*raw\_values* counter exposes an array of measured values instead of a single value as many of the other counter types. Counters of this type expose a *counter\_value\_array* instead of a *counter\_value*. Those will also not implement the *get\_counter\_value()* functionality. The results are exposed through a separate *get\_counter\_values\_array()* function.

enum class **counter\_status** : *std::uint8\_t*

*Values:*

enumerator **valid\_data**

No error occurred, data is valid.

enumerator **new\_data**

Data is valid and different from last call.

enumerator **invalid\_data**

Some error occurred, data is not value.

enumerator **already\_defined**

The type or instance already has been defined.

enumerator **counter\_unknown**

The counter instance is unknown.

enumerator **counter\_type\_unknown**

The counter type is unknown.

enumerator **generic\_error**

A unknown error occurred.

enumerator **valid\_data**

enumerator **new\_data**

enumerator **invalid\_data**

enumerator **already\_defined**

enumerator **counter\_unknown**

enumerator **counter\_type\_unknown**

enumerator **generic\_error**

enum class **discover\_counters\_mode** : *std::uint8\_t*

*Values:*

enumerator **minimal**

enumerator **full**

## Functions

*std::string* &**ensure\_counter\_prefix**(*std::string* &name)

*std::string* **ensure\_counter\_prefix**(*std::string* const &counter)

*std::string* &**remove\_counter\_prefix**(*std::string* &name)

*std::string* **remove\_counter\_prefix**(*std::string* const &counter)

inline constexpr bool **operator<**(*counter\_type* lhs, *counter\_type* rhs) noexcept

inline constexpr bool **operator>**(*counter\_type* lhs, *counter\_type* rhs) noexcept

char const \***get\_counter\_type\_name**(*counter\_type* state)

*std::ostream* &**operator<<**(*std::ostream* &os, *counter\_status* rhs)

*counter\_status* **get\_counter\_type\_name**(*counter\_type\_path\_elements* const &path, *std::string* &result,  
*error\_code* &ec = *throws*)

Create a full name of a counter type from the contents of the given *counter\_type\_path\_elements* instance. The generated counter type name will not contain any parameters.

*counter\_status* **get\_full\_counter\_type\_name**(*counter\_type\_path\_elements* const &path, *std::string* &result, *error\_code* &ec = throws)

Create a full name of a counter type from the contents of the given *counter\_type\_path\_elements* instance. The generated counter type name will contain all parameters.

*counter\_status* **get\_counter\_name**(*counter\_path\_elements* const &path, *std::string* &result, *error\_code* &ec = throws)

Create a full name of a counter from the contents of the given *counter\_path\_elements* instance.

*counter\_status* **get\_counter\_instance\_name**(*counter\_path\_elements* const &path, *std::string* &result, *error\_code* &ec = throws)

Create a name of a counter instance from the contents of the given *counter\_path\_elements* instance.

*counter\_status* **get\_counter\_type\_path\_elements**(*std::string* const &name, *counter\_type\_path\_elements* &path, *error\_code* &ec = throws)

Fill the given *counter\_type\_path\_elements* instance from the given full name of a counter type.

*counter\_status* **get\_counter\_path\_elements**(*std::string* const &name, *counter\_path\_elements* &path, *error\_code* &ec = throws)

Fill the given *counter\_path\_elements* instance from the given full name of a counter.

*counter\_status* **get\_counter\_name**(*std::string* const &name, *std::string* &countername, *error\_code* &ec = throws)

Return the canonical counter instance name from a given full instance name.

*counter\_status* **get\_counter\_type\_name**(*std::string* const &name, *std::string* &type\_name, *error\_code* &ec = throws)

Return the canonical counter type name from a given (full) instance name.

**HPX\_DEPRECATED\_V (1, 9, HPX\_DISCOVER\_COUNTERS\_MODE\_UNSCOPED\_ENUM\_DEPRECATION\_MSG) inline const expr discover\_counters\_**

*counter\_status* **complement\_counter\_info**(*counter\_info* &info, *counter\_info* const &type\_info, *error\_code* &ec = throws)

Complement the counter info if parent instance name is missing.

*counter\_status* **complement\_counter\_info**(*counter\_info* &info, *error\_code* &ec = throws)

*counter\_status* **add\_counter\_type**(*counter\_info* const &info, *create\_counter\_func* const &create\_counter, *discover\_counters\_func* const &discover\_counters, *error\_code* &ec = throws)

*counter\_status* **add\_counter\_type**(*counter\_info* const &info, *error\_code* &ec = throws)

*counter\_status* **discover\_counter\_types**(*discover\_counter\_func* const &discover\_counter, *discover\_counters\_mode* mode = *discover\_counters\_mode::minimal*, *error\_code* &ec = throws)

Call the supplied function for each registered counter type.

*counter\_status* **discover\_counter\_types**(*std::vector<counter\_info>* &counters, *discover\_counters\_mode* mode = *discover\_counters\_mode::minimal*, *error\_code* &ec = throws)

Return a list of all available counter descriptions.

```
counter_status discover_counter_type(std::string const &name, discover_counter_func const  
    &discover_counter, discover_counters_mode mode =  
    discover_counters_mode::minimal, error_code &ec =  
    throws)
```

Call the supplied function for the given registered counter type.

```
counter_status discover_counter_type(counter_info const &info, discover_counter_func const  
    &discover_counter, discover_counters_mode mode =  
    discover_counters_mode::minimal, error_code &ec =  
    throws)
```

```
counter_status discover_counter_type(std::string const &name, std::vector<counter_info>  
    &counters, discover_counters_mode mode =  
    discover_counters_mode::minimal, error_code &ec =  
    throws)
```

Return a list of matching counter descriptions for the given registered counter type.

```
counter_status discover_counter_type(counter_info const &info, std::vector<counter_info>  
    &counters, discover_counters_mode mode =  
    discover_counters_mode::minimal, error_code &ec =  
    throws)
```

```
bool expand_counter_info(counter_info const&, discover_counter_func const&, error_code&)  
    call the supplied function will all expanded versions of the supplied counter info.
```

This function expands all locality#\* and worker-thread#\* wild cards only.

```
counter_status remove_counter_type(counter_info const &info, error_code &ec = throws)
```

Remove an existing counter type from the (local) registry.

---

**Note:** This doesn't remove existing counters of this type, it just inhibits defining new counters using this type.

---

```
counter_status get_counter_type(std::string const &name, counter_info &info, error_code &ec =  
    throws)
```

Retrieve the counter type for the given counter name from the (local) registry.

```
hpx::future<hpx::id_type> get_counter_async(std::string name, error_code &ec = throws)
```

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter name.

```
hpx::future<hpx::id_type> get_counter_async(counter_info const &info, error_code &ec = throws)
```

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter info.

```
hpx::id_type get_counter(std::string const &name, error_code &ec)
```

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter name.

```
hpx::id_type get_counter(counter_info const &info, error_code &ec = throws)
```

Get the global id of an existing performance counter, if the counter does not exist yet, the function attempts to create the counter based on the given counter info.

```
void get_counter_infos(counter_info const &info, counter_type &type, std::string &helptext,
                      std::uint32_t &version, error_code &ec = throws)
```

Retrieve the meta data specific for the given counter instance.

```
void get_counter_infos(std::string name, counter_type &type, std::string &helptext, std::uint32_t
                      &version, error_code &ec = throws)
```

Retrieve the meta data specific for the given counter instance.

## Variables

## plugin\_factories

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/plugin\_factories/plugin\_registry.hpp

Defined in header `hpx/plugin_factories/plugin_registry.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace plugins
```

```
template<typename Plugin, char const *const Name, char const *const Section, char const *const Suffix>
```

```
struct plugin_registry : public plugin_registry_base
```

*#include <plugin\_registry.hpp>* The `plugin_registry` provides a minimal implementation of a plugin's registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a plugin's registry instance.

#### Template Parameters

**Plugin** – The plugin type this registry should be responsible for.

### Public Functions

```
inline bool get_plugin_info(std::vector<std::string> &fillini) override
```

Return the ini-information for all contained components.

#### Parameters

**fillini** – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.

#### Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

### hpx/plugin\_factories/binary\_filter\_factory.hpp

Defined in header `hpx/plugin_factories/binary_filter_factory.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

namespace **plugins**

template<typename **BinaryFilter**>

struct **binary\_filter\_factory** : public binary\_filter\_factory\_base

*#include <binary\_filter\_factory.hpp>* The *message\_handler\_factory* provides a minimal implementation of a message handler's factory. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a message handler's factory instance.

#### Template Parameters

**BinaryFilter** – The message handler type this factory should be responsible for.

### Public Functions

inline **binary\_filter\_factory**(*util::section* const \*global, *util::section* const \*local, bool isenabled)

Construct a new factory instance.

---

**Note:** The contents of both sections has to be cloned in order to save the configuration setting for later use.

---

#### Parameters

- **global** – [in] The pointer to a *hpx::util::section* instance referencing the settings read from the [settings] section of the global configuration file (hpx.ini) This pointer may be nullptr if no such section has been found.
- **local** – [in] The pointer to a *hpx::util::section* instance referencing the settings read from the section describing this component type: [hpx.components.<name>], where <name> is the instance name of the component as given in the configuration files.
- **isenabled** –

~**binary\_filter\_factory**() override = default

inline *serialization::binary\_filter* \***create**(bool compress, *serialization::binary\_filter* \*next\_filter = nullptr) override

Create a new instance of a message handler

return Returns the newly created instance of the message handler supported by this factory

### Protected Attributes

*util::section* **global\_settings\_**

*util::section* **local\_settings\_**

bool **isenabled\_**

### **hpx/plugin\_factories/parcelport\_factory.hpp**

Defined in header `hpx/plugin_factories/parcelport_factory.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### **hpx/plugin\_factories/message\_handler\_factory.hpp**

Defined in header `hpx/plugin_factories/message_handler_factory.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### **runtime\_components**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### **hpx/runtime\_components/macros.hpp**

Defined in header `hpx/runtime_components/macros.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## **Defines**

**HPX\_REGISTER\_MINIMAL\_COMPONENT\_FACTORY(...)**

## hpx/runtime\_components/components\_fwd.hpp

Defined in header `hpx/runtime_components/components_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

### Functions

`components::server::runtime_support *get_runtime_support_ptr()`

namespace **components**

template<typename **Component**>

struct **component\_factory**

namespace **server**

namespace **stubs**

namespace **components**

## hpx::new\_

Defined in header `hpx/components.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

### Functions

template<typename **Component**, typename ...**Ts**>

auto **new\_**(id\_type const &locality, *Ts*&&... vs)

Create one or more new instances of the given **Component** type on the specified locality.

This function creates one or more new instances of the given **Component** type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

---

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =  
    hpx::new_<some_component>(hpx::find_here(), ...);  
hpx::id_type id = f.get();
```

---

### Parameters

- **locality** – [in] The global address of the locality where the new instance should be created on.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

### Returns

The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```
template<typename Component, typename ...Ts>
auto local_new(Ts&&... vs)
```

Create one new instance of the given *Component* type on the current locality.

This function creates one new instance of the given *Component* type on the current locality and returns a future object for the global address which can be used to reference the new component instance.

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
    hpx::local_new<some_component>(...);
hpx::id_type id = f.get();
```

**Note:** The difference of this function to `hpx::new_` is that it can be used in cases where the supplied arguments are non-copyable and non-movable. All operations are guaranteed to be local only.

### Parameters

- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

### Returns

The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an `hpx::future` object instance which can be used to retrieve the global address of the newly created component. If the first argument is `hpx::launch::sync` the function will directly return an `hpx::id_type`.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will

return a new instance of that type which can be used to refer to the newly created component instance.

```
template<typename Component, typename ...Ts>  
auto new_(id_type const &locality, std::size_t count, Ts&&... vs)
```

Create multiple new instances of the given *Component* type on the specified locality.

This function creates multiple new instances of the given *Component* type on the specified locality and returns a future object for the global address which can be used to reference the new component instance.

---

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<std::vector<hpx::id_type> > f =  
    hpx::new_<some_component[]>(hpx::find_here(), 10, ...);  
hpx::id_type id = f.get();
```

---

### Parameters

- **locality** – [in] The global address of the locality where the new instance should be created on.
- **count** – [in] The number of component instances to create
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

### Returns

The function returns different types depending on its use:

- If the explicit template argument *Component* represents an array of a component type (i.e. *Component*[], where `traits::is_component<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a global address of one of the newly created components.
- If the explicit template argument *Component* represents an array of a client side object type (i.e. *Component*[], where `traits::is_client<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

```
template<typename Component, typename DistPolicy, typename ...Ts>  
auto new_(DistPolicy const &policy, Ts&&... vs)
```

Create one or more new instances of the given *Component* type based on the given distribution policy.

This function creates one or more new instances of the given *Component* type on the localities defined by the given distribution policy and returns a future object for global address which can be used to reference the new component instance(s).

---

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<hpx::id_type> f =
    hpx::new_<some_component>(hpx::default_layout, ...);
hpx::id_type id = f.get();
```

### Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

### Returns

The function returns different types depending on its use:

- If the explicit template argument *Component* represents a component type (`traits::is_component<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which can be used to retrieve the global address of the newly created component.
- If the explicit template argument *Component* represents a client side object (`traits::is_client<Component>::value` evaluates to true), the function will return a new instance of that type which can be used to refer to the newly created component instance.

```
template<typename Component, typename DistPolicy, typename ...Ts>
auto new_(DistPolicy const &policy, std::size_t count, Ts&&... vs)
```

Create multiple new instances of the given Component type on the localities as defined by the given distribution policy.

This function creates multiple new instances of the given Component type on the localities defined by the given distribution policy and returns a future object for the global address which can be used to reference the new component instance.

**Note:** This function requires to specify an explicit template argument which will define what type of component(s) to create, for instance:

```
hpx::future<std::vector<hpx::id_type> > f =
    hpx::new_<some_component[]>(hpx::default_layout, 10, ...);
hpx::id_type id = f.get();
```

### Parameters

- **policy** – [in] The distribution policy used to decide where to place the newly created.
- **count** – [in] The number of component instances to create
- **vs** – [in] Any number of arbitrary arguments (passed by value, by const reference or by rvalue reference) which will be forwarded to the constructor of the created component instance.

### Returns

The function returns different types depending on its use:

- If the explicit template argument *Component* represents an array of a component type (i.e. *Component*[], where `traits::is_component<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a global address of one of the newly created components.
- If the explicit template argument *Component* represents an array of a client side object type (i.e. *Component*[], where `traits::is_client<Component>::value` evaluates to true), the function will return an *hpx::future* object instance which holds a `std::vector<hpx::id_type>`, where each of the items in this vector is a client side instance of the given type, each representing one of the newly created components.

## HPX\_REGISTER\_COMPONENT

Defined in header `hpx/components.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### Defines

**HPX\_REGISTER\_COMPONENT**(type, name, mode)

Define a component factory for a component type.

This macro is used create and to register a minimal component factory for a component type which allows it to be remotely created using the *hpx::new\_<>* function.

This macro can be invoked with one, two or three arguments

#### Parameters

- **type** – The *type* parameter is a (fully decorated) type of the component type for which a factory should be defined.
- **name** – The *name* parameter specifies the name to use to register the factory. This should uniquely (system-wide) identify the component type. The *name* parameter must conform to the C++ identifier rules (without any namespace). If this parameter is not given, the first parameter is used.
- **mode** – The *mode* parameter has to be one of the defined enumeration values of the enumeration *hpx::components::factory\_state*. The default for this parameter is *hpx::components::factory\_state::enabled*.

## hpx/runtime\_components/component\_registry.hpp

Defined in header `hpx/runtime_components/component_registry.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

template<typename **Component**, *factory\_state* **state**>

struct **component\_registry** : public *component\_registry\_base*

*#include <component\_registry.hpp>* The *component\_registry* provides a minimal implementation of a component's registry. If no additional functionality is required this type can be used to implement the full set of minimally required functions to be exposed by a component's registry instance.

#### Template Parameters

**Component** – The component type this registry should be responsible for.

### Public Functions

inline bool **get\_component\_info**(*std::vector<std::string>* &fillini, *std::string* const &filepath, bool is\_static = false) override

Return the ini-information for all contained components.

#### Parameters

- **fillini** – [in] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** –
- **is\_static** –

#### Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

inline void **register\_component\_type**() override

Enables this type of registry and sets its destroy mechanism.

## runtime\_distributed

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/runtime\_distributed.hpp

Defined in header *hpx/runtime\_distributed.hpp*.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **runtime\_distributed** : public *runtime*

*#include <runtime\_distributed.hpp>* The *runtime* class encapsulates the *HPX* runtime system in a simple to use way. It makes sure all required parts of the *HPX* runtime system are properly initialized.

