improved.
- The following algorithms have been added/adapted to be C++20 conformant:
 - `min_element`
 - `max_element`
 - `minmax_element`
 - `starts_with`
 - `ends_with`
 - `swap_ranges`
 - `unique`
 - `unique_copy`
 - `rotate`
 - `rotate_copy`
 - `sort`
 - `shift_left`
 - `shift_right`
 - `stable_sort`
 - `partition`
 - `partition_copy`
 - `stable_partition`
 - `adjacent_difference`
 - `nth_element`
 - `partial_sort`
 - `partial_sort_copy`.
- `HPX_FORWARD`/`HPX_MOVE` macros were introduced that replaced the `std::move` and `std::forward` facilities that in the library code.
- Hangs on distributed barrier were fixed.

- The performance of `scan_partitioner` was improved.
- Support was added for `thread_priority` to the `parallel_execution_policy`
- Regarding senders/receivers and the P2300 proposal various actions took place. `stop_token` was adapted to the recent proposal version (`in_place_stop_token` was introduced). Also `hint`, `annotation`, `priority` and `stacksize` properties were added to the scheduler executor. Stop support was added to `when_all`. Support for completion signatures was added. The following schedulers and algorithms were added:
 - `get_completion_scheduler`
 - `any_sender` and `unique_any_sender`
 - `split` sender
 - `transform_mpi` sender
 - `transfer` sender
 - `let_error`, `let_stopped`
 - `get_env` and related environment queries
 - `schedule`, `set_value`, `set_error`, `set_done`, `start` and `connect` are now proper customization points as defined in P2300.
- Several namespaces were altered towards conformance with C++20. Compatibility layers have been added and the old versions will be removed in next releases. The namespace changes are the following:
 - `hpx::parallel::induction/reduction` were moved into namespace `hpx::experimental`
 - `for_loop` and `friends` were moved into namespace `hpx::experimental`.
 - `hpx::util::optional` and `friends` were moved into namespace `hpx`.
 - `hpx::lcos::barrier` has been moved into the `hpx::distributed` namespace and `hpx::lcos::local::cpp20_barrier` has been renamed to `barrier` and moved into the `hpx` namespace.
 - `hpx::lcos::latch` has been moved into the `hpx::distributed` namespace and `lcos::local::latch` has been moved into the `hpx` namespace. The `count_down_and_wait()` functionality of `latch` has been renamed to `arrive_and_wait()`.
 - `hpx::util::unique_function_nonsr` has been renamed to `hpx::move_only_function`.
 - `hpx::util::unique_function` has been renamed to `hpx::distributed::move_only_function`.
 - `hpx::util::function` has been renamed to `hpx::distributed::function`.
 - `hpx::util::function_nonsr` has been renamed to `hpx::function`.
 - `hpx::util::function_ref` have been moved to namespace `hpx`.
 - `hpx::lcos::split_future` changed namespace and is now used as `hpx::split_future`.
 - `hpx::lcos::local::counting_semaphore` has been deprecated and `hpx::lcos::local::cpp20_counting_semaphore` has been renamed to `hpx::counting_semaphore`.

- `hpx::lcos::local::cpp20_binary_semaphore` has been renamed to `hpx::binary_semaphore`.
- `hpx::lcos::local::sliding_semaphore` has been renamed to `hpx::sliding_semaphore` and
- `hpx::lcos::local::sliding_semaphore_var` has been renamed to `hpx::sliding_semaphore_var`.
- `hpx::lcos::local::spinlock` has been renamed to `hpx::spinlock`.
- `hpx::lcos::local::mutex` has been renamed to `hpx::mutex`.
- `hpx::lcos::local::timed_mutex` has been renamed to `hpx::timed_mutex`.
- `hpx::lcos::local::no_mutex` has been renamed to `hpx::no_mutex`.
- `hpx::lcos::local::recursive_mutex` has been renamed to `hpx::recursive_mutex`.
- `hpx::lcos::local::shared_mutex` has been renamed to `hpx::shared_mutex`.
- `hpx::lcos::local::upgrade_lock` has been renamed to `hpx::upgrade_lock`.
- `hpx::lcos::local::upgrade_to_unique_lock` has been renamed to `hpx::upgrade_to_unique_lock`.
- `hpx::lcos::local::condition_variable` has been renamed to `hpx::condition_variable`. `hpx::lcos::local::condition_variable_var` has been renamed to `hpx::condition_variable_var`.
- `hpx::lcos::local::once_flag` has been renamed to `hpx::once_flag`, and `hpx::lcos::local::call_once` has been renamed to `hpx::call_once`.
- The new LCI (Lightweight Communication Interface) `parcelport` was added that supports irregular and asynchronous applications like graph analysis, sparse linear algebra, modern parallel architectures etc. Major features include:
 - Support for advanced communication primitives like two sided send/rcv and one sided remote put.
 - Better multi-threaded performance.
 - Explicit user control of communication resource.
 - Flexible signaling mechanisms (synchronizer, completion queue, active message handler).
- The following CMake flags were added, mostly to support using HPX as a backend for SHAD (<https://github.com/pnnl/SHAD>). Please note that these options enable questionable functionalities, partially they even enable undefined behavior. Please only use any of them if you know what you're doing:
 - `HPX_SERIALIZATION_WITH_ALLOW_RAW_POINTER_SERIALIZATION`
 - `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`
 - `HPX_SERIALIZATION_WITH_ALLOW_CONST_TUPLE_MEMBERS`

Breaking changes

- Minimum required C++ standard library is C++17.
- Support for GCC 7 and Clang 8.0.0 and below has been removed.
- CUDA version required updated to 11.4.
- CMake version required updated to 3.18.
- The default version of Asio used was updated to 1.20.0.
- The default version of APEX used was updated to 2.5.1.
- APEX version was updated to 2.5.1.
- `tagged_pair` and `tagged_tuple` were removed.
- `tag_dispatch` was renamed to `tag_invoke`.
- `hpx.max_background_threads` was renamed to `hpx.parcel.max_background_threads`.
- The following CMake flags were removed after being deprecated for at least two releases:
 - `HPX_SCHEDULER_MAX_TERMINATED_THREADS`
 - `HPX_WITH_GOOGLE_PERFTOOLS`
 - `HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY`
 - `HPX_HAVE_{COROUTINE,PLUGIN}_GCC_HIDDEN_VISIBILITY`
 - `HPX_TOP_LEVEL`
 - `HPX_WITH_COMPUTE_CUDA`
 - `HPX_WITH_ASYNC_CUDA`
- `annotate_function` was renamed to `scoped_annotation`.
- `execution::transform` was renamed to `execution::then`.
- `execution::detach` was renamed to `execution::start_detached`.
- `execution::on_sender` was renamed to `execution::schedule_on`.
- `execution::just_on` was renamed to `execution::just_transfer`.
- `execution::set_done` was renamed to `execution::set_stopped`.

- Issue #4495¹⁷⁴⁴ - Add anchor links to table rows in documentation
- Issue #4469¹⁷⁴⁵ - New thread state: *pending_low*
- Issue #4321¹⁷⁴⁶ - After the modularization the libfabric parcellport does not compile
- Issue #4308¹⁷⁴⁷ - Using APEX on multinode jobs when HPX_WITH_NETWORKING = OFF
- Issue #3995¹⁷⁴⁸ - Use C++20 `std::source_location` where available, adapt ours to conform
- Issue #3861¹⁷⁴⁹ - Selected processor does not support 'yield' in ARM mode
- Issue #3706¹⁷⁵⁰ - Add `shift_left` and `shift_right` algorithms
- Issue #3646¹⁷⁵¹ - Parallel algorithms should accept iterator/sentinel pairs
- Issue #3636¹⁷⁵² - HPX Modularization
- Issue #3546¹⁷⁵³ - Modularization of HPX
- Issue #3474¹⁷⁵⁴ - Modernize CMake used in HPX
- Issue #1836¹⁷⁵⁵ - `hpx::parallel` does not have a sort implementation
- Issue #1668¹⁷⁵⁶ - Adapt all parallel algorithms to Ranges TS
- Issue #1141¹⁷⁵⁷ - Implement N4409 on top of HPX

Closed pull requests

HPX V1.7.1 (Aug 12, 2021)

This is a bugfix release with a few minor fixes.

General changes

- Added a CMake option to assume that all types are bitwise serializable by default: `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`. The default value OFF corresponds to the old behaviour.
- Added a version check for Asio. The minimum Asio version supported by *HPX* is 1.12.0.
- Fixed a bug affecting usage of actions, where the internals of *HPX* relied on function addresses being unique. This was fixed by relying on variable addresses being unique instead.
- Made `hpx::util::bind` more strict in checking the validity of placeholders.
- Small performance improvement to spinlocks.
- Adapted the following parallel algorithms to C++20: `inclusive_scan`, `exclusive_scan`, `transform_inclusive_scan`, `transform_exclusive_scan`.

Breaking changes

- The experimental `hpx::execution::simdpar` execution policy (introduced in 1.7.0) was renamed to `hpx::execution::par_simd` for consistency with the other parallel policies.

HPX V1.7.0 (Jul 14, 2021)

This release is again focused on C++20 conformance of algorithms. Additionally, many new experimental sender-based algorithms have been added based on the latest proposals.

²⁰⁹⁷ <https://github.com/TheHPXProject/hpx/pull/5439>

²⁰⁹⁸ <https://github.com/TheHPXProject/hpx/pull/5436>

General changes

- The following algorithms have been adapted to be C++20 conformant:
 - `remove`,
 - `remove_if`,
 - `remove_copy`,
 - `remove_copy_if`,
 - `replace`,
 - `replace_if`,
 - `reverse`, and
 - `lexicographical_compare`.
- When the compiler and standard library support the standard execution policies `std::execution::seq`, `std::execution::par`, and `std::execution::par_unseq` they can now be used in all *HPX* parallel algorithms with equivalent behaviour to the non-task policies `hpx::execution::seq`, `hpx::execution::par`, and `hpx::execution::par_unseq`.
- Vc support has been fixed, after being broken in 1.6.0. In addition, *HPX* now experimentally supports GCC's SIMD implementation, when available. The implementation can be used through the `hpx::execution::simd` and `hpx::execution::simdpair` execution policies.
- The customization points `sync_execute`, `async_execute`, `then_execute`, `post`, `bulk_sync_execute`, `bulk_async_execute`, and `bulk_then_execute` are now implemented using `tag_dispatch` (previously `tag_invoke`). Executors can still be implemented by providing the aforementioned functions as member functions of an executor.
- New functionality, enhancements, and fixes based on P0443r14 (executors proposal) and P1897 (sender-based algorithms) have been added to the `hpx::execution::experimental` namespace. These can be accessed through the `hpx/execution.hpp` and `hpx/local/execution.hpp` headers. In particular, the following sender-based algorithms have been added:
 - `detach`,
 - `ensure_started`,
 - `just`,
 - `just_on`,
 - `let_error`,
 - `let_value`,
 - `on`,
 - `transform`, and
 - `when_all`.

Additionally, futures now implement the sender concept. `make_future` can be used to turn a sender into a future. All functionality is experimental and can change without notice.

- All `hpx::init` and `hpx::start` overloads now take `std::functions` instead of `hpx::util::function_nonser`. No changes should be required in user code to accommodate this change.
- `hpx::util::unwrapping` and other related unwrapping functionality has been moved up into the `hpx` namespace. Names in `hpx::util` are still usable with a deprecation warning. This functionality can now be accessed through the `hpx/unwrap.hpp` and `hpx/local/unwrap.hpp` headers.
- The default tag for APEX has been update from 2.3.1 to 2.4.0. In particular, this fixes a bug which could lead to hangs in distributed runs.
- The dependency on Boost.Asio has been replaced with the standalone Asio available at <https://github.com/chriskohlhoff/asio>. By default, a system-installed Asio will be used. `ASIO_ROOT` can be given as a hint to tell CMake where to find Asio. Alternatively, Asio can be fetched automatically using CMake's `fetchcontent` by setting `HPX_WITH_FETCH_ASIO=ON`. In general, dependencies on Boost have again been reduced.
- Modularization of the library has continued. In this release almost all functionality has been moved into modules. These changes do not generally affect user code. Warnings are still issued for headers that have moved.
- `hipBLAS` is now optional when compiling with `hipcc`. A warning instead of an error will be printed if `hipBLAS` is not found during configuration.
- Previously `HPX_COMPUTE_HOST_CODE` was defined in host code only if HPX was configured with CUDA or HIP. In this release `HPX_COMPUTE_HOST_CODE` is always defined in host code.
- An experimental `HPX_WITH_PRECOMPILED_HEADERS` CMake option has been added to use precompiled headers when building *HPX*. This option should not be used on Windows.
- Numerous bug fixes.

Breaking changes

- The minimum required CMake version is now 3.17.
- The minimum required Boost version is now 1.71.0.
- The customization mechanism used to implement and extend sender functionality and algorithms has been renamed from `tag_invoke` to `tag_dispatch`. All customization of sender functionality should be done by overloading `tag_dispatch`.
- The following compatibility options have been removed, along with their compatibility implementations:
 - `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`
 - `HPX_WITH_ACTION_BASE_COMPATIBILITY` - `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`
 - `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY` - `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`
 - `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`
 - `HPX_WITH_REGISTER_THREAD_OVERLOADS_COMPATIBILITY`
 - `HPX_WITH_THREAD_AWARE_TIMER_COMPATIBILITY`
 - `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`
 - `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`
- The `HPX_WITH_THREAD_SCHEDULERS` CMake option has been removed. All schedulers are now enabled when possible.

- `HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY` has been turned off by default.

Closed issues

²¹⁵⁹ <https://github.com/TheHPXProject/hpx/pull/5388>

²¹⁶⁰ <https://github.com/TheHPXProject/hpx/pull/5387>

- PR #5386²¹⁶¹ - Attempt to fix the startup hang with nodes > 32
- PR #5384²¹⁶² - Remove HPX 1.5.0 deprecations
- PR #5382²¹⁶³ - Prefer installed Asio before considering FetchContent
- PR #5379²¹⁶⁴ - Allow using pre-downloaded (not installed) versions of Asio and/or Apex
- PR #5376²¹⁶⁵ - Remove unnecessary explicit listing of library modules.rst files in CMakeLists.txt
- PR #5375²¹⁶⁶ - Slight performance improvement for `hpx::copy` and `hpx::move` et.al.
- PR #5374²¹⁶⁷ - Remove unnecessary moves from future sender implementations
- PR #5373²¹⁶⁸ - More changes to clang-cuda Jenkins configuration
- PR #5372²¹⁶⁹ - Slight improvements to `min/max/minmax_element` algorithms
- PR #5371²¹⁷⁰ - Adapt `uninitialized_copy` and `uninitialized_copy_n` to C++ 20
- PR #5370²¹⁷¹ - Decay types in `just_sender` `value_types` to match stored types
- PR #5367²¹⁷² - Disable `pkgconfig` by default again on macOS
- PR #5365²¹⁷³ - Use `ccache` for Jenkins builds on Piz Daint
- PR #5363²¹⁷⁴ - Update `cuda` toolkit module name in clang-cuda Jenkins configuration
- PR #5362²¹⁷⁵ - Adding `channel_communicator`
- PR #5361²¹⁷⁶ - Fix compilation with MPI enabled
- PR #5360²¹⁷⁷ - Update APEX and asio tags
- PR #5359²¹⁷⁸ - Fix check for `pu-step` in single-core case
- PR #5357²¹⁷⁹ - Making sure collective operations can be reused by preallocating communicator
- PR #5356²¹⁸⁰ - Update API documentation
- PR #5355²¹⁸¹ - Make the `sequenced_executor` `processing_units_count` member function const
- PR #5354²¹⁸² - Making sure `default_stack_size` is defined whenever declared

²¹⁸¹ <https://github.com/TheHPXProject/hpx/pull/5355>

²¹⁸² <https://github.com/TheHPXProject/hpx/pull/5354>

- PR #5353²¹⁸³ - Add CUDA timestamp support to HPX Hardware Clock
- PR #5352²¹⁸⁴ - Adding missing includes
- PR #5351²¹⁸⁵ - Adding `enable_logging/disable_logging` API functions
- PR #5350²¹⁸⁶ - Adapt `lexicographical_compare` to C++20
- PR #5349²¹⁸⁷ - Update minimum boost version needed on the docs
- PR #5348²¹⁸⁸ - Rename `tag_invoke` and related facilities to `tag_dispatch`
- PR #5347²¹⁸⁹ - Remove `make_` prefix for executor properties
- PR #5346²¹⁹⁰ - Remove and disable compatibility options for 1.7.0
- PR #5343²¹⁹¹ - Fix `timed_executor` static cast conversion
- PR #5342²¹⁹² - Refactor CUDA event polling
- PR #5341²¹⁹³ - Adding `make_with_annotation` and `get_annotation` properties
- PR #5339²¹⁹⁴ - Making sure `hpx::util::hardware::timestamp()` is always defined
- PR #5338²¹⁹⁵ - Fixing `timed_executor` specializations of customization points
- PR #5335²¹⁹⁶ - Make `partial_algorithm` work with any number of arguments
- PR #5334²¹⁹⁷ - Follow up `iter_sent` include on #5225
- PR #5332²¹⁹⁸ - Simplify `tag_invoke` and friends
- PR #5331²¹⁹⁹ - More work on cleaning up executor CPOs
- PR #5330²²⁰⁰ - Add option to disable `pkgconfig` generation
- PR #5328²²⁰¹ - Adapt data parallel support using `std-simd`
- PR #5327²²⁰² - Fix missing `ifdef HPX_SMT_PAUSE`
- PR #5326²²⁰³ - Adding `resize()` to `serialize_buffer` allowing to shrink its size
- PR #5324²²⁰⁴ - Add `get` member functions to `async_rw_mutex` proxy objects for explicitly getting the wrapped value
- PR #5323²²⁰⁵ - Add `keep_future` algorithm

HPX V1.6.0 (Feb 17, 2021)

General changes

This release continues the focus on C++20 conformance with multiple new algorithms adapted to be C++20 conformant and becoming customization point objects (CPOs). We have also added experimental support for HIP, allowing previous CUDA features to now be compiled with `hipcc` and run on AMD GPUs.

- The following algorithms have been adapted to be C++20 conformant: `adjacent_find`, `includes`, `inplace_merge`, `is_heap`, `is_heap_until`, `is_partitioned`, `is_sorted`, `is_sorted_until`, `merge`, `set_difference`, `set_intersection`, `set_symmetric_difference`, `set_union`.
- Experimental HIP support can be enabled by compiling *HPX* with `hipcc`. All CUDA functionality in *HPX* can now be used with HIP. The HIP functionality is for the time being exposed through the same API as the CUDA functionality, i.e. no changes are required in user code. The CUDA, and now HIP, functionality is in the `hpx::cuda` namespace.
- We have added `partial_sort` based on Francisco Tapia's implementation.
- `hpx::init` and `hpx::start` gained new overloads taking an `hpx::init_params` struct in 1.5.0. All overloads not taking an `hpx::init_params` are now deprecated.
- We have added an experimental `fork_join_executor`. This executor can be used for OpenMP-style fork-join parallelism, where the latency of a parallel region is important for performance.
- The `parallel_executor` now uses a hierarchical spawning scheme for bulk execution, which improves data locality and performance.
- `hpx::dataflow` can now be used with executors that inject additional parameters into the call of the user-provided function.
- We have added experimental support for properties as proposed in [P2220](#)²³⁴⁵. Currently the only supported property is the scheduling hint on `parallel_executor`.
- `hpx::util::annotated_function` can now be passed a dynamically generated `std::string`.

²³⁴⁰ <https://github.com/TheHPXProject/hpx/pull/5117>

²³⁴¹ <https://github.com/TheHPXProject/hpx/pull/5099>

²³⁴² <https://github.com/TheHPXProject/hpx/pull/5092>

²³⁴³ <https://github.com/TheHPXProject/hpx/pull/5053>

²³⁴⁴ <https://github.com/TheHPXProject/hpx/pull/5044>

²³⁴⁵ <https://wg21.link/p2220>

- In moving functionality to new namespaces, old names have been deprecated. A deprecation warning will be issued if you are using deprecated functionality, with instructions on how to correct or ignore the warning.
- We have removed all support for C and Fortran from our build system.
- We have further reduced the use of Boost types within *HPX* (`boost::system::error_code` and `boost::detail::spinlock`).
- We have enabled more warnings in our CI builds (unused variables and unused typedefs).

Breaking changes

- `hpxMP` support has been completely removed.
- The verbs `parcelpost` has been removed.
- The following compatibility options have been disabled by default: `HPX_WITH_ACTION_BASE_COMPATIBILITY`, `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`, `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`, `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`, `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`, `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`, `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`, `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`, `HPX_THREAD_AWARE_TIMER_COMPATIBILITY`, `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. Unless noted here, the above functionalities do not come with replacements. Unscoped enumerations have been replaced by scoped enumerations. Previously deprecated unscoped enumerations are disabled by `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`. Newly deprecated unscoped enumerations have been given deprecation warnings and replaced by scoped enumerations. `hpx::promise` has been replaced with `hpx::distributed::promise`. `hpx::program_options` is a drop-in replacement for `boost::program_options`. `hpx::execution::parallel_executor` now has constructors which take a thread pool, covering the use case of `hpx::threads::executors::pool_executor`. A pool can be supplied with `hpx::resource::get_thread_pool`.

HPX V1.5.1 (Sep 30, 2020)

General changes

This is a patch release. It contains the following changes:

- Remove restriction on suspending runtime with multiple localities, users are now responsible for synchronizing work between localities before suspending.
- Fixes several compilation problems and warnings.
- Adds notes in the documentation explaining how to cite HPX.

HPX V1.5.0 (Sep 02, 2020)

General changes

The main focus of this release is on APIs and C++20 conformance. We have added many new C++20 features and adapted multiple algorithms to be fully C++20 conformant. As part of the modularization we have begun specifying the public API of *HPX* in terms of headers and functionality, and aligning it more closely to the C++ standard. All non-distributed modules are now in place, along with an experimental option to completely disable distributed features in *HPX*. We have also added experimental asynchronous MPI and CUDA executors. Lastly this release introduces CMake targets for depending projects, performance improvements, and many bug fixes.

²⁵³² <https://github.com/TheHPXProject/hpx/pull/4941>

²⁵³³ <https://github.com/TheHPXProject/hpx/pull/4939>

- We have added the C++20 features `hpx::jthread` and `hpx::stop_token`. `hpx::condition_variable_any` now exposes new functions supporting `hpx::stop_token`.
- We have added `hpx::stable_sort` based on Francisco Tapia's implementation.
- We have adapted existing synchronization primitives to be fully conformant C++20: `hpx::barrier`, `hpx::latch`, `hpx::counting_semaphore`, and `hpx::binary_semaphore`.
- We have started using customization point objects (CPOs) to make the corresponding algorithms fully conformant to C++20 as well as to make algorithm extension easier for the user. `all_of/any_of/none_of`, `copy`, `count`, `destroy`, `equal`, `fill`, `find`, `for_each`, `generate`, `mismatch`, `move`, `reduce`, `transform_reduce` are using those CPOs (all in namespace `hpx`). We also have adapted their corresponding `hpx::ranges` versions to be conforming to C++20 in this release.
- We have adapted support for `co_await` to C++20, in addition to `hpx::future` it now also supports `hpx::shared_future`. We have also added allocator support for futures returned by `co_return`. It is no longer in the `experimental` namespace.
- We added serialization support for `std::variant` and `std::tuple`.
- `result_of` and `is_callable` are now deprecated and replaced by `invoke_result` and `is_invocable` to conform to C++20.
- We continued with the modularization, making it easier for us to add the new experimental `HPX_WITH_DISTRIBUTED_RUNTIME` CMake option (see below). A significant amount of headers have been deprecated. We adapted the namespaces and headers we could to be closer to the standard ones (*Public API*). Depending code should still compile, however warnings are now generated instructing to change the include statements accordingly.
- It is now possible to have a basic CUDA support including a helper function to get a future from a CUDA stream and target handling. They are available under the `hpx::cuda::experimental` namespace and they can be enabled with the `-DHPX_WITH_ASYNC_CUDA=ON` CMake option.
- We added a new `hpx::mpi::experimental` namespace for getting futures from an asynchronous MPI call and a new minimal MPI executor `hpx::mpi::experimental::executor`. These can be enabled with the `-DHPX_WITH_ASYNC_MPI=On` CMake option.
- A polymorphic executor has been implemented to reduce compile times as a function accepting executors can potentially be instantiated only once instead of multiple times with different executors. It accepts the function signature as a template argument. It needs to be constructed from any other executor. Please note, that the function signatures that can be scheduled using `then_execute`, `bulk_sync_execute`, `bulk_async_execute` and `bulk_then_execute` are slightly different (See the comment in [PR #4514](https://github.com/TheHPXProject/hpx/pull/4514)²⁵³⁴ for more details).
- The underlying executor of `block_executor` has been updated to a newer one.
- We have added a parameter to `auto_chunk_size` to control the amount of iterations to measure.
- All executor parameter hooks can now be exposed through the executor itself. This will allow to deprecate the `.with()` functionality on execution policies in the future. This is

²⁵³⁴ <https://github.com/TheHPXProject/hpx/pull/4514>

also a first step towards simplifying our executor APIs in preparation for the upcoming C++23 executors (senders/receivers).

- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`. Please note this is a breaking change without backwards-compatibility option. We have converted all of those APIs to be based on customization point objects. Two new executors have been added to enable easy integration of the existing resiliency features with other facilities (like the parallel algorithms): `replay_executor` and `replicate_executor`.
- We have added performance counters type information (aggregating, monotonically increasing, average count, average timer, etc.).
- HPX threads are now re-scheduled on the same worker thread they were suspended on to avoid cache misses from moving from one thread to the other. This behavior doesn't prevent the thread from being stolen, however.
- We have added a new configuration option `hpx.exception_verbosity` to allow to control the level of verbosity of the exceptions (3 levels available).
- `broadcast_to`, `broadcast_from`, `scatter_to` and `scatter_from` have been added to the collectives, modernization of `gather_here` and `gather_there` with futures taken by rvalue references. See the breaking change on `all_to_all` in the next section. None of the collectives need supporting macros anymore (e.g. specifying the data types used for a collective operation using `HPX_REGISTER_ALLGATHER` and similar is not needed anymore).
- New API functions have been added: a) to get the number of cores which are idle (`hpx::get_idle_core_count`) and b) returning a bitmask representing the currently idle cores (`hpx::get_idle_core_mask`).
- We have added an experimental option to only enable the local runtime, you can disable the distributed runtime with `HPX_WITH_DISTRIBUTED_RUNTIME=OFF`. You can also enable the local runtime by using the `--hpx:local` runtime option.
- We fixed task annotations for actions.
- The alias `hpx::promise` to `hpx::lcos::promise` is now deprecated. You can use `hpx::lcos::promise` directly instead. `hpx::promise` will refer to the local-only promise in the future.
- We have added a `prepare_checkpoint` API function that calculates the amount of necessary buffer space for a particular set of arguments checkpointed.
- We have added `hpx::upgrade_lock` and `hpx::upgrade_to_unique_lock`, which make `hpx::shared_mutex` (and similar) usable in more flexible ways.
- We have changed the CMake targets exposed to the user, it now includes `HPX:hpx`, `HPX:wrap_main` (int main as the first HPX thread of the application, see [Starting the HPX runtime](#)), `HPX:plugin`, `HPX:component`. The CMake variables `HPX_INCLUDE_DIRS` and `HPX_LIBRARIES` are deprecated and will be removed in a future release, you should now link directly to the `HPX:hpx` CMake target.
- A new example is demonstrating how to create and use a wrapping executor (`quickstart/executor_with_thread_hooks.cpp`)
- A new example is demonstrating how to disable thread stealing during the execution of parallel algorithms (`quickstart/disable_thread_stealing_executor.cpp`)
- We now require for our CMake build system configuration files to be formatted using `cmake-format`.

- We have removed more dependencies on various Boost libraries.
- We have added an experimental option enabling unity builds of HPX using the `-DHPX_WITH_UNITY_BUILD=On` CMake option.
- Many bug fixes.

Breaking changes

- *HPX* now requires a C++14 capable compiler. We have set the *HPX* C++ standard automatically to C++14 and if it needs to be set explicitly, it should be specified through the `CMAKE_CXX_STANDARD` setting as mandated by CMake. The `HPX_WITH_CXX*` variables are now deprecated and will be removed in the future.
- Building and using HPX is now supported only when using CMake V3.13 or later, Boost V1.64 or newer, and when compiling with clang V5, gcc V7, or VS2019, or later. Other compilers might still work but have not been tested thoroughly.
- We have added a `hpx::init_params` struct to pass parameters for *HPX* initialization e.g. the resource partitioner callback to initialize thread pools (*Using the resource partitioner*).
- The `all_to_all` algorithm is renamed to `all_gather`, and the new `all_to_all` algorithm is not compatible with the old one.
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`.

- Issue #4686²⁵⁶⁶ - Fix tutorials examples
- Issue #4685²⁵⁶⁷ - HPX distributed map fails to compile
- Issue #4680²⁵⁶⁸ - Build error with HPX_WITH_DYNAMIC_HPX_MAIN=OFF
- Issue #4679²⁵⁶⁹ - Build error for hpx w/ Apex on Summit
- Issue #4675²⁵⁷⁰ - build error with HPX_WITH_NETWORKING=OFF
- Issue #4674²⁵⁷¹ - Error running Quickstart tests on OS X
- Issue #4662²⁵⁷² - MPI initialization broken when networking off
- Issue #4652²⁵⁷³ - How to fix distributed action annotation
- Issue #4650²⁵⁷⁴ - thread descriptions are broken... again
- Issue #4648²⁵⁷⁵ - Thread stacksize not properly set
- Issue #4647²⁵⁷⁶ - Rename generated collective headers in modules
- Issue #4639²⁵⁷⁷ - Update deprecation warnings in compatibility headers to point to collective headers
- Issue #4628²⁵⁷⁸ - mpi parcelport totally broken
- Issue #4619²⁵⁷⁹ - Fully document hpx_wrap behaviour and targets
- Issue #4612²⁵⁸⁰ - Compilation issue with HPX 1.4.1 and 1.4.0
- Issue #4594²⁵⁸¹ - Rename modules
- Issue #4578²⁵⁸² - Default value for HPX_WITH_THREAD_BACKTRACE_DEPTH
- Issue #4572²⁵⁸³ - Thread manager should be given a runtime_configuration
- Issue #4571²⁵⁸⁴ - Add high-level documentation to new modules
- Issue #4569²⁵⁸⁵ - Annoying warning when compiling - pls suppress or fix it.
- Issue #4555²⁵⁸⁶ - HPX_HAVE_THREAD_BACKTRACE_ON_SUSPENSION compilation error
- Issue #4543²⁵⁸⁷ - Segfaults in Release builds using *sleep_for*

- Issue #4539²⁵⁸⁸ - Compilation Error when HPX_MPI_WITH_FUTURES=ON
- Issue #4537²⁵⁸⁹ - Linking issue with libhpx_initd.a
- Issue #4535²⁵⁹⁰ - API for checking if pool with a given name exists
- Issue #4523²⁵⁹¹ - Build of PR #4311 (git tag 9955e8e) fails
- Issue #4519²⁵⁹² - Documentation problem
- Issue #4513²⁵⁹³ - HPXConfig.cmake contains ill-formed paths when library paths use backslashes
- Issue #4507²⁵⁹⁴ - User-polling introduced by MPI futures module should be more generally usable
- Issue #4506²⁵⁹⁵ - Make sure force_linking.hpp is not included in main module header
- Issue #4501²⁵⁹⁶ - Fix compilation of PAPI tests
- Issue #4497²⁵⁹⁷ - Add modules CI checks
- Issue #4489²⁵⁹⁸ - Polymorphic executor
- Issue #4476²⁵⁹⁹ - Use CMake targets defined by FindBoost
- Issue #4473²⁶⁰⁰ - Add vcpkg installation instructions
- Issue #4470²⁶⁰¹ - Adapt hpx::future to C++20 co_await
- Issue #4468²⁶⁰² - Compile error on Raspberry Pi 4
- Issue #4466²⁶⁰³ - Compile error on Windows, current stable:
- Issue #4453²⁶⁰⁴ - Installing HPX on fedora with dnf is not adding cmake files
- Issue #4448²⁶⁰⁵ - New std::variant serialization broken
- Issue #4438²⁶⁰⁶ - Add performance counter flag is monotonically increasing
- Issue #4436²⁶⁰⁷ - Build problem: same code build and works with 1.4.0 but it doesn't with 1.4.1
- Issue #4429²⁶⁰⁸ - Function descriptions not supported in distributed
- Issue #4423²⁶⁰⁹ - --hpx:ini=hpx.lock_detection=0 has no effect

- PR #4864²⁶⁷⁵ - Release notes 1.5.0
- PR #4863²⁶⁷⁶ - adding libcds-hpx tag to prepare for hpx1.5 release
- PR #4862²⁶⁷⁷ - Adding version specific deprecation options
- PR #4861²⁶⁷⁸ - Limiting executor improvements
- PR #4860²⁶⁷⁹ - Making fill and fill_n compatible with C++20
- PR #4859²⁶⁸⁰ - Adapting all_of, any_of, and none_of to C++20
- PR #4857²⁶⁸¹ - Improve libCDS integration
- PR #4856²⁶⁸² - Correct typos in the documentation of the hpx performance counters
- PR #4854²⁶⁸³ - Removing obsolete code
- PR #4853²⁶⁸⁴ - Adding test that derives component from two other components
- PR #4852²⁶⁸⁵ - Fix mpi_ring test in distributed mode by ensuring all ranks run hpx_main
- PR #4851²⁶⁸⁶ - Converting resiliency APIs to tag_invoke based CPOs
- PR #4849²⁶⁸⁷ - Enable use of future_overhead test when DISTRIBUTED_RUNTIME is OFF
- PR #4847²⁶⁸⁸ - Fixing 'error prone' constructs as reported by Codacy
- PR #4846²⁶⁸⁹ - Disable Boost.Asio concepts support
- PR #4845²⁶⁹⁰ - Fix PAPI counters
- PR #4843²⁶⁹¹ - Remove dependency on various Boost headers
- PR #4841²⁶⁹² - Rearrange public API headers
- PR #4840²⁶⁹³ - Fixing TSS problems during thread termination
- PR #4839²⁶⁹⁴ - Fix async_cuda build problems when distributed runtime is disabled
- PR #4837²⁶⁹⁵ - Restore compatibility for old (now deprecated) copy algorithms
- PR #4836²⁶⁹⁶ - Adding CPOs for hpx::reduce
- PR #4835²⁶⁹⁷ - Remove using util::result_of from namespace hpx

- PR #4799²⁷²⁰ - Fixing #include paths in compatibility headers
- PR #4798²⁷²¹ - Include the main module header (fixes partially #4488)
- PR #4797²⁷²² - Change cmake targets
- PR #4794²⁷²³ - Removing 128bit integer emulation
- PR #4793²⁷²⁴ - Make sure global variable is handled properly
- PR #4792²⁷²⁵ - Replace enable_if with **HPX_CONCEPT_REQUIRES_** and add is_sentinel_for constraint
- PR #4790²⁷²⁶ - Move deprecation warnings from base template to template specializations for result_of etc. structs
- PR #4789²⁷²⁷ - Fix hangs during assertion handling and distributed runtime construction
- PR #4788²⁷²⁸ - Fixing inclusive transform scan algorithm to properly handle initial value
- PR #4785²⁷²⁹ - Fixing barrier test
- PR #4784²⁷³⁰ - Fixing deleter argument bindings in serialize_buffer
- PR #4783²⁷³¹ - Add coveralls badge
- PR #4782²⁷³² - Make header tests parallel again
- PR #4780²⁷³³ - Remove outdated comment about hpx::stop in documentation
- PR #4776²⁷³⁴ - debug print improvements
- PR #4775²⁷³⁵ - Checkpoint cleanup
- PR #4771²⁷³⁶ - Fix compilation with HPX_WITH_NETWORKING=OFF
- PR #4767²⁷³⁷ - Remove all force linking leftovers
- PR #4765²⁷³⁸ - Fix 1d stencil index calculation
- PR #4764²⁷³⁹ - Force some tests to run serially
- PR #4762²⁷⁴⁰ - Update pointees in compatibility headers
- PR #4761²⁷⁴¹ - Fix running and building of execution module tests on CircleCI

- PR #4491²⁸⁹⁹ - Add missing `current_executor` header
- PR #4490²⁹⁰⁰ - Update GitHub actions configs
- PR #4487²⁹⁰¹ - Properly dispatch exceptions thrown from `hpx_main` to be rethrown from `hpx::init/hpx::stop`
- PR #4486²⁹⁰² - Fixing an initialization order problem
- PR #4485²⁹⁰³ - Move miscellaneous files to their rightful modules
- PR #4483²⁹⁰⁴ - Clean up imported CMake target naming
- PR #4481²⁹⁰⁵ - Add `vcpkg` installation instructions
- PR #4479²⁹⁰⁶ - Add hints to allow to specify `MIMALLOC_ROOT`
- PR #4478²⁹⁰⁷ - Async modules
- PR #4475²⁹⁰⁸ - Fix `rp` init changes
- PR #4474²⁹⁰⁹ - Use `#pragma once` in headers
- PR #4472²⁹¹⁰ - Add more descriptive error message when using x86 coroutines on non-x86 platforms
- PR #4467²⁹¹¹ - Add `mimalloc` find cmake script
- PR #4465²⁹¹² - Add `thread_executors` module
- PR #4464²⁹¹³ - Include module
- PR #4462²⁹¹⁴ - Merge `hpx_init` and `hpx_wrap` into one static library
- PR #4461²⁹¹⁵ - Making `thread_data` test more realistic
- PR #4460²⁹¹⁶ - Suppress MPI warnings in `version.cpp`
- PR #4459²⁹¹⁷ - Make sure `pkgconfig` applications link with `hpx_init`
- PR #4458²⁹¹⁸ - Added example demonstrating how to create and use a wrapping executor
- PR #4457²⁹¹⁹ - Fixing execution of thread exit functions
- PR #4456²⁹²⁰ - Move backtrace files to debugging module

- PR #4455²⁹²¹ - Move deadlock_detection and maintain_queue_wait_times source files into schedulers module
- PR #4450²⁹²² - Fixing compilation with std::filesystem enabled
- PR #4449²⁹²³ - Fixing build system to actually build variant test
- PR #4447²⁹²⁴ - This fixes an obsolete #include
- PR #4446²⁹²⁵ - Resume tasks where they were suspended
- PR #4444²⁹²⁶ - Minor CUDA fixes
- PR #4443²⁹²⁷ - Add missing tests to CircleCI config
- PR #4442²⁹²⁸ - Adding a tag to all auto-generated files allowing for tools to visually distinguish those
- PR #4441²⁹²⁹ - Adding performance counter type information
- PR #4440²⁹³⁰ - Fixing MSVC build
- PR #4439²⁹³¹ - Link HPX::plugin and component privately in hpx_setup_target
- PR #4437²⁹³² - Adding a test that verifies the problem can be solved using a trait specialization
- PR #4434²⁹³³ - Clean up Boost dependencies and copy string algorithms to new module
- PR #4433²⁹³⁴ - Fixing compilation issues (!) if MPI parselport is enabled
- PR #4431²⁹³⁵ - Ignore warnings about name mangling changing
- PR #4430²⁹³⁶ - Add performance_counters module
- PR #4428²⁹³⁷ - Don't add compatibility headers to module API reference
- PR #4426²⁹³⁸ - Add currently failing tests on GitHub actions to blacklist
- PR #4425²⁹³⁹ - Clean up and correct minimum required versions
- PR #4424²⁹⁴⁰ - Making sure hpx.lock_detection=0 works as advertized
- PR #4421²⁹⁴¹ - Making sure interval time stops underlying timer thread on termination
- PR #4417²⁹⁴² - Adding serialization support for std::variant (if available) and std::tuple

- PR #4415²⁹⁴³ - Partially reverting changes applied by PR 4373
- PR #4414²⁹⁴⁴ - Added documentation for the compiler-wrapper script hpxcxx.in in creating_hpx_projects.rst
- PR #4413²⁹⁴⁵ - Merging from V1.4.1 release
- PR #4412²⁹⁴⁶ - Making sure to issue a warning if a file specified using `-hpx:options-file` is not found
- PR #4411²⁹⁴⁷ - Make test specific to HPX_WITH_SHARED_PRIORITY_SCHEDULER
- PR #4407²⁹⁴⁸ - Adding minimal MPI executor
- PR #4405²⁹⁴⁹ - Fix cross pool injection test, use default scheduler as fallback
- PR #4404²⁹⁵⁰ - Fix a race condition and clean-up usage of scheduler mode
- PR #4399²⁹⁵¹ - Add more threading modules
- PR #4398²⁹⁵² - Add CODEOWNERS file
- PR #4395²⁹⁵³ - Adding a parameter to `auto_chunk_size` allowing to control the amount of iterations to measure
- PR #4393²⁹⁵⁴ - Use appropriate cache-line size defaults for different platforms
- PR #4391²⁹⁵⁵ - Fixing use of allocator for C++20
- PR #4390²⁹⁵⁶ - Making `-hpx:help` behavior consistent
- PR #4388²⁹⁵⁷ - Change the resource partitioner initialization
- PR #4387²⁹⁵⁸ - Fix `roll_release.sh`
- PR #4386²⁹⁵⁹ - Add warning messages for using thread binding options on macOS
- PR #4385²⁹⁶⁰ - Cuda futures
- PR #4384²⁹⁶¹ - Make enabling dynamic `hpx_main` on non-Linux systems a configuration error
- PR #4383²⁹⁶² - Use `configure_file` for `HPXCacheVariables.cmake`
- PR #4382²⁹⁶³ - Update spellchecking whitelist and fix more typos

- [PR #4017](#)³⁰³² - Require C++14

HPX V1.4.1 (Feb 12, 2020)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation issues on Windows, macOS, FreeBSD, and with gcc 10
- Install missing pdb files on Windows
- Allow running tests using an installed version of *HPX*
- Skip MPI finalization if HPX has not initialized MPI
- Give a hard error when attempting to use IO counters on Windows

Closed issues

- [Issue #4320](#)³⁰³³ - HPX 1.4.0 does not compile with gcc 10

HPX V1.4.0 (January 15, 2020)

General changes

- We have added the collectives `all_to_all` and `all_reduce`.
- We have added APIs for resiliency, which allows replication and replay for failed tasks. See the [documentation](#) for more details.
- Components can now be checkpointed.
- Performance improvements to schedulers and coroutines. A significant change is the addition of stackless coroutines. These are to be used for tasks that do not need to be suspended and can reduce overheads noticeably in applications with short tasks. A stackless coroutine can be created with the new stack size `thread_stacksize_nostack`.
- We have added an implementation of `unique_any`, which is a non-copyable version of `any`.
- The `shared_priority_queue_scheduler` has been improved. It now has lower overheads than the default scheduler in many situations. Unlike the default scheduler it fully supports NUMA scheduling hints. Enable it with the command line option `--hpx:queuing=shared-priority`. This scheduler should still be considered experimental, but its use is encouraged in real applications to help us make it production ready.
- We have added the performance counters `background-receive-duration` and `background-receive-overhead` for inspecting the time and overhead spent on receiving parcels in the background.
- Compilation time has been further improved when `HPX_WITH_NETWORKING=OFF`.
- We no longer require compiled Boost dependencies in certain configurations. This requires at least Boost 1.70, compiling on x86 with GCC 9, clang (libc++) 9, or VS2019 in C++17 mode. The dependency on `Boost.Filesystem` can explicitly be turned on with `HPX_FILESYSTEM_WITH_BOOST_FILESYSTEM_COMPATIBILITY=ON` (it is off by default if the standard library supports `std::filesystem`). `Boost.ProgramOptions` has been copied into the HPX repository. We have a compatibility layer for users who must explicitly use `Boost.ProgramOptions` instead of the `ProgramOptions` provided by HPX. To remove the dependency `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY` must be explicitly set to `OFF`. This option will be removed in a future release. We have also removed several other header-only dependencies on Boost.
- It is now possible to use the process affinity mask set by tools like `numactl` and various batch environments with the command line option `--hpx:use-process-mask`. Enabling this option implies `--hpx:ignore-batch-env`.
- It is now possible to create standalone thread pools without starting the runtime. See the `standalone_thread_pool_executor.cpp` test in the `execution` module for an example.

³⁰⁴⁵ <https://github.com/TheHPXProject/hpx/pull/4315>

³⁰⁴⁶ <https://github.com/TheHPXProject/hpx/pull/4310>

- Tasks annotated with `hpx::util::annotated_function` now have their correct name when using APEX to generate OTF2 files.
- Cloning of APEX was defective in previous releases (it required manual intervention to check out the correct tag or branch). This has been fixed.
- The option `HPX_WITH_MORE_THAN_64_THREADS` is now ignored and will be removed in a future release. The value is instead derived directly from `HPX_WITH_MAX_CPU_COUNT` option.
- We have deprecated compiling in C++11 mode. The next release will require a C++14 capable compiler.
- We have deprecated support for the Vc library. This option will be replaced with SIMD support from the standard library in a future release.
- We have significantly refactored our CMake setup. This is intended to be a non-breaking change and will allow for using HPX through CMake targets in the future.
- We have continued modularizing the HPX library. In the process we have rearranged many header files into module-specific directories. All moved headers have compatibility headers which forward from the old location to the new location, together with a deprecation warning. The compatibility headers will eventually be removed.
- We now enforce formatting with `clang-format` on the majority of our source files.
- We have added SPDX license tags to all files.
- Many bugfixes.

Breaking changes

- The `HPX_WITH_THREAD_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_UNWRAPPED_COMPATIBILITY` option and the associated compatibility layer has been removed.