## Public Functions

explicit **runtime\_distributed**(util::runtime\_configuration &rtcfg, int (\*pre\_main)(runtime\_mode) = nullptr, void (\*post\_main)() = nullptr)

Construct a new HPX runtime instance

### Parameters

- **rtcfg** – Runtime configuration for this instance
- **pre\_main** – Function to be called before running the main action of this instance
- **post\_main** – Function to be called after running the main action of this instance

**~runtime\_distributed**()

The destructor makes sure all HPX runtime services are properly shut down before exiting.

int **start**(hpx::function<hpx\_main\_function\_type> const &func, bool blocking = false) override

Start the runtime system.

### Parameters

- **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx\_main\_function\_type*.
- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally.

### Returns

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter *func*. Otherwise it will return zero.

int **start**(bool blocking = false) override

Start the runtime system.

### Parameters

**blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally .

### Returns

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter *func*. Otherwise it will return zero.

int **wait**() override

Wait for the shutdown action to be executed.

### Returns

This function will return the value as returned as the result of the invocation of the function object given by the parameter *func*.

void **stop**(bool blocking = true) override

Initiate termination of the runtime system.

### Parameters

**blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

int **finalize**(double shutdown\_timeout) override

void **stop\_helper**(bool blocking, std::condition\_variable &cond, std::mutex &mtx)

Stop the runtime system, wait for termination.

**Parameters**

- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.
- **cond** – Condition used to update all thread when done
- **mtx** – Mutex used by this function to sync all threads

int **suspend**() override

Suspend the runtime system.

int **resume**() override

Resume the runtime system.

bool **report\_error**(std::size\_t num\_thread, std::exception\_ptr const &e, bool terminate\_all = true) override

Report a non-recoverable error to the runtime system.

**Parameters**

- **num\_thread** – [in] The number of the operating system thread the error has been detected in.
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate\_all** – [in] Kill all localities attached to the currently running application (default: true)

bool **report\_error**(std::exception\_ptr const &e, bool terminate\_all = true) override

Report a non-recoverable error to the runtime system.

---

**Note:** This function will retrieve the number of the current shepherd thread and forward to the `report_error` function above.

---

**Parameters**

- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate\_all** – [in] Kill all localities attached to the currently running application (default: true)

int **run**(hpx::function<hpx\_main\_function\_type> const &func) override

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

---

**Note:** The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

---

**Parameters**

**func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx\_main\_function\_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

**Returns**

This function will return the value as returned as the result of the invocation of the function object given by the parameter *func*.

int **run()** override

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

**Returns**

This function will always return 0 (zero).

bool **is\_networking\_enabled()** override

template<typename F>

inline *components::server::console\_error\_dispatcher::sink\_type* **set\_error\_sink**(F &&sink)

*performance\_counters::registry* &**get\_counter\_registry**()

Allow access to the registry counter registry instance used by the HPX runtime.

*performance\_counters::registry* const &**get\_counter\_registry**() const

Allow access to the registry counter registry instance used by the HPX runtime.

void **register\_query\_counters**(*std::shared\_ptr<util::query\_counters>* const &active\_counters)

void **start\_active\_counters**(*error\_code* &ec = *throws*) const

void **stop\_active\_counters**(*error\_code* &ec = *throws*) const

void **reset\_active\_counters**(*error\_code* &ec = *throws*) const

void **reinit\_active\_counters**(bool reset = true, *error\_code* &ec = *throws*) const

void **evaluate\_active\_counters**(bool reset = false, char const \*description = nullptr, *error\_code* &ec = *throws*) const

void **stop\_evaluating\_counters**(bool terminate = false) const

*agas::addressing\_service* &**get\_agas\_client**()

Allow access to the AGAS client instance used by the HPX runtime.

*hpx::threads::threadmanager* &**get\_thread\_manager**() override

Allow access to the thread manager instance used by the HPX runtime.

*applier::applier* &**get\_applier**()

Allow access to the applier instance used by the HPX runtime.

*std::string* **here**() const override

Returns a string of the locality endpoints (usable in debug output)

*naming::address\_type* **get\_runtime\_support\_lva**() const

*naming::gid\_type* **get\_next\_id**(*std::size\_t* count = 1)

void **init\_id\_pool\_range**()

*util::unique\_id\_ranges* &**get\_id\_pool**()

void **initialize\_agas**()

Initialize AGAS operation.

void **add\_pre\_startup\_function**(*startup\_function\_type* f) override

Add a function to be executed inside a HPX thread before `hpx_main` but guaranteed to be executed before any startup function registered with `add_startup_function`.

---

**Note:** The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

---

**Parameters**

**f** – The function ‘f’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

void **add\_startup\_function**(*startup\_function\_type* f) override

Add a function to be executed inside a HPX thread before `hpx_main`

**Parameters**

**f** – The function ‘f’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to setup the runtime environment of the application (install performance counters, etc.)

void **add\_pre\_shutdown\_function**(*shutdown\_function\_type* f) override

Add a function to be executed inside a HPX thread during `hpx::finalize`, but guaranteed before any of the shutdown functions is executed.

---

**Note:** The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

---

**Parameters**

**f** – The function ‘f’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

void **add\_shutdown\_function**(*shutdown\_function\_type* f) override

Add a function to be executed inside a HPX thread during `hpx::finalize`

**Parameters**

**f** – The function ‘f’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

*hpx::util::io\_service\_pool* \***get\_thread\_pool**(char const \*name) override

Access one of the internal thread pools (`io_service` instances) HPX is using to perform specific tasks. The three possible values for the argument name are “main\_pool”, “io\_pool”, “parcel\_pool”, and “timer\_pool”. For any other argument value the function will return zero.

bool **register\_thread**(char const \*name, *std::size\_t* num = 0, bool service\_thread = true, *error\_code* &ec = *throws*) override

Register an external OS-thread with HPX.

*notification\_policy\_type* **get\_notification\_policy**(char const \*prefix, *runtime\_local::os\_thread\_type* type) override

Generate a new notification policy instance for the given thread name prefix

*std::uint32\_t* **get\_locality\_id**(*error\_code* &ec) const override

```
std::size_t get_num_worker_threads() const override  
  
std::uint32_t get_num_localities(hpx::launch::sync_policy, error_code &ec) const override  
  
std::uint32_t get_initial_num_localities() const override  
  
hpx::future<std::uint32_t> get_num_localities() const override  
  
std::string get_locality_name() const override  
  
std::uint32_t get_num_localities(hpx::launch::sync_policy, components::component_type type,  
                                error_code &ec) const  
  
hpx::future<std::uint32_t> get_num_localities(components::component_type type) const  
  
std::uint32_t assign_cores(std::string const &locality_basename, std::uint32_t num_threads) override  
  
std::uint32_t assign_cores() override
```

## Public Static Functions

```
static void register_counter_types()  
    Install all performance counters related to this runtime instance.
```

## Private Types

```

## Private Static Functions

static void **default\_errorsink**(*std::string* const&)

## hpx/runtime\_distributed/get\_locality\_name.hpp

Defined in header `hpx/runtime_distributed/get_locality_name.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

## Functions

*future<std::string>* **get\_locality\_name**(*hpx::id\_type* const &id)

Return the name of the referenced locality.

This function returns a future referring to the name for the locality of the given id.

### See also:

*std::string* *get\_locality\_name*()

### Parameters

**id** – [in] The global id of the locality for which the name should be retrieved

**Returns**

This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

**hpx/runtime\_distributed/applier\_fwd.hpp**

Defined in header `hpx/runtime_distributed/applier_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **applier**

**Functions**

*applier* &**get\_applier**()

The function *get\_applier* returns a reference to the (thread specific) applier instance.

*applier* \***get\_applier\_ptr**()

The function *get\_applier* returns a pointer to the (thread specific) applier instance. The returned pointer is NULL if the current thread is not known to HPX or if the runtime system is not active.

namespace **applier**

The namespace *applier* contains all definitions needed for the class `hpx::applier::applier` and its related functionality. This namespace is part of the HPX core module.

**hpx::find\_root\_locality, hpx::find\_all\_localities, hpx::find\_remote\_localities**

Defined in header `hpx/runtime.hpp`<sup>820</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

**Functions**

*hpx::id\_type* **find\_root\_locality**(*error\_code* &*ec* = *throws*)

Return the global id representing the root locality.

The function `find_root_locality()` can be used to retrieve the global id usable to refer to the root locality. The root locality is the locality where the main AGAS service is hosted.

**See also:**

`hpx::find_all_localities()`, `hpx::find_locality()`

---

<sup>820</sup> <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

---

**Note:** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

---

---

**Note:** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

---

---

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return *hpx::invalid\_id* otherwise.

---

#### Parameters

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Returns

The global id representing the root locality for this application.

`std::vector<hpx::id_type> find_all_localities(error_code &ec = throws)`

Return the list of global ids representing all localities available to this application.

The function `find_all_localities()` can be used to retrieve the global ids of all localities currently available to this application.

#### See also:

`hpx::find_here()`, `hpx::find_locality()`

---

**Note:** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

---

---

**Note:** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

---

---

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

---

#### Parameters

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Returns

The global ids representing the localities currently available to this application.

`std::vector<hpx::id_type> find_remote_localities(error_code &ec = throws)`

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function `find_remote_localities()` can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one).

**See also:**

`hpx::find_here()`, `hpx::find_locality()`

---

**Note:** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

---

---

**Note:** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

---

---

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

---

**Parameters**

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns**

The global ids representing the remote localities currently available to this application.

## hpx/runtime\_distributed/runtime\_fwd.hpp

Defined in header `hpx/runtime_distributed/runtime_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

### Functions

*runtime\_distributed* &**get\_runtime\_distributed**()

*runtime\_distributed* \***get\_runtime\_distributed\_ptr**()

*naming::gid\_type* const &**get\_locality**()

The function `get_locality` returns a reference to the locality prefix.

void **start\_active\_counters**(*error\_code* &*ec* = *throws*)

Start all active performance counters, optionally naming the section of code.

---

**Note:** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

---

---

**Note:** The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

---

#### Parameters

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

void **reset\_active\_counters**(*error\_code* &ec = *throws*)

Resets all active performance counters.

---

**Note:** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

---

---

**Note:** The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

---

#### Parameters

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

void **reinit\_active\_counters**(bool reset = true, *error\_code* &ec = *throws*)

Re-initialize all active performance counters.

---

**Note:** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

---

---

**Note:** The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

---

#### Parameters

- **reset** – [in] Reset the current values before re-initializing counters (default: true)
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

void **stop\_active\_counters**(*error\_code* &ec = *throws*)

Stop all active performance counters.

---

**Note:** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

---

---

**Note:** The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

---

#### Parameters

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

void **evaluate\_active\_counters**(bool reset = false, char const \*description = nullptr, *error\_code* &ec = *throws*)

Evaluate and output all active performance counters, optionally naming the point in code marked by this function.

---

**Note:** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

---

---

**Note:** The output generated by this function is redirected to the destination specified by the corresponding command line options (see `-hpx:print-counter-destination`).

---

---

**Note:** The active counters are those which have been specified on the command line while executing the application (see command line option `-hpx:print-counter`)

---

#### Parameters

- **reset** – [in] this is an optional flag allowing to reset the counter value after it has been evaluated.
- **description** – [in] this is an optional value naming the point in the code marked by the call to this function.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

*serialization::binary\_filter* \***create\_binary\_filter**(char const \*binary\_filter\_type, bool compress, *serialization::binary\_filter* \*next\_filter = nullptr, *error\_code* &ec = *throws*)

Create an instance of a binary filter plugin.

---

**Note:** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

---

#### Parameters

- **binary\_filter\_type** – [in] The type of the binary filter to create
- **compress** – [in] The created filter should support compression
- **next\_filter** – [in] Use this as the filter to dispatch the invocation into.

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

## hpx/runtime\_distributed/applier.hpp

Defined in header `hpx/runtime_distributed/applier.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **applier**

class **applier**

*#include <applier.hpp>* The *applier* class is used to decide whether a particular action has to be issued on a local or a remote resource. If the target component is local a new *thread* will be created, if the target is remote a parcel will be sent.

### Public Functions

**applier**(*applier* const&) = delete

**applier**(*applier*&&) = delete

*applier* &**operator**=(*applier* const&) = delete

*applier* &**operator**=(*applier*&&) = delete

**applier**()

void **init**(*threads::threadmanager* &tm)

**~applier**() = default

void **initialize**(*std::uint64\_t* rts)

*threads::threadmanager* &**get\_thread\_manager**()

Access the *thread-manager* instance associated with this *applier*.

This function returns a reference to the thread manager this *applier* instance has been created with.

*naming::gid\_type* const &**get\_raw\_locality**(*error\_code* &ec = *throws*) const

Allow access to the locality of the locality this *applier* instance is associated with.

This function returns a reference to the locality this *applier* instance is associated with.

*std::uint32\_t* **get\_locality\_id**(*error\_code* &ec = *throws*) const

Allow access to the id of the locality this *applier* instance is associated with.

This function returns a reference to the id of the locality this *applier* instance is associated with.

bool **get\_raw\_remote\_localities**(*std::vector<naming::gid\_type>* &locality\_ids,  
*components::component\_type* type =  
*to\_int(hpx::components::component\_enum\_type::invalid)*,  
*error\_code* &ec = *throws*) const

Return list of localities of all remote localities registered with the AGAS service for a specific component type.

This function returns a list of all remote localities (all localities known to AGAS except the local one) supporting the given component type.

**Parameters**

- **locality\_ids** – [out] The reference to a vector of `id_type`s filled by the function.
- **type** – [in] The type of the component which needs to exist on the returned localities.

**Returns**

The function returns *true* if there is at least one remote locality known to the AGAS service (!`prefixes.empty()`).

```
bool get_remote_localities(std::vector<hpx::id_type> &locality_ids,
                          components::component_type type =
                          to_int(hpx::components::component_enum_type::invalid),
                          error_code &ec = throws) const
```

```
bool get_raw_localities(std::vector<naming::gid_type> &locality_ids,
                       components::component_type type =
                       to_int(hpx::components::component_enum_type::invalid)) const
```

Return list of `locality_ids` of all localities registered with the AGAS service for a specific component type.

This function returns a list of all localities (all localities known to AGAS except the local one) supporting the given component type.

**Parameters**

- **locality\_ids** – [out] The reference to a vector of `id_type`s filled by the function.
- **type** – [in] The type of the component which needs to exist on the returned localities.

**Returns**

The function returns *true* if there is at least one remote locality known to the AGAS service (!`prefixes.empty()`).

```
bool get_localities(std::vector<hpx::id_type> &locality_ids, error_code &ec = throws) const
```

```
bool get_localities(std::vector<hpx::id_type> &locality_ids, components::component_type
                    type, error_code &ec = throws) const
```

```
inline naming::gid_type const &get_runtime_support_raw_gid() const
```

By convention the `runtime_support` has a `gid` identical to the prefix of the locality the `runtime_support` is responsible for

```
inline hpx::id_type const &get_runtime_support_gid() const
```

By convention the `runtime_support` has a `gid` identical to the prefix of the locality the `runtime_support` is responsible for

## Private Members

hpx::id_type runtime_support_id_
```

## hpx/runtime\_distributed/copy\_component.hpp

Defined in header `hpx/runtime_distributed/copy_component.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

### Functions

```
template<typename Component>
future<hpx::id_type> copy(hpx::id_type const &to_copy)
```

Copy given component to the specified target locality.

The function `copy<Component>` will create a copy of the component referenced by `to_copy` on the locality specified with `target_locality`. It returns a future referring to the newly created component instance.

---

**Note:** The new component instance is created on the locality of the component instance which is to be copied.

---

#### Parameters

**to\_copy** – [in] The global id of the component to copy

#### Template Parameters

**The** – only template argument specifies the component type to create.

#### Returns

A future representing the global id of the newly (copied) component instance.

```
template<typename Component>
future<hpx::id_type> copy(hpx::id_type const &to_copy, hpx::id_type const &target_locality)
```

Copy given component to the specified target locality.

The function `copy<Component>` will create a copy of the component referenced by `to_copy` on the locality specified with `target_locality`. It returns a future referring to the newly created component instance.

#### Parameters

- **to\_copy** – [in] The global id of the component to copy
- **target\_locality** – [in ] The locality where the copy should be created.

#### Template Parameters

**The** – only template argument specifies the component type to create.

#### Returns

A future representing the global id of the newly (copied) component instance.

```
template<typename Derived, typename Stub, typename Data>
Derived copy(client_base<Derived, Stub, Data> const &to_copy, hpx::id_type const &target_locality =
             hpx::invalid_id)
```

Copy given component to the specified target locality.

The function `copy` will create a copy of the component referenced by the client side object `to_copy` on the locality specified with `target_locality`. It returns a new client side object future referring to the newly created component instance.