- PR #4176³¹⁸⁵ - Add back HPX_LIBRARIES and friends to HPXConfig.cmake
- PR #4175³¹⁸⁶ - Make Vc public and add it to HPXConfig.cmake
- PR #4173³¹⁸⁷ - Wait for runtime to be running before returning from hpx::start
- PR #4172³¹⁸⁸ - More protection against shutdown problems in error handling scenarios.
- PR #4171³¹⁸⁹ - Ignore lock in condition_variable::wait
- PR #4170³¹⁹⁰ - Adding APEX dependency to MPI parcelport
- PR #4168³¹⁹¹ - Adding utility include
- PR #4167³¹⁹² - Add a condition to setup the external libraries
- PR #4166³¹⁹³ - Add an INTERNAL_FLAGS option to link to hpx_internal_flags
- PR #4165³¹⁹⁴ - Forward HPX_* cmake cache variables to external projects
- PR #4164³¹⁹⁵ - Affinity and batch environment modules
- PR #4162³¹⁹⁶ - Handle quick exit
- PR #4160³¹⁹⁷ - Using target_link_libraries for cmake versions >= 3.12
- PR #4159³¹⁹⁸ - Make sure HPX_WITH_NATIVE_TLS is forwarded to dependent projects
- PR #4158³¹⁹⁹ - Adding allocator imported target as a dependency of allocator module
- PR #4157³²⁰⁰ - Add hpx_memory as a dependency of parcelport plugins
- PR #4156³²⁰¹ - Stackless coroutines now can refer to themselves (through get_self() and friends)
- PR #4154³²⁰² - Added CMake policy CMP0060 for HPX applications.
- PR #4153³²⁰³ - add header iomanip to tests and tool
- PR #4152³²⁰⁴ - Casting MPI tag value
- PR #4149³²⁰⁵ - Add back private m_desc member variable in program_options module
- PR #4147³²⁰⁶ - Resource partitioner and threadmanager modules
- PR #4146³²⁰⁷ - Google Season of Docs updates to documentation; creating hpx projects

HPX V1.3.0 (May 23, 2019)

General changes

- Performance improvements: the schedulers have significantly reduced overheads from removing false sharing and the parallel executor has been updated to create fewer futures.
- HPX now defaults to not turning on networking when running on one locality. This means that you can run multiple instances on the same system without adding command line options.
- Multiple issues reported by Clang sanitizers have been fixed.
- We have added (back) single-page HTML documentation and PDF documentation.
- We have started modularizing the HPX library. This is useful both for developers and users. In the long term users will be able to consume only parts of the HPX libraries if they do not require all the functionality that HPX currently provides.
- We have added an implementation of `function_ref`.
- The `barrier` and `latch` classes have gained a few additional member functions.

Breaking changes

- Executable and library targets are now created without the `_exe` and `_lib` suffix respectively. For example, the target `1d_stencil_1_exe` is now simply called `1d_stencil_1`.
- We have removed the following deprecated functionality: `queue`, `scoped_unlock`, and support for input iterators in algorithms.
- We have turned off the compatibility layer for `unwrapped` by default. The functionality will be removed in the next release. The option can still be turned on using the [CMake](#)³⁴¹⁴ option `HPX_WITH_UNWRAPPED_SUPPORT`. Likewise, `inclusive_scan` compatibility overloads have been turned off by default. They can still be turned on with `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY`.
- The minimum compiler and dependency versions have been updated. We now support GCC from version 5 onwards, Clang from version 4 onwards, and Boost from version 1.61.0 onwards.

³⁴⁰⁹ <https://github.com/TheHPXProject/hpx/pull/3799>

³⁴¹¹ <https://github.com/TheHPXProject/hpx/pull/3496>

³⁴¹² <https://github.com/TheHPXProject/hpx/pull/3192>

³⁴¹³ <https://github.com/TheHPXProject/hpx/pull/3159>

³⁴¹⁴ <https://www.cmake.org>

- The headers for preprocessor macros have moved as a result of the functionality being moved to a separate module. The old headers are deprecated and will be removed in a future version of HPX. You can turn off the warnings by setting `HPX_PREPROCESSOR_WITH_DEPRECATION_WARNINGS=OFF` or turn off the compatibility headers completely with `HPX_PREPROCESSOR_WITH_COMPATIBILITY_HEADERS=OFF`.

- PR #3773³⁵³⁹ - Enable migration of polymorphic components
- PR #3771³⁵⁴⁰ - Fix link to stackoverflow in documentation
- PR #3770³⁵⁴¹ - Replacing constexpr if in brace-serialization code
- PR #3769³⁵⁴² - Fix SIGSEGV handler
- PR #3768³⁵⁴³ - Adding flags to scheduler allowing to control thread stealing and idle back-off
- PR #3767³⁵⁴⁴ - Fix help formatting in hpxrun.py
- PR #3765³⁵⁴⁵ - Fix a couple of bugs in the thread test
- PR #3764³⁵⁴⁶ - Workaround for SFINAE regression in msvc14.2
- PR #3762³⁵⁴⁷ - Prevent MSVC from prematurely instantiating things
- PR #3761³⁵⁴⁸ - Update python scripts to work with python 3
- PR #3760³⁵⁴⁹ - Fix callable vtable for GCC4.9
- PR #3759³⁵⁵⁰ - Rename PAGE_SIZE to PAGE_SIZE_ because AppleClang
- PR #3755³⁵⁵¹ - Making sure locks are not held during suspension
- PR #3754³⁵⁵² - Disable more code if networking is not available/not enabled
- PR #3752³⁵⁵³ - Move util::format implementation to source file
- PR #3751³⁵⁵⁴ - Fixing problems with lcos::barrier and iostreams
- PR #3750³⁵⁵⁵ - Change error message to take into account use_guard_page setting
- PR #3749³⁵⁵⁶ - Fix lifetime problem in run_as_hpx_thread
- PR #3748³⁵⁵⁷ - Fixed unusable behavior of the clang code analyzer.
- PR #3747³⁵⁵⁸ - Added PMIX_RANK to the defaults of HPX_WITH_PARCELPOR MPI_ENV.
- PR #3745³⁵⁵⁹ - Introduced cache_aligned_data and cache_line_data helper structure
- PR #3742³⁵⁶⁰ - Remove more unused functionality from util/logging

- PR #3740³⁵⁶¹ - Fix includes in partitioned vector tests
- PR #3739³⁵⁶² - More fixes to make sure that `std::flush` really flushes all output
- PR #3737³⁵⁶³ - Fix potential shutdown problems
- PR #3736³⁵⁶⁴ - Fix `guided_pool_executor` after dataflow changes caused compilation fail
- PR #3734³⁵⁶⁵ - Limiting executor
- PR #3732³⁵⁶⁶ - More constrained bound constructors
- PR #3730³⁵⁶⁷ - Attempt to fix deadlocks during component loading
- PR #3729³⁵⁶⁸ - Add latch member function `count_up` and `reset`, requested by `hpxMP`
- PR #3728³⁵⁶⁹ - Send even empty buffers on `hpx::endl` and `hpx::flush`
- PR #3727³⁵⁷⁰ - Adding example demonstrating how to customize the memory management for a component
- PR #3726³⁵⁷¹ - Adding support for passing command line options through the `HPX_COMMANDLINE_OPTIONS` environment variable
- PR #3722³⁵⁷² - Document known broken OpenMPI builds
- PR #3716³⁵⁷³ - Add barrier reset function, requested by `hpxMP` for reusing barrier
- PR #3715³⁵⁷⁴ - More work on functions and vtables
- PR #3714³⁵⁷⁵ - Generate single-page HTML, PDF, manpage from documentation
- PR #3713³⁵⁷⁶ - Updating default APEX version to 2.1.2
- PR #3712³⁵⁷⁷ - Update release procedure
- PR #3710³⁵⁷⁸ - Fix the C++11 build, after #3704
- PR #3709³⁵⁷⁹ - Move some `component_registry` functionality to source file
- PR #3708³⁵⁸⁰ - Ignore all locks while handling assertions
- PR #3707³⁵⁸¹ - Remove obsolete `hpx` runtime executable
- PR #3705³⁵⁸² - Fix and simplify `make_ready_future` overload sets

HPX V1.2.1 (Feb 19, 2019)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation on ARM, s390x and 32-bit architectures.
- Fix a critical bug in the `future` implementation.
- Fix several problems in the CMake configuration which affects external projects.

HPX V1.2.0 (Nov 12, 2018)

General changes

Here are some of the main highlights and changes for this release:

- Thanks to the work of our Google Summer of Code student, Nikunj Gupta, we now have a new implementation of `hpx_main.hpp` on supported platforms (Linux, BSD and MacOS). This is intended to be a less fragile drop-in replacement for the old implementation relying on preprocessor macros. The new implementation does not require changes if you are using the [CMake](https://www.cmake.org)³⁷⁰⁸ or `pkg-config`. The old behaviour can be restored by setting `HPX_WITH_DYNAMIC_HPX_MAIN=OFF` during [CMake](https://www.cmake.org)³⁷⁰⁹ configuration. The implementation on Windows is unchanged.
- We have added functionality to allow passing scheduling hints to our schedulers. These will allow us to create executors that for example target a specific NUMA domain or allow for *HPX* threads to be pinned to a particular worker thread.
- We have significantly improved the performance of our futures implementation by making the shared state atomic.
- We have replaced Boostbook by Sphinx for our documentation. This means the documentation is easier to navigate with built-in search and table of contents. We have also added a quick start section and restructured the documentation to be easier to follow for new users.
- We have added a new option to the `--hpx:threads` command line option. It is now possible to use `cores` to tell *HPX* to only use one worker thread per core, unlike the existing option `all` which uses one worker thread per processing unit (processing unit can be a hyperthread if hyperthreads are available). The default value of `--hpx:threads` has also been changed to `cores` as this leads to better performance in most cases.
- All command line options can now be passed alongside configuration options when initializing *HPX*. This means that some options that were previously only available on the command line can now be set as configuration options.
- HPXMP is a portable, scalable, and flexible application programming interface using the OpenMP specification that supports multi-platform shared memory multiprocessing programming in C and C++. HPXMP can be enabled within *HPX* by setting `DHPX_WITH_HPXMP=ON` during [CMake](https://www.cmake.org)³⁷¹⁰ configuration.
- Two new performance counters were added for measuring the time spent doing background work. `/threads/time/background-work-duration` returns the time spent doing background on a given thread or locality, while `/threads/time/background-overhead` returns the fraction of time spent doing background work with respect to the overall time spent running the scheduler. The new performance counters are disabled by default and can be turned on by setting `HPX_WITH_BACKGROUND_THREAD_COUNTERS=ON` during [CMake](https://www.cmake.org)³⁷¹¹ configuration.
- The idling behaviour of *HPX* has been tweaked to allow for faster idling. This is useful in interactive applications where the *HPX* worker threads may not have work all the time. This behaviour can be tweaked and turned off as before with `HPX_WITH_THREAD_MANAGER_IDLE_BACKOFF=OFF` during [CMake](https://www.cmake.org)³⁷¹² configuration.

³⁷⁰⁸ <https://www.cmake.org>

³⁷⁰⁹ <https://www.cmake.org>

³⁷¹⁰ <https://www.cmake.org>

³⁷¹¹ <https://www.cmake.org>

³⁷¹² <https://www.cmake.org>

- It is now possible to register callback functions for *HPX* worker thread events. Callbacks can be registered for starting and stopping worker threads, and for when errors occur.

Breaking changes

- The implementation of `hpx_main.hpp` has changed. If you are using custom Makefiles you will need to make changes. Please see the documentation on *using Makefiles* for more details.
- The default value of `--hpx:threads` has changed from `all` to `cores`. The new option `cores` only starts one worker thread per core.
- We have dropped support for Boost 1.56 and 1.57. The minimal version of Boost we now test is 1.58.
- Our `boost::format`-based formatting implementation has been revised and replaced with a custom implementation. This changes the formatting syntax and requires changes if you are relying on `hpx::util::format` or `hpx::util::format_to`. The pull request for this change contains more information: [PR #3266](#)³⁷¹³.
- The following deprecated options have now been completely removed: `HPX_WITH_ASYNC_FUNCTION_COMPATIBILITY`, `HPX_WITH_LOCAL_DATAFLOW`, `HPX_WITH_GENERIC_EXECUTION_POLICY`, `HPX_WITH_BOOST_CHRONO_COMPATIBILITY`, `HPX_WITH_EXECUTOR_COMPATIBILITY`, `HPX_WITH_EXECUTION_POLICY_COMPATIBILITY`, and `HPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY`.

³⁷⁴⁶ <https://github.com/TheHPXProject/hpx/issues/3285>

- Issue #3280³⁷⁴⁷ - HPX fails on OSX
- Issue #3272³⁷⁴⁸ - CircleCI does not upload generated docker image any more
- Issue #3270³⁷⁴⁹ - Error when compiling CUDA examples
- Issue #3267³⁷⁵⁰ - `tests.unit.host_.block_allocator` fails occasionally
- Issue #3264³⁷⁵¹ - Possible move to Sphinx for documentation
- Issue #3263³⁷⁵² - Documentation improvements
- Issue #3259³⁷⁵³ - `set_parcel_write_handler` test fails occasionally
- Issue #3258³⁷⁵⁴ - Links to source code in documentation are broken
- Issue #3247³⁷⁵⁵ - Rare `tests.unit.host_.block_allocator` test failure on 1.1.0-rc1
- Issue #3244³⁷⁵⁶ - Slowing down and speeding up an `interval_timer`
- Issue #3215³⁷⁵⁷ - Cannot build both tests and examples on MSVC with pseudo-dependencies enabled
- Issue #3195³⁷⁵⁸ - Unnecessary customization point route causing performance penalty
- Issue #3088³⁷⁵⁹ - A strange thing in `parallel::sort`.
- Issue #2650³⁷⁶⁰ - libfabric support for passive endpoints
- Issue #1205³⁷⁶¹ - TSS is broken

- PR #3466³⁸¹² - - bugfix : fix compilation with llvm-7.0
- PR #3465³⁸¹³ - This patch adds various optimizations extracted from the thread_local_allocator work
- PR #3464³⁸¹⁴ - Check for forked repos in CircleCI docker push step
- PR #3463³⁸¹⁵ - - cmake : create the parent directory before symlinking
- PR #3459³⁸¹⁶ - Remove unused/incomplete functionality from util/logging
- PR #3458³⁸¹⁷ - Fix a problem with scope of CMAKE_CXX_FLAGS and hpx_add_compile_flag
- PR #3457³⁸¹⁸ - Fixing more size_t -> int16_t (and similar) warnings
- PR #3456³⁸¹⁹ - Add #ifdefs to topology.cpp to support old hwloc versions again
- PR #3454³⁸²⁰ - Fixing warnings related to silent conversion of size_t -> int16_t
- PR #3451³⁸²¹ - Add examples as unit tests
- PR #3450³⁸²² - Constexpr-fying bind and other functional facilities
- PR #3446³⁸²³ - Fix some thread suspension timeouts
- PR #3445³⁸²⁴ - Fix various warnings
- PR #3443³⁸²⁵ - Only enable service pool config options if pools are enabled
- PR #3441³⁸²⁶ - Fix missing closing brackets in documentation
- PR #3439³⁸²⁷ - Use correct MPI CXX libraries for MPI parcelport
- PR #3436³⁸²⁸ - Add projection function to find_* (and fix very bad bug)
- PR #3435³⁸²⁹ - Fixing 1205
- PR #3434³⁸³⁰ - Fix threads cores
- PR #3433³⁸³¹ - Add Heise Online to release announcement list
- PR #3432³⁸³² - Don't track task dependencies for distributed runs
- PR #3431³⁸³³ - Circle CI setting changes for hpxMP

- PR #3430³⁸³⁴ - Fix unused params warning
- PR #3429³⁸³⁵ - One thread per core
- PR #3428³⁸³⁶ - This suppresses a deprecation warning that is being issued by MSVC 19.15.26726
- PR #3427³⁸³⁷ - Fixes #3426
- PR #3425³⁸³⁸ - Use source cache and workspace between job steps on CircleCI
- PR #3421³⁸³⁹ - Add CDash timing output to future overhead test (for graphs)
- PR #3420³⁸⁴⁰ - Add guided_pool_executor
- PR #3419³⁸⁴¹ - Fix typo in CircleCI config
- PR #3418³⁸⁴² - Add sphinx documentation
- PR #3415³⁸⁴³ - Scheduler NUMA hint and shared priority scheduler
- PR #3414³⁸⁴⁴ - Adding step to synchronize the APEX release
- PR #3413³⁸⁴⁵ - Fixing multiple defines of APEX_HAVE_HPX
- PR #3412³⁸⁴⁶ - Fixes linking with libhpx_wrap error with BSD and Windows based systems
- PR #3410³⁸⁴⁷ - Fix typo in CMakeLists.txt
- PR #3409³⁸⁴⁸ - Fix brackets and indentation in existing_performance_counters.qbk
- PR #3407³⁸⁴⁹ - Fix unused param and extra ; warnings emitted by gcc 8.x
- PR #3406³⁸⁵⁰ - Adding thread local allocator and use it for future shared states
- PR #3405³⁸⁵¹ - Adding DHPX_HAVE_THREAD_LOCAL_STORAGE=ON to builds
- PR #3404³⁸⁵² - fixing multiple definition of main() in linux
- PR #3402³⁸⁵³ - Allow debug option to be enabled only for Linux systems with dynamic main on
- PR #3401³⁸⁵⁴ - Fix cuda_future_helper.h when compiling with C++11
- PR #3400³⁸⁵⁵ - Fix floating point exception scheduler_base idle backoff

- PR #3398³⁸⁵⁶ - Atomic future state
- PR #3397³⁸⁵⁷ - Fixing code for older gcc versions
- PR #3396³⁸⁵⁸ - Allowing to register thread event functions (start/stop/error)
- PR #3394³⁸⁵⁹ - Fix small mistake in primary_namespace_server.cpp
- PR #3393³⁸⁶⁰ - Explicitly instantiate configured schedulers
- PR #3392³⁸⁶¹ - Add performance counters background overhead and background work duration
- PR #3391³⁸⁶² - Adapt integration of HPXMP to latest build system changes
- PR #3390³⁸⁶³ - Make AGAS measurements optional
- PR #3389³⁸⁶⁴ - Fix deadlock during shutdown
- PR #3388³⁸⁶⁵ - Add several functionalities allowing to optimize synchronous action invocation
- PR #3387³⁸⁶⁶ - Add cmake option to opt out of fail-compile tests
- PR #3386³⁸⁶⁷ - Adding support for boost::container::small_vector to dataflow
- PR #3385³⁸⁶⁸ - Adds Debug option for hpx initializing from main
- PR #3384³⁸⁶⁹ - This hopefully fixes two tests that occasionally fail
- PR #3383³⁸⁷⁰ - Making sure thread local storage is enable for hpxMP
- PR #3382³⁸⁷¹ - Fix usage of HPX_CAPTURE together with default value capture [=]
- PR #3381³⁸⁷² - Replace undefined instantiations of uniform_int_distribution
- PR #3380³⁸⁷³ - Add missing semicolons to uses of HPX_COMPILER_FENCE
- PR #3379³⁸⁷⁴ - Fixing #3378
- PR #3377³⁸⁷⁵ - Adding build system support to integrate hpxmp into hpx at the user's machine
- PR #3375³⁸⁷⁶ - Replacing wrapper for __libc_start_main with main

- [PR #3374](#)³⁸⁷⁷ - Adds `hpx_wrap` to `HPX_LINK_LIBRARIES` which links only when specified.
- [PR #3373](#)³⁸⁷⁸ - Forcing cache settings in `HPXConfig.cmake` to guarantee updated values
- [PR #3372](#)³⁸⁷⁹ - Fix some more c++11 build problems
- [PR #3371](#)³⁸⁸⁰ - Adds `HPX_LINKER_FLAGS` to HPX applications without editing their source codes
- [PR #3370](#)³⁸⁸¹ - `util::format`: add `type_specifier<>` specializations for `%!s(MISSING)` and `%!(MISSING)s`
- [PR #3369](#)³⁸⁸² - Adding configuration option to allow explicit disable of the new `hpx_main` feature on Linux
- [PR #3368](#)³⁸⁸³ - Updates doc with recent `hpx_wrap` implementation
- [PR #3367](#)³⁸⁸⁴ - Adds Mac OS implementation to `hpx_main.hpp`
- [PR #3365](#)³⁸⁸⁵ - Fix order of `hpx` libs in `HPX_CONF_LIBRARIES`.
- [PR #3363](#)³⁸⁸⁶ - Apex fixing null wrapper
- [PR #3361](#)³⁸⁸⁷ - Making sure all parcels get destroyed on an HPX thread (TCP pp)
- [PR #3359](#)³⁸⁸⁸ - Feature/improve error for compiler
- [PR #3357](#)³⁸⁸⁹ - Static/dynamic executable implementation
- [PR #3355](#)³⁸⁹⁰ - Reverting changes introduced by #3283 as those make applications hang
- [PR #3354](#)³⁸⁹¹ - Add external dependencies to `HPX_LIBRARY_DIR`
- [PR #3353](#)³⁸⁹² - Fix `libfabric tcp`
- [PR #3351](#)³⁸⁹³ - Move obsolete header to tests directory.
- [PR #3350](#)³⁸⁹⁴ - Renaming two functions to avoid problem described in #3285
- [PR #3349](#)³⁸⁹⁵ - Make idle backoff exponential with maximum sleep time
- [PR #3347](#)³⁸⁹⁶ - Replace *simple_component** with *component** in the Documentation
- [PR #3346](#)³⁸⁹⁷ - Fix `CMakeLists.txt` example in quick start

HPX V1.1.0 (Mar 24, 2018)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- We have changed the way *HPX* manages the processing units on a node. We do not longer implicitly bind all available cores to a single thread pool. The user has now full control over what processing units are bound to what thread pool, each with a separate scheduler. It is now also possible to create your own scheduler implementation and control what processing units this scheduler should use. We added the `hpx::resource::partitioner` that manages all available processing units and assigns resources to the used thread pools. Thread pools can now be suspended/resumed independently. This functionality helps in running *HPX* concurrently to code that is directly relying on [OpenMP](#)³⁹⁷⁰ and/or [MPI](#)³⁹⁷¹.
- We have continued to implement various parallel algorithms. *HPX* now almost completely implements all of the parallel algorithms as specified by the [C++17 Standard](#)³⁹⁷². We have also continued to implement these algorithms for the distributed use case (for segmented data structures, such as `hpx::partitioned_vector`).
- Added a compatibility layer for `std::thread`, `std::mutex`, and `std::condition_variable` allowing for the code to use those facilities where available and to fall back to the corresponding Boost facilities otherwise. The [CMake](#)³⁹⁷³ configuration option `-DHPX_WITH_THREAD_COMPATIBILITY=On` can be used to force using the Boost equivalents.
- The parameter sequence for the `hpx::parallel::transform_inclusive_scan` overload taking one iterator range has changed (again) to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to [CMake](#)³⁹⁷⁴.

³⁹⁷³ <https://www.cmake.org>

³⁹⁷⁴ <https://www.cmake.org>

- The parameter sequence for the `hpx::parallel::inclusive_scan` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY=On` to CMake.
- Added a helper facility `hpx::local_new` which is equivalent to `hpx::new_` except that it creates components locally only. As a consequence, the used component constructor may accept non-serializable argument types and/or non-const references or pointers.
- Removed the (broken) component type `hpx::lcos::queue<T>`. The old type is still available at configure time by passing `-DHPX_WITH_QUEUE_COMPATIBILITY=On` to CMake.
- The parallel algorithms adopted for C++17 restrict the iterator categories usable with those to at least forward iterators. Our implementation of the parallel algorithms was supporting input iterators (and output iterators) as well by simply falling back to sequential execution. We have now made our implementations conforming by requiring at least forward iterators. In order to enable the old behavior use the compatibility option `-DHPX_WITH_ALGORITHM_INPUT_ITERATOR_SUPPORT=On` on the CMake³⁹⁷⁵ command line.
- We have added the functionalities allowing for LCOs being implemented using (simple) components. Before LCOs had to always be implemented using managed components.
- User defined components don't have to be default-constructible anymore. Return types from actions don't have to be default-constructible anymore either. Our serialization layer now in general supports non-default-constructible types.
- We have added a new launch policy `hpx::launch::lazy` that allows one to defer the decision on what launch policy to use to the point of execution. This policy is initialized with a function (object) that – when invoked – is expected to produce the desired launch policy.

Breaking changes

- We have dropped support for the gcc compiler version V4.8. The minimal gcc version we now test on is gcc V4.9. The minimally required version of CMake³⁹⁷⁶ is now V3.3.2.
- We have dropped support for the Visual Studio 2013 compiler version. The minimal Visual Studio version we now test on is Visual Studio 2015.5.
- We have dropped support for the Boost V1.51-V1.54. The minimal version of Boost we now test is Boost V1.55.
- We have dropped support for the `hpx::util::unwrapped` API. `hpx::util::unwrapped` will stay functional to some degree, until it finally gets removed in a later version of HPX. The functional usage of `hpx::util::unwrapped` should be changed to the new `hpx::util::unwrapping` function whereas the immediate usage should be replaced to `hpx::util::unwrap`.
- The performance counter names referring to properties as exposed by the threading subsystem have changes as those now additionally have to specify the thread-pool. See the corresponding documentation for more details.
- The overloads of `hpx::async` that invoke an action do not perform implicit unwrapping of the returned future anymore in case the invoked function does return a future in the

³⁹⁷⁵ <https://www.cmake.org>

³⁹⁷⁶ <https://www.cmake.org>

first place. In this case `hpx::async` now returns a `hpx::future<future<T>>` making its behavior conforming to its local counterpart.

- We have replaced the use of `boost::exception_ptr` in our APIs with the equivalent `std::exception_ptr`. Please change your codes accordingly. No compatibility settings are provided.
- We have removed the compatibility settings for `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` as their life-cycle has reached its end.
- We have removed the experimental thread schedulers `hierarchy_scheduler`, `periodic_priority_scheduler` and `throttling_scheduler` in an effort to clean up and consolidate our thread schedulers.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #3250³⁹⁷⁷](#) - Apex refactoring with guides
- [PR #3249³⁹⁷⁸](#) - Updating People.qbk
- [PR #3246³⁹⁷⁹](#) - Assorted fixes for CUDA
- [PR #3245³⁹⁸⁰](#) - Apex refactoring with guides
- [PR #3242³⁹⁸¹](#) - Modify task counting in `thread_queue.hpp`
- [PR #3240³⁹⁸²](#) - Fixed typos

⁴⁴⁷⁶ <https://github.com/TheHPXProject/hpx/pull/2677>

- PR #2676⁴⁴⁷⁷ - Adding `parallel::destroy` and `destroy_n`
- PR #2675⁴⁴⁷⁸ - Making sure statistics counters work as expected
- PR #2674⁴⁴⁷⁹ - Turning assertions into exceptions
- PR #2673⁴⁴⁸⁰ - Inhibit direct conversion from `future<future<T>>` -> `future<void>`
- PR #2672⁴⁴⁸¹ - C++17 invoke forms
- PR #2671⁴⁴⁸² - Adding `uninitialized_value_construct` and `uninitialized_value_construct_n`
- PR #2670⁴⁴⁸³ - Integrate `spmd` multidimensional views for `partitioned_vectors`
- PR #2669⁴⁴⁸⁴ - Adding `uninitialized_default_construct` and `uninitialized_default_construct_n`
- PR #2668⁴⁴⁸⁵ - Fixing documentation index
- Issue #2667⁴⁴⁸⁶ - Ambiguity of nested `hpx::future<void>`'s
- Issue #2666⁴⁴⁸⁷ - Statistics Performance counter is not working
- PR #2664⁴⁴⁸⁸ - Adding `uninitialized_move` and `uninitialized_move_n`
- Issue #2663⁴⁴⁸⁹ - Seg fault in `managed_component::get_base_gid`, possibly cause by `util::reinitializable_static`
- Issue #2662⁴⁴⁹⁰ - Crash in `managed_component::get_base_gid` due to problem with `util::reinitializable_static`
- PR #2665⁴⁴⁹¹ - Hide the `detail` namespace in `doxygen` per default
- PR #2660⁴⁴⁹² - Add documentation to `hpx::util::unwrapped` and `hpx::util::unwrapped2`
- PR #2659⁴⁴⁹³ - Improve integration with `vcpkg`
- PR #2658⁴⁴⁹⁴ - Unify `access_data` trait for use in both, serialization and de-serialization
- PR #2657⁴⁴⁹⁵ - Removing `hpx::lcos::queue<T>`
- PR #2656⁴⁴⁹⁶ - Reduce `MAX_TERMINATED_THREADS` default, improve memory use on manycore cpus
- PR #2655⁴⁴⁹⁷ - Maintenance for emulate-deleted macros

- PR #2654⁴⁴⁹⁸ - Implement parallel `is_heap` and `is_heap_until`
- PR #2653⁴⁴⁹⁹ - Drop support for VS2013
- PR #2652⁴⁵⁰⁰ - This patch makes sure that all parcels in a batch are properly handled
- PR #2649⁴⁵⁰¹ - Update docs (Table 18) - move transform to end
- Issue #2647⁴⁵⁰² - `hpx::parcelset::detail::parcel_data::has_continuation_` is uninitialized
- Issue #2644⁴⁵⁰³ - Some `.vcxproj` in the `HPX.sln` fail to build
- Issue #2641⁴⁵⁰⁴ - `hpx::lcos::queue` should be deprecated
- PR #2640⁴⁵⁰⁵ - A new throttling policy with public APIs to suspend/resume
- PR #2639⁴⁵⁰⁶ - Fix a tiny typo in tutorial.
- Issue #2638⁴⁵⁰⁷ - Invalid return type 'void' of `constexpr` function
- PR #2636⁴⁵⁰⁸ - Add and use `HPX_MSVC_WARNING_PRAGMA` for `#pragma` warning
- PR #2633⁴⁵⁰⁹ - Distributed `define_spmc_block`
- PR #2632⁴⁵¹⁰ - Making sure container serialization uses size-compatible types
- PR #2631⁴⁵¹¹ - Add `lcos::local::one_element_channel`
- PR #2629⁴⁵¹² - Move `unordered_map` out of `parcelport` into `hpx/concurrent`
- PR #2628⁴⁵¹³ - Making sure that shutdown does not hang
- PR #2627⁴⁵¹⁴ - Fix serialization
- PR #2626⁴⁵¹⁵ - Generate `cmake_variables.qbk` and `cmake_toolchains.qbk` outside of the source tree
- PR #2625⁴⁵¹⁶ - Supporting `-std=c++17` flag
- PR #2624⁴⁵¹⁷ - Fixing a small `cmake` typo
- PR #2622⁴⁵¹⁸ - Update CMake minimum required version to 3.0.2 (closes #2621)
- Issue #2621⁴⁵¹⁹ - Compiling `hpx` master fails with `/usr/bin/ld: final link failed: Bad value`
- PR #2620⁴⁵²⁰ - Remove warnings due to some captured variables

HPX V1.0.0 (Apr 24, 2017)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- Added the facility `hpx::split_future` which allows one to convert a `future<tuple<Ts...>>` into a `tuple<future<Ts>...>`. This functionality is not available when compiling *HPX* with VS2012.
- Added a new type of performance counter which allows one to return a list of values for each invocation. We also added a first counter of this type which collects a histogram of the times between parcels being created.
- Added new LCOs: `hpx::lcos::channel` and `hpx::lcos::local::channel` which are very similar to the well known channel constructs used in the Go language.
- Added new performance counters reporting the amount of data handled by the networking layer on a action-by-action basis (please see [PR #2289](#)⁴⁵⁸⁶ for more details).
- Added a new facility `hpx::lcos::barrier`, replacing the equally named older one. The new facility has a slightly changed API and is much more efficient. Most notable, the new facility exposes a (global) function `hpx::lcos::barrier::synchronize()` which represents a global barrier across all localities.
- We have started to add support for vectorization to our parallel algorithm implementations. This support depends on using an external library, currently either Vc Library or [|boost_simd|](#). Please see [Issue #2333](#)⁴⁵⁸⁷ for a list of currently supported algorithms. This is an experimental feature and its implementation and/or API might change in the future. Please see this [blog-post](#)⁴⁵⁸⁸ for more information.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overload can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17. The old `inner_product` names can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- Added versions of `hpx::get_ptr` taking client side representations for component instances as their parameter (instead of a global id).
- Added the helper utility `hpx::performance_counters::performance_counter_set` helping to encapsulate a set of performance counters to be managed concurrently.
- All execution policies and related classes have been renamed to be consistent with the naming changes applied for C++17. All policies now live in the namespace `hpx::parallel::execution`. The old names can be still enabled at configure time by specifying `-DHPX_WITH_EXECUTION_POLICY_COMPATIBILITY=On` to CMake.
- The thread scheduling subsystem has undergone a major refactoring which results in significant performance improvements. We have also improved the performance of creating `hpx::future` and of various facilities handling those.

⁴⁵⁸⁶ <https://github.com/TheHPXProject/hpx/pull/2289>

⁴⁵⁸⁷ <https://github.com/TheHPXProject/hpx/issues/2333>

⁴⁵⁸⁸ <http://stellar-group.org/2016/09/vectorized-cpp-parallel-algorithms-with-hpx/>

- We have consolidated all of the code in `HPX.Compute` related to the integration of CUDA. `hpx::partitioned_vector` has been enabled to be usable with `hpx::compute::vector` which allows one to place the partitions on one or more GPU devices.
- Added new performance counters exposing various internals of the thread scheduling subsystem, such as the current idle- and busy-loop counters and instantaneous scheduler utilization.
- Extended and improved the use of the `ITTNotify` hooks allowing to collect performance counter data and function annotation information from within the Intel Amplifier tool.

Breaking changes

- We have dropped support for the gcc compiler versions V4.6 and 4.7. The minimal gcc version we now test on is gcc V4.8.
- We have removed (default) support for `boost::chrono` in interfaces, uses of it have been replaced with `std::chrono`. This facility can be still enabled at configure time by specifying `-DHPX_WITH_BOOST_CHRONO_COMPATIBILITY=On` to CMake.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17.
- the build options `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` are now disabled by default. Please change your code still depending on the deprecated interfaces.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #2596](#)⁴⁵⁸⁹ - Adding apex data
- [PR #2595](#)⁴⁵⁹⁰ - Remove obsolete file
- [Issue #2594](#)⁴⁵⁹¹ - FindOpenCL.cmake mismatch with the official cmake module
- [PR #2592](#)⁴⁵⁹² - First attempt to introduce `spmd_block` in `hpx`
- [Issue #2591](#)⁴⁵⁹³ - Feature request: continuation (then) which does not require the callable object to take a `future<R>` as parameter
- [PR #2588](#)⁴⁵⁹⁴ - Daint fixes
- [PR #2587](#)⁴⁵⁹⁵ - Fixing `transfer_(continuation)_action::schedule`

- PR #2384⁴⁷⁷¹ - Fixing race condition in `for_loop_reduction`
- PR #2383⁴⁷⁷² - Continuations
- PR #2382⁴⁷⁷³ - add `LibFlatArray`-based backend for `datapar`
- PR #2381⁴⁷⁷⁴ - remove unused `typedef` to get rid of compiler warnings
- PR #2380⁴⁷⁷⁵ - Tau cleanup
- PR #2379⁴⁷⁷⁶ - Can send immediate
- PR #2378⁴⁷⁷⁷ - Renaming `copy_helper/copy_n_helper/move_helper/move_n_helper`
- Issue #2376⁴⁷⁷⁸ - Boost trunk's `spinlock` initializer fails to compile
- PR #2375⁴⁷⁷⁹ - Add support for minimal thread local data
- PR #2374⁴⁷⁸⁰ - Adding API functions `set_config_entry_callback`
- PR #2373⁴⁷⁸¹ - Add a simple utility for debugging that gives suspended task backtraces
- PR #2372⁴⁷⁸² - Barrier Fixes
- Issue #2370⁴⁷⁸³ - Can't wait on a wrapped future
- PR #2369⁴⁷⁸⁴ - Fixing `stable_partition`
- PR #2367⁴⁷⁸⁵ - Fixing `find_prefixes` for Windows platforms
- PR #2366⁴⁷⁸⁶ - Testing for experimental/optional only in C++14 mode
- PR #2364⁴⁷⁸⁷ - Adding `set_config_entry`
- PR #2363⁴⁷⁸⁸ - Fix `papi`
- PR #2362⁴⁷⁸⁹ - Adding missing macros for new non-direct actions
- PR #2361⁴⁷⁹⁰ - Improve `cmake` output to help debug compiler incompatibility check
- PR #2360⁴⁷⁹¹ - Fixing race condition in `condition_variable`
- PR #2359⁴⁷⁹² - Fixing shutdown when parcels are still in flight
- Issue #2357⁴⁷⁹³ - failed to insert `console_print_action` into `typename_to_id_t` registry

- PR #2356⁴⁷⁹⁴ - Fixing return type of `get_iterator_tuple`
- PR #2355⁴⁷⁹⁵ - Fixing compilation against Boost 1.62
- PR #2354⁴⁷⁹⁶ - Adding serialization for `mask_type` if `CPU_COUNT > 64`
- PR #2353⁴⁷⁹⁷ - Adding hooks to tie in APEX into the parcel layer
- Issue #2352⁴⁷⁹⁸ - Compile errors when using intel 17 beta (for KNL) on edison
- PR #2351⁴⁷⁹⁹ - Fix function vtable `get_function_address` implementation
- Issue #2350⁴⁸⁰⁰ - Build failure - master branch (4de09f5) with Intel Compiler v17
- PR #2349⁴⁸⁰¹ - Enabling zero-copy serialization support for `std::vector<>`
- PR #2348⁴⁸⁰² - Adding test to verify #2334 is fixed
- PR #2347⁴⁸⁰³ - Bug fixes for `hpx.compute` and `hpx::lcos::channel`
- PR #2346⁴⁸⁰⁴ - Removing cmake “find” files that are in the APEX cmake Modules
- PR #2345⁴⁸⁰⁵ - Implemented `parallel::stable_partition`
- PR #2344⁴⁸⁰⁶ - Making `hpx::lcos::channel` usable with basename registration
- PR #2343⁴⁸⁰⁷ - Fix a couple of examples that failed to compile after recent api changes
- Issue #2342⁴⁸⁰⁸ - Enabling APEX causes link errors
- PR #2341⁴⁸⁰⁹ - Removing cmake “find” files that are in the APEX cmake Modules
- PR #2340⁴⁸¹⁰ - Implemented all existing datapar algorithms using Boost.SIMD
- PR #2339⁴⁸¹¹ - Fixing 2338
- PR #2338⁴⁸¹² - Possible race in sliding semaphore
- PR #2337⁴⁸¹³ - Adjust `osu_latency` test to measure `window_size` parcels in flight at once
- PR #2336⁴⁸¹⁴ - Allowing remote direct actions to be executed without spawning a task
- PR #2335⁴⁸¹⁵ - Making sure multiple components are properly initialized from arguments
- Issue #2334⁴⁸¹⁶ - Cannot construct component with large vector on a remote locality

⁴⁸¹⁶ <https://github.com/TheHPXProject/hpx/issues/2334>

- PR #2332⁴⁸¹⁷ - Fixing `hpx::lcos::local::barrier`
- PR #2331⁴⁸¹⁸ - Updating APEX support to include OTF2
- PR #2330⁴⁸¹⁹ - Support for data-parallelism for parallel algorithms
- Issue #2329⁴⁸²⁰ - Coordinate settings in `cmake`
- PR #2328⁴⁸²¹ - fix `LibGeoDecomp` builds with HPX + GCC 5.3.0 + CUDA 8RC
- PR #2326⁴⁸²² - Making `scan_partitioner` work (for now)
- Issue #2323⁴⁸²³ - Constructing a vector of components only correctly initializes the first component
- PR #2322⁴⁸²⁴ - Fix problems that bubbled up after merging #2278
- PR #2321⁴⁸²⁵ - Scalable barrier
- PR #2320⁴⁸²⁶ - Std flag fixes
- Issue #2319⁴⁸²⁷ - `-std=c++14` and `-std=c++1y` with Intel can't build recent Boost builds due to insufficient C++14 support; don't enable these flags by default for Intel
- PR #2318⁴⁸²⁸ - Improve handling of `-hpx:bind=<bind-spec>`
- PR #2317⁴⁸²⁹ - Making sure command line warnings are printed once only
- PR #2316⁴⁸³⁰ - Fixing command line handling for default bind mode
- PR #2315⁴⁸³¹ - Set `id_retrieved` if `set_id` is present
- Issue #2314⁴⁸³² - Warning for requested/allocated thread discrepancy is printed twice
- Issue #2313⁴⁸³³ - `-hpx:print-bind` doesn't work with `-hpx:pu-step`
- Issue #2312⁴⁸³⁴ - `-hpx:bind` range specifier restrictions are overly restrictive
- Issue #2311⁴⁸³⁵ - `hpx_0.9.99` out of project build fails
- PR #2310⁴⁸³⁶ - Simplify function registration
- PR #2309⁴⁸³⁷ - Spelling and grammar revisions in documentation (and some code)
- PR #2306⁴⁸³⁸ - Correct minor typo in the documentation

HPX V0.9.99 (Jul 15, 2016)

General changes

As the version number of this release hints, we consider this release to be a preview for the upcoming *HPX* V1.0. All of the functionalities we set out to implement for V1.0 are in place; all of the features we wanted to have exposed are ready. We are very happy with the stability and performance of *HPX* and we would like to present this release to the community in order for us to gather broad feedback before releasing V1.0. We still expect for some minor details to change, but on the whole this release represents what we would like to have in a V1.0.

Overall, since the last release we have had almost 1600 commits while closing almost 400 tickets. These numbers reflect the incredible development activity we have seen over the last couple of months. We would like to express a big ‘Thank you!’ to all contributors and those who helped to make this release happen.

The most notable addition in terms of new functionality available with this release is the full implementation of object migration (i.e. the ability to transparently move *HPX* components to a different compute node). Additionally, this release of *HPX* cleans up many minor issues and some API inconsistencies.

Here are some of the main highlights and changes for this release (in no particular order):

- We have fixed a couple of issues in AGAS and the parcel layer which have caused hangs, segmentation faults at exit, and a slowdown of applications over time. Fixing those has significantly increased the overall stability and performance of distributed runs.
- We have started to add parallel algorithm overloads based on the C++ Extensions for Ranges ([N4560](#)⁴⁹¹²) proposal. This also includes the addition of projections to the existing algorithms. Please see [Issue #1668](#)⁴⁹¹³ for a list of algorithms which have been adapted to [N4560](#)⁴⁹¹⁴.
- We have implemented index-based parallel for-loops based on a corresponding standardization proposal ([P0075R1](#)⁴⁹¹⁵). Please see [Issue #2016](#)⁴⁹¹⁶ for a list of available algorithms.

⁴⁹¹⁶ <https://github.com/TheHPXProject/hpx/issues/2016>

- We have added implementations for more parallel algorithms as proposed for the upcoming C++ 17 Standard. See [Issue #1141](#)⁴⁹¹⁷ for an overview of which algorithms are available by now.
- We have started to implement a new prototypical functionality with *HPX.Compute* which uniformly exposes some of the higher level APIs to heterogeneous architectures (currently CUDA). This functionality is an early preview and should not be considered stable. It may change considerably in the future.
- We have pervasively added (optional) executor arguments to all API functions which schedule new work. Executors are now used throughout the code base as the main means of executing tasks.
- Added `hpx::make_future<R>(future<T> &&)` allowing to convert a future of any type `T` into a future of any other type `R`, either based on default conversion rules of the embedded types or using a given explicit conversion function.
- We finally finished the implementation of transparent migration of components to another locality. It is now possible to trigger a migration operation without ‘stopping the world’ for the object to migrate. *HPX* will make sure that no work is being performed on an object before it is migrated and that all subsequently scheduled work for the migrated object will be transparently forwarded to the new locality. Please note that the global id of the migrated object does not change, thus the application will not have to be changed in any way to support this new functionality. Please note that this feature is currently considered experimental. See [Issue #559](#)⁴⁹¹⁸ and [PR #1966](#)⁴⁹¹⁹ for more details.
- The `hpx::dataflow` facility is now usable with actions. Similarly to `hpx::async`, actions can be specified as an explicit template argument (`hpx::dataflow<Action>(target, ...)`) or as the first argument (`hpx::dataflow(Action(), target, ...)`). We have also enabled the use of distribution policies as the target for dataflow invocations. Please see [Issue #1265](#)⁴⁹²⁰ and [PR #1912](#)⁴⁹²¹ for more information.
- Adding overloads of `gather_here` and `gather_there` to accept the plain values of the data to gather (in addition to the existing overloads expecting futures).
- We have cleaned up and refactored large parts of the code base. This helped reducing compile and link times of *HPX* itself and also of applications depending on it. We have further decreased the dependency of *HPX* on the Boost libraries by replacing part of those with facilities available from the standard libraries.
- Wherever possible we have removed dependencies of our API on Boost by replacing those with the equivalent facility from the C++11 standard library.
- We have added new performance counters for parcel coalescing, file-IO, the AGAS cache, and overall scheduler time. Resetting performance counters has been overhauled and fixed.
- We have introduced a generic client type `hpx::components::client<>` and added support for using it with `hpx::async`. This removes the necessity to implement specific client types for every component type without losing type safety. This deemphasizes the need for using the low level `hpx::id_type` for referencing (possibly remote) component instances. The plan is to deprecate the direct use of `hpx::id_type` in user code in the future.

⁴⁹¹⁷ <https://github.com/TheHPXProject/hpx/issues/1141>

⁴⁹¹⁸ <https://github.com/TheHPXProject/hpx/issues/559>

⁴⁹¹⁹ <https://github.com/TheHPXProject/hpx/pull/1966>

⁴⁹²⁰ <https://github.com/TheHPXProject/hpx/issues/1265>

⁴⁹²¹ <https://github.com/TheHPXProject/hpx/pull/1912>

- We have added a special iterator which supports automatic prefetching of one or more arrays for speeding up loop-like code (see `hpx::parallel::util::make_prefetcher_context()`).
- We have extended the interfaces exposed from executors (as proposed by N4406⁴⁹²²) to accept an arbitrary number of arguments.