---

**Note:** If the second argument is omitted (or is `invalid_id`) the new component instance is created on the locality of the component instance which is to be copied.

---

**Parameters**

- **to\_copy** – [in] The client side object representing the component to copy
- **target\_locality** – [in, optional] The locality where the copy should be created (default is same locality as source).

**Template Parameters**

**The** – only template argument specifies the component type to create.

**Returns**

A future representing the global id of the newly (copied) component instance.

**hpx/runtime\_distributed/find\_here.hpp**

Defined in header `hpx/runtime_distributed/find_here.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

**Functions**

`hpx::id_type find_here(error_code &ec = throws)`

Return the global id representing this locality.

The function `find_here()` can be used to retrieve the global id usable to refer to the current locality.

**See also:**

`hpx::find_all_localities()`, `hpx::find_locality()`

---

**Note:** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

---

---

**Note:** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of `hpx::exception`.

---

---

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return `hpx::invalid_id` otherwise.

---

**Parameters**

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**Returns**

The global id representing the locality this function has been called on.

## hpx::find\_locality

Defined in header `hpx/runtime.hpp`<sup>821</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

### Functions

`std::vector<hpx::id_type> find_all_localities(components::component_type type, error_code &ec = throws)`

Return the list of global ids representing all localities available to this application which support the given component type.

The function `find_all_localities()` can be used to retrieve the global ids of all localities currently available to this application which support the creation of instances of the given component type.

#### See also:

`hpx::find_here()`, `hpx::find_locality()`

---

**Note:** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

---

---

**Note:** As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of `hpx::exception`.

---

---

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

---

#### Parameters

- **type** – [in] The type of the components for which the function should return the available localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

#### Returns

The global ids representing the localities currently available to this application which support the creation of instances of the given component type. If no localities supporting the given component type are currently available, this function will return an empty vector.

`std::vector<hpx::id_type> find_remote_localities(components::component_type type, error_code &ec = throws)`

---

<sup>821</sup> <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

Return the list of locality ids of remote localities supporting the given component type. By default this function will return the list of all remote localities (all but the current locality).

The function `find_remote_localities()` can be used to retrieve the global ids of all remote localities currently available to this application (i.e. all localities except the current one) which support the creation of instances of the given component type.

**See also:**

`hpx::find_here()`, `hpx::find_locality()`

---

**Note:** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

---

---

**Note:** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

---

---

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return an empty vector otherwise.

---

**Parameters**

- **type** – [in] The type of the components for which the function should return the available remote localities.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns**

The global ids representing the remote localities currently available to this application.

*hpx::id\_type* **find\_locality**(*components::component\_type* type, *error\_code* &ec = *throws*)

Return the global id representing an arbitrary locality which supports the given component type.

The function `find_locality()` can be used to retrieve the global id of an arbitrary locality currently available to this application which supports the creation of instances of the given component type.

**See also:**

`hpx::find_here()`, `hpx::find_all_localities()`

---

**Note:** Generally, the id of a locality can be used for instance to create new instances of components and to invoke plain actions (global functions).

---

---

**Note:** As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

---

---

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return *hpx::invalid\_id* otherwise.

---

#### Parameters

- **type** – [in] The type of the components for which the function should return any available locality.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Returns

The global id representing an arbitrary locality currently available to this application which supports the creation of instances of the given component type. If no locality supporting the given component type is currently available, this function will return *hpx::invalid\_id*.

### hpx/runtime\_distributed/get\_num\_localities.hpp

Defined in header `hpx/runtime_distributed/get_num_localities.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

#### Functions

*hpx::future<std::uint32\_t>* **get\_num\_localities**(*components::component\_type* t)

Asynchronously return the number of localities which are currently registered for the running application.

The function *get\_num\_localities* asynchronously returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

#### See also:

*hpx::find\_all\_localities*, *hpx::get\_num\_localities*

---

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

---

#### Parameters

**t** – The component type for which the number of connected localities should be retrieved.

*std::uint32\_t* **get\_num\_localities**(*launch::sync\_policy*, *components::component\_type* t, *error\_code* &ec = *throws*)

Synchronously return the number of localities which are currently registered for the running application.

The function *get\_num\_localities* returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

See also:

*hpx::find\_all\_localities*, *hpx::get\_num\_localities*

---

**Note:** This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

---

#### Parameters

- **t** – The component type for which the number of connected localities should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

### hpx/runtime\_distributed/runtime\_support.hpp

Defined in header `hpx/runtime_distributed/runtime_support.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **agas**

#### Functions

struct runtime\_components\_init\_interface\_functions &**runtime\_components\_init**()

namespace **components**

#### Functions

struct counter\_interface\_functions &**counter\_init**()

class **runtime\_support** : public *hpx::components::stubs::runtime\_support*

*#include <runtime\_support.hpp>* The `runtime_support` class is the client side representation of a `server::runtime_support` component

#### Public Functions

inline **runtime\_support**(*hpx::id\_type* const &gid = *hpx::invalid\_id*)

Create a client side representation for the existing `server::runtime_support` instance with the given global id *gid*.

template<typename **Component**, typename ...**Ts**>

inline *hpx::id\_type* **create\_component**(*Ts*&&... vs)

Create a new component type using the *runtime\_support*.

template<typename **Component**, typename ...**Ts**>

```

inline hpx::future<hpx::id_type> create_component_async(Ts&&... vs)
    Asynchronously create a new component using the runtime_support.

template<bool WithCount, typename Component, typename ...Ts>
inline std::vector<hpx::id_type> bulk_create_component(std::size_t count, Ts&&... vs)
    Asynchronously create N new default constructed components using the runtime_support

template<bool WithCount, typename Component, typename ...Ts>
inline hpx::future<std::vector<hpx::id_type>> bulk_create_components_async(std::size_t
                                                                    count, Ts&&...
                                                                    vs)

    Asynchronously create a new component using the runtime_support.

inline hpx::future<int> load_components_async() const

inline int load_components() const

inline hpx::future<void> call_startup_functions_async(bool pre_startup) const

inline void call_startup_functions(bool pre_startup) const

inline hpx::future<void> shutdown_async(double timeout = -1) const
    Shutdown the given runtime system.

inline void shutdown(double timeout = -1) const

inline void shutdown_all(double timeout = -1) const
    Shutdown the runtime systems of all localities.

inline hpx::future<void> terminate_async() const
    Terminate the given runtime system.

inline void terminate() const

inline void terminate_all() const
    Terminate the runtime systems of all localities.

inline void get_config(util::section &ini) const
    Retrieve configuration information.

inline hpx::id_type const &get_id() const

inline naming::gid_type const &get_raw_gid() const

```

### Private Types

```

using base_type = stubs::runtime_support

```

## Private Members

## hpx/runtime\_distributed/migrate\_component.hpp

Defined in header `hpx/runtime_distributed/migrate_component.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

## Functions

```
template<typename Component, typename DistPolicy>
future<hpx::id_type> migrate(hpx::id_type const &to_migrate, [[maybe_unused]] DistPolicy const
                             &policy)
```

Migrate the given component to the specified target locality

The function `migrate<Component>` will migrate the component referenced by `to_migrate` to the locality specified with `target_locality`. It returns a future referring to the migrated component instance.

### Parameters

- **to\_migrate** – [in] The client side representation of the component to migrate.
- **policy** – [in] A distribution policy which will be used to determine the locality to migrate this object to.

### Template Parameters

- **Component** – Specifies the component type of the component to migrate.
- **DistPolicy** – Specifies the distribution policy to use to determine the destination locality.

### Returns

A future representing the global id of the migrated component instance. This should be the same as `migrate_to`.

```
template<typename Derived, typename Stub, typename Data, typename DistPolicy>
Derived migrate(client_base<Derived, Stub, Data> const &to_migrate, DistPolicy const &policy)
```

Migrate the given component to the specified target locality

The function `migrate<Component>` will migrate the component referenced by `to_migrate` to the locality specified with `target_locality`. It returns a future referring to the migrated component instance.

### Parameters

- **to\_migrate** – [in] The client side representation of the component to migrate.
- **policy** – [in] A distribution policy which will be used to determine the locality to migrate this object to.

### Template Parameters

- **Derived** – Specifies the component type of the component to migrate.
- **DistPolicy** – Specifies the distribution policy to use to determine the destination locality.

### Returns

A future representing the global id of the migrated component instance. This should be the same as `migrate_to`.

```
template<typename Component>
future<hpx::id_type> migrate(hpx::id_type const &to_migrate, hpx::id_type const &target_locality)
```

Migrate the component with the given id to the specified target locality

The function *migrate*<*Component*> will migrate the component referenced by *to\_migrate* to the locality specified with *target\_locality*. It returns a future referring to the migrated component instance.

**Parameters**

- **to\_migrate** – [in] The global id of the component to migrate.
- **target\_locality** – [in] The locality where the component should be migrated to.

**Template Parameters**

**Component** – Specifies the component type of the component to migrate.

**Returns**

A future representing the global id of the migrated component instance. This should be the same as *migrate\_to*.

```
template<typename Derived, typename Stub, typename Data>
Derived migrate(client_base<Derived, Stub, Data> const &to_migrate, hpx::id_type const
&target_locality)
```

Migrate the given component to the specified target locality

The function *migrate*<*Component*> will migrate the component referenced by *to\_migrate* to the locality specified with *target\_locality*. It returns a future referring to the migrated component instance.

**Parameters**

- **to\_migrate** – [in] The client side representation of the component to migrate.
- **target\_locality** – [in] The id of the locality to migrate this object to.

**Template Parameters**

**Derived** – Specifies the component type of the component to migrate.

**Returns**

A client side representation of representing of the migrated component instance. This should be the same as *migrate\_to*.

## hpx/runtime\_distributed/server/copy\_component.hpp

Defined in header hpx/runtime\_distributed/server/copy\_component.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
namespace components
```

```
namespace server
```

## Functions

```
template<typename Component>
hpx::id_type copy_component_here(hpx::id_type const &to_copy)

template<typename Component>
future<hpx::id_type> copy_component(hpx::id_type const &to_copy, hpx::id_type const
                                   &target_locality)

template<typename Component>

struct copy_component_action : public hpx::actions::action<future<hpx::id_type>
(*)(hpx::id_type const&, hpx::id_type const&), &copy_component<Component>,
copy_component_action<Component>>

template<typename Component>

struct copy_component_action_here : public hpx::actions::action<hpx::id_type (*)
(hpx::id_type const&), &copy_component_here<Component>, copy_component_action_here<Component>>
```

## hpx/runtime\_distributed/server/runtime\_support.hpp

Defined in header `hpx/runtime_distributed/server/runtime_support.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

namespace **server**

class **runtime\_support**

## Public Types

using **type\_holder** = *runtime\_support*

## Public Functions

```
explicit runtime_support(hpx::util::runtime_configuration &cfg)

inline ~runtime_support()

void delete_function_lists()

void tidy()

template<typename Component>
```

*naming::gid\_type* **create\_component**()

Actions to create new objects.

template<typename **Component**>  
*naming::gid\_type* **migrate\_component\_to\_here**(*std::shared\_ptr*<*Component*> const &p,  
*hpx::id\_type*)

void **shutdown**(double timeout, *hpx::id\_type* const &respond\_to)

Gracefully shutdown this runtime system instance.

void **shutdown\_all**(double timeout)

Gracefully shutdown runtime system instances on all localities.

void **terminate**(*hpx::id\_type* const &respond\_to)

Shutdown this runtime system instance.

inline void **terminate\_act**(*hpx::id\_type* const &id)

void **terminate\_all**()

Shutdown runtime system instances on all localities.

inline void **terminate\_all\_act**()

*util::section* **get\_config**()

Retrieve configuration information.

int **load\_components**()

Load all components on this locality.

void **call\_startup\_functions**(bool pre\_startup)

void **call\_shutdown\_functions**(bool pre\_shutdown)

void **garbage\_collect**()

Force a garbage collection operation in the AGAS layer.

*naming::gid\_type* **create\_performance\_counter**(*performance\_counters::counter\_info* const  
&info)

Create the given performance counter instance.

void **remove\_from\_connection\_cache**(*naming::gid\_type* const &gid,  
*parcelset::endpoints\_type* const &eps)

Remove the given locality from our connection cache.

**HPX\_DEFINE\_COMPONENT\_ACTION** (*runtime\_support*, *terminate\_act*,  
*terminate\_action*) **HPX\_DEFINE\_COMPONENT\_ACTION**(*runtime\_support*  
termination detection

**terminate\_all\_action** **HPX\_DEFINE\_COMPONENT\_ACTION** (*runtime\_support*,  
*remove\_from\_connection\_cache*) **void run()**

Start the *runtime\_support* component.

**void wait()**

Wait for the *runtime\_support* component to notify the calling thread.

This function will be called from the main thread, causing it to block while the HPX functionality is executed. The main thread will block until the *shutdown\_action* is executed, which in turn notifies all waiting threads.

**void stop**(double timeout, *hpx::id\_type* const &*respond\_to*, bool *remove\_from\_remote\_caches*)

Notify all waiting (blocking) threads allowing the system to be properly stopped.

---

**Note:** This function can be called from any thread.

---

**void stopped()**

called locally only

**void notify\_waiting\_main()**

inline bool **was\_stopped()** const

## hpx/runtime\_distributed/stubs/runtime\_support.hpp

Defined in header `hpx/runtime_distributed/stubs/runtime_support.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

```

namespace hpx

namespace components

namespace stubs

struct runtime_support
    Subclassed by hpx::components::runtime_support

```

## Public Static Functions

```
template<typename Component, typename ...Ts>
static inline hpx::future<hpx::id_type> create_component_async(hpx::id_type const &gid,
                                                             Ts&&... vs)
```

Create a new component *type* using the *runtime\_support* with the given *targetgid*. This is a non-blocking call. The caller needs to call *future::get* on the result of this function to obtain the global id of the newly created object.

```
template<typename Component, typename ...Ts>
static inline hpx::id_type create_component(hpx::id_type const &gid, Ts&&... vs)
```

Create a new component *type* using the *runtime\_support* with the given *targetgid*. Block for the creation to finish.

```
template<bool WithCount, typename Component, typename ...Ts>
static inline hpx::future<std::vector<hpx::id_type>> bulk_create_component_colocated_async(hpx::id_type
                                                                                          const
                                                                                          &gid,
                                                                                          std::size_t
                                                                                          count,
                                                                                          Ts&&...
                                                                                          vs)
```

Create multiple new components *type* using the *runtime\_support* colocated with the given *targetgid*. This is a non-blocking call.

```
template<bool WithCount, typename Component, typename ...Ts>
static inline std::vector<hpx::id_type> bulk_create_component_colocated(hpx::id_type
                                                                                          const &gid,
                                                                                          std::size_t
                                                                                          count, Ts&&...
                                                                                          vs)
```

Create multiple new components *type* using the *runtime\_support* colocated with the given *targetgid*. Block for the creation to finish.

```
template<bool WithCount, typename Component, typename ...Ts>
static inline hpx::future<std::vector<hpx::id_type>> bulk_create_component_async(hpx::id_type
                                                                                          const
                                                                                          &gid,
                                                                                          std::size_t
                                                                                          count,
                                                                                          Ts&&...
                                                                                          vs)
```

Create multiple new components *type* using the *runtime\_support* on the given locality. This is a non-blocking call.

```
template<bool WithCount, typename Component, typename ...Ts>
static inline std::vector<hpx::id_type> bulk_create_component(hpx::id_type const &gid,
                                                             std::size_t count, Ts&&...
                                                             vs)
```

Create multiple new components *type* using the *runtime\_support* on the given locality. Block for the creation to finish.

```
template<typename Component, typename ...Ts>
static inline hpx::future<hpx::id_type> create_component_colocated_async(hpx::id_type
                                                                                          const &gid,
                                                                                          Ts&&... vs)
```

Create a new component *type* using the *runtime\_support* with the given *targetgid*. This is a non-blocking call. The caller needs to call *future::get* on the result of this function to obtain the global id of the newly created object.

```
template<typename Component, typename ...Ts>
static inline hpx::id_type create_component_colocated(hpx::id_type const &gid, Ts&&...
                                                    vs)
```

Create a new component *type* using the *runtime\_support* with the given *targetgid*. Block for the creation to finish.