Breaking changes

- In order to move the dataflow facility to namespace `hpx` we added a definition of `hpx::dataflow` which might create ambiguities in existing codes. The previous definition of this facility (`hpx::lcos::local::dataflow`) has been deprecated and is available only if the constant `-DHPX_WITH_LOCAL_DATAFLOW_COMPATIBILITY=On` to CMake⁴⁹²³ is defined at configuration time. Please explicitly qualify all uses of the dataflow facility if you enable this compatibility setting and encounter ambiguities.
- The adaptation of the C++ Extensions for Ranges (N4560⁴⁹²⁴) proposal imposes some breaking changes related to the return types of some of the parallel algorithms. Please see Issue #1668⁴⁹²⁵ for a list of algorithms which have already been adapted.
- The facility `hpx::lcos::make_future_void()` has been replaced by `hpx::make_future<void>()`.
- We have removed support for Intel V13 and gcc 4.4.x.
- We have removed (default) support for the generic `hpx::parallel::execution_policy` because it was removed from the Parallelism TS (`__cpp11_n4104__`) while it was being added to the upcoming C++17 Standard. This facility can be still enabled at configure time by specifying `-DHPX_WITH_GENERIC_EXECUTION_POLICY=On` to CMake.
- Uses of `boost::shared_ptr` and related facilities have been replaced with `std::shared_ptr` and friends. Uses of `boost::unique_lock`, `boost::lock_guard` etc. have also been replaced by the equivalent (and equally named) tools available from the C++11 standard library.
- Facilities that used to expect an explicit `boost::unique_lock` now take an `std::unique_lock`. Additionally, `condition_variable` no longer aliases `condition_variable_any`; its interface now only works with `std::unique_lock<local::mutex>`.
- Uses of `boost::function`, `boost::bind`, `boost::tuple` have been replaced by the corresponding facilities in *HPX* (`hpx::util::function`, `hpx::util::bind`, and `hpx::util::tuple`, respectively).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #2250⁴⁹²⁶ - change default chunker of parallel executor to static one
- PR #2247⁴⁹²⁷ - HPX on ppc64le
- PR #2244⁴⁹²⁸ - Fixing MSVC problems
- PR #2238⁴⁹²⁹ - Fixing small typos
- PR #2237⁴⁹³⁰ - Fixing small typos
- PR #2234⁴⁹³¹ - Fix broken add test macro when extra args are passed in
- PR #2231⁴⁹³² - Fixing possible race during future awaiting in serialization
- PR #2230⁴⁹³³ - Fix stream nvcc
- PR #2229⁴⁹³⁴ - Fixed run_as_hpx_thread
- PR #2228⁴⁹³⁵ - On prefetching_test branch : adding prefetching_iterator and related tests used for prefetching containers within lambda functions
- PR #2227⁴⁹³⁶ - Support for HPXCL's opencil::event
- PR #2226⁴⁹³⁷ - Preparing for release of V0.9.99
- PR #2225⁴⁹³⁸ - fix issue when compiling components with hpxcxx
- PR #2224⁴⁹³⁹ - Compute alloc fix
- PR #2223⁴⁹⁴⁰ - Simplify promise
- PR #2222⁴⁹⁴¹ - Replace last uses of boost::function by util::function_nonsr
- PR #2221⁴⁹⁴² - Fix config tests
- PR #2220⁴⁹⁴³ - Fixing gcc 4.6 compilation issues
- PR #2219⁴⁹⁴⁴ - nullptr support for [unique_]function
- PR #2218⁴⁹⁴⁵ - Introducing clang tidy
- PR #2216⁴⁹⁴⁶ - Replace NULL with nullptr

- PR #2116⁵⁰³⁷ - Use a lightweight bind implementation when no placeholders are given
- PR #2115⁵⁰³⁸ - Replace boost::shared_ptr with std::shared_ptr
- PR #2114⁵⁰³⁹ - Adding hook functions for executor_parameter_traits supporting timers
- Issue #2113⁵⁰⁴⁰ - Compilation error with gcc version 4.9.3 (MacPorts gcc49 4.9.3_0)
- PR #2112⁵⁰⁴¹ - Replace uses of safe_bool with explicit operator bool
- Issue #2111⁵⁰⁴² - Compilation error on QT example
- Issue #2110⁵⁰⁴³ - Compilation error when passing non-future argument to unwrapped continuation in dataflow
- Issue #2109⁵⁰⁴⁴ - Warning while compiling hpx
- Issue #2109⁵⁰⁴⁵ - Stack trace of last bug causing issues with octotiger
- Issue #2108⁵⁰⁴⁶ - Stack trace of last bug causing issues with octotiger
- PR #2107⁵⁰⁴⁷ - Making sure that a missing parcel_coalescing module does not cause startup exceptions
- PR #2106⁵⁰⁴⁸ - Stop using hpx_fwd.hpp
- Issue #2105⁵⁰⁴⁹ - coalescing plugin handler is not optional any more
- Issue #2104⁵⁰⁵⁰ - Make executor_traits N-nary
- Issue #2103⁵⁰⁵¹ - Build error with octotiger and hpx commit e657426d
- PR #2102⁵⁰⁵² - Combining thread data storage
- PR #2101⁵⁰⁵³ - Added repartition version of 1d stencil that uses any performance counter
- PR #2100⁵⁰⁵⁴ - Drop obsolete TR1 result_of protocol
- PR #2099⁵⁰⁵⁵ - Replace uses of boost::bind with util::bind
- PR #2098⁵⁰⁵⁶ - Deprecated inspect checks
- PR #2097⁵⁰⁵⁷ - Reduce by key, extends #1141
- PR #2096⁵⁰⁵⁸ - Moving local cache from external to hpx/util

- PR #2095⁵⁰⁵⁹ - Bump minimum required Boost to 1.50.0
- PR #2094⁵⁰⁶⁰ - Add include checks for several Boost utilities
- Issue #2093⁵⁰⁶¹ - `./.../local_cache.hpp(89): error #303: explicit type is missing ("int" assumed)`
- PR #2091⁵⁰⁶² - Fix for Raspberry pi build
- PR #2090⁵⁰⁶³ - Fix storage size for `util::function<>`
- PR #2089⁵⁰⁶⁴ - Fix #2088
- Issue #2088⁵⁰⁶⁵ - More verbose output from cmake configuration
- PR #2087⁵⁰⁶⁶ - Making sure `init_globally` always executes `hpx_main`
- Issue #2086⁵⁰⁶⁷ - Race condition with recent HPX
- PR #2085⁵⁰⁶⁸ - Adding `#include` checker
- PR #2084⁵⁰⁶⁹ - Replace boost lock types with standard library ones
- PR #2083⁵⁰⁷⁰ - Simplify packaged task
- PR #2082⁵⁰⁷¹ - Updating APEX version for testing
- PR #2081⁵⁰⁷² - Cleanup exception headers
- PR #2080⁵⁰⁷³ - Make `call_once` variadic
- Issue #2079⁵⁰⁷⁴ - With GNU C++, line 85 of `hpx/config/version.hpp` causes link failure when linking application
- Issue #2078⁵⁰⁷⁵ - Simple test fails with `_GLIBCXX_DEBUG` defined
- PR #2077⁵⁰⁷⁶ - Instantiate board in nqueen client
- PR #2076⁵⁰⁷⁷ - Moving coalescing registration to TUs
- PR #2075⁵⁰⁷⁸ - Fixed some documentation typos
- PR #2074⁵⁰⁷⁹ - Adding flush-mode to message handler flush
- PR #2073⁵⁰⁸⁰ - Fixing performance regression introduced lately

HPX V0.9.11 (Nov 11, 2015)

Our main focus for this release was the design and development of a coherent set of higher-level APIs exposing various types of parallelism to the application programmer. We introduced the concepts of an **executor**, which can be used to customize the **where** and **when** of execution of tasks in the context of parallelizing codes. We extended all APIs related to managing parallel tasks to support executors which gives the user the choice of either using one of the predefined executor types or to provide its own, possibly application specific, executor. We paid very close attention to align all of these changes with the existing C++ Standards documents or with the ongoing proposals for standardization.

This release is the first after our change to a new development policy. We switched all development to be strictly performed on branches only, all direct commits to our main branch (**master**) are prohibited. Any change has to go through a peer review before it will be merged to **master**. As a result the overall stability of our code base has significantly increased, the development process itself has been simplified. This change manifests itself in a large number of pull-requests which have been merged (please see below for a full list of closed issues and pull-requests). All in all for this release, we closed almost 100 issues and merged over 290 pull-requests. There have been over 1600 commits to the master branch since the last release.

General changes

- We are moving into the direction of unifying managed and simple components. As such, the classes `hpx::components::component` and `hpx::components::component_base` have been added which currently just forward to the currently existing simple component facilities. The examples have been converted to only use those two classes.
- Added integration with the [CircleCI](https://circleci.com/gh/TheHPXProject/hpx)⁵³²⁰ hosted continuous integration service. This gives us constant and immediate feedback on the health of our master branch.
- The compiler configuration subsystem in the build system has been reimplemented. Instead of using Boost.Config we now use our own lightweight set of cmake scripts to determine the available language and library features supported by the used compiler.
- The API for creating instances of components has been consolidated. All component instances should be created using the `hpx::new_` only. It allows one to instantiate both, single component instances and multiple component instances. The placement of the created components can be controlled by special distribution policies. Please see the corresponding documentation outlining the use of `hpx::new_`.
- Introduced four new distribution policies which can be used with many API functions which traditionally expected to be used with a locality id. The new distribution policies are:
 - `hpx::components::default_distribution_policy` which tries to place multiple component instances as evenly as possible.
 - `hpx::components::colocating_distribution_policy` which will refer to the locality where a given component instance is currently placed.
 - `hpx::components::binpacking_distribution_policy` which will place multiple component instances as evenly as possible based on any performance counter.

⁵³²⁰ <https://circleci.com/gh/TheHPXProject/hpx>

- `hpx::components::target_distribution_policy` which allows one to represent a given locality in the context of a distribution policy.
- The new distribution policies can now be also used with `hpx::async`. This change also deprecates `hpx::async_colocated(id, ...)` which now is replaced by a distribution policy: `hpx::async(hpx::colocated(id), ...)`.
- The `hpx::vector` and `hpx::unordered_map` data structures can now be used with the new distribution policies as well.
- The parallel facility `hpx::parallel::task_region` has been renamed to `hpx::parallel::task_block` based on the changes in the corresponding standardization proposal [N4411](#)⁵³²¹.
- Added extensions to the parallel facility `hpx::parallel::task_block` allowing to combine a `task_block` with an execution policy. This implies a minor breaking change as the `hpx::parallel::task_block` is now a template.
- Added new LCOs: `hpx::lcos::latch` and `hpx::lcos::local::latch` which semantically conform to the proposed `std::latch` (see [N4399](#)⁵³²²).
- Added performance counters exposing data related to data transferred by input/output (filesystem) operations (thanks to Maciej Brodowicz).
- Added performance counters allowing to track the number of action invocations (local and remote invocations).
- Added new command line options `-hpx:print-counter-at` and `-hpx:reset-counters`.
- The `hpx::vector` component has been renamed to `hpx::partitioned_vector` to make it explicit that the underlying memory is not contiguous.
- Introduced a completely new and uniform higher-level parallelism API which is based on executors. All existing parallelism APIs have been adapted to this. We have added a large number of different executor types, such as a numa-aware executor, a this-thread executor, etc.
- Added support for the MingW toolchain on Windows (thanks to Eric Lemanissier).
- HPX now includes support for APEX, (Autonomic Performance Environment for eXascale). APEX is an instrumentation and software adaptation library that provides an interface to TAU profiling / tracing as well as runtime adaptation of HPX applications through policy definitions. For more information and documentation, please see <https://github.com/UO-OACISS/xpress-apex>. To enable APEX at configuration time, specify `-DHPX_WITH_APEX=On`. To also include support for TAU profiling, specify `-DHPX_WITH_TAU=On` and specify the `-DTAU_ROOT`, `-DTAU_ARCH` and `-DTAU_OPTIONS` cmake parameters.
- We have implemented many more of the *Using parallel algorithms*. Please see [Issue #1141](#)⁵³²³ for the list of all available parallel algorithms (thanks to Daniel Bourgeois and John Biddiscombe for contributing their work).

⁵³²³ <https://github.com/TheHPXProject/hpx/issues/1141>

Breaking changes

- We are moving into the direction of unifying managed and simple components. In order to stop exposing the old facilities, all examples have been converted to use the new classes. The breaking change in this release is that performance counters are now a `hpx::components::component_base` instead of `hpx::components::managed_component_base`.
- We removed the support for stackless threads. It turned out that there was no performance benefit when using stackless threads. As such, we decided to clean up our codebase. This feature was not documented.
- The CMake project name has changed from 'hpx' to 'HPX' for consistency and compatibility with naming conventions and other CMake projects. Generated config files go into `<prefix>/lib/cmake/HPX` and not `<prefix>/lib/cmake/hpx`.
- The macro `HPX_REGISTER_MINIMAL_COMPONENT_FACTORY` has been deprecated. Please use `HPX_REGISTER_COMPONENT` instead. The old macro will be removed in the next release.
- The obsolete `distributing_factory` and `binpacking_factory` components have been removed. The corresponding functionality is now provided by the `hpx::new_` API function in conjunction with the `hpx::default_layout` and `hpx::binpacking` distribution policies (`hpx::components::default_distribution_policy` and `hpx::components::binpacking_distribution_policy`).
- The API function `hpx::new_colocated` has been deprecated. Please use the consolidated API `hpx::new_` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of HPX if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The API function `hpx::async_colocated` has been deprecated. Please use the consolidated API `hpx::async` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of HPX if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The obsolete `remote_object` component has been removed.
- Replaced the use of `Boost.Serialization` with our own solution. While the new version is mostly compatible with `Boost.Serialization`, this change requires some minor code modifications in user code. For more information, please see the corresponding [announcement](#)⁵³²⁴ on the `hpx-users@stellar.cct.lsu.edu` mailing list.
- The names used by cmake to influence various configuration options have been unified. The new naming scheme relies on all configuration constants to start with `HPX_WITH_...`, while the preprocessor constant which is used at build time starts with `HPX_HAVE_...`. For instance, the former cmake command line `-DHPX_MALLOC=...` now has to be specified as `-DHPX_WITH_MALLOC=...` and will cause the preprocessor constant `HPX_HAVE_MALLOC` to be defined. The actual name of the constant (i.e. `MALLOC`) has not changed. Please see the corresponding documentation for more details (*CMake options*).
- The `get_gid()` functions exposed by the component base classes `hpx::components::server::simple_component_base`, `hpx::components::server::managed_component_base`, and `hpx::components::server::fixed_component_base` have been replaced by

⁵³²⁴ <http://thread.gmane.org/gmane.comp.lib.hpx.devel/196>

two new functions: `get_unmanaged_id()` and `get_id()`. To enable the old function name for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.

- All functions which were named `get_gid()` but were returning `hpx::id_type` have been renamed to `get_id()`. To enable the old function names for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #1855⁵³²⁵](#) - Completely removing external/endian
- [PR #1854⁵³²⁶](#) - Don't pollute `CMAKE_CXX_FLAGS` through `find_package()`
- [PR #1853⁵³²⁷](#) - Updating CMake configuration to get correct version of TAU library
- [PR #1852⁵³²⁸](#) - Fixing Performance Problems with MPI Parcelport
- [PR #1851⁵³²⁹](#) - Fixing `hpx_add_link_flag()` and `hpx_remove_link_flag()`
- [PR #1850⁵³³⁰](#) - Fixing 1836, adding `parallel::sort`

HPX V0.9.10 (Mar 24, 2015)

General changes

This is the 12th official release of *HPX*. It coincides with the 7th anniversary of the first commit to our source code repository. Since then, we have seen over 12300 commits amounting to more than 220000 lines of C++ code.

The major focus of this release was to improve the reliability of large scale runs. We believe to have achieved this goal as we now can reliably run *HPX* applications on up to ~24k cores. We have also shown that HPX can be used with success for symmetric runs (applications using both, host cores and Intel Xeon/Phi coprocessors). This is a huge step forward in terms of the usability of *HPX*. The main focus of this work involved isolating the causes of the segmentation faults at start up and shut down. Many of these issues were discovered to be the result of the suspension of threads which hold locks.

A very important improvement introduced with this release is the refactoring of the code representing our parcel-port implementation. Parcel-ports can now be implemented by 3rd parties as independent plugins which are dynamically loaded at runtime (static linking of parcel-ports is also supported). This refactoring also includes a massive improvement of the performance of our existing parcel-ports. We were able to significantly reduce the networking latencies and to improve the available networking bandwidth. Please note that in this release we disabled the `ibverbs` and `ipc` parcel ports as those have not been ported to the new plugin system yet (see [Issue #839⁵⁷²⁹](#)).

Another corner stone of this release is our work towards a complete implementation of `__cpp11_n4104__` (Working Draft, Technical Specification for C++ Extensions for Parallelism). This document defines a set of parallel algorithms to be added to the C++ standard library. We now have implemented about 75% of all specified parallel algorithms (see [\[link hpx.manual.parallel.parallel_algorithms Parallel Algorithms\]](#) for more details). We also implemented some extensions to `__cpp11_n4104__` allowing to invoke all of the algorithms asynchronously.

This release adds a first implementation of `hpx::vector` which is a distributed data structure closely aligned to the functionality of `std::vector`. The difference is that `hpx::vector` stores the data in partitions where the partitions can be distributed over different localities. We started to work on allowing to use the parallel algorithms with `hpx::vector`. At this point we have implemented only a few of the parallel algorithms

⁵⁷²³ <https://github.com/TheHPXProject/hpx/pull/1300>

⁵⁷²⁴ <https://github.com/TheHPXProject/hpx/issues/1251>

⁵⁷²⁵ <https://github.com/TheHPXProject/hpx/issues/1008>

⁵⁷²⁶ <https://github.com/TheHPXProject/hpx/issues/1001>

⁵⁷²⁷ <https://github.com/TheHPXProject/hpx/issues/721>

⁵⁷²⁸ <https://github.com/TheHPXProject/hpx/issues/524>

⁵⁷²⁹ <https://github.com/TheHPXProject/hpx/issues/839>

to support distributed data structures (like `hpx::vector`) for testing purposes (see [Issue #1338](#)⁵⁷³⁰ for a documentation of our progress).

Breaking changes

With this release we put a lot of effort into changing the code base to be more compatible to C++11. These changes have caused the following issues for backward compatibility:

- **Move to Variadics**- All of the API now uses variadic templates. However, this change required to modify the argument sequence for some of the exiting API functions (`hpx::async_continue`, `hpx::apply_continue`, `hpx::when_each`, `hpx::wait_each`, synchronous invocation of actions).
- **Changes to Macros**- We also removed the macros `HPX_STD_FUNCTION` and `HPX_STD_TUPLE`. This shouldn't affect any user code as we replaced `HPX_STD_FUNCTION` with `hpx::util::function_nonser` which was the default expansion used for this macro. All *HPX* API functions which expect a `hpx::util::function_nonser` (or a `hpx::util::unique_function_nonser`) can now be transparently called with a compatible `std::function` instead. Similarly, `HPX_STD_TUPLE` was replaced by its default expansion as well: `hpx::util::tuple`.
- **Changes to `hpx::unique_future`**- `hpx::unique_future`, which was deprecated in the previous release for `hpx::future` is now completely removed from *HPX*. This completes the transition to a completely standards conforming implementation of `hpx::future`.
- **Changes to Supported Compilers**. Finally, in order to utilize more C++11 semantics, we have officially dropped support for GCC 4.4 and MSVC 2012. Please see our [Prerequisites](#) page for more details.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1402](#)⁵⁷³¹ - Internal shared_future serialization copies
- [Issue #1399](#)⁵⁷³² - Build takes unusually long time...
- [Issue #1398](#)⁵⁷³³ - Tests using the scan partitioner are broken on at least gcc 4.7 and intel compiler
- [Issue #1397](#)⁵⁷³⁴ - Completely remove `hpx::unique_future`
- [Issue #1396](#)⁵⁷³⁵ - Parallel scan algorithms with different initial values
- [Issue #1395](#)⁵⁷³⁶ - Race Condition - `1d_stencil_8` - SuperMIC
- [Issue #1394](#)⁵⁷³⁷ - "suspending thread while at least one lock is being held" - `1d_stencil_8` - SuperMIC

HPX V0.9.9 (Oct 31, 2014, codename Spooky)

General changes

We have had over 1500 commits since the last release and we have closed over 200 tickets (bugs, feature requests, pull requests, etc.). These are by far the largest numbers of commits and resolved issues for any of the *HPX* releases so far. We are especially happy about the large number of people who contributed for the first time to *HPX*.

- We completed the transition from the older (non-conforming) implementation of `hpx::future` to the new and fully conforming version by removing the old code and by renaming the type `hpx::unique_future` to `hpx::future`. In order to maintain backwards compatibility with existing code which uses the type `hpx::unique_future` we support the configuration variable `HPX_UNIQUE_FUTURE_ALIAS`. If this variable is set to `ON` while running `cmake` it will additionally define a template alias for this type.
- We rewrote and significantly changed our build system. Please have a look at the new (now generated) documentation here: *Building HPX*. Please revisit your build scripts to adapt to the changes. The most notable changes are:
 - `HPX_NO_INSTALL` is no longer necessary.
 - For external builds, you need to set `HPX_DIR` instead of `HPX_ROOT` as described here: *Using HPX with CMake-based projects*.
 - IDEs that support multiple configurations (Visual Studio and XCode) can now be used as intended. that means no build dir.
 - Building *HPX* statically (without dynamic libraries) is now supported (`-DHPX_STATIC_LINKING=On`).
 - Please note that many variables used to configure the build process have been renamed to unify the naming conventions (see the section *CMake options* for more information).
 - This also fixes a long list of issues, for more information see [Issue #1204](#)⁵⁸⁴⁴.
- We started to implement various proposals to the C++ Standardization committee related to parallelism and concurrency, most notably [N4409](#)⁵⁸⁴⁵ (Working Draft, Technical Specification for C++ Extensions for Parallelism), [N4411](#)⁵⁸⁴⁶ (Task Region Rev. 3), and [N4313](#)⁵⁸⁴⁷ (Working Draft, Technical Specification for C++ Extensions for Concurrency).
- We completely remodeled our automatic build system to run builds and unit tests on various systems and compilers. This allows us to find most bugs right as they were introduced and helps to maintain a high level of quality and compatibility. The newest build logs can be found at *HPX Buildbot Website*⁵⁸⁴⁸.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- Issue #1296⁵⁸⁴⁹ - Rename `make_error_future` to `make_exceptional_future`, adjust to N4123
- Issue #1295⁵⁸⁵⁰ - building issue
- Issue #1293⁵⁸⁵¹ - Transpose example
- Issue #1292⁵⁸⁵² - Wrong `abs()` function used in example
- Issue #1291⁵⁸⁵³ - non-synchronized shift operators have been removed
- Issue #1290⁵⁸⁵⁴ - RDTSCP is defined as true for Xeon Phi build
- Issue #1289⁵⁸⁵⁵ - Fixing 1288
- Issue #1288⁵⁸⁵⁶ - Add new performance counters
- Issue #1287⁵⁸⁵⁷ - Hierarchy scheduler broken performance counters
- Issue #1286⁵⁸⁵⁸ - Algorithm cleanup
- Issue #1285⁵⁸⁵⁹ - Broken Links in Documentation
- Issue #1284⁵⁸⁶⁰ - Uninitialized copy
- Issue #1283⁵⁸⁶¹ - missing `boost::scoped_ptr` includes
- Issue #1282⁵⁸⁶² - Update documentation of build options for schedulers
- Issue #1281⁵⁸⁶³ - reset idle rate counter
- Issue #1280⁵⁸⁶⁴ - Bug when executing on Intel MIC
- Issue #1279⁵⁸⁶⁵ - Add improved `when_all/wait_all`
- Issue #1278⁵⁸⁶⁶ - Implement improved `when_all/wait_all`
- Issue #1277⁵⁸⁶⁷ - feature request: get access to `argc` `argv` and `variables_map`
- Issue #1276⁵⁸⁶⁸ - Remove merging map
- Issue #1274⁵⁸⁶⁹ - Weird (wrong) string code in `papi.cpp`

⁵⁸⁶⁹ <https://github.com/TheHPXProject/hpx/issues/1274>

- Issue #1273⁵⁸⁷⁰ - Sequential task execution policy
- Issue #1272⁵⁸⁷¹ - Avoid CMake name clash for Boost.Thread library
- Issue #1271⁵⁸⁷² - Updates on HPX Test Units
- Issue #1270⁵⁸⁷³ - hpx/util/safe_lexical_cast.hpp is added
- Issue #1269⁵⁸⁷⁴ - Added default value for “LIB” cmake variable
- Issue #1268⁵⁸⁷⁵ - Memory Counters not working
- Issue #1266⁵⁸⁷⁶ - FindHPX.cmake is not installed
- Issue #1263⁵⁸⁷⁷ - apply_remote test takes too long
- Issue #1262⁵⁸⁷⁸ - Chrono cleanup
- Issue #1261⁵⁸⁷⁹ - Need make install for papi counters and this builds all the examples
- Issue #1260⁵⁸⁸⁰ - Documentation of Stencil example claims
- Issue #1259⁵⁸⁸¹ - Avoid double-linking Boost on Windows
- Issue #1257⁵⁸⁸² - Adding additional parameter to create_thread
- Issue #1256⁵⁸⁸³ - added buildbot changes to release notes
- Issue #1255⁵⁸⁸⁴ - Cannot build MiniGhost
- Issue #1253⁵⁸⁸⁵ - hpx::thread defects
- Issue #1252⁵⁸⁸⁶ - HPX_PREFIX is too fragile
- Issue #1250⁵⁸⁸⁷ - switch_to_fiber_emulation does not work properly
- Issue #1249⁵⁸⁸⁸ - Documentation is generated under Release folder
- Issue #1248⁵⁸⁸⁹ - Fix usage of hpx_generic_coroutine_context and get tests passing on powerpc
- Issue #1247⁵⁸⁹⁰ - Dynamic linking error
- Issue #1246⁵⁸⁹¹ - Make cpuid.cpp C++11 compliant
- Issue #1245⁵⁸⁹² - HPX fails on startup (setting thread affinity mask)

- Issue #1244⁵⁸⁹³ - HPX_WITH_RDTSC configure test fails, but should succeed
- Issue #1243⁵⁸⁹⁴ - CTest dashboard info for CScs CDash drop location
- Issue #1242⁵⁸⁹⁵ - Mac fixes
- Issue #1241⁵⁸⁹⁶ - Failure in Distributed with Boost 1.56
- Issue #1240⁵⁸⁹⁷ - fix a race condition in examples.diskperf
- Issue #1239⁵⁸⁹⁸ - fix wait_each in examples.diskperf
- Issue #1238⁵⁸⁹⁹ - Fixed #1237: hpx::util::portable_binary_iarchive failed
- Issue #1237⁵⁹⁰⁰ - hpx::util::portable_binary_iarchive failed
- Issue #1235⁵⁹⁰¹ - Fixing clang warnings and errors
- Issue #1234⁵⁹⁰² - TCP runs fail: Transport endpoint is not connected
- Issue #1233⁵⁹⁰³ - Making sure the correct number of threads is registered with AGAS
- Issue #1232⁵⁹⁰⁴ - Fixing race in wait_xxx
- Issue #1231⁵⁹⁰⁵ - Parallel minmax
- Issue #1230⁵⁹⁰⁶ - Distributed run of 1d_stencil_8 uses less threads than spec. & sometimes gives errors
- Issue #1229⁵⁹⁰⁷ - Unstable number of threads
- Issue #1228⁵⁹⁰⁸ - HPX link error (cmake / MPI)
- Issue #1226⁵⁹⁰⁹ - Warning about struct/class thread_counters
- Issue #1225⁵⁹¹⁰ - Adding parallel::replace etc
- Issue #1224⁵⁹¹¹ - Extending dataflow to pass through non-future arguments
- Issue #1223⁵⁹¹² - Remaining find algorithms implemented, N4071
- Issue #1222⁵⁹¹³ - Merging all the changes
- Issue #1221⁵⁹¹⁴ - No error output when using mpirun with hpx
- Issue #1219⁵⁹¹⁵ - Adding new AGAS cache performance counters

- Issue #1216⁵⁹¹⁶ - Fixing using futures (clients) as arguments to actions
- Issue #1215⁵⁹¹⁷ - Error compiling simple component
- Issue #1214⁵⁹¹⁸ - Stencil docs
- Issue #1213⁵⁹¹⁹ - Using more than a few dozen MPI processes on SuperMike results in a seg fault before getting to hpx_main
- Issue #1212⁵⁹²⁰ - Parallel rotate
- Issue #1211⁵⁹²¹ - Direct actions cause the future's shared_state to be leaked
- Issue #1210⁵⁹²² - Refactored local::promise to be standard conformant
- Issue #1209⁵⁹²³ - Improve command line handling
- Issue #1208⁵⁹²⁴ - Adding parallel::reverse and parallel::reverse_copy
- Issue #1207⁵⁹²⁵ - Add copy_backward and move_backward
- Issue #1206⁵⁹²⁶ - N4071 additional algorithms implemented
- Issue #1204⁵⁹²⁷ - Cmake simplification and various other minor changes
- Issue #1203⁵⁹²⁸ - Implementing new launch policy for (local) async: `hpx::launch::fork`.
- Issue #1202⁵⁹²⁹ - Failed assertion in connection_cache.hpp
- Issue #1201⁵⁹³⁰ - pkg-config doesn't add mpi link directories
- Issue #1200⁵⁹³¹ - Error when querying time performance counters
- Issue #1199⁵⁹³² - library path is now configurable (again)
- Issue #1198⁵⁹³³ - Error when querying performance counters
- Issue #1197⁵⁹³⁴ - tests fail with intel compiler
- Issue #1196⁵⁹³⁵ - Silence several warnings
- Issue #1195⁵⁹³⁶ - Rephrase initializers to work with VC++ 2012
- Issue #1194⁵⁹³⁷ - Simplify parallel algorithms

HPX V0.9.8 (Mar 24, 2014)

We have had over 800 commits since the last release and we have closed over 65 tickets (bugs, feature requests, etc.).

With the changes below, *HPX* is once again leading the charge of a whole new era of computation. By intrinsically breaking down and synchronizing the work to be done, *HPX* insures that application developers will no longer have to fret about where a segment of code executes. That allows coders to focus their time and energy to understanding the data dependencies of their algorithms and thereby the core obstacles to an efficient code. Here are some of the advantages of using *HPX*:

- *HPX* is solidly rooted in a sophisticated theoretical execution model – ParalleX
- *HPX* exposes an API fully conforming to the C++11 and the draft C++14 standards, extended and applied to distributed computing. Everything programmers know about the concurrency primitives of the standard C++ library is still valid in the context of *HPX*.
- It provides a competitive, high performance implementation of modern, future-proof ideas which gives an smooth migration path from today's mainstream techniques
- There is no need for the programmer to worry about lower level parallelization paradigms like threads or message passing; no need to understand pthreads, MPI, OpenMP, or Windows threads, etc.
- There is no need to think about different types of parallelism such as tasks, pipelines, or fork-join, task or data parallelism.
- The same source of your program compiles and runs on Linux, BlueGene/Q, Mac OS X, Windows, and Android.
- The same code runs on shared memory multi-core systems and supercomputers, on handheld devices and Intel® Xeon Phi™ accelerators, or a heterogeneous mix of those.

General changes

- A major API breaking change for this release was introduced by implementing `hpx::future` and `hpx::shared_future` fully in conformance with the [C++11 Standard](#)⁶⁰⁷³. While `hpx::shared_future` is new and will not create any compatibility problems, we revised the interface and implementation of the existing `hpx::future`. For more details please see the [mailing list archive](#)⁶⁰⁷⁴. To avoid any incompatibilities for existing code we named the type which implements the `std::future` interface as `hpx::unique_future`. For the next release this will be renamed to `hpx::future`, making it full conforming to [C++11 Standard](#)⁶⁰⁷⁵.

⁶⁰⁷¹ <https://github.com/TheHPXProject/hpx/issues/183>

⁶⁰⁷² <https://github.com/TheHPXProject/hpx/issues/44>

⁶⁰⁷³ <http://www.open-std.org/jtc1/sc22/wg21>

⁶⁰⁷⁴ <http://mail.cct.lsu.edu/pipermail/hpx-users/2014-January/000141.html>

⁶⁰⁷⁵ <http://www.open-std.org/jtc1/sc22/wg21>

- A large part of the code base of *HPX* has been refactored and partially re-implemented. The main changes were related to
 - The threading subsystem: these changes significantly reduce the amount of overheads caused by the schedulers, improve the modularity of the code base, and extend the variety of available scheduling algorithms.
 - The parcel subsystem: these changes improve the performance of the *HPX* networking layer, modularize the structure of the parcelports, and simplify the creation of new parcelports for other underlying networking libraries.
 - The API subsystem: these changes improved the conformance of the API to C++11 Standard, extend and unify the available API functionality, and decrease the overheads created by various elements of the API.
 - The robustness of the component loading subsystem has been improved significantly, allowing to more portably and more reliably register the components needed by an application as startup. This additionally speeds up general application initialization.
- We added new API functionality like `hpx::migrate` and `hpx::copy_component` which are the basic building blocks necessary for implementing higher level abstractions for system-wide load balancing, runtime-adaptive resource management, and object-oriented checkpointing and state-management.
- We removed the use of C++11 move emulation (using `Boost.Move`), replacing it with C++11 rvalue references. This is the first step towards using more and more native C++11 facilities which we plan to introduce in the future.
- We improved the reference counting scheme used by *HPX* which helps managing distributed objects and memory. This improves the overall stability of *HPX* and further simplifies writing real world applications.
- The minimal Boost version required to use *HPX* is now V1.49.0.
- This release coincides with the first release of HPXPI (V0.1.0), the first implementation of the *XPI specification*⁶⁰⁷⁶.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1086](#)⁶⁰⁷⁷ - Expose internal `boost::shared_array` to allow user management of array lifetime

HPX V0.9.7 (Nov 13, 2013)

We have had over 1000 commits since the last release and we have closed over 180 tickets (bugs, feature requests, etc.).

General changes

- Ported HPX to BlueGene/Q
- Improved HPX support for Xeon/Phi accelerators
- Reimplemented `hpx::bind`, `hpx::tuple`, and `hpx::function` for better performance and better compliance with the C++11 Standard. Added `hpx::mem_fn`.
- Reworked `hpx::when_all` and `hpx::when_any` for better compliance with the ongoing C++ standardization effort, added heterogeneous version for those functions. Added `hpx::when_any_swapped`.
- Added `hpx::copy` as a precursor for a migrate functionality
- Added `hpx::get_ptr` allowing to directly access the memory underlying a given component
- Added the `hpx::lcos::broadcast`, `hpx::lcos::reduce`, and `hpx::lcos::fold` collective operations
- Added `hpx::get_locality_name` allowing to retrieve the name of any of the localities for the application.
- Added support for more flexible thread affinity control from the HPX command line, such as new modes for `--hpx:bind` (`balanced`, `scattered`, `compact`), improved default settings when running multiple localities on the same node.
- Added experimental executors for simpler thread pooling and scheduling. This API may change in the future as it will stay aligned with the ongoing C++ standardization efforts.
- Massively improved the performance of the HPX serialization code. Added partial support for zero copy serialization of array and bitwise-copyable types.
- General performance improvements of the code related to threads and futures.

HPX V0.9.6 (Jul 30, 2013)

We have had over 1200 commits since the last release and we have closed roughly 140 tickets (bugs, feature requests, etc.).

General changes

The major new features in this release are:

- We further consolidated the API exposed by *HPX*. We aligned our APIs as much as possible with the existing [C++11 Standard](#)⁶³³⁷ and related proposals to the C++ standardization committee (such as [N3632](#)⁶³³⁸ and [N3857](#)⁶³³⁹).
- We implemented a first version of a distributed AGAS service which essentially eliminates all explicit AGAS network traffic.
- We created a native `ibverbs` `parcelpoint` allowing to take advantage of the superior latency and bandwidth characteristics of Infiniband networks.
- We successfully ported *HPX* to the Xeon Phi platform.
- Support for the SLURM scheduling system was implemented.

⁶³²⁶ <https://github.com/TheHPXProject/hpx/issues/534>

⁶³²⁷ <https://github.com/TheHPXProject/hpx/issues/508>

⁶³²⁸ <https://github.com/TheHPXProject/hpx/issues/506>

⁶³²⁹ <https://github.com/TheHPXProject/hpx/issues/470>

⁶³³⁰ <https://github.com/TheHPXProject/hpx/issues/453>

⁶³³¹ <https://github.com/TheHPXProject/hpx/issues/445>

⁶³³² <https://github.com/TheHPXProject/hpx/issues/443>

⁶³³³ <https://github.com/TheHPXProject/hpx/issues/421>

⁶³³⁴ <https://github.com/TheHPXProject/hpx/issues/316>

⁶³³⁵ <https://github.com/TheHPXProject/hpx/issues/249>

⁶³³⁶ <https://github.com/TheHPXProject/hpx/issues/136>

⁶³³⁷ <http://www.open-std.org/jtc1/sc22/wg21>

⁶³³⁸ <http://wg21.link/n3632>

⁶³³⁹ <http://wg21.link/n3857>

- Major efforts have been dedicated to improving the performance counter framework, numerous new counters were implemented and new APIs were added.
- We added a modular parcel compression system allowing to improve bandwidth utilization (by reducing the overall size of the transferred data).
- We added a modular parcel coalescing system allowing to combine several parcels into larger messages. This reduces latencies introduced by the communication layer.
- Added an experimental executors API allowing to use different scheduling policies for different parts of the code. This API has been modelled after the Standards proposal N3562⁶³⁴⁰. This API is bound to change in the future, though.
- Added minimal security support for localities which is enforced on the parcelport level. This support is preliminary and experimental and might change in the future.
- We created a parcelport using low level MPI functions. This is in support of legacy applications which are to be gradually ported and to support platforms where MPI is the only available portable networking layer.
- We added a preliminary and experimental implementation of a tuple-space object which exposes an interface similar to such systems described in the literature (see for instance *The Linda Coordination Language*⁶³⁴¹).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is again a very long list of newly implemented features and fixed issues.

- [Issue #806](#)⁶³⁴² - make (all) in examples folder does nothing
- [Issue #805](#)⁶³⁴³ - Adding the introduction and fixing DOCBOOK dependencies for Windows use
- [Issue #804](#)⁶³⁴⁴ - Add stackless (non-suspendable) thread type
- [Issue #803](#)⁶³⁴⁵ - Create proper serialization support functions for util::tuple
- [Issue #800](#)⁶³⁴⁶ - Add possibility to disable array optimizations during serialization
- [Issue #798](#)⁶³⁴⁷ - HPX_LIMIT does not work for local dataflow
- [Issue #797](#)⁶³⁴⁸ - Create a parcelport which uses MPI
- [Issue #796](#)⁶³⁴⁹ - Problem with Large Numbers of Threads
- [Issue #793](#)⁶³⁵⁰ - Changing dataflow test case to hang consistently
- [Issue #792](#)⁶³⁵¹ - CMake Error

- Issue #791⁶³⁵² - Problems with local::dataflow
- Issue #790⁶³⁵³ - wait_for() doesn't compile
- Issue #789⁶³⁵⁴ - HPX with Intel compiler segfaults
- Issue #788⁶³⁵⁵ - Intel compiler support
- Issue #787⁶³⁵⁶ - Fixed SFINAE specializations
- Issue #786⁶³⁵⁷ - Memory issues during benchmarking.
- Issue #785⁶³⁵⁸ - Create an API allowing to register external threads with HPX
- Issue #784⁶³⁵⁹ - util::plugin is throwing an error when a symbol is not found
- Issue #783⁶³⁶⁰ - How does hpx::bind work?
- Issue #782⁶³⁶¹ - Added quotes around STRING REPLACE potentially empty arguments
- Issue #781⁶³⁶² - Make sure no exceptions propagate into the thread manager
- Issue #780⁶³⁶³ - Allow arithmetics performance counters to expand its parameters
- Issue #779⁶³⁶⁴ - Test case for 778
- Issue #778⁶³⁶⁵ - Swapping futures segfaults
- Issue #777⁶³⁶⁶ - hpx::lcos::details::when_xxx don't restore completion handlers
- Issue #776⁶³⁶⁷ - Compiler chokes on dataflow overload with launch policy
- Issue #775⁶³⁶⁸ - Runtime error with local dataflow (copying futures?)
- Issue #774⁶³⁶⁹ - Using local dataflow without explicit namespace
- Issue #773⁶³⁷⁰ - Local dataflow with unwrap: functor operators need to be const
- Issue #772⁶³⁷¹ - Allow (remote) actions to return a future
- Issue #771⁶³⁷² - Setting HPX_LIMIT gives huge boost MPL errors
- Issue #770⁶³⁷³ - Add launch policy to (local) dataflow
- Issue #769⁶³⁷⁴ - Make compile time configuration information available

⁶³⁷⁴ <https://github.com/TheHPXProject/hpx/issues/769>

- Issue #768⁶³⁷⁵ - Const correctness problem in local dataflow
- Issue #767⁶³⁷⁶ - Add launch policies to async
- Issue #766⁶³⁷⁷ - Mark data structures for optimized (array based) serialization
- Issue #765⁶³⁷⁸ - Align hpx::any with N3508: Any Library Proposal (Revision 2)
- Issue #764⁶³⁷⁹ - Align hpx::future with newest N3558: A Standardized Representation of Asynchronous Operations
- Issue #762⁶³⁸⁰ - added a human readable output for the ping pong example
- Issue #761⁶³⁸¹ - Ambiguous typename when constructing derived component
- Issue #760⁶³⁸² - Simple components can not be derived
- Issue #759⁶³⁸³ - make install doesn't give a complete install
- Issue #758⁶³⁸⁴ - Stack overflow when using locking_hook<>
- Issue #757⁶³⁸⁵ - copy paste error; unsupported function overloading
- Issue #756⁶³⁸⁶ - GTCX runtime issue in Gordon
- Issue #755⁶³⁸⁷ - Papi counters don't work with reset and evaluate API's
- Issue #753⁶³⁸⁸ - cmake bugfix and improved component action docs
- Issue #752⁶³⁸⁹ - hpx simple component docs
- Issue #750⁶³⁹⁰ - Add hpx::util::any
- Issue #749⁶³⁹¹ - Thread phase counter is not reset
- Issue #748⁶³⁹² - Memory performance counter are not registered
- Issue #747⁶³⁹³ - Create performance counters exposing arithmetic operations
- Issue #745⁶³⁹⁴ - apply_callback needs to invoke callback when applied locally
- Issue #744⁶³⁹⁵ - CMake fixes
- Issue #743⁶³⁹⁶ - Problem Building github version of HPX
- Issue #742⁶³⁹⁷ - Remove HPX_STD_BIND

- Issue #716⁶⁴¹⁹ - Non-option arguments to programs run using pbsdsh must be before `--hpx:nodes`, contrary to directions
- Issue #715⁶⁴²⁰ - Re-thrown exceptions should retain the original call site
- Issue #714⁶⁴²¹ - failed assertion in debug mode
- Issue #713⁶⁴²² - Add performance counters monitoring connection caches
- Issue #712⁶⁴²³ - Adjust parcel related performance counters to be connection type specific
- Issue #711⁶⁴²⁴ - configuration failure
- Issue #710⁶⁴²⁵ - Error “timed out while trying to find room in the connection cache” when trying to start multiple localities on a single computer
- Issue #709⁶⁴²⁶ - Add new thread state ‘staged’ referring to task descriptions
- Issue #708⁶⁴²⁷ - Detect/mitigate bad non-system installs of GCC on Redhat systems
- Issue #707⁶⁴²⁸ - Many examples do not link with Git HEAD version
- Issue #706⁶⁴²⁹ - `hpx::init` removes portions of non-option command line arguments before last = sign
- Issue #705⁶⁴³⁰ - Create rolling average and median aggregating performance counters
- Issue #704⁶⁴³¹ - Create performance counter to expose thread queue waiting time
- Issue #703⁶⁴³² - Add support to HPX build system to find libcrtool.a and related headers
- Issue #699⁶⁴³³ - Generalize instrumentation support
- Issue #698⁶⁴³⁴ - compilation failure with hwloc absent
- Issue #697⁶⁴³⁵ - Performance counter counts should be zero indexed
- Issue #696⁶⁴³⁶ - Distributed problem
- Issue #695⁶⁴³⁷ - Bad perf counter time printed
- Issue #693⁶⁴³⁸ - `--help` doesn’t print component specific command line options
- Issue #692⁶⁴³⁹ - SLURM support broken

HPX V0.9.5 (Jan 16, 2013)

We have had over 1000 commits since the last release and we have closed roughly 150 tickets (bugs, feature requests, etc.).

General changes

This release is continuing along the lines of code and API consolidation, and overall usability improvements. We dedicated much attention to performance and we were able to significantly improve the threading and networking subsystems.

We successfully ported *HPX* to the Android platform. *HPX* applications now not only can run on mobile devices, but we support heterogeneous applications running across architecture boundaries. At the Supercomputing Conference 2012 we demonstrated connecting Android tablets to simulations running on a Linux cluster. The Android tablet was used to query performance counters from the Linux simulation and to steer its parameters.

We successfully ported *HPX* to Mac OSX (using the Clang compiler). Thanks to Pyry Jähkola for contributing the corresponding patches. Please see the section `macos_installation` for more details.

We made a special effort to make *HPX* usable in highly concurrent use cases. Many of the *HPX* API functions which possibly take longer than 100 microseconds to execute now can be invoked asynchronously. We added uniform support for composing futures which simplifies to write asynchronous code. *HPX* actions (function objects encapsulating possibly concurrent remote function invocations) are now well integrated with all other API facilities such like `hpx::bind`.

All of the API has been aligned as much as possible with established paradigms. *HPX* now mirrors many of the facilities as defined in the C++11 Standard, such as `hpx::thread`, `hpx::function`, `hpx::future`, etc.