```
template<typename Component>
static inline hpx::future<hpx::id_type> copy_create_component_async(hpx::id_type const
                                                                    &gid,
                                                                    std::shared_ptr<Component>
                                                                    const &p, bool
                                                                    local_op)
```

```
template<typename Component>
static inline hpx::id_type copy_create_component(hpx::id_type const &gid,
                                                    std::shared_ptr<Component> const &p,
                                                    bool local_op)
```

```
template<typename Component>
static inline hpx::future<hpx::id_type> migrate_component_async(hpx::id_type const
                                                                &target_locality,
                                                                std::shared_ptr<Component>

```

## segmented\_algorithms

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx/parallel/segmented\_algorithms/is\_partitioned.hpp

Defined in header `hpx/parallel/segmented_algorithms/is_partitioned.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

## Functions

```
template<typename InIter, typename Pred>
bool tag_invoke(hpx::is_partitioned_t, InIter first, InIter last, Pred &&pred)

template<typename ExPolicy, typename SegIter, typename Pred>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> tag_invoke(hpx::is_partitioned_t,
                                                                    ExPolicy &&policy, SegIter
                                                                    first, SegIter last, Pred
                                                                    &&pred)
```

### hpx/parallel/segmented\_algorithms/adjacent\_find.hpp

Defined in header `hpx/parallel/segmented_algorithms/adjacent_find.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

## Functions

```
template<typename InIter, typename Pred>
InIter tag_invoke(hpx::adjacent_find_t, InIter first, InIter last, Pred &&pred = Pred())

template<typename ExPolicy, typename SegIter, typename Pred>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, SegIter> tag_invoke(hpx::adjacent_find_t,
                                                                    ExPolicy &&policy,
                                                                    SegIter first, SegIter last,
                                                                    Pred &&pred)
```

### hpx/parallel/segmented\_algorithms/for\_each.hpp

Defined in header `hpx/parallel/segmented_algorithms/for_each.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

## Functions

```
template<typename InIter, typename F>
InIter tag_invoke(hpx::for_each_t, InIter first, InIter last, F &&f)

template<typename ExPolicy, typename SegIter, typename F>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, SegIter> tag_invoke(hpx::for_each_t, ExPolicy
&&policy, SegIter first,
SegIter last, F &&f)

template<typename InIter, typename Size, typename F>
InIter tag_invoke(hpx::for_each_n_t, InIter first, Size count, F &&f)

template<typename ExPolicy, typename SegIter, typename Size, typename F>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, SegIter> tag_invoke(hpx::for_each_n_t,
ExPolicy &&policy,
SegIter first, Size count,
F &&f)
```

## `hpx/parallel/segmented_algorithms/replace_copy.hpp`

Defined in header `hpx/parallel/segmented_algorithms/replace_copy.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

## Functions

```
template<typename SegIter, typename OutIter, typename T>
OutIter tag_invoke(hpx::replace_copy_t, SegIter first, SegIter last, OutIter dest, T const &old_value, T
const &new_value)

template<typename ExPolicy, typename SegIter, typename OutIter, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, OutIter> tag_invoke(hpx::replace_copy_t,
ExPolicy &&policy,
SegIter first, SegIter last,
OutIter dest, T const
&old_value, T const
&new_value)

template<typename SegIter, typename OutIter, typename Pred, typename T>
OutIter tag_invoke(hpx::replace_copy_if_t, SegIter first, SegIter last, OutIter dest, Pred &&pred, T
const &new_value)

template<typename ExPolicy, typename SegIter, typename OutIter, typename Pred, typename T>
```

```

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, OutIter> tag_invoke(hpx::replace_copy_if_t,
                                     ExPolicy &&policy,
                                     SegIter first, SegIter last,
                                     OutIter dest, Pred
                                     &&pred, T const
                                     &new_value)

```

## hpx/parallel/segmented\_algorithms/transform.hpp

Defined in header `hpx/parallel/segmented_algorithms/transform.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

### Functions

```

template<typename SegIter, typename OutIter, typename F>
hpx::parallel::util::in_out_result<SegIter, OutIter> tag_invoke(hpx::transform_t, SegIter first, SegIter
                                                                last, OutIter dest, F &&f)

```

```

template<typename ExPolicy, typename SegIter, typename OutIter, typename F>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, hpx::parallel::util::in_out_result<SegIter, OutIter>> tag_invoke(

```

```

template<typename InIter1, typename InIter2, typename OutIter, typename F>
hpx::parallel::util::in_in_out_result<InIter1, InIter2, OutIter> tag_invoke(hpx::transform_t, InIter1
                                                                first1, InIter1 last1, InIter2
                                                                first2, OutIter dest, F &&f)

```

```

template<typename ExPolicy, typename InIter1, typename InIter2, typename OutIter, typename
F>

```

*hpx::parallel::util::detail::algorithm\_result\_t<ExPolicy, hpx::parallel::util::in\_in\_out\_result<InIter1, InIter2, OutIter>> tag*

```
template<typename InIter1, typename InIter2, typename OutIter, typename F>
hpx::parallel::util::in_in_out_result<InIter1, InIter2, OutIter> tag_invoke(hpx::transform_t, InIter1
                                                                    first1, InIter1 last1, InIter2
                                                                    first2, InIter2 last2, OutIter
                                                                    dest, F &&f)
```

```
template<typename ExPolicy, typename InIter1, typename InIter2, typename OutIter, typename F>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, hpx::parallel::util::in_in_out_result<InIter1, InIter2, OutIter>> tag
```

## hpx/parallel/segmented\_algorithms/transform\_exclusive\_scan.hpp

Defined in header `hpx/parallel/segmented_algorithms/transform_exclusive_scan.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **segmented**

### Functions

```
template<typename InIter, typename OutIter, typename T, typename Op, typename Conv>
OutIter tag_invoke(hpx::transform_exclusive_scan_t, InIter first, InIter last, OutIter dest, T init, Op
&&op, Conv &&conv)
```

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T, typename Op,
typename Conv>
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> tag_invoke(hpx::transform_exclusive_scan_t,
ExPolicy &&policy,
FwdIter1 first, FwdIter1
last, FwdIter2 dest, T init,
Op &&op, Conv &&conv)
```

## hpx/parallel/segmented\_algorithms/minmax.hpp

Defined in header `hpx/parallel/segmented_algorithms/minmax.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Size count, T const
&value)
```

### hpx/parallel/segmented\_algorithms/generate.hpp

Defined in header `hpx/parallel/segmented_algorithms/generate.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

#### Functions

```
template<typename SegIter, typename F>
SegIter tag_invoke(hpx::generate_t, SegIter first, SegIter last, F &&f)
```

```
template<typename SegIter, typename Size, typename F>
SegIter tag_invoke(hpx::generate_n_t, SegIter first, Size count, F &&f)
```

```
template<typename ExPolicy, typename SegIter, typename F>
parallel::util::detail::algorithm_result_t<ExPolicy, SegIter> tag_invoke(hpx::generate_t, ExPolicy
&&policy, SegIter first,
SegIter last, F &&f)
```

```
template<typename ExPolicy, typename SegIter, typename Size, typename F>
parallel::util::detail::algorithm_result_t<ExPolicy, SegIter> tag_invoke(hpx::generate_n_t, ExPolicy
&&policy, SegIter first, Size
count, F &&f)
```

### hpx/parallel/segmented\_algorithms/count.hpp

Defined in header `hpx/parallel/segmented_algorithms/count.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

## Functions

```
template<typename InIter, typename T>
std::iterator_traits<InIter>::difference_type tag_invoke(hpx::count_t, InIter first, InIter last, T const
&value)
```

```
template<typename ExPolicy, typename SegIter, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, typename std::iterator_traits<SegIter>::difference_type> tag_invo
```

```
template<typename InIter, typename F>
std::iterator_traits<InIter>::difference_type tag_invoke(hpx::count_if_t, InIter first, InIter last, F
&&f)
```

```
template<typename ExPolicy, typename SegIter, typename F>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, typename std::iterator_traits<SegIter>::difference_type> tag_invo
```

### `hpx/parallel/segmented_algorithms/inclusive_scan.hpp`

Defined in header `hpx/parallel/segmented_algorithms/inclusive_scan.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace parallel
```

namespace **segmented**

### Functions

```
template<typename InIter, typename OutIter, typename Op = std::plus<>>
OutIter tag_invoke(hpx::inclusive_scan_t, InIter first, InIter last, OutIter dest, Op &&op = Op())

template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Op = std::plus<>>
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> tag_invoke(hpx::inclusive_scan_t,
    ExPolicy &&policy,
    FwdIter1 first, FwdIter1
    last, FwdIter2 dest, Op
    &&op = Op())

template<typename InIter, typename OutIter, typename Op, typename T>
OutIter tag_invoke(hpx::inclusive_scan_t, InIter first, InIter last, OutIter dest, Op &&op, T &&init)

template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Op, typename T>
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> tag_invoke(hpx::inclusive_scan_t,
    ExPolicy &&policy,
    FwdIter1 first, FwdIter1
    last, FwdIter2 dest, Op
    &&op, T &&init)
```

## hpx/parallel/segmented\_algorithms/is\_sorted.hpp

Defined in header `hpx/parallel/segmented_algorithms/is_sorted.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

### Functions

```
template<typename InIter, typename Pred = hpx::parallel::detail::less>
InIter tag_invoke(hpx::is_sorted_until_t, InIter first, InIter last, Pred &&pred = Pred())

template<typename ExPolicy, typename SegIter, typename Pred = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, SegIter> tag_invoke(hpx::is_sorted_until_t,
    ExPolicy &&policy,
    SegIter first, SegIter last,
    Pred &&pred = Pred())

template<typename InIter, typename Pred = hpx::parallel::detail::less>
bool tag_invoke(hpx::is_sorted_t, InIter first, InIter last, Pred &&pred = Pred())

template<typename ExPolicy, typename SegIter, typename Pred = hpx::parallel::detail::less>
```

```

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> tag_invoke(hpx::is_sorted_t, ExPolicy
&&policy, SegIter first,
SegIter last, Pred &&pred =
Pred())

```

### hpx/parallel/segmented\_algorithms/reduce.hpp

Defined in header `hpx/parallel/segmented_algorithms/reduce.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace parallel
```

```
namespace hpx
```

```
    namespace segmented
```

#### Functions

```

template<typename InIterB, typename InIterE, typename T, typename F>
T tag_invoke(hpx::reduce_t, InIterB first, InIterE last, T init, F &&f)

```

```

template<typename ExPolicy, typename InIterB, typename InIterE, typename T, typename F>
parallel::util::detail::algorithm_result_t<ExPolicy, T> tag_invoke(hpx::reduce_t, ExPolicy &&policy,
InIterB first, InIterE last, T init, F
&&f)

```

### hpx/parallel/segmented\_algorithms/transform\_reduce.hpp

Defined in header `hpx/parallel/segmented_algorithms/transform_reduce.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace parallel
```

```
    namespace segmented
```

## Functions

```
template<typename SegIter, typename T, typename Reduce, typename Convert>
std::decay_t<T> tag_invoke(hpx::transform_reduce_t, SegIter first, SegIter last, T &&init, Reduce
&&red_op, Convert &&conv_op)
```

```
template<typename ExPolicy, typename SegIter, typename T, typename Reduce, typename
Convert>
parallel::util::detail::algorithm_result_t<ExPolicy, std::decay_t<T>> tag_invoke(hpx::transform_reduce_t,
ExPolicy &&policy,
SegIter first, SegIter
last, T &&init,
Reduce &&red_op,
Convert
&&conv_op)
```

```
template<typename FwdIter1, typename FwdIter2, typename T, typename Reduce, typename
Convert>
T tag_invoke(hpx::transform_reduce_t, FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, T init, Reduce
&&red_op, Convert &&conv_op)
```

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T, typename
Reduce, typename Convert>
parallel::util::detail::algorithm_result_t<ExPolicy, T> tag_invoke(hpx::transform_reduce_t, ExPolicy
&&policy, FwdIter1 first1,
FwdIter1 last1, FwdIter2 first2, T
init, Reduce &&red_op, Convert
&&conv_op)
```

## hpx/parallel/segmented\_algorithms/replace.hpp

Defined in header `hpx/parallel/segmented_algorithms/replace.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

## Functions

```
template<typename SegIter, typename T>
SegIter tag_invoke(hpx::replace_t, SegIter first, SegIter last, T const &old_value, T const
&new_value)
```

```
template<typename ExPolicy, typename SegIter, typename T>
```

```

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, SegIter> tag_invoke(hpx::replace_t, ExPolicy
&&policy, SegIter first,
SegIter last, T const
&old_value, T const
&new_value)

template<typename SegIter, typename Pred, typename T>
SegIter tag_invoke(hpx::replace_if_t, SegIter first, SegIter last, Pred &&pred, T const &new_value)

template<typename ExPolicy, typename SegIter, typename Pred, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, SegIter> tag_invoke(hpx::replace_if_t,
ExPolicy &&policy,
SegIter first, SegIter last,
Pred &&pred, T const
&new_value)

```

### hpx/parallel/segmented\_algorithms/equal.hpp

Defined in header `hpx/parallel/segmented_algorithms/equal.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

#### Functions

```

template<typename SegIter1, typename SegIter2, typename Pred = hpx::parallel::detail::equal_to>
bool tag_invoke(hpx::equal_t, SegIter1 first1, SegIter1 last1, SegIter2 first2, Pred &&pred = Pred())

template<typename ExPolicy, typename SegIter1, typename SegIter2, typename Pred =
hpx::parallel::detail::equal_to>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> tag_invoke(hpx::equal_t, ExPolicy
&&policy, SegIter1 first1,
SegIter1 last1, SegIter2
first2, Pred &&pred =
Pred())

```

### hpx/parallel/segmented\_algorithms/all\_any\_none.hpp

Defined in header `hpx/parallel/segmented_algorithms/all_any_none.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

### Functions

```
template<typename InIter, typename F>  
bool tag_invoke(hpx::none_of_t, InIter first, InIter last, F &&f)
```

```
template<typename ExPolicy, typename SegIter, typename F>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> tag_invoke(hpx::none_of_t, ExPolicy  
    &&policy, SegIter first,  
    SegIter last, F &&f)
```

```
template<typename InIter, typename F>  
bool tag_invoke(hpx::any_of_t, InIter first, InIter last, F &&f)
```

```
template<typename ExPolicy, typename SegIter, typename F>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> tag_invoke(hpx::any_of_t, ExPolicy  
    &&policy, SegIter first,  
    SegIter last, F &&f)
```

```
template<typename InIter, typename F>  
bool tag_invoke(hpx::all_of_t, InIter first, InIter last, F &&f)
```

```
template<typename ExPolicy, typename SegIter, typename F>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> tag_invoke(hpx::all_of_t, ExPolicy  
    &&policy, SegIter first,  
    SegIter last, F &&f)
```

### hpx/parallel/segmented\_algorithms/exclusive\_scan.hpp

Defined in header `hpx/parallel/segmented_algorithms/exclusive_scan.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **segmented**

## Functions

```
template<typename InIter, typename OutIter, typename T, typename Op = std::plus<T>>
OutIter tag_invoke(hpx::exclusive_scan_t, InIter first, InIter last, OutIter dest, T init, Op &&op =
    Op())
```

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T, typename Op =
    std::plus<T>>
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> tag_invoke(hpx::exclusive_scan_t,
    ExPolicy &&policy,
    FwdIter1 first, FwdIter1
    last, FwdIter2 dest, T init,
    Op &&op = Op())
```

## hpx/parallel/segmented\_algorithms/transform\_inclusive\_scan.hpp

Defined in header `hpx/parallel/segmented_algorithms/transform_inclusive_scan.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **segmented**

## Functions

```
template<typename InIter, typename OutIter, typename Op, typename Conv>
OutIter tag_invoke(hpx::transform_inclusive_scan_t, InIter first, InIter last, OutIter dest, Op &&op,
    Conv &&conv)
```

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Op, typename
    Conv>
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> tag_invoke(hpx::transform_inclusive_scan_t,
    ExPolicy &&policy,
    FwdIter1 first, FwdIter1
    last, FwdIter2 dest, Op
    &&op, Conv &&conv)
```

```
template<typename InIter, typename OutIter, typename T, typename Op, typename Conv>
OutIter tag_invoke(hpx::transform_inclusive_scan_t, InIter first, InIter last, OutIter dest, Op &&op,
    Conv &&conv, T init)
```

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T, typename Op,
    typename Conv>
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> tag_invoke(hpx::transform_inclusive_scan_t,
    ExPolicy &&policy,
    FwdIter1 first, FwdIter1 last,
    FwdIter2 dest, Op &&op,
    Conv &&conv, T init)
```

## 2.10 Contributing to *HPX*

*HPX* development happens on Github. The following sections are a collection of useful information related to *HPX* development.

### 2.10.1 Contributing to *HPX*

The main source of information to understand the process of how to contribute to *HPX* can be found in [this document](#)<sup>822</sup>. This is a living document that is constantly updated with relevant information.

### 2.10.2 *HPX* governance model

The *HPX* project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. [This document](#)<sup>823</sup> describes how that participation takes place and how to set about earning merit within the project community.