A lot of work has been put into improving the documentation. Many of the API functions are documented now, concepts are explained in detail, and examples are better described than before. The new documentation index enables finding information with lesser effort.

This is the first release of *HPX* we perform after the move to [Github](https://github.com/TheHPXProject/hpx/)⁶⁴⁸². This step has enabled a wider participation from the community and further encourages us in our decision to release *HPX* as a true open source library (*HPX* is licensed under the very liberal [Boost Software License](https://www.boost.org/LICENSE_1_0.txt)⁶⁴⁸³).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is by far the longest list of newly implemented features and fixed issues for any of *HPX*' releases so far.

- [Issue #666](#)⁶⁴⁸⁴ - Segfault on calling `hpx::finalize` twice
- [Issue #665](#)⁶⁴⁸⁵ - Adding declaration `num_of_cores`

⁶⁴⁸² <https://github.com/TheHPXProject/hpx/>

⁶⁴⁸³ https://www.boost.org/LICENSE_1_0.txt

⁶⁴⁸⁴ <https://github.com/TheHPXProject/hpx/issues/666>

⁶⁴⁸⁵ <https://github.com/TheHPXProject/hpx/issues/665>

- Issue #662⁶⁴⁸⁶ - pkgconfig is building wrong
- Issue #660⁶⁴⁸⁷ - Need uninterrupt function
- Issue #659⁶⁴⁸⁸ - Move our logging library into a different namespace
- Issue #658⁶⁴⁸⁹ - Dynamic performance counter types are broken
- Issue #657⁶⁴⁹⁰ - HPX v0.9.5 (RC1) hello_world example segfaulting
- Issue #656⁶⁴⁹¹ - Define the affinity of parcel-pool, io-pool, and timer-pool threads
- Issue #654⁶⁴⁹² - Integrate the Boost auto_index tool with documentation
- Issue #653⁶⁴⁹³ - Make HPX build on OS X + Clang + libc++
- Issue #651⁶⁴⁹⁴ - Add fine-grained control for thread pinning
- Issue #650⁶⁴⁹⁵ - Command line no error message when using -hpx:(anything)
- Issue #645⁶⁴⁹⁶ - Command line aliases don't work in [teletype]``@file``[c++]
- Issue #644⁶⁴⁹⁷ - Terminated threads are not always properly cleaned up
- Issue #640⁶⁴⁹⁸ - future_data<T>::set_on_completed_ used without locks
- Issue #638⁶⁴⁹⁹ - hpx build with intel compilers fails on linux
- Issue #637⁶⁵⁰⁰ - -copy-dt-needed-entries breaks with gold
- Issue #635⁶⁵⁰¹ - Boost V1.53 will add Boost.Lockfree and Boost.Atomic
- Issue #633⁶⁵⁰² - Re-add examples to final 0.9.5 release
- Issue #632⁶⁵⁰³ - Example thread_aware_timer is broken
- Issue #631⁶⁵⁰⁴ - FFT application throws error in parcellayer
- Issue #630⁶⁵⁰⁵ - Event synchronization example is broken
- Issue #629⁶⁵⁰⁶ - Waiting on futures hangs
- Issue #628⁶⁵⁰⁷ - Add an HPX_ALWAYS_ASSERT macro
- Issue #625⁶⁵⁰⁸ - Port coroutines context switch benchmark

- Issue #595⁶⁵³⁰ - I need a place to store data in a thread self pointer
- Issue #594⁶⁵³¹ - 32/64 interoperability
- Issue #593⁶⁵³² - Warn if logging is disabled at compile time but requested at runtime
- Issue #592⁶⁵³³ - Add optional argument value to `--hpx:list-counters` and `--hpx:list-counter-infos`
- Issue #591⁶⁵³⁴ - Allow for wildcards in performance counter names specified with `--hpx:print-counter`
- Issue #590⁶⁵³⁵ - Local promise semantic differences
- Issue #589⁶⁵³⁶ - Create API to query performance counter names
- Issue #587⁶⁵³⁷ - Add `get_num_localities` and `get_num_threads` to AGAS API
- Issue #586⁶⁵³⁸ - Adjust local AGAS cache size based on number of localities
- Issue #585⁶⁵³⁹ - Error while using counters in HPX
- Issue #584⁶⁵⁴⁰ - counting argument size of actions, initial pass.
- Issue #581⁶⁵⁴¹ - Remove `RemoteResult` template parameter for `future<>`
- Issue #580⁶⁵⁴² - Add possibility to hook into actions
- Issue #578⁶⁵⁴³ - Use angle brackets in HPX error dumps
- Issue #576⁶⁵⁴⁴ - Exception incorrectly thrown when `--help` is used
- Issue #575⁶⁵⁴⁵ - `HPX(bad_component_type)` with gcc 4.7.2 and boost 1.51
- Issue #574⁶⁵⁴⁶ - `--hpx:connect` command line parameter not working correctly
- Issue #571⁶⁵⁴⁷ - `hpx::wait()` (callback version) should pass the future to the callback function
- Issue #570⁶⁵⁴⁸ - `hpx::wait` should operate on `boost::arrays` and `std::lists`
- Issue #569⁶⁵⁴⁹ - Add a logging sink for Android
- Issue #568⁶⁵⁵⁰ - 2-argument version of `HPX_DEFINE_COMPONENT_ACTION`
- Issue #567⁶⁵⁵¹ - Connecting to a running HPX application works only once

HPX V0.9.0 (Jul 5, 2012)

We have had roughly 800 commits since the last release and we have closed approximately 80 tickets (bugs, feature requests, etc.).

General changes

- Significant improvements made to the usability of *HPX* in large-scale, distributed environments.
- Renamed `hpx::lcos::packaged_task` to `hpx::lcos::packaged_action` to reflect the semantic differences to a `packaged_task` as defined by the C++11 Standard⁶⁶⁴⁰.
- *HPX* now exposes `hpx::thread` which is compliant to the C++11 `std::thread` type except that it (purely locally) represents an *HPX* thread. This new type does not expose any of the remote capabilities of the underlying *HPX*-thread implementation.
- The type `hpx::lcos::future` is now compliant to the C++11 `std::future<>` type. This type can be used to synchronize both, local and remote operations. In both cases the control flow will ‘return’ to the future in order to trigger any continuation.
- The types `hpx::lcos::local::promise` and `hpx::lcos::local::packaged_task` are now compliant to the C++11 `std::promise<>` and `std::packaged_task<>` types. These can be used to create a future representing local work only. Use the types `hpx::lcos::promise` and `hpx::lcos::packaged_action` to wrap any (possibly remote) action into a future.
- `hpx::thread` and `hpx::lcos::future` are now cancelable.
- Added support for sequential and logic composition of `hpx::lcos::futures`. The member function `hpx::lcos::future::when` permits futures to be sequentially composed. The helper functions `hpx::wait_all`, `hpx::wait_any`, and `hpx::wait_n` can be used to wait for more than one future at a time.
- *HPX* now exposes `hpx::apply` and `hpx::async` as the preferred way of creating (or invoking) any deferred work. These functions are usable with various types of functions, function objects, and actions and provide a uniform way to spawn deferred tasks.
- *HPX* now utilizes `hpx::util::bind` to (partially) bind local functions and function objects, and also actions. Remote bound actions can have placeholders as well.
- *HPX* continuations are now fully polymorphic. The class `hpx::actions::forwarding_continuation` is an example of how the user can write his own types of continuations. It can be used to execute any function as an continuation of a particular action.
- Reworked the action invocation API to be fully conformant to normal functions. Actions can now be invoked using `hpx::apply`, `hpx::async`, or using the `operator()` implemented on actions. Actions themselves can now be cheaply instantiated as they do not have any members anymore.
- Reworked the lazy action invocation API. Actions can now be directly bound using `hpx::util::bind` by passing an action instance as the first argument.
- A minimal *HPX* program now looks like this:

⁶⁶⁴⁰ <http://www.open-std.org/jtc1/sc22/wg21>

```
#include <hpx/hpx_init.hpp>

int hpx_main()
{
    return hpx::finalize();
}

int main()
{
    return hpx::init();
}
```

This removes the immediate dependency on the `Boost.Program_options`⁶⁶⁴¹ library.

Note

This minimal version of an *HPX* program does not support any of the default command line arguments (such as `-help`, or command line options related to PBS). It is suggested to always pass `argc` and `argv` to *HPX* as shown in the example below.

- In order to support those, but still not to depend on `Boost.Program_options`⁶⁶⁴², the minimal program can be written as:

```
#include <hpx/hpx_init.hpp>

// The arguments
↪ for hpx_main can be left off, which very similar to the
// behavior of ``main()`` as defined by C++.
int hpx_main(int argc, char* argv[])
{
    return hpx::finalize();
}

int main(int argc, char* argv[])
{
    return hpx::init(argc, argv);
}
```

- Added performance counters exposing the number of component instances which are alive on a given locality.
- Added performance counters exposing then number of messages sent and received, the number of parcels sent and received, the number of bytes sent and received, the overall time required to send and receive data, and the overall time required to serialize and deserialize the data.
- Added a new component: `hpx::components::binpacking_factory` which is equivalent to the existing `hpx::components::distributing_factory` component, except that it equalizes the overall population of the components to create. It exposes two factory methods, one based on the number of existing instances of the component type to

⁶⁶⁴¹ https://www.boost.org/doc/html/program_options.html

⁶⁶⁴² https://www.boost.org/doc/html/program_options.html

create, and one based on an arbitrary performance counter which will be queried for all relevant localities.

- Added API functions allowing to access elements of the diagnostic information embedded in the given exception: `hpx::get_locality_id`, `hpx::get_host_name`, `hpx::get_process_id`, `hpx::get_function_name`, `hpx::get_file_name`, `hpx::get_line_number`, `hpx::get_os_thread`, `hpx::get_thread_id`, and `hpx::get_thread_description`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- [Issue #71⁶⁶⁴³](#) - GIDs that are not serialized via `handle_gid<>` should raise an exception
- [Issue #105⁶⁶⁴⁴](#) - Allow for `hpx::util::functions` to be registered in the AGAS symbolic namespace
- [Issue #107⁶⁶⁴⁵](#) - Nasty threadmanger race condition (reproducible in `sheneos_test`)
- [Issue #108⁶⁶⁴⁶](#) - Add millisecond resolution to *HPX* logs on Linux
- [Issue #110⁶⁶⁴⁷](#) - Shutdown hang in distributed with release build
- [Issue #116⁶⁶⁴⁸](#) - Don't use TSS for the applier and runtime pointers
- [Issue #162⁶⁶⁴⁹](#) - Move local synchronous execution shortcut from `hpx::function` to the applier
- [Issue #172⁶⁶⁵⁰](#) - Cache sources in CMake and check if they change manually
- [Issue #178⁶⁶⁵¹](#) - Add an INI option to turn off ranged-based AGAS caching
- [Issue #187⁶⁶⁵²](#) - Support for disabling performance counter deployment
- [Issue #202⁶⁶⁵³](#) - Support for sending performance counter data to a specific file
- [Issue #218⁶⁶⁵⁴](#) - `boost.coroutines` allows different stack sizes, but stack pool is unaware of this
- [Issue #231⁶⁶⁵⁵](#) - Implement movable `boost::bind`
- [Issue #232⁶⁶⁵⁶](#) - Implement movable `boost::function`
- [Issue #236⁶⁶⁵⁷](#) - Allow binding `hpx::util::function` to actions
- [Issue #239⁶⁶⁵⁸](#) - Replace `hpx::function` with `hpx::util::function`

HPX V0.8.1 (Apr 21, 2012)

This is a point release including important bug fixes for *HPX V0.8.0 (Mar 23, 2012)*.

General changes

- HPX does not need to be installed anymore to be functional.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this point release:

- [Issue #295⁶⁷⁰⁵](#) - Don't require install path to be known at compile time.
- [Issue #371⁶⁷⁰⁶](#) - Add `hpx iostreams` to standard build.
- [Issue #384⁶⁷⁰⁷](#) - Fix compilation with GCC 4.7.
- [Issue #390⁶⁷⁰⁸](#) - Remove `keep_factory_alive` startup call from ShenEOS; add shutdown call to `H5close`.
- [Issue #393⁶⁷⁰⁹](#) - Thread affinity control is broken.

Bug fixes (commits)

Here is a list of the important commits included in this point release:

- [r7642](#) - External: Fix backtrace memory violation.
- **[r7775](#) - Components: Fix symbol visibility bug with component startup providers.** This prevents one components providers from overriding another components.
- [r7778](#) - Components: Fix startup/shutdown provider shadowing issues.

HPX V0.8.0 (Mar 23, 2012)

We have had roughly 1000 commits since the last release and we have closed approximately 70 tickets (bugs, feature requests, etc.).

General changes

- Improved PBS support, allowing for arbitrary naming schemes of node-hostnames.
- Finished verification of the reference counting framework.
- Implemented decrement merging logic to optimize the distributed reference counting system.
- Restructured the LCO framework. Renamed `hpx::lcos::eager_future<>` and `hpx::lcos::lazy_future<>` into `hpx::lcos::packaged_task` and `hpx::lcos::deferred_packaged_task`. Split `hpx::lcos::promise` into `hpx::lcos::packaged_task` and `hpx::lcos::future`. Added ‘local’ futures (in namespace `hpx::lcos::local`).
- Improved the general performance of local and remote action invocations. This (under certain circumstances) drastically reduces the number of copies created for each of the parameters and return values.
- Reworked the performance counter framework. Performance counters are now created only when needed, which reduces the overall resource requirements. The new framework allows for much more flexible creation and management of performance counters. The new sine example application demonstrates some of the capabilities of the new infrastructure.
- Added a buildbot-based continuous build system which gives instant, automated feedback on each commit to SVN.
- Added more automated tests to verify proper functioning of *HPX*.
- Started to create documentation for *HPX* and its API.
- Added documentation toolchain to the build system.
- Added dataflow LCO.
- Changed default *HPX* command line options to have `hpx:` prefix. For instance, the former option `--threads` is now `--hpx:threads`. This has been done to make ambiguities with possible application specific command line options as unlikely as possible. See the section *HPX Command Line Options* for a full list of available options.
- Added the possibility to define command line aliases. The former short (one-letter) command line options have been predefined as aliases for backwards compatibility. See the section *HPX Command Line Options* for a detailed description of command line option aliasing.
- Network connections are now cached based on the connected host. The number of simultaneous connections to a particular host is now limited. Parcels are buffered and bundled if all connections are in use.
- Added more refined thread affinity control. This is based on the external library Portable Hardware Locality (HWLOC).
- Improved support for Windows builds with CMake.
- Added support for components to register their own command line options.

- Added the possibility to register custom startup/shutdown functions for any component. These functions are guaranteed to be executed by an *HPX* thread.
- Added two new experimental thread schedulers: `hierarchy_scheduler` and `periodic_priority_scheduler`. These can be activated by using the command line options `--hpx:queuing=hierarchy` or `--hpx:queuing=periodic`.

Example applications

- [Graph500 performance benchmark](#)⁶⁷¹⁰ (thanks to Matthew Anderson for contributing this application).
- [GTC \(Gyrokinetic Toroidal Code\)](#)⁶⁷¹¹: a skeleton for particle in cell type codes.
- Random Memory Access: an example demonstrating random memory accesses in a large array
- [ShenEOS example](#)⁶⁷¹², demonstrating partitioning of large read-only data structures and exposing an interpolation API.
- Sine performance counter demo.
- Accumulator examples demonstrating how to write and use *HPX* components.
- Quickstart examples (like `hello_world`, `fibonacci`, `quicksort`, `factorial`, etc.) demonstrating simple *HPX* concepts which introduce some of the concepts in *HPX*.
- Load balancing and work stealing demos.

API changes

- Moved all local LCOs into a separate namespace `hpx::lcos::local` (for instance, `hpx::lcos::local_mutex` is now `hpx::lcos::local::mutex`).
- Replaced `hpx::actions::function` with `hpx::util::function`. Cleaned up related code.
- Removed `hpx::traits::handle_gid` and moved handling of global reference counts into the corresponding serialization code.
- Changed terminology: `prefix` is now called `locality_id`, renamed the corresponding API functions (such as `hpx::get_prefix`, which is now called `hpx::get_locality_id`).
- Adding `hpx::find_remote_localities`, and `hpx::get_num_localities`.
- Changed performance counter naming scheme to make it more bash friendly. The new performance counter naming scheme is now

```
/object{parentname#parentindex/instance#index}/counter#parameters
```

- Added `hpx::get_worker_thread_num` replacing `hpx::threadmanager_base::get_thread_num`.
- Renamed `hpx::get_num_os_threads` to `hpx::get_os_threads_count`.
- Added `hpx::threads::get_thread_count`.

⁶⁷¹⁰ <http://www.graph500.org/>

⁶⁷¹¹ <http://www.nersc.gov/research-and-development/benchmarking-and-workload-characterization/nersc-6-benchmarks/gtc/>

⁶⁷¹² <http://stellarcollapse.org/equationofstate>

- Restructured the Futures sub-system, renaming types in accordance with the terminology used by the C++11 ISO standard.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- [Issue #31](#)⁶⁷¹³ - Specialize `handle_gid<>` for examples and tests
- [Issue #72](#)⁶⁷¹⁴ - Fix AGAS reference counting
- [Issue #104](#)⁶⁷¹⁵ - heartbeat throws an exception when decrefing the performance counter it's watching
- [Issue #111](#)⁶⁷¹⁶ - throttle causes an exception on the target application
- [Issue #142](#)⁶⁷¹⁷ - One failed component loading causes an unrelated component to fail
- [Issue #165](#)⁶⁷¹⁸ - Remote exception propagation bug in AGAS reference counting test
- [Issue #186](#)⁶⁷¹⁹ - Test credit exhaustion/splitting (e.g. `prepare_gid` and symbol NS)
- [Issue #188](#)⁶⁷²⁰ - Implement remaining AGAS reference counting test cases
- [Issue #258](#)⁶⁷²¹ - No type checking of GIDs in stubs classes
- [Issue #271](#)⁶⁷²² - Seg fault/shared pointer assertion in distributed code
- [Issue #281](#)⁶⁷²³ - CMake options need descriptive text
- [Issue #283](#)⁶⁷²⁴ - AGAS caching broken (`gva_cache` needs to be rewritten with ICL)
- [Issue #285](#)⁶⁷²⁵ - `HPX_INSTALL` root directory not the same as `CMAKE_INSTALL_PREFIX`
- [Issue #286](#)⁶⁷²⁶ - New segfault in dataflow applications
- [Issue #289](#)⁶⁷²⁷ - Exceptions should only be logged if not handled
- [Issue #290](#)⁶⁷²⁸ - c++11 tests failure
- [Issue #293](#)⁶⁷²⁹ - Build target for component libraries
- [Issue #296](#)⁶⁷³⁰ - Compilation error with Boost V1.49rc1
- [Issue #298](#)⁶⁷³¹ - Illegal instructions on termination

HPX V0.7.0 (Dec 12, 2011)

We have had roughly 1000 commits since the last release and we have closed approximately 120 tickets (bugs, feature requests, etc.).

General changes

- Completely removed code related to deprecated AGAS V1, started to work on AGAS V2.1.
- Started to clean up and streamline the exposed APIs (see 'API changes' below for more details).
- Revamped and unified performance counter framework, added a lot of new performance counter instances for monitoring of a diverse set of internal *HPX* parameters (queue lengths, access statistics, etc.).
- Improved general error handling and logging support.
- Fixed several race conditions, improved overall stability, decreased memory footprint, improved overall performance (major optimizations include native TLS support and ranged-based AGAS caching).
- Added support for running *HPX* applications with PBS.
- Many updates to the build system, added support for gcc 4.5.x and 4.6.x, added C++11 support.
- Many updates to default command line options.
- Added many tests, set up buildbot for continuous integration testing.
- Better shutdown handling of distributed applications.

⁶⁷⁵⁴ <https://github.com/TheHPXProject/hpx/issues/343>

⁶⁷⁵⁵ <https://github.com/TheHPXProject/hpx/issues/351>

⁶⁷⁵⁶ <https://github.com/TheHPXProject/hpx/issues/353>

⁶⁷⁵⁷ <https://github.com/TheHPXProject/hpx/issues/355>

⁶⁷⁵⁸ <https://github.com/TheHPXProject/hpx/issues/356>

⁶⁷⁵⁹ <https://github.com/TheHPXProject/hpx/issues/359>

⁶⁷⁶⁰ <https://github.com/TheHPXProject/hpx/issues/361>

⁶⁷⁶¹ <https://github.com/TheHPXProject/hpx/issues/364>

Example applications

- quickstart/factorial and quickstart/fibonacci, future-recursive parallel algorithms.
- quickstart/hello_world, distributed hello world example.
- quickstart/rma, simple remote memory access example
- quickstart/quicksort, parallel quicksort implementation.
- gtc, gyrokinetic torodial code.
- bfs, breadth-first-search, example code for a graph application.
- sheneos, partitioning of large data sets.
- accumulator, simple component example.
- balancing/os_thread_num, balancing/px_thread_phase, examples demonstrating load balancing and work stealing.

API changes

- Added `hpx::find_all_localities`.
- Added `hpx::terminate` for non-graceful termination of applications.
- Added `hpx::lcos::async` functions for simpler asynchronous programming.
- Added new AGAS interface for handling of symbolic namespace (`hpx::agas::*`).
- Renamed `hpx::components::wait` to `hpx::lcos::wait`.
- Renamed `hpx::lcos::future_value` to `hpx::lcos::promise`.
- Renamed `hpx::lcos::recursive_mutex` to `hpx::lcos::local_recursive_mutex`, `hpx::lcos::mutex` to `hpx::lcos::local_mutex`
- Removed support for Boost versions older than V1.38, recommended Boost version is now V1.47 and newer.
- Removed `hpx::process` (this will be replaced by a real process implementation in the future).
- Removed non-functional LCO code (`hpx::lcos::dataflow`, `hpx::lcos::thunk`, `hpx::lcos::dataflow_variable`).
- Removed deprecated `hpx::naming::full_address`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- [Issue #28⁶⁷⁶²](#) - Integrate Windows/Linux CMake code for *HPX* core
- [Issue #32⁶⁷⁶³](#) - `hpx::cout()` should be `hpx::cout`
- [Issue #33⁶⁷⁶⁴](#) - AGAS V2 legacy client does not properly handle `error_code`

⁶⁷⁶² <https://github.com/TheHPXProject/hpx/issues/28>

⁶⁷⁶³ <https://github.com/TheHPXProject/hpx/issues/32>

⁶⁷⁶⁴ <https://github.com/TheHPXProject/hpx/issues/33>

- Issue #60⁶⁷⁶⁵ - AGAS: allow for registerid to optionally take ownership of the gid
- Issue #62⁶⁷⁶⁶ - adaptive1d compilation failure in Fusion
- Issue #64⁶⁷⁶⁷ - Parcel subsystem doesn't resolve domain names
- Issue #83⁶⁷⁶⁸ - No error handling if no console is available
- Issue #84⁶⁷⁶⁹ - No error handling if a hosted locality is treated as the bootstrap server
- Issue #90⁶⁷⁷⁰ - Add general commandline option -N
- Issue #91⁶⁷⁷¹ - Add possibility to read command line arguments from file
- Issue #92⁶⁷⁷² - Always log exceptions/errors to the log file
- Issue #93⁶⁷⁷³ - Log the command line/program name
- Issue #95⁶⁷⁷⁴ - Support for distributed launches
- Issue #97⁶⁷⁷⁵ - Attempt to create a bad component type in AMR examples
- Issue #100⁶⁷⁷⁶ - factorial and factorial_get examples trigger AGAS component type assertions
- Issue #101⁶⁷⁷⁷ - Segfault when hpx::process::here() is called in fibonacci2
- Issue #102⁶⁷⁷⁸ - unknown_component_address in int_object_semaphore_client
- Issue #114⁶⁷⁷⁹ - marduk raises assertion with default parameters
- Issue #115⁶⁷⁸⁰ - Logging messages for SMP runs (on the console) shouldn't be buffered
- Issue #119⁶⁷⁸¹ - marduk linking strategy breaks other applications
- Issue #121⁶⁷⁸² - pbsdsh problem
- Issue #123⁶⁷⁸³ - marduk, dataflow and adaptive1d fail to build
- Issue #124⁶⁷⁸⁴ - Lower default preprocessing arity
- Issue #125⁶⁷⁸⁵ - Move hpx::detail::diagnostic_information out of the detail namespace
- Issue #126⁶⁷⁸⁶ - Test definitions for AGAS reference counting
- Issue #128⁶⁷⁸⁷ - Add averaging performance counter

2.11.3 Namespace changes

HPX V1.9.0 Namespace changes

The latest release includes amongst others changes in the namespaces so that *HPX* facilities correspond to the C++ Standard Library. The old namespaces are deprecated. Below is a comprehensive list of the namespace changes.