### 2.10.3 Release procedure for *HPX*

Below is a step by step procedure for making an *HPX* release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an *HPX* release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.
2. For minor and major releases: create and check out a new branch at an appropriate point on `master` with the name `release-major.minor.X`. `major` and `minor` should be the major and minor versions of the release. For patch releases: check out the corresponding `release-major.minor.X` branch.
3. Write release notes in `docs/sphinx/releases/whats_new_${VERSION}.rst`. Keep adding merged PRs and closed issues to this until just before the release is made. Use `tools/generate_pr_issue_list.sh` to generate the lists. Add the new release notes to the table of contents in `docs/sphinx/releases.rst`.
4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:
  - `$HPX_SOURCE/README.rst`
    - Update grant information
  - `docs/sphinx/releases/whats_new_${VERSION}.rst`
  - `docs/sphinx/about_hpx/people.rst`
    - Update collaborators
    - Update grant information
5. This step does not apply to patch releases. For APEX:

---

<sup>822</sup> <https://github.com/TheHPXProject/hpx/blob/master/.github/CONTRIBUTING.md>

<sup>823</sup> <http://hpx.stellar-group.org/documents/governance/>

- Change the release branch to be the most current release tag available in the APEX `git_external` section in the main `CMakeLists.txt`. Please contact the maintainers of the respective packages to generate a new release to synchronize with the HPX release (APEX<sup>824</sup>).
6. Make sure `HPX_VERSION_MAJOR/MINOR/SUBMINOR` in `CMakeLists.txt` contain the correct values. Change them if needed.
  7. Change version references in `CITATION.cff`. There are two occurrences. Change year in the copyright file under `/libs/core/version/src/version.cpp`.
  8. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main `CMakeLists.txt` and also deleting all related code and tests from the main source tree.  
  
The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:
    - a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.
    - b. Second release cycle: turn this build option OFF by default.
    - c. Third release cycle: completely remove the old code.
 The main `CMakeLists.txt` contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don't have a replacement yet, we keep them around in case (like Vc for example).
  9. Update the minimum required versions if necessary (compilers, dependencies, etc.) in `prerequisites.rst`. Update latest tested versions.
  10. Verify that the Jenkins setups for the release branch on Rostam are running and do not display any errors.
  11. Repeat the following steps until satisfied with the release.
    1. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to `-rcN`, where N is the current iteration of this step. Start with `-rc1`.
    2. Create a pre-release on GitHub using the script `tools/roll_release.sh`. This script automatically tag with the corresponding release number. The script requires that you have the STE||AR Group signing key.
    3. This step is not necessary for patch releases. Notify [hpx-users@stellar-group.org](mailto:hpx-users@stellar-group.org) of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.
    4. Allow at least a week for testing of the release candidate.
      - Use `git merge` when possible, and fall back to `git cherry-pick` when needed. For patch releases `git cherry-pick` is most likely your only choice if there have been significant unrelated changes on master since the previous release.
      - Go back to the first step when enough patches have been added.
      - If there are no more patches, continue to make the final release.
  12. Update any occurrences of the latest stable release to refer to the version about to be released. For example, `quickstart.rst` contains instructions to check out the latest stable tag. Make sure that refers to the new version.
  13. Add a new entry to the RPM changelog (`cmake/packaging/rpm/Changelog.txt`) with the new version number and a link to the corresponding changelog.
  14. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to an empty string.
  15. Add the release date to the caption of the current “What’s New” section in the docs, and change the value of `HPX_VERSION_DATE` in `CMakeLists.txt`.

<sup>824</sup> <http://github.com/UO-OACISS/xpress-apex>

16. Create a release on GitHub using the script `tools/roll_release.sh`. This script automatically tag the with the corresponding release number. The script requires that you have the STE||AR Group signing key.
17. Update the websites ([hpx.stellar-group.org](https://hpx.stellar-group.org)<sup>825</sup> and [stellar-group.org](https://stellar-group.org) <<https://stellar-group.org>>). You can login on wordpress through *this page* <<https://hpx.stellar-group.org/wp-login.php>>. You can update the pages with the following:
  - Update links on the downloads page. Link to the release on GitHub.
  - Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
  - A new blog post announcing the release, which links to downloads and the “What’s New” section in the documentation (see previous releases for examples).
18. Merge release branch into master.
19. Post-release cleanup. Create a new pull request against master with the following changes:
  1. Modify the release procedure if necessary.
  2. Change `HPX_VERSION_TAG` in `CMakeLists.txt` back to `-trunk`.
  3. Increment `HPX_VERSION_MINOR` in `CMakeLists.txt`.
20. Update Vcpkg (<https://github.com/Microsoft/vcpkg>) to pull from latest release.
  - Update version number in `CONTROL`
  - Update tag and SHA512 to that of the new release
21. Update spack (<https://github.com/spack/spack>) with the latest HPX package.
  - Update version number in `hpx/package.py` and SHA256 to that of the new release
22. Announce the release on [hpx-users@stellar-group.org](mailto:hpx-users@stellar-group.org), [stellar@cct.lsu.edu](mailto:stellar@cct.lsu.edu), [allcct@cct.lsu.edu](mailto:allcct@cct.lsu.edu), [faculty@csc.lsu.edu](mailto:faculty@csc.lsu.edu), [faculty@ece.lsu.edu](mailto:faculty@ece.lsu.edu), the *HPX* Slack channel, the STE||AR-GROUP Discord channel, our list of external collaborators, [isocpp.org](https://isocpp.org), [reddit.com](https://reddit.com), [HPC Wire](https://hpcwire.com), [Inside HPC](https://insidehpc.com), [Heise Online](https://heiseonline.com), and a CCT press release.
23. Beer and pizza.

## 2.10.4 Testing *HPX*

To ensure correctness of *HPX*, we ship a large variety of unit and regression tests. The tests are driven by the `CTest`<sup>826</sup> tool and are executed automatically on each commit to the *HPX* [Github](https://github.com)<sup>827</sup> repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our *HPX* [Issues](https://github.com/TheHPXProject/hpx/issues)<sup>828</sup> tracker with detailed information about the target system.

---

<sup>825</sup> <https://hpx.stellar-group.org>

<sup>826</sup> <https://gitlab.kitware.com/cmake/community/wikis/doc/ctest/Testing-With-CTest>

<sup>827</sup> <https://github.com/TheHPXProject/hpx/>

<sup>828</sup> <https://github.com/TheHPXProject/hpx/issues>

## Running tests manually

Running the tests manually is as easy as typing `make tests` && `make test`. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the `ctest` command. You can list all available test targets using `make help | grep tests`. Please see the [CTest Documentation](#)<sup>829</sup> for further details.

## Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under `tools/perftests_ci/local_run.sh` (to be run in the build directory specifying the *HPX* source directory as the argument to the script, default is `$HOME/projects/hpx_perftests_ci`).

## Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with `hpx::util::perftests_report`, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call `hpx::util::perftests_print_times`. To see an example of use, see `future_overhead_report.cpp`. Finally, you can add the test to the CI report editing the `hpx_targets` variable for the executable name and the `hpx_test_options` variable for the corresponding options to use for the run in the performance test script `.jenkins/cscs-perftests/launch_perftests.sh`. And then run the `tools/perftests_ci/local_run.sh` script to get a reference json run (use the name of the test) to be added in the `tools/perftests_ci/perftest/references/daint_default` directory.

## Issue tracker

If you stumble over a bug or missing feature in *HPX*, please submit an issue to our [HPX Issues](#)<sup>830</sup> page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the [Support Website](#)<sup>831</sup> page.

## Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both [\[github\]](#). You can see the dashboards [CDash HPX dashboard](#)<sup>832</sup>.

### 2.10.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, [Docker](#)<sup>833</sup> provides a convenient alternative to quickly get all the dependencies needed to start development of *HPX*. Our testing setup on [\[github\]](#) uses a docker image to run all tests.

<sup>829</sup> <https://www.cmake.org/cmake/help/latest/manual/ctest.1.html>

<sup>830</sup> <https://github.com/TheHPXProject/hpx/issues>

<sup>831</sup> <https://stellar.cct.lsu.edu/support/>

<sup>832</sup> <https://cdash.rostam.cct.lsu.edu/index.php?project=HPX>

<sup>833</sup> <https://www.docker.com>

To get started you need to install [Docker](#)<sup>834</sup> using whatever means is most convenient on your system. Once you have [Docker](#)<sup>835</sup> installed, you can pull or directly run the docker image. The image is based on Debian and Clang, and can be found on [Docker Hub](#)<sup>836</sup>. To start a container using the *HPX* build environment, run:

```
$ docker run --interactive --tty stellargroup/build_env:latest bash
```

You are now in an environment where all the *HPX* build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the [Docker Documentation](#)<sup>837</sup> for more information on using [Docker](#)<sup>838</sup>.

**Warning:** All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the *HPX* source tree) after closing the container, you can bind directories from the host system into the container (see [Docker Documentation \(Bind mounts\)](#)<sup>839</sup>).

## 2.10.6 Documentation

This documentation is built using [Sphinx](#)<sup>840</sup>, and an automatically generated API reference using [Doxygen](#)<sup>841</sup> and [Breathe](#)<sup>842</sup>.

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

### Prerequisites

To build the *HPX* documentation, you need recent versions of the following packages:

- python3
- sphinx 4.5.0 (Python package)
- sphinx-book-theme (Python package)
- breathe 4.33.1 (Python package)
- doxygen
- sphinxcontrib-bibtex
- sphinx-copybutton

If the [Python](#)<sup>843</sup> dependencies are not available through your system package manager, you can install them using the Python package manager `pip`:

```
pip install --user "sphinx<5" sphinx-book-theme breathe sphinxcontrib-bibtex sphinx-  
↪ copybutton
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

---

<sup>834</sup> <https://www.docker.com>

<sup>835</sup> <https://www.docker.com>

<sup>836</sup> [https://hub.docker.com/r/stellargroup/build\\_env/](https://hub.docker.com/r/stellargroup/build_env/)

<sup>837</sup> <https://docs.docker.com/>

<sup>838</sup> <https://www.docker.com>

<sup>839</sup> <https://docs.docker.com/storage/bind-mounts/>

<sup>840</sup> <http://www.sphinx-doc.org>

<sup>841</sup> <https://www.doxygen.org>

<sup>842</sup> <https://breathe.readthedocs.io/en/latest>

<sup>843</sup> <https://www.python.org>

**Doxygen\_ROOT:PATH**

Specifies where to look for the installation of the [Doxygen](https://www.doxygen.org)<sup>844</sup> tool.

**Sphinx\_ROOT:PATH**

Specifies where to look for the installation of the [Sphinx](http://www.sphinx-doc.org)<sup>845</sup> tool.

**Breathe\_APIDOC\_ROOT:PATH**

Specifies where to look for the installation of the [Breathe](https://breathe.readthedocs.io/en/latest)<sup>846</sup> tool.

**Building documentation**

Enable building of the documentation by setting `HPX_WITH_DOCUMENTATION=ON` during [CMake](https://www.cmake.org)<sup>847</sup> configuration. To build the documentation, build the `docs` target using your build tool. The default output format is HTML documentation. You can choose alternative output formats (single-page HTML, PDF, and man) with the `HPX_WITH_DOCUMENTATION_OUTPUT_FORMATS` CMake option.

---

**Note:** If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

---

**Style guide**

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with `=`.
- Sub-headings use only underlines with characters in decreasing level of importance: `=`, `-` and `..`
- Use sentence case in headings.
- Refer to common terminology using `:term:`Component``.
- Indent content of directives (`.. directive::`) by three spaces.
- For C++ code samples at the end of paragraphs, use `::` and indent the code sample by 4 spaces.
  - For other languages (or if you don't want a colon at the end of the paragraph), use `.. code-block:: language` and indent by three spaces as with other directives.
- Use `.. list-table::` to wrap tables with a lot of text in cells.

---

<sup>844</sup> <https://www.doxygen.org>

<sup>845</sup> <http://www.sphinx-doc.org>

<sup>846</sup> <https://breathe.readthedocs.io/en/latest>

<sup>847</sup> <https://www.cmake.org>

## API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the `doxygen_dependencies` variable in `docs/CMakeLists.txt`.

## Adding new API documentation

When you add new public APIs to *HPX*, follow these guidelines to ensure the documentation is correctly generated and easy to use.

## Documenting headers

At the top of a new header file, include the standard Doxygen documentation block. For example, if the new feature is called *my\_new\_feature*, you should:

- List the name of the new file under `\file`.
- Specify the page name with `\page` (e.g., `hpx:my_new_feature`).
- Reference the existing header that will include your new file under `\headerfile`.

```
/// \file my_new_feature.hpp
/// \page hpx:my_new_feature
/// \headerfile hpx/existing_header_of_new_feature.hpp
```

## Adding to the public API reference

For the documentation to appear in the generated API reference, add your new API to `docs/sphinx/api/public_api.rst` under the appropriate table (usually “Functions”) for the relevant header (for example, `hpx/existing_header_of_new_feature.hpp`).

## Including examples

Do **not** inline examples in the API reference. If you want to provide an example of how to use the new API, there are two recommended options:

1. **Documentation page option** Edit an existing relevant manual page to explain the new functionality and include a code example. Use this option if you want to provide additional context about how the API works.
2. **Standalone examples option** Create a separate example under `docs/sphinx/examples/`. Examples in this directory are typically more comprehensive and executable, making them suitable for richer or more complex scenarios.

## 2.10.7 Module structure

This section explains the structure of an *HPX* module.

The tool `create_library_skeleton.py`<sup>848</sup> can be used to generate a basic skeleton. To create a library skeleton, run the tool in the `libs` subdirectory with the module name as an argument:

```
$ ./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an *HPX* module. It will not create any actual source files. The structure of this skeleton is as follows:

- `<lib_name>/`
  - `README.rst`
  - `CMakeLists.txt`
  - `cmake`
  - `docs/`
    - \* `index.rst`
  - `examples/`
    - \* `CMakeLists.txt`
  - `include/`
    - \* `hpx/`
      - `<lib_name>`
  - `src/`
    - \* `CMakeLists.txt`
  - `tests/`
    - \* `CMakeLists.txt`
    - \* `unit/`
      - `CMakeLists.txt`
    - \* `regressions/`
      - `CMakeLists.txt`
    - \* `performance/`
      - `CMakeLists.txt`

A `README.rst` should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main `CMakeLists.txt` is created in the root directory of the module. By default it contains a call to `add_hpx_module` which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

`add_hpx_module` requires a module name. Optional flags are:

Optional single-value arguments are:

- `INSTALL_BINARIES`: Install the resulting library.

<sup>848</sup> [https://github.com/TheHPXProject/hpx/blob/master/libs/create\\_module\\_skeleton.py](https://github.com/TheHPXProject/hpx/blob/master/libs/create_module_skeleton.py)

Optional multi-value arguments-are:

- **SOURCES**: List of source files.
- **HEADERS**: List of header files.
- **COMPAT\_HEADERS**: List of compatibility header files.
- **DEPENDENCIES**: Libraries that this module depends on, such as other modules.
- **CMAKE\_SUBDIRS**: List of subdirectories to add to the module.

The `include` directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the `src` directory. This allows for clear separation. The `cmake` subdirectory may include additional [CMake](https://www.cmake.org)<sup>849</sup> scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an `include_compatibility` directory. This directory is not created by default.

Documentation is placed in the `docs` folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the `include` directory will automatically be processed by Doxygen and included into the documentation.

Tests are placed in suitable subdirectories of `tests`.

When in doubt, consult existing modules for examples on how to structure the module.

## Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it's not clear what is causing the circular dependency, running the `cpp-dependencies`<sup>850</sup> tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the `cpp-dependencies` tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See *Using docker for development* for details on how to use the docker image.