Table 2.194: Namespace changes in V1.9.0

Old namespace	New namespace
<code>hpx::util::mem_fn</code>	<code>hpx::mem_fn</code>
<code>hpx::util::invoke</code>	<code>hpx::invoke</code>
<code>hpx::util::invoke_r</code>	<code>hpx::invoke_r</code>
<code>hpx::util::invoke_fused</code>	<code>hpx::invoke_fused</code>
<code>hpx::util::invoke_fused_r</code>	<code>hpx::invoke_fused_r</code>
<code>hpx::util::unlock_guard</code>	<code>hpx::unlock_guard</code>
<code>hpx::parallel::v1::reduce_by_key</code>	<code>hpx::experimental::reduce_by_key</code>
<code>hpx::parallel::v1::sort_by_key</code>	<code>hpx::experimental::sort_by_key</code>
<code>hpx::parallel::task_canceled_exception</code>	<code>hpx::experimental::task_canceled_exception</code>
<code>hpx::parallel::task_block</code>	<code>hpx::experimental::task_block</code>
<code>hpx::parallel::define_task_block</code>	<code>hpx::experimental::define_task_block</code>
<code>hpx::parallel::define_task_block_restore_thread</code>	<code>hpx::experimental::define_task_block_restore_thread</code>
<code>hpx::execution::experimental::task_group</code>	<code>hpx::experimental::task_group</code>

2.12 Citing *HPX*

2.13 HPX users

A list of institutions and projects using *HPX* can be found on the [HPX Users](#)⁶⁸⁴⁰ page.

2.14 About HPX

2.14.1 History

The development of High Performance ParalleX (*HPX*) began in 2007. At that time, Hartmut Kaiser became interested in the work done by the ParalleX group at the [Center for Computation and Technology \(CCT\)](#)⁶⁸⁴¹, a multi-disciplinary research institute at [Louisiana State University \(LSU\)](#)⁶⁸⁴². The ParalleX group was working to develop a new and experimental execution model for future high performance computing architectures. This model was christened ParalleX. The first implementations of ParalleX were crude, and many of those designs had to be discarded entirely. However, over time the team learned quite a bit about how to design a parallel, distributed runtime system which implements the concepts of ParalleX.

From the very beginning, this endeavour has been a group effort. In addition to a handful of interested researchers, there have always been graduate and undergraduate students participating in the discussions, design, and implementation of *HPX*. In 2011 we decided to formalize our collective research efforts by creating the [STE||AR](#)⁶⁸⁴³ group (Systems Technology, Emergent Parallelism, and Algorithm Research). Over time, the team grew to include researchers around the country and the world. In 2014, the [STE||AR](#)⁶⁸⁴⁴ Group was reorganized to become the international community it is today. This consortium of researchers aims to develop stable, sustainable, and scalable tools which will enable application developers to exploit the parallelism latent in the machines of today and tomorrow. Our goal of the *HPX* project is to create a high quality, freely available, open source implementation of ParalleX concepts for conventional and future systems by building a modular and standards conforming runtime system for SMP and distributed application environments. The API exposed by *HPX* is conformant to the interfaces defined by the C++ ISO Standard and adheres to the programming guidelines used by the [Boost](#)⁶⁸⁴⁵ collection of C++ libraries. We steer the development of *HPX* with real world applications and aim to provide a smooth migration path for domain scientists.

To learn more about [STE||AR](#)⁶⁸⁴⁶ and ParalleX, see [People](#) and [Why HPX?](#).

2.14.2 People

The **STE||AR**⁶⁸⁴⁷ Group (pronounced as stellar) stands for “Systems Technology, Emergent Parallelism, and Algorithm Research”. We are an international group of faculty, researchers, and students working at various institutions around the world. The goal of the **STE||AR**⁶⁸⁴⁸ Group is to promote the development of scalable parallel applications by providing a community for ideas, a framework for collaboration, and a platform for communicating these concepts to the broader community.

Our work is focused on building technologies for scalable parallel applications. *HPX*, our general purpose C++ runtime system for parallel and distributed applications, is no exception. We use *HPX* for a broad range of scientific applications, helping scientists and developers to write code which scales better and shows better performance compared to more conventional programming models such as MPI.

HPX is based on *ParalleX* which is a new (and still experimental) parallel execution model aiming to overcome the limitations imposed by the current hardware and the techniques we use to write applications today. Our group focuses on two types of applications - those requiring excellent strong scaling, allowing for a dramatic reduction of execution time for fixed workloads and those needing highest level of sustained performance through massive parallelism. These applications are presently unable (through conventional practices) to effectively exploit a relatively small number of cores in a multi-core system. By extension, these application will not be able to exploit high-end exascale computing systems which are likely to employ hundreds of millions of such cores by the end of this decade.

Critical bottlenecks to the effective use of new generation high performance computing (HPC) systems include:

- *Starvation*: due to lack of usable application parallelism and means of managing it,
- *Overhead*: reduction to permit strong scalability, improve efficiency, and enable dynamic resource management,
- *Latency*: from remote access across system or to local memories,
- *Contention*: due to multicore chip I/O pins, memory banks, and system interconnects.

The *ParalleX* model has been devised to address these challenges by enabling a new computing dynamic through the application of message-driven computation in a global address space context with lightweight synchronization. The work on *HPX* is centered around implementing the concepts as defined by the *ParalleX* model. *HPX* is currently targeted at conventional machines, such as classical Linux based Beowulf clusters and SMP nodes.

We fully understand that the success of *HPX* (and *ParalleX*) is very much the result of the work of many people. To see a list of who is contributing see our tables below.

Acknowledgements

Thanks also to the following people who contributed directly or indirectly to the project through discussions, pull requests, documentation patches, etc.

- Panos Syskakis for benchmarking and optimizing our parallel algorithms.
- Shreyas Atre, for contributing fixes to our implementation of senders/receivers and extending our coroutines integration with senders/receivers.
- Alexander Neumann, for contributing fixes to the cmake build system.
- Dimitra Karatza, for her work on refactoring the documentation and providing a new user-friendly environment during and after Google Season of Docs 2021.
- Srinivas Yadav, for his work on SIMD support in algorithms before and during Google Summer of Code 2021.
- Akhil Nair, for his work on adapting algorithms to C++20 before and during Google Summer of Code 2021.
- Alexander Toktarev, for updating the parallel algorithm customization points to use `tag_fallback_invoke` for the default implementations.
- Brice Goglin, for reporting and helping fix issues related to the integration of hwloc in *HPX*.
- Giannis Gonidelis, for his work on the ranges adaptation during the Google Summer of Code 2020.
- Auriane Reverdell ([Swiss National Supercomputing Centre](https://www.cct.lsu.edu)⁶⁸⁷⁸), for her tireless work on refactoring our CMake setup and modularizing *HPX*.
- Christopher Hinz, for his work on refactoring our CMake setup.
- Weile Wei, for fixing *HPX* builds with CUDA on Summit.
- Severin Strobl, for fixing our CMake setup related to linking and adding new entry points to the *HPX* runtime.
- Rebecca Stobaugh, for her major documentation review and contributions during and after the 2019 Google Season of Documentation.
- Jan Melech, for adding automatic serialization of simple structs.
- Austin McCartney, for adding concept emulation of the Ranges TS bidirectional and random access iterator concepts.
- Marco Diers, reporting and fixing issues related PMIx.
- Maximilian Bremer, for reporting multiple issues and extending the component migration tests.

- Piotr Mikolajczyk, for his improvements and fixes to the set and count algorithms.
- Grant Rostig, for reporting several deficiencies on our web pages.
- Jakub Golinowski, for implementing an *HPX* backend for OpenCV and in the process improving documentation and reporting issues.
- Mikael Simberg ([Swiss National Supercomputing Centre](https://www.cscs.ch)⁶⁸⁷⁹), for his tireless help cleaning up and maintaining *HPX*.
- Tianyi Zhang, for his work on HPXMP.
- Shahrzad Shirzad, for her contributions related to Phylanx.
- Christopher Ogle, for his contributions to the parallel algorithms.
- Surya Priy, for his work with statistic performance counters.
- Anushi Maheshwari, for her work on random number generation.
- Bruno Pitrus, for his work with parallel algorithms.
- Nikunj Gupta, for rewriting the implementation of `hpx_main.hpp` and for his fixes for tests.
- Christopher Taylor, for his interest in *HPX* and the fixes he provided. Chris also contributed support for RISC-V architectures.
- Shoshana Jakobovits, for her work on the resource partitioner.
- Denis Blank, who re-wrote our unwrapped function to accept plain values arbitrary containers, and properly deal with nested futures.
- Ajai V. George, who implemented several of the parallel algorithms.
- Taeguk Kwon, who worked on implementing parallel algorithms as well as adapting the parallel algorithms to the Ranges TS.
- Zach Byerly ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁸⁸⁰), who in his work developing applications on top of *HPX* opened tickets and contributed to the *HPX* examples.
- Daniel Estermann, for his work porting *HPX* to the Raspberry Pi.
- Alireza Kheirkhahan ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁸⁸¹), who built and administered our local cluster as well as his work in distributed IO.
- Abhimanyu Rawat, who worked on stack overflow detection.
- David Pfander, who improved signal handling in *HPX*, provided his optimization expertise, and worked on incorporating the Vc vectorization into *HPX*.
- Denis Demidov, who contributed his insights with VexCL.
- Khalid Hasanov, who contributed changes which allowed to run *HPX* on 64Bit power-pc architectures.
- Zahra Khatami ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁸⁸²), who contributed the prefetching iterators and the persistent auto chunking executor parameters implementation.
- Marcin Copik, who worked on implementing GPU support for C++AMP and HCC. He also worked on implementing a HCC backend for *HPX.Compute*.

⁶⁸⁸⁰ <https://www.lsu.edu>

⁶⁸⁸¹ <https://www.lsu.edu>

⁶⁸⁸² <https://www.lsu.edu>

- Minh-Khanh Do, who contributed the implementation of several segmented algorithms.
- Bibek Wagle ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁸⁸³), who worked on fixing and analyzing the performance of the *parcel* coalescing plugin in *HPX*.
- Lukas Troska, who reported several problems and contributed various test cases allowing to reproduce the corresponding issues.
- Andreas Schaefer, who worked on integrating his library ([LibGeoDecomp](https://www.libgeodecomp.org/)⁶⁸⁸⁴) with *HPX*. He reported various problems and submitted several patches to fix issues allowing for a better integration with [LibGeoDecomp](https://www.libgeodecomp.org/)⁶⁸⁸⁵.
- Satyaki Upadhyay, who contributed several examples to *HPX*.
- Brandon Cordes, who contributed several improvements to the inspect tool.
- Harris Brakmic, who contributed an extensive build system description for building *HPX* with Visual Studio.
- Parsa Amini ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁸⁸⁶), who refactored and simplified the implementation of *AGAS* in *HPX* and who works on its implementation and optimization.
- Luis Martinez de Bartolome who implemented a build system extension for *HPX* integrating it with the [Conan](https://www.conan.io/)⁶⁸⁸⁷ C/C++ package manager.
- Vinay C Amatya ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁸⁸⁸), who contributed to the documentation and provided some of the *HPX* examples.
- Kevin Huck and Nick Chaimov ([University of Oregon](https://uoregon.edu/)⁶⁸⁸⁹), who contributed the integration of APEX (Autonomic Performance Environment for eXascale) with *HPX*.
- Francisco Jose Tapia, who helped with implementing the parallel sort algorithm for *HPX*.
- Patrick Diehl, who worked on implementing CUDA support for our companion library targeting GPGPUs (*HPXCL*⁶⁸⁹⁰).
- Eric Lemanissier contributed fixes to allow compilation using the MingW toolchain.
- Nidhi Makhijani who helped cleaning up some enum consistencies in *HPX* and contributed to the resource manager used in the thread scheduling subsystem. She also worked on *HPX* in the context of the Google Summer of Code 2015.
- Larry Xiao, Devang Bacharwar, Marcin Copik, and Konstantin Kronfeldner who worked on *HPX* in the context of the Google Summer of Code program 2015.
- Daniel Bourgeois ([Center for Computation and Technology \(CCT\)](https://www.cct.lsu.edu)⁶⁸⁹¹) who contributed to *HPX* the implementation of several parallel algorithms (as proposed by [N4313](http://wg21.link/n4313)⁶⁸⁹²).
- Anuj Sharma and Christopher Bross ([Department of Computer Science 3 - Computer Architecture](https://www3.cs.fau.de)⁶⁸⁹³), who worked on *HPX* in the context of the Google Summer of Code⁶⁸⁹⁴ program 2014.

- Martin Stumpf (Department of Computer Science 3 - Computer Architecture⁶⁸⁹⁵), who rebuilt our contiguous testing infrastructure (see the *HPX Buildbot Website*⁶⁸⁹⁶). Martin is also working on *HPXCL*⁶⁸⁹⁷ (mainly all work related to *OpenCL*⁶⁸⁹⁸) and implementing an *HPX* backend for *POCL*⁶⁸⁹⁹, a portable computing language solution based on *OpenCL*⁶⁹⁰⁰.
- Grant Mercer (University of Nevada, Las Vegas⁶⁹⁰¹), who helped creating many of the parallel algorithms (as proposed by N4313⁶⁹⁰²).
- Damond Howard (Louisiana State University (LSU)⁶⁹⁰³), who works on *HPXCL*⁶⁹⁰⁴ (mainly all work related to *CUDA*⁶⁹⁰⁵).
- Christoph Junghans (Los Alamos National Lab), who helped making our buildsystem more portable.
- Antoine Tran Tan (Laboratoire de Recherche en Informatique, Paris), who worked on integrating *HPX* as a backend for *NT2*⁶⁹⁰⁶. He also contributed an implementation of an API similar to Fortran co-arrays on top of *HPX*.
- John Biddiscombe (Swiss National Supercomputing Centre⁶⁹⁰⁷), who helped with the BlueGene/Q port of *HPX*, implemented the parallel sort algorithm, and made several other contributions.
- Erik Schnetter (Perimeter Institute for Theoretical Physics), who greatly helped to make *HPX* more robust by submitting a large amount of problem reports, feature requests, and made several direct contributions.
- Mathias Gaunard (Metascale), who contributed several patches to reduce compile time warnings generated while compiling *HPX*.
- Andreas Buhr, who helped with improving our documentation, especially by suggesting some fixes for inconsistencies.
- Patricia Grubel (New Mexico State University⁶⁹⁰⁸), who contributed the description of the different *HPX* thread scheduler policies and is working on the performance analysis of our thread scheduling subsystem.
- Lars Viklund, whose wit, passion for testing, and love of odd architectures has been an amazing contribution to our team. He has also contributed platform specific patches for FreeBSD and MSVC12.
- Agustin Berge, who contributed patches fixing some very nasty hidden template meta-programming issues. He rewrote large parts of the API elements ensuring strict conformance with the C++ ISO Standard.
- Anton Bikineev for contributing changes to make using `boost::lexical_cast` safer, he also contributed a thread safety fix to the `iostreams` module. He also contributed a

`hpx::ranges::experimental::for_loop_strided` (C++ function), 1132, 1134, 1135, 1137
`hpx::ranges::fill` (C++ function), 1273–1275
`hpx::ranges::fill_n` (C++ function), 1276–1278
`hpx::ranges::fold_left` (C++ function), 1436, 1437
`hpx::ranges::fold_left_first` (C++ function), 1438
`hpx::ranges::fold_left_first_with_iter` (C++ function), 1443
`hpx::ranges::fold_left_with_iter` (C++ function), 1442
`hpx::ranges::fold_right` (C++ function), 1439, 1440
`hpx::ranges::fold_right_last` (C++ function), 1440, 1441
`hpx::ranges::for_each` (C++ function), 1105–1108
`hpx::ranges::for_each_n` (C++ function), 1109, 1110
`hpx::ranges::generate` (C++ function), 1091–1093
`hpx::ranges::generate_n` (C++ function), 1094, 1096
`hpx::ranges::includes` (C++ function), 1183, 1185, 1186, 1188
`hpx::ranges::inclusive_scan` (C++ function), 1299, 1300, 1302, 1303, 1305, 1306, 1308, 1309
`hpx::ranges::inplace_merge` (C++ function), 1392–1395
`hpx::ranges::iota` (C++ function), 1088–1090
`hpx::ranges::is_heap` (C++ function), 1217–1220
`hpx::ranges::is_heap_until` (C++ function), 1221–1224
`hpx::ranges::is_partitioned` (C++ function), 1225–1228
`hpx::ranges::is_sorted` (C++ function), 1139, 1140, 1142, 1143
`hpx::ranges::is_sorted_until` (C++ function), 1144–1147
`hpx::ranges::lexicographical_compare` (C++ function), 1344, 1346, 1348, 1349
`hpx::ranges::make_heap` (C++ function), 1288–1294
`hpx::ranges::max_element` (C++ function), 1363–1366
`hpx::ranges::merge` (C++ function), 1384, 1386, 1389, 1390
`hpx::ranges::min_element` (C++ function), 1358–1361
`hpx::ranges::minmax_element` (C++ function), 1368–1371
`hpx::ranges::mismatch` (C++ function), 1352, 1354, 1355, 1357
`hpx::ranges::move` (C++ function), 1169, 1171, 1172
`hpx::ranges::none_of` (C++ function), 1244–1247
`hpx::ranges::nth_element` (C++ function), 1489–1492
`hpx::ranges::partial_sort` (C++ function), 1396, 1397, 1399, 1400
`hpx::ranges::partial_sort_copy` (C++ function), 1332, 1333, 1335, 1336
`hpx::ranges::partition` (C++ function), 1256, 1257, 1259, 1260
`hpx::ranges::partition_copy` (C++ function), 1266, 1268, 1270, 1271
`hpx::ranges::reduce` (C++ function), 1156, 1157, 1159–1162, 1164–1168
`hpx::ranges::remove` (C++ function), 1449–1452
`hpx::ranges::remove_if` (C++ function), 1454–1457
`hpx::ranges::replace` (C++ function), 1195–1198

`hpx::ranges::replace_copy` (C++ function), 1205–1207, 1209

`hpx::ranges::replace_copy_if` (C++ function), 1211–1213, 1215

`hpx::ranges::replace_if` (C++ function), 1200–1203

`hpx::ranges::reverse` (C++ function), 1311–1313

`hpx::ranges::reverse_copy` (C++ function), 1314–1316

`hpx::ranges::rotate` (C++ function), 1096–1099

`hpx::ranges::rotate_copy` (C++ function), 1100, 1101, 1103

`hpx::ranges::search` (C++ function), 1416, 1417, 1419, 1420

`hpx::ranges::search_n` (C++ function), 1422, 1423, 1425, 1426

`hpx::ranges::set_difference` (C++ function), 1149, 1151, 1153, 1154

`hpx::ranges::set_intersection` (C++ function), 1248, 1250, 1252, 1254

`hpx::ranges::set_symmetric_difference` (C++ function), 1428, 1430, 1432, 1434

`hpx::ranges::set_union` (C++ function), 1378, 1380, 1382

`hpx::ranges::shift_left` (C++ function), 1084–1086

`hpx::ranges::shift_right` (C++ function), 1080–1082

`hpx::ranges::sort` (C++ function), 1327–1330

`hpx::ranges::stable_partition` (C++ function), 1261, 1262, 1264, 1265

`hpx::ranges::stable_sort` (C++ function), 1323–1326

`hpx::ranges::starts_with` (C++ function), 1444, 1445, 1447, 1448

`hpx::ranges::swap_ranges` (C++ function), 1284, 1286

`hpx::ranges::transform` (C++ function), 1173, 1174, 1176, 1178–1181

`hpx::ranges::transform_exclusive_scan` (C++ function), 1494, 1496, 1498, 1499

`hpx::ranges::transform_inclusive_scan` (C++ function), 1401, 1403, 1405, 1406, 1408, 1410, 1412, 1413

`hpx::ranges::uninitialized_copy` (C++ function), 1189–1192

`hpx::ranges::uninitialized_copy_n` (C++ function), 1193, 1194

`hpx::ranges::uninitialized_default_construct` (C++ function), 1318–1320

`hpx::ranges::uninitialized_default_construct_n` (C++ function), 1321, 1322

`hpx::ranges::uninitialized_fill` (C++ function), 1074–1077

`hpx::ranges::uninitialized_fill_n` (C++ function), 1078

`hpx::ranges::uninitialized_move` (C++ function), 1502–1505

`hpx::ranges::uninitialized_move_n` (C++ function), 1506, 1507

`hpx::ranges::uninitialized_value_construct` (C++ function), 1373–1375

`hpx::ranges::uninitialized_value_construct_n` (C++ function), 1376, 1377

`hpx::ranges::unique` (C++ function), 1463–1466

`hpx::ranges::unique_copy` (C++ function), 1468, 1469, 1471, 1472

`hpx::recursive_mutex` (C++ type), 1865

`hpx::reduce` (C++ function), 838–840, 842–844

`hpx::reduce_deterministic` (C++ function), 785, 787–791

`hpx::ref` (C++ function), 1744

`hpx::reference_wrapper` (C++ function), 1743

`hpx::register_on_exit` (C++ function), 1828

`hpx::register_pre_shutdown_function` (C++ function), 1823

`hpx::register_pre_startup_function` (C++ function), 1852

`hpx::register_shutdown_function` (C++ function), 1824

`hpx::register_startup_function` (C++ function), 1853

`hpx::register_thread` (C++ function), 1825

`hpx::register_thread_on_error_func` (C++ function), 1819

`hpx::register_thread_on_start_func` (C++ function), 1819

`hpx::register_thread_on_stop_func` (C++ function), 1819