To produce the graph produced by CI run the following command (`HPX_SOURCE` is assumed to hold the path to the *HPX* source directory):

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a `dot` file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have `graphviz` installed:

```
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an `svg` file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on `config`, the following should give you a long list of paths from `algorithms` to `config`:

---

<sup>849</sup> <https://www.cmake.org>

<sup>850</sup> <https://github.com/tomtom-international/cpp-dependencies>

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest algorithms config
```

The following should report that it can't find a path between the two modules:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest config algorithms
```

## 2.11 Releases

### 2.11.1 List of supported releases

#### HPX V2.0.0 (TBD)

##### General changes

##### Breaking changes

##### Closed issues

##### Closed pull requests

#### HPX V1.11.0 (Jun 30, 2025)

This release is the last version of HPX that supports C++17. Future versions of HPX will require compilation using C++20 or above.

##### General changes

- Added synchronous versions of all collective operations. Added global predefined communicator objects that are accessible through new APIs: `hpx::collectives::get_world_communicator()` refers to all localities and `hpx::collectives::get_local_communicator()` refers to all threads on the calling locality. We unified the interfaces of the different communicator objects.
- Added `hpx::experimental::run_on_all` allowing to run a given function (possibly concurrently) using a given execution policy.
- Added a helper object `hpx::runtime_manager` that simplifies the initialization of HPX without needing to modify the main function of the application.
- We improved the compatibility with various accelerator frameworks (SYCL, OneAPI).
- Applied build system changes that allow building HPX without any prerequisites. This requires to pass `-DHPX_WITH_FETCH_HWLOC=On` and `-DHPX_WITH_FETCH_BOOST=On` to the [CMake](https://www.cmake.org)<sup>851</sup> configuration.
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- Added the `hpx::contains` and `hpx::contains_subrange` parallel algorithms.
- Adapted many of HPX' parallel algorithms to be usable with senders/receivers.

<sup>851</sup> <https://www.cmake.org>

## Breaking changes

- We have moved most of the APIs that were defined in the namespace `hpx::parallel::execution` to the namespace `hpx::execution::experimental`. It was not possible to add compatibility facilities that will allow to continue using the old APIs, applications will have to be changed in order to continue functioning correctly.
- The CMake configuration parameter `HPX_WITH_RUN_MAIN_EVERYWHERE` is now deprecated and will be removed in the future. Use the preprocessor macro `HPX_HAVE_RUN_MAIN_EVERYWHERE` on a target-by-target case instead.
- Removed the dysfunctional libfabric parcelport.
- Removed features that were long deprecated (starting V1.8): - `hpx::flush`, `hpx::endl`, `hpx::async_flush`, `hpx::async_endl` - Various enumerator types are now only available as `class enum` requiring explicit scoped use of the enumerator values - Various non-conforming overloads of parallel algorithms - `hpx::for_loop` and friends (now only available as

`hpx::experimental::for_loop`)

- `hpx::parallel::induction` is now only available as `hpx::experimental::induction`
- `hpx::parallel::reduction` and friends are now only available as `hpx::experimental::reduction`
- `hpx::assertion::source_location` is now only available as `hpx::source_location`
- `hpx::lcos::split_future` is now only available as `hpx::split_future`
- `hpx::lcos::wait` and friends have been removed altogether
- `hpx::lcos::wait_any` and friends are now only available as `hpx::wait_any`
- `hpx::lcos::wait_some` and friends are now only available as `hpx::wait_some`
- `hpx::lcos::wait_each` and friends are now only available as `hpx::wait_each`
- `hpx::lcos::wait_all` and friends are now only available as `hpx::wait_all`
- `hpx::lcos::when_all` and friends are now only available as `hpx::when_all`
- `hpx::lcos::when_any` and friends are now only available as `hpx::when_any`
- `hpx::lcos::when_each` and friends are now only available as `hpx::when_each`
- `hpx::lcos::when_some` and friends are now only available as `hpx::when_some`
- `hpx::util::optional` and related facilities are now only available as `hpx::optional`
- `hpx::util::bind` and related facilities are now only available as `hpx::bind`
- `hpx::util::function` and friends are now only available as `hpx::function`
- `hpx::traits::is_bound_action` and related facilities are now only available as `hpx::is_bound_action`
- `hpx::traits::is_bind_expression` and related facilities are now only available as `hpx::is_bind_expression`
- `hpx::traits::is_placeholder` and related facilities are now only available as `hpx::is_placeholder`
- `hpx::lcos::future` and related facilities are now only available as `hpx::future`
- `hpx::memory::intrusive_ptr` is now only available as `hpx::intrusive_ptr`
- `hpx::lcos::local::barrier` is now only available as `hpx::barrier`
- `hpx::lcos::barrier` is now only available as `hpx::distributed::barrier`

- `hpx::lcos::local::cpp20_binary_semaphore` is now only available as `hpx::detail::binary_semaphore`
- `hpx::lcos::local::condition_variable` and friends are now only available as `hpx::condition_variable`
- `hpx::lcos::local::counting_semaphore` and friends are now only available as `hpx::counting_semaphore`
- `hpx::lcos::local::cpp20_latch` and is now only available as `hpx::latch`
- `hpx::lcos::latch` and is now only available as `hpx::distributed::latch`
- `hpx::lcos::local::upgrade_lock` and friends are now only available as `hpx::upgrade_lock`
- `hpx::lcos::local::mutex` and friends are now only available as `hpx::mutex`
- `hpx::lcos::local::spinlock` and friends are now only available as `hpx::spinlock`
- `hpx::lcos::local::call_once` and friends are now only available as `hpx::call_once`
- `hpx::util::annotated_function` and is now only available as `hpx::annotated_function`
- `hpx::components::abstract_simple_component_base` and is now only available as `hpx::components::abstract_component_base`
- `hpx::naming::id_type` and is now only available as `hpx::id_type`

## 2.11.2 List of older releases

### HPX V1.10.0 (May 29, 2024)

#### General changes

- The HPX documentation has seen a major overhaul for this release. We finished documenting the public local HPX API, we have added migration guides from widely used parallelization platforms to HPX (OpenMP, TBB, and MPI).
- We have added facilities enabling optimizations for trivially-relocatable types (see [P1144](https://wg21.link/p1144)<sup>1001</sup> for more details).
- We have added (and use) the `scope_xxx` helper facilities as specified by the C++ library fundamentals TS v3 (see: [N4948](http://wg21.link/n4948)<sup>1002</sup>).
- We have added configuration options that allow to build HPX without pre-installing any prerequisites. Use `HPX_WITH_FETCH_HWLOC=On` to have [Portable Hardware Locality \(HWLOC\)](https://www.open-mpi.org/projects/hwloc/)<sup>1003</sup> installed for you. Similarly, setting `HPX_WITH_FETCH_BOOST=On` during configuration time will install the necessary [Boost](https://www.boost.org/)<sup>1004</sup> libraries (currently V1.84.0).
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- The collective operations APIs have seen an unification, we have fixed issues and performance problems for the collectives.
- The HPX executors have seen a streamlining and some consistency changes. We have applied many performance improvements to the executor implementations that directly positively impact the performance of our parallel algorithms.
- We have added a new parcelport allowing to use Gasnet as a communication platform.
- We have added optimizations to various parcelports improving overall communication performance. This includes - amongst other things - send immediate optimizations and receiver-side zero-copy optimizations.
- Futures will now execute the associated task eagerly and inline on any wait operation if the task has not started running yet. This feature can be enabled using the `HPX_COROUTINES_WITH_THREAD_SCHEDULE_HINT_RUNS_AS_CHILD=On` configuration setting (which is *Off* by default).
- We have enabled using json files to supply configuration information through the command line. This feature can be enabled with the configuration option `HPX_COMMAND_LINE_HANDLING_WITH_JSON_CONFIGURATION_FILES=On`. This functionality depends on the external [JSON library](https://github.com/nlohmann/json)<sup>1005</sup>, which can be built at configuration time by supplying `HPX_WITH_FETCH_JSON=On` to [CMake](https://www.cmake.org)<sup>1006</sup>.
- We have applied many fixes to our CUDA, ROCm, and SYCL build environments.

<sup>1005</sup> <https://github.com/nlohmann/json>

<sup>1006</sup> <https://www.cmake.org>

## Breaking changes

- The `CMake`<sup>1007</sup> configuration keys `SOMELIB_ROOT` (e.g., `BOOST_ROOT`) have been renamed to `Somelib_ROOT` (e.g., `Boost_ROOT`) to avoid warnings when using newer versions of `CMake`<sup>1008</sup>. Please update your scripts accordingly. For now, the old variable names are re-assigned to the new names and unset in the `CMake`<sup>1009</sup> cache.

## Closed issues

## HPX V1.9.1 (August 4, 2023)

### General changes

This point release fixes a couple of problems reported for the V1.9.0 release. Most importantly, we fixed various occasional hanging during startup and shutdown in distributed scenarios. We also added support for zero-copy serialization on the receiving side to the TCP, MPI, and LCI parcelports. Last but not least, we have added support for Visual Studio 2019 and gcc using MINGW on Windows, and also support for gcc V13 and clang V15.

HPX headers are now made consistently named the same as their standard library counterparts, e.g. `#include <thread>` now corresponds to `#include <hpx/thread.hpp>`. This significantly simplifies porting existing standards conforming codes to HPX.

A lot of work has been done to improve and optimize our network communication layers. Primary focus of this work was on the LCI parcelport, but we have also cleaned up and improved the MPI parcelport.

Additionally, we have continued working on our documentation. The main focus here was on completing the API documentation of the most important API functions. We have started adding migration guides for people interested in moving their codes away from other, commonplace parallelization frameworks like OpenMP.

## **HPX V1.9.0 (May 2, 2023)**

### **General changes**

- Added RISC-V 64bit support. HPX is now compatible with RISC-V architectures which have revolutionized the HPC world.
- LCI parcelport has been optimized to transfer parcels with fewer messages and use the HPX resource partitioner for its progress thread allocation. It should generally provide better performance than before. It also removes its dependency on the MPI library.
- HPX dependency on Boost was further relaxed by replacing headers from `Boost.Range`, `Boost.Tokenizer` and `Boost.Lockfree`.
- Improvements took place on our parallel algorithms implementation.
- Our Senders/Receivers (P2300) integration was extended:
  - Coroutines were integrated with senders/receivers.
- `get_completion_signatures` now works with awaitable senders. - `with_awaitable_senders` allows the passed senders to retrieve the value i.e. senders are transparently awaitable from within a coroutine. - `when_all_vector` was added.
- `sync_wait` and `sync_wait_with_variant` sender consumers were added. The user can now initiate the execution of their asynchronous pipeline by blocking the current thread that executes the `main()` function until the result is retrieved.
- The combinators for futures (a.k.a. `async_combinators`) `when_*`, `wait_*`, `wait_*_nothrow` were turned into CPOs allowing for end-user customization. For more information on the `async_combinators` refer to the documentation, [https://hpx-docs.stellar-group.org/latest/html/libs/core/async\\_combinators/docs/index.html?highlight=combinators](https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators).
- The new datapar backend SVE allows `simd` and `par_simd` execution policies to exploit dataparallelism in the processors that have SVE vector registers like A64FX and Neoverse V1.
- The documentation for parallel algorithms, container algorithms was further improved. The Public API page was vastly enriched.
- Copy button shortkey was added at the top-right of code-blocks.
- Pragma directive that reports warnings as errors on MSVC was fixed.
- Command line argument `--hpx:loopback_network` was added to facilitate debugging with networks.
- We added an HPX-SYCL integration, allowing users to obtain HPX futures for SYCL events. This effectively enables the integration of arbitrary asynchronous SYCL operations into the HPX task graph. Bolted on top of this integration, we further added an HPX-SYCL executor for ease of use.

<sup>1238</sup> <https://github.com/TheHPXProject/hpx/pull/6279>

<sup>1239</sup> <https://github.com/TheHPXProject/hpx/pull/6281>

<sup>1240</sup> <https://github.com/TheHPXProject/hpx/pull/6283>

## Breaking changes

- Stopped supporting Clang V8, the minimal version supported is now Clang V10.
- Stopped supporting gcc V8, the minimal version supported is now gcc V9.
- Stopped supporting Visual Studio 2015, the minimal version supported is now Visual Studio 2019.
- `tag_policy_tag` et.al. were re-added after HPX V1.8.1 deprecation.
- `get_chunk_size` and `processing_units_count` API is now expecting the time for one iteration as an argument.
- The list of all the namespace changes can be found here: *HPX V1.9.0 Namespace changes*.

<sup>1324</sup> <https://github.com/TheHPXProject/hpx/pull/6127>

- PR #6126<sup>1325</sup> - Deprecate `hpx::parallel::task_block` in favor of `hpx::experimental::task_block`
- PR #6125<sup>1326</sup> - Making sure `sync_wait` compiles when used with an lvalue sender involving bulk
- PR #6124<sup>1327</sup> - Fixing use of `any_sender` in combination with `when_all`
- PR #6123<sup>1328</sup> - Fixed issues found by PVS-Studio
- PR #6121<sup>1329</sup> - Modernize modules of level 21, 22
- PR #6120<sup>1330</sup> - Use `index_queue` for parallel executors `bulk_async_execute`
- PR #6119<sup>1331</sup> - Update `CMakeLists.txt`
- PR #6118<sup>1332</sup> - Modernize modules from level 17, 18, 19, and 20
- PR #6117<sup>1333</sup> - Initialize `buffer_allocate_time_` to 0
- PR #6116<sup>1334</sup> - Add new command line argument `-hpx:loopback_network`
- PR #6115<sup>1335</sup> - Modernize modules of levels 14, 15, and 16
- PR #6114<sup>1336</sup> - Enhance the formatting of the documentation
- PR #6113<sup>1337</sup> - Modernize modules in module level 11, 12, and 13
- PR #6112<sup>1338</sup> - Modernize modules from levels 9 and 10
- PR #6111<sup>1339</sup> - Modernize all modules from module level 8
- PR #6110<sup>1340</sup> - Use pragma error directive to report warnings as errors on msvc
- PR #6109<sup>1341</sup> - Modernize serialization module
- PR #6107<sup>1342</sup> - Modernize error module
- PR #6106<sup>1343</sup> - Modernizing modules of levels 0 to 5
- PR #6105<sup>1344</sup> - Optimizations on LCI parcelport: merge small messages; remove sender mutex lock.
- PR #6104<sup>1345</sup> - Adding parameters API: `measure_iteration`
- PR #6103<sup>1346</sup> - Document `task_group` and include in Public API
- PR #6102<sup>1347</sup> - Prevent warnings generated by clang-cl

- PR #6101<sup>1348</sup> - Using more fold expressions
- PR #6100<sup>1349</sup> - Deprecate `hpx::parallel::reduce_by_key` in favor of `hpx::experimental::reduce_by_key`
- PR #6098<sup>1350</sup> - Forking Boost.Lockfree
- PR #6096<sup>1351</sup> - Forking Boost.Tokenizer
- PR #6095<sup>1352</sup> - Replacing facilities from Boost.Range
- PR #6094<sup>1353</sup> - Removing object\_semaphore
- PR #6093<sup>1354</sup> - Replace `boost::string_ref` with `std::string_view`
- PR #6092<sup>1355</sup> - Use C++17 `static_assert` where possible
- PR #6091<sup>1356</sup> - Replace artificial sequencing with fold expressions
- PR #6090<sup>1357</sup> - Fixing use of `get_chunk_size` customization point
- PR #6088<sup>1358</sup> - Add/fix Public API documentation
- PR #6086<sup>1359</sup> - Deprecate `hpx::util::unlock_guard` in favor of `hpx::unlock_guard`
- PR #6085<sup>1360</sup> - Add experimental `sycl` integration/executor
- PR #6084<sup>1361</sup> - Renaming `hpx::apply` and friends to `hpx::post`
- PR #6083<sup>1362</sup> - Using `if constexpr` instead of tag-dispatching, where possible
- PR #6082<sup>1363</sup> - Replace `util::always_void_t` with `std::void_t`
- PR #6081<sup>1364</sup> - Update github actions to avoid warnings
- PR #6080<sup>1365</sup> - Disable some tests that fail on LCI
- PR #6079<sup>1366</sup> - Adding more `natvis` files, correct existing
- PR #6078<sup>1367</sup> - Changing target name of `memory_counters` component
- PR #6077<sup>1368</sup> - Making default constructor of `hpx::mutex` `constexpr`
- PR #6076<sup>1369</sup> - Cleaning up functionality that was deprecated in V1.7
- PR #6075<sup>1370</sup> - Remove conditional code for gcc V7 and below

## HPX V1.8.1 (Aug 5, 2022)

This is a bugfix release with a few minor additions and resolved problems.

### General changes

This patch release adds a number of small new features and fixes a handful of problems discovered since the last release, in particular:

- A lot of work has been done to improve vectorization support for our parallel algorithms. HPX now supports using EVE - the Expressive Vector Engine as a vectorization backend.
- Added a simple average power consumption performance counter.
- Added performance counters related to the use of zero-copy chunks in the networking layer.
- More work was done towards full compatibility with the sender/receivers proposal P2300.
- Fixing sync\_wait to decay the result types
- Fixed collective operations to properly avoid overalapping consecutive operations on the same communicator.
- Simplified the implementation of our execution policies and added mapping functions between those.
- Fixed performance issues with our implementation of *small\_vector*.
- Serialization now works with buffers of unsigned characters.
- Fixing dangling reference in serialization of non-default constructible types
- Fixed static linking on Windows.
- Fixed support for M1/MacOS based architectures.
- Fixed support for gentoo/musl.
- Fixed *hpx::counting\_semaphore\_var*.
- Properly check start and end bounds for *hpx::for\_loop*
- A lot of changes and fixes to the documentation (see <https://hpx-docs.stellar-group.org>).

- PR #5879<sup>1530</sup> - New performance counters related to zero-copy chunks.

## HPX V1.8.0 (May 18, 2022)

With HPX parallel algorithms been fully adapted to C++20 the new release achieves full conformance with C++20 concurrency and parallelism facilities. HPX now supports all of the algorithms as specified by C++20. We have added support for vectorization to more of our algorithms. Much work has been done towards implementing P2300 (“std::execution”) and implementing the underlying senders/receivers facilities. Finally, The new release comes with a brand new documentation interface!

### General changes

- The new documentation can now be found on our webpage: <https://hpx-docs.stellar-group.org>. This includes a completely new and user-friendly interface environment along with restructuring of certain components. The content in the “Quick start”, “Manual” and “Examples” was improved, while the “Build system” page was adapted to include necessary information for newcomers.
- With the vectorization support available in modern hardware architectures HPX now provides new data-parallel vector execution policies `hpx::execution::simd` and `hpx::execution::par_simd` that enable significant speed-up of our parallel algorithm implementations. The following algorithms now support SIMD execution:
  - `copy`, `copy_n`
  - `generate`
  - `adjacent_difference`, `adjacent_find`
  - `all_of`, `any_of`, `none_of`
  - `equal`, `mismatch`,
  - `inner_product`
  - `count`, `count_if`
  - `fill`, `fill_n`
  - `find`, `find_end`, `find_first_of`, `find_if`, `find_if_not`
  - `for_each`, `for_each_n`
  - `generate`, `generate_n`.
- Based on top of P2300 the HPX parallel algorithms now support the pipeline syntax towards an effort to unify their usage along with senders/receivers. The HPX parallel algorithms can now bind with senders/receivers using the pipeline operator.
- Several changes took place on the executors provided by HPX:
- The executors now support the `num_cores` options in order for the user to be able to specify the desired number of cores to be used in the corresponding execution.
- The `scheduler` executor was implemented on top of senders/receivers and can be used with all HPX facilities that schedule new work, such as parallel algorithms, `hpx::async`, `hpx::dataflow`, etc.
- The performance of `fork_join_executor` was improved.
- The following algorithms have been added/adapted to be C++20 conformant:
  - `min_element`

<sup>1530</sup> <https://github.com/TheHPXProject/hpx/pull/5879>

- `max_element`
  - `minmax_element`
  - `starts_with`
  - `ends_with`
  - `swap_ranges`
  - `unique`
  - `unique_copy`
  - `rotate`
  - `rotate_copy`
  - `sort`
  - `shift_left`
  - `shift_right`
  - `stable_sort`
  - `partition`
  - `partition_copy`
  - `stable_partition`
  - `adjacent_difference`
  - `nth_element`
  - `partial_sort`
  - `partial_sort_copy`.
- HPX\_FORWARD/HPX\_MOVE macros were introduced that replaced the `std::move` and `std::forward` facilities that in the library code.
  - Hangs on distributed barrier were fixed.
  - The performance of `scan_partitioner` was improved.
  - Support was added for `thread_priority` to the `parallel_execution_policy`
  - Regarding senders/receivers and the P2300 proposal various actions took place. `stop_token` was adapted to the recent proposal version (`in_place_stop_token` was introduced). Also hint, annotation, priority and stacksize properties were added to the scheduler executor. Stop support was added to `when_all`. Support for completion signatures was added. The following schedulers and algorithms were added:
    - `get_completion_scheduler`
    - `any_sender` and `unique_any_sender`
    - `split` sender
    - `transform_mpi` sender
    - `transfer` sender
    - `let_error`, `let_stopped`
    - `get_env` and related environment queries
    - `schedule`, `set_value`, `set_error`, `set_done`, `start` and `connect` are now proper customization points as defined in P2300.

- Several namespaces were altered towards conformance with C++20. Compatibility layers have been added and the old versions will be removed in next releases. The namespace changes are the following:
  - `hpx::parallel::induction/reduction` were moved into namespace `hpx::experimental`
  - `for_loop` and friends were moved into namespace `hpx::experimental`.
  - `hpx::util::optional` and friends were moved into namespace `hpx`.
  - `hpx::lcos::barrier` has been moved into the `hpx::distributed` namespace and `hpx::lcos::local::cpp20_barrier` has been renamed to `barrier` and moved into the `hpx` namespace.
  - `hpx::lcos::latch` has been moved into the `hpx::distributed` namespace and `lcos::local::latch` has been moved into the `hpx` namespace. The `count_down_and_wait()` functionality of `latch` has been renamed to `arrive_and_wait()`.
  - `hpx::util::unique_function_nonsr` has been renamed to `hpx::move_only_function`.
  - `hpx::util::unique_function` has been renamed to `hpx::distributed::move_only_function`.
  - `hpx::util::function` has been renamed to `hpx::distributed::function`.
  - `hpx::util::function_nonsr` has been renamed to `hpx::function`.
  - `hpx::util::function_ref` have been moved to namespace `hpx`.
  - `hpx::lcos::split_future` changed namespace and is now used as `hpx::split_future`.
  - `hpx::lcos::local::counting_semaphore` has been deprecated and `hpx::lcos::local::cpp20_counting_semaphore` has been renamed to `hpx::counting_semaphore`.
  - `hpx::lcos::local::cpp20_binary_semaphore` has been renamed to `hpx::binary_semaphore`.
  - `hpx::lcos::local::sliding_semaphore` has been renamed to `hpx::sliding_semaphore` and
  - `hpx::lcos::local::sliding_semaphore_var` has been renamed to `hpx::sliding_semaphore_var`.
  - `hpx::lcos::local::spinlock` has been renamed to `hpx::spinlock`.
  - `hpx::lcos::local::mutex` has been renamed to `hpx::mutex`.
  - `hpx::lcos::local::timed_mutex` has been renamed to `hpx::timed_mutex`.
  - `hpx::lcos::local::no_mutex` has been renamed to `hpx::no_mutex`.
  - `hpx::lcos::local::recursive_mutex` has been renamed to `hpx::recursive_mutex`.
  - `hpx::lcos::local::shared_mutex` has been renamed to `hpx::shared_mutex`.
  - `hpx::lcos::local::upgrade_lock` has been renamed to `hpx::upgrade_lock`.
  - `hpx::lcos::local::upgrade_to_unique_lock` has been renamed to `hpx::upgrade_to_unique_lock`.
  - `hpx::lcos::local::condition_variable` has been renamed to `hpx::condition_variable`. `hpx::lcos::local::condition_variable_var` has been renamed to `hpx::condition_variable_var`.
  - `hpx::lcos::local::once_flag` has been renamed to `hpx::once_flag`, and `hpx::lcos::local::call_once` has been renamed to `hpx::call_once`.
- The new LCI (Lightweight Communication Interface) `parcelexport` was added that supports irregular and asynchronous applications like graph analysis, sparse linear algebra, modern parallel architectures etc. Major features include:

- Support for advanced communication primitives like two sided send/recv and one sided remote put.
- Better multi-threaded performance.
- Explicit user control of communication resource.
- Flexible signaling mechanisms (synchronizer, completion queue, active message handler).
- The following CMake flags were added, mostly to support using HPX as a backend for SHAD (<https://github.com/pnnl/SHAD>). Please note that these options enable questionable functionalities, partially they even enable undefined behavior. Please only use any of them if you know what you're doing:
  - HPX\_SERIALIZATION\_WITH\_ALLOW\_RAW\_POINTER\_SERIALIZATION
  - HPX\_SERIALIZATION\_WITH\_ALL\_TYPES\_ARE\_BITWISE\_SERIALIZABLE
  - HPX\_SERIALIZATION\_WITH\_ALLOW\_CONST\_TUPLE\_MEMBERS

## Breaking changes

- Minimum required C++ standard library is C++17.
- Support for GCC 7 and Clang 8.0.0 and below has been removed.
- CUDA version required updated to 11.4.
- CMake version required updated to 3.18.
- The default version of Asio used was updated to 1.20.0.
- The default version of APEX used was updated to 2.5.1.
- APEX version was updated to 2.5.1.
- `tagged_pair` and `tagged_tuple` were removed.
- `tag_dispatch` was renamed to `tag_invoke`.
- `hpx.max_backgroud_threads` was renamed to `hpx.parcel.max_background_threads`.
- The following CMake flags were removed after being deprecated for at least two releases:
  - HPX\_SCHEDULER\_MAX\_TERMINATED\_THREADS
  - HPX\_WITH\_GOOGLE\_PERFTOOLS
  - HPX\_WITH\_INIT\_START\_OVERLOADS\_COMPATIBILITY
  - HPX\_HAVE\_{COROUTINE,PLUGIN}\_GCC\_HIDDEN\_VISIBILITY
  - HPX\_TOP\_LEVEL
  - HPX\_WITH\_COMPUTE\_CUDA
  - HPX\_WITH\_ASYNC\_CUDA
- `annotate_function` was renamed to `scoped_annotation`.
- `execution::transform` was renamed to `execution::then`.
- `execution::detach` was renamed to `execution::start_detached`.
- `execution::on_sender` was renamed to `execution::schedule_on`.
- `execution::just_on` was renamed to `execution::just_transfer`.
- `execution::set_done` was renamed to `execution::set_stopped`.

- PR #5749<sup>1690</sup> - P2300 stop token
- PR #5748<sup>1691</sup> - Adding environmental query CPOs
- PR #5747<sup>1692</sup> - Renaming set\_done to set\_stopped (as per P2300)
- PR #5745<sup>1693</sup> - Modernize serialization module
- PR #5743<sup>1694</sup> - Add check for MPICH and set the correct env to support multi-threaded
- PR #5742<sup>1695</sup> - Remove obsolete files related to cpuid, etc.
- PR #5741<sup>1696</sup> - Support for data-parallelism for adjacent find
- PR #5740<sup>1697</sup> - Support for data-parallelism for find algorithms
- PR #5739<sup>1698</sup> - Enable the option to attach a debugger on a segmentation fault (linux)
- PR #5738<sup>1699</sup> - Fixing spell-checking errors
- PR #5737<sup>1700</sup> - Attempt to fix migrate\_component issue
- PR #5736<sup>1701</sup> - Set commit status from Jenkins also for special branches
- PR #5734<sup>1702</sup> - Revert #5586
- PR #5732<sup>1703</sup> - Attempt to improve build-id reporting to cdash
- PR #5731<sup>1704</sup> - Randomly delay execution of bash scripts launched by Jenkins
- PR #5729<sup>1705</sup> - Workaround for CMake/Ninja generator OOM problem
- PR #5727<sup>1706</sup> - Moving compression plugins to components directory
- PR #5726<sup>1707</sup> - Moving/consolidating parcel coalescing plugin sources
- PR #5725<sup>1708</sup> - Making sure headers for serialization filters are being installed
- PR #5723<sup>1709</sup> - Moving more tests to modules
- PR #5722<sup>1710</sup> - Removing superfluous semicolons
- PR #5720<sup>1711</sup> - Moving parcelports into modules
- PR #5719<sup>1712</sup> - Moving more files to parcelset module

## HPX V1.7.1 (Aug 12, 2021)

This is a bugfix release with a few minor fixes.

### General changes

- Added a CMake option to assume that all types are bitwise serializable by default: `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`. The default value `OFF` corresponds to the old behaviour.
- Added a version check for Asio. The minimum Asio version supported by *HPX* is 1.12.0.
- Fixed a bug affecting usage of actions, where the internals of *HPX* relied on function addresses being unique. This was fixed by relying on variable addresses being unique instead.
- Made `hpx::util::bind` more strict in checking the validity of placeholders.
- Small performance improvement to spinlocks.
- Adapted the following parallel algorithms to C++20: `inclusive_scan`, `exclusive_scan`, `transform_inclusive_scan`, `transform_exclusive_scan`.

### Breaking changes

- The experimental `hpx::execution::simdpair` execution policy (introduced in 1.7.0) was renamed to `hpx::execution::par_simd` for consistency with the other parallel policies.

### Closed issues

- [Issue #5494](#)<sup>1920</sup> - Rename *simdpair* execution policy to *par\_simd*
- [Issue #5488](#)<sup>1921</sup> - `hpx::util::bind` doesn't bounds-check placeholders
- [Issue #5486](#)<sup>1922</sup> - Possible V1.7.1 release

### Closed pull requests

## HPX V1.7.0 (Jul 14, 2021)

This release is again focused on C++20 conformance of algorithms. Additionally, many new experimental sender-based algorithms have been added based on the latest proposals.

### General changes

- The following algorithms have been adapted to be C++20 conformant:
  - `remove`,
  - `remove_if`,
  - `remove_copy`,
  - `remove_copy_if`,
  - `replace`,
  - `replace_if`,
  - `reverse`, and
  - `lexicographical_compare`.
- When the compiler and standard library support the standard execution policies `std::execution::seq`, `std::execution::par`, and `std::execution::par_unseq` they can now be used in all *HPX* parallel algorithms with equivalent behaviour to the non-task policies `hpx::execution::seq`, `hpx::execution::par`, and `hpx::execution::par_unseq`.
- Vc support has been fixed, after being broken in 1.6.0. In addition, *HPX* now experimentally supports GCC's SIMD implementation, when available. The implementation can be used through the `hpx::execution::simd` and `hpx::execution::simdpair` execution policies.
- The customization points `sync_execute`, `async_execute`, `then_execute`, `post`, `bulk_sync_execute`, `bulk_async_execute`, and `bulk_then_execute` are now implemented using `tag_dispatch` (previously `tag_invoke`). Executors can still be implemented by providing the aforementioned functions as member functions of an executor.
- New functionality, enhancements, and fixes based on P0443r14 (executors proposal) and P1897 (sender-based algorithms) have been added to the `hpx::execution::experimental` namespace. These can be accessed through the `hpx/execution.hpp` and `hpx/local/execution.hpp` headers. In particular, the following sender-based algorithms have been added:
  - `detach`,

<sup>1929</sup> <https://github.com/TheHPXProject/hpx/pull/5445>

<sup>1930</sup> <https://github.com/TheHPXProject/hpx/pull/5444>

<sup>1931</sup> <https://github.com/TheHPXProject/hpx/pull/5440>

<sup>1932</sup> <https://github.com/TheHPXProject/hpx/pull/5439>

<sup>1933</sup> <https://github.com/TheHPXProject/hpx/pull/5436>

- `ensure_started`,
- `just`,
- `just_on`,
- `let_error`,
- `let_value`,
- `on`,
- `transform`, and
- `when_all`.

Additionally, futures now implement the sender concept. `make_future` can be used to turn a sender into a future. All functionality is experimental and can change without notice.

- All `hpx::init` and `hpx::start` overloads now take `std::functions` instead of `hpx::util::function_nonser`. No changes should be required in user code to accommodate this change.
- `hpx::util::unwrapping` and other related unwrapping functionality has been moved up into the `hpx` namespace. Names in `hpx::util` are still usable with a deprecation warning. This functionality can now be accessed through the `hpx/unwrap.hpp` and `hpx/local/unwrap.hpp` headers.
- The default tag for APEX has been update from 2.3.1 to 2.4.0. In particular, this fixes a bug which could lead to hangs in distributed runs.
- The dependency on Boost.Asio has been replaced with the standalone Asio available at <https://github.com/chriskohlhoff/asio>. By default, a system-installed Asio will be used. `ASIO_ROOT` can be given as a hint to tell CMake where to find Asio. Alternatively, Asio can be fetched automatically using CMake's `fetchcontent` by setting `HPX_WITH_FETCH_ASIO=ON`. In general, dependencies on Boost have again been reduced.
- Modularization of the library has continued. In this release almost all functionality has been moved into modules. These changes do not generally affect user code. Warnings are still issued for headers that have moved.
- `hipBLAS` is now optional when compiling with `hipcc`. A warning instead of an error will be printed if `hipBLAS` is not found during configuration.
- Previously `HPX_COMPUTE_HOST_CODE` was defined in host code only if HPX was configured with CUDA or HIP. In this release `HPX_COMPUTE_HOST_CODE` is always defined in host code.
- An experimental `HPX_WITH_PRECOMPILED_HEADERS` CMake option has been added to use precompiled headers when building *HPX*. This option should not be used on Windows.
- Numerous bug fixes.

## Breaking changes

- The minimum required CMake version is now 3.17.
- The minimum required Boost version is now 1.71.0.
- The customization mechanism used to implement and extend sender functionality and algorithms has been re-named from `tag_invoke` to `tag_dispatch`. All customization of sender functionality should be done by overloading `tag_dispatch`.
- The following compatibility options have been removed, along with their compatibility implementations:
  - `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`
  - `HPX_WITH_ACTION_BASE_COMPATIBILITY`
  - `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`
  - `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`
  - `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`

HPX\_WITH\_REGISTER\_THREAD\_COMPATIBILITY - HPX\_WITH\_REGISTER\_THREAD\_OVERLOADS\_COMPATIBILITY  
 - HPX\_WITH\_THREAD\_AWARE\_TIMER\_COMPATIBILITY - HPX\_WITH\_THREAD\_EXECUTORS\_COMPATIBILITY -  
 HPX\_WITH\_THREAD\_POOL\_OS\_EXECUTOR\_COMPATIBILITY

- The HPX\_WITH\_THREAD\_SCHEDULERS CMake option has been removed. All schedulers are now enabled when possible.
- HPX\_WITH\_INIT\_START\_OVERLOADS\_COMPATIBILITY has been turned off by default.

## Closed pull requests

- [PR #5438](#)<sup>1958</sup> - Delete `datapar/foreach_tests.hpp`
- [PR #5437](#)<sup>1959</sup> - Add back explicit `-pthread` flags when available
- [PR #5435](#)<sup>1960</sup> - This adds support for systems that assume all types are bitwise serializable by default
- [PR #5434](#)<sup>1961</sup> - Update CUDA polling logging to be more verbose
- [PR #5433](#)<sup>1962</sup> - Fix `when_all_sender` connect for references
- [PR #5432](#)<sup>1963</sup> - Add deprecation warnings for v1.8
- [PR #5431](#)<sup>1964</sup> - Rename the new P0443/P2300 executor to `thread_pool_scheduler`
- [PR #5430](#)<sup>1965</sup> - Revert “Adding the missing defined for `HPX_HAVE_DEPRECATED_WARNINGS`”
- [PR #5427](#)<sup>1966</sup> - Removing unneeded `typedef`
- [PR #5426](#)<sup>1967</sup> - Adding more concept checks for sender/receiver algorithms
- [PR #5425](#)<sup>1968</sup> - Adding the missing defined for `HPX_HAVE_DEPRECATED_WARNINGS`
- [PR #5424](#)<sup>1969</sup> - Disable Vc in final docker image created in CI
- [PR #5422](#)<sup>1970</sup> - Adding `execution::experimental::bulk` algorithm
- [PR #5420](#)<sup>1971</sup> - Update logic to find threading library
- [PR #5418](#)<sup>1972</sup> - Reduce max size and number of files in `ccache` cache

- PR #5387<sup>1995</sup> - Extend thread state logging and change default stealing parameters
- PR #5386<sup>1996</sup> - Attempt to fix the startup hang with nodes > 32
- PR #5384<sup>1997</sup> - Remove HPX 1.5.0 deprecations
- PR #5382<sup>1998</sup> - Prefer installed Asio before considering FetchContent
- PR #5379<sup>1999</sup> - Allow using pre-downloaded (not installed) versions of Asio and/or Apex
- PR #5376<sup>2000</sup> - Remove unnecessary explicit listing of library modules.rst files in CMakeLists.txt
- PR #5375<sup>2001</sup> - Slight performance improvement for `hpx::copy` and `hpx::move` et.al.
- PR #5374<sup>2002</sup> - Remove unnecessary moves from future sender implementations
- PR #5373<sup>2003</sup> - More changes to clang-cuda Jenkins configuration
- PR #5372<sup>2004</sup> - Slight improvements to `min/max/minmax_element` algorithms
- PR #5371<sup>2005</sup> - Adapt `uninitialized_copy` and `uninitialized_copy_n` to C++ 20
- PR #5370<sup>2006</sup> - Decay types in `just_sender value_types` to match stored types
- PR #5367<sup>2007</sup> - Disable `pkgconfig` by default again on macOS
- PR #5365<sup>2008</sup> - Use `ccache` for Jenkins builds on Piz Daint
- PR #5363<sup>2009</sup> - Update `cuda toolkit` module name in clang-cuda Jenkins configuration
- PR #5362<sup>2010</sup> - Adding `channel_communicator`
- PR #5361<sup>2011</sup> - Fix compilation with MPI enabled
- PR #5360<sup>2012</sup> - Update APEX and asio tags
- PR #5359<sup>2013</sup> - Fix check for `pu-step` in single-core case
- PR #5357<sup>2014</sup> - Making sure collective operations can be reused by preallocating communicator
- PR #5356<sup>2015</sup> - Update API documentation
- PR #5355<sup>2016</sup> - Make the `sequenced_executor processing_units_count` member function `const`
- PR #5354<sup>2017</sup> - Making sure `default_stack_size` is defined whenever declared

- PR #5322<sup>2041</sup> - Replace executor customization point implementations with `tag_invoke`
- PR #5321<sup>2042</sup> - Separate segmented algorithms for `reduce`
- PR #5320<sup>2043</sup> - Fix `is_sender` trait and other small fixes to p0443 traits
- PR #5319<sup>2044</sup> - gcc 11.1 c++20 build fixes
- PR #5318<sup>2045</sup> - Make hipblas dependency optional as not always available
- PR #5316<sup>2046</sup> - Attempt to fix checking for `libatomic`
- PR #5315<sup>2047</sup> - Add `explicit` keyword to fixture constructor
- PR #5314<sup>2048</sup> - Fix a race condition in `async_mpi` affecting limiting executor
- PR #5312<sup>2049</sup> - Use local runtime and local headers in local-only modules and tests
- PR #5311<sup>2050</sup> - Add GCC 11 builder to jenkins
- PR #5310<sup>2051</sup> - Adding `hpx::execution::experimental::task_group`
- PR #5309<sup>2052</sup> - Separate `datapar`
- PR #5308<sup>2053</sup> - Separate segmented algorithms for `find`, `find_if`, `find_if_not`
- PR #5307<sup>2054</sup> - Separate segmented algorithms for `fill` and `generate`
- PR #5304<sup>2055</sup> - Fix compilation of sender CPOs with `nvcc`
- PR #5300<sup>2056</sup> - Remove `PRIVATE` flag that was propagated into the `LANGUAGES`
- PR #5298<sup>2057</sup> - Separate `datapar`
- PR #5297<sup>2058</sup> - Specify exact `cmake` and `ninja` versions when loading them in jenkins jobs
- PR #5295<sup>2059</sup> - Update `clang-newest` configuration to use clang 12 and Boost 1.76.0
- PR #5293<sup>2060</sup> - Fix Clang 11 `cuda_future` test bug
- PR #5292<sup>2061</sup> - Add `async_rw_mutex` based on senders
- PR #5291<sup>2062</sup> - “Fix” termination detection
- PR #5290<sup>2063</sup> - Fixed source file line statements in examples documentation

## HPX V1.6.0 (Feb 17, 2021)

### General changes

This release continues the focus on C++20 conformance with multiple new algorithms adapted to be C++20 conformant and becoming customization point objects (CPOs). We have also added experimental support for HIP, allowing previous CUDA features to now be compiled with `hipcc` and run on AMD GPUs.

- The following algorithms have been adapted to be C++20 conformant: `adjacent_find`, `includes`, `inplace_merge`, `is_heap`, `is_heap_until`, `is_partitioned`, `is_sorted`, `is_sorted_until`, `merge`, `set_difference`, `set_intersection`, `set_symmetric_difference`, `set_union`.
- Experimental HIP support can be enabled by compiling *HPX* with `hipcc`. All CUDA functionality in *HPX* can now be used with HIP. The HIP functionality is for the time being exposed through the same API as the CUDA functionality, i.e. no changes are required in user code. The CUDA, and now HIP, functionality is in the `hpx::cuda` namespace.
- We have added `partial_sort` based on Francisco Tapia's implementation.
- `hpx::init` and `hpx::start` gained new overloads taking an `hpx::init_params` struct in 1.5.0. All overloads not taking an `hpx::init_params` are now deprecated.
- We have added an experimental `fork_join_executor`. This executor can be used for OpenMP-style fork-join parallelism, where the latency of a parallel region is important for performance.
- The `parallel_executor` now uses a hierarchical spawning scheme for bulk execution, which improves data locality and performance.
- `hpx::dataflow` can now be used with executors that inject additional parameters into the call of the user-provided function.
- We have added experimental support for properties as proposed in [P2220](#)<sup>2180</sup>. Currently the only supported property is the scheduling hint on `parallel_executor`.
- `hpx::util::annotated_function` can now be passed a dynamically generated `std::string`.
- In moving functionality to new namespaces, old names have been deprecated. A deprecation warning will be issued if you are using deprecated functionality, with instructions on how to correct or ignore the warning.
- We have removed all support for C and Fortran from our build system.
- We have further reduced the use of Boost types within *HPX* (`boost::system::error_code` and `boost::detail::spinlock`).
- We have enabled more warnings in our CI builds (unused variables and unused typedefs).

---

<sup>2179</sup> <https://github.com/TheHPXProject/hpx/pull/5044>

<sup>2180</sup> <https://wg21.link/p2220>

## Breaking changes

- hpxMP support has been completely removed.
- The verbs parcelport has been removed.
- The following compatibility options have been disabled by default: `HPX_WITH_ACTION_BASE_COMPATIBILITY`, `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`, `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`, `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`, `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`, `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`, `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`, `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`, `HPX_THREAD_AWARE_TIMER_COMPATIBILITY`, `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. Unless noted here, the above functionalities do not come with replacements. Unscoped enumerations have been replaced by scoped enumerations. Previously deprecated unscoped enumerations are disabled by `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`. Newly deprecated unscoped enumerations have been given deprecation warnings and replaced by scoped enumerations. `hpx::promise` has been replaced with `hpx::distributed::promise`. `hpx::program_options` is a drop-in replacement for `boost::program_options`. `hpx::execution::parallel_executor` now has constructors which take a thread pool, covering the use case of `hpx::threads::executors::pool_executor`. A pool can be supplied with `hpx::resource::get_thread_pool`.

## Closed issues

- Issue #5148<sup>2181</sup> - `runtime_support.hpp` does not work with newer cling
- Issue #5147<sup>2182</sup> - Wrong results with parallel reduce
- Issue #5129<sup>2183</sup> - Missing specialization for `std::hash<hpx::thread::id>`
- Issue #5126<sup>2184</sup> - Use `std::string` for task annotations
- Issue #5115<sup>2185</sup> - Don't expect `hwloc` to always report Cores
- Issue #5113<sup>2186</sup> - Handle threadmanager exceptions during startup
- Issue #5112<sup>2187</sup> - libatomic problems causing unexpected fails
- Issue #5089<sup>2188</sup> - Remove non-BSL files
- Issue #5088<sup>2189</sup> - Unwrapping problem
- Issue #5087<sup>2190</sup> - Remove hpxMP support
- Issue #5077<sup>2191</sup> - PAPI counters are not accessible when HPX is installed
- Issue #5075<sup>2192</sup> - Make the structs in all `iter_sent.hpp` lower case
- Issue #5067<sup>2193</sup> - Bug `string_util/split.hpp`

## HPX V1.5.1 (Sep 30, 2020)

### General changes

This is a patch release. It contains the following changes:

- Remove restriction on suspending runtime with multiple localities, users are now responsible for synchronizing work between localities before suspending.
- Fixes several compilation problems and warnings.
- Adds notes in the documentation explaining how to cite HPX.

### Closed issues

- [Issue #4971<sup>2355</sup>](#) - Parallel sort fails to compile with C++20
- [Issue #4950<sup>2356</sup>](#) - Build with `HPX_WITH_PARCELPORT_ACTION_COUNTERS_ON` fails
- [Issue #4940<sup>2357</sup>](#) - Codespell report for “HPX” (on fossies.org)
- [Issue #4937<sup>2358</sup>](#) - Allow suspension of runtime for multiple localities

## HPX V1.5.0 (Sep 02, 2020)

### General changes

The main focus of this release is on APIs and C++20 conformance. We have added many new C++20 features and adapted multiple algorithms to be fully C++20 conformant. As part of the modularization we have begun specifying the public API of *HPX* in terms of headers and functionality, and aligning it more closely to the C++ standard. All non-distributed modules are now in place, along with an experimental option to completely disable distributed features in *HPX*. We have also added experimental asynchronous MPI and CUDA executors. Lastly this release introduces CMake targets for depending projects, performance improvements, and many bug fixes.

- We have added the C++20 features `hpx::jthread` and `hpx::stop_token`. `hpx::condition_variable_any` now exposes new functions supporting `hpx::stop_token`.
- We have added `hpx::stable_sort` based on Francisco Tapia's implementation.
- We have adapted existing synchronization primitives to be fully conformant C++20: `hpx::barrier`, `hpx::latch`, `hpx::counting_semaphore`, and `hpx::binary_semaphore`.
- We have started using customization point objects (CPOs) to make the corresponding algorithms fully conformant to C++20 as well as to make algorithm extension easier for the user. `all_of/any_of/none_of`, `copy`, `count`, `destroy`, `equal`, `fill`, `find`, `for_each`, `generate`, `mismatch`, `move`, `reduce`, `transform_reduce` are using those CPOs (all in namespace `hpx`). We also have adapted their corresponding `hpx::ranges` versions to be conforming to C++20 in this release.
- We have adapted support for `co_await` to C++20, in addition to `hpx::future` it now also supports `hpx::shared_future`. We have also added allocator support for futures returned by `co_return`. It is no longer in the `experimental` namespace.
- We added serialization support for `std::variant` and `std::tuple`.
- `result_of` and `is_callable` are now deprecated and replaced by `invoke_result` and `is_invocable` to conform to C++20.
- We continued with the modularization, making it easier for us to add the new experimental `HPX_WITH_DISTRIBUTED_RUNTIME` CMake option (see below) . A significant amount of headers have been deprecated. We adapted the namespaces and headers we could to be closer to the standard ones (*Public API*). Depending code should still compile, however warnings are now generated instructing to change the include statements accordingly.
- It is now possible to have a basic CUDA support including a helper function to get a future from a CUDA stream and target handling. They are available under the `hpx::cuda::experimental` namespace and they can be enabled with the `-DHPX_WITH_ASYNC_CUDA=ON` CMake option.
- We added a new `hpx::mpi::experimental` namespace for getting futures from an asynchronous MPI call and a new minimal MPI executor `hpx::mpi::experimental::executor`. These can be enabled with the `-DHPX_WITH_ASYNC_MPI=On` CMake option.
- A polymorphic executor has been implemented to reduce compile times as a function accepting executors can potentially be instantiated only once instead of multiple times with different executors. It accepts the function signature as a template argument. It needs to be constructed from any other executor. Please note, that the function signatures that can be scheduled using `then_execute`, `bulk_sync_execute`, `bulk_async_execute` and `bulk_then_execute` are slightly different (See the comment in [PR #4514](#)<sup>2369</sup> for more details).
- The underlying executor of `block_executor` has been updated to a newer one.

---

<sup>2368</sup> <https://github.com/TheHPXProject/hpx/pull/4939>

<sup>2369</sup> <https://github.com/TheHPXProject/hpx/pull/4514>

- We have added a parameter to `auto_chunk_size` to control the amount of iterations to measure.
- All executor parameter hooks can now be exposed through the executor itself. This will allow to deprecate the `.with()` functionality on execution policies in the future. This is also a first step towards simplifying our executor APIs in preparation for the upcoming C++23 executors (senders/receivers).
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`. Please note this is a breaking change without backwards-compatibility option. We have converted all of those APIs to be based on customization point objects. Two new executors have been added to enable easy integration of the existing resiliency features with other facilities (like the parallel algorithms): `replay_executor` and `replicate_executor`.
- We have added performance counters type information (aggregating, monotonically increasing, average count, average timer, etc.).
- HPX threads are now re-scheduled on the same worker thread they were suspended on to avoid cache misses from moving from one thread to the other. This behavior doesn't prevent the thread from being stolen, however.
- We have added a new configuration option `hpx.exception_verbosity` to allow to control the level of verbosity of the exceptions (3 levels available).
- `broadcast_to`, `broadcast_from`, `scatter_to` and `scatter_from` have been added to the collectives, modernization of `gather_here` and `gather_there` with futures taken by rvalue references. See the breaking change on `all_to_all` in the next section. None of the collectives need supporting macros anymore (e.g. specifying the data types used for a collective operation using `HPX_REGISTER_ALLGATHER` and similar is not needed anymore).
- New API functions have been added: a) to get the number of cores which are idle (`hpx::get_idle_core_count`) and b) returning a bitmask representing the currently idle cores (`hpx::get_idle_core_mask`).
- We have added an experimental option to only enable the local runtime, you can disable the distributed runtime with `HPX_WITH_DISTRIBUTED_RUNTIME=OFF`. You can also enable the local runtime by using the `--hpx:local` runtime option.
- We fixed task annotations for actions.
- The alias `hpx::promise` to `hpx::lcos::promise` is now deprecated. You can use `hpx::lcos::promise` directly instead. `hpx::promise` will refer to the local-only promise in the future.
- We have added a `prepare_checkpoint` API function that calculates the amount of necessary buffer space for a particular set of arguments checkpointed.
- We have added `hpx::upgrade_lock` and `hpx::upgrade_to_unique_lock`, which make `hpx::shared_mutex` (and similar) usable in more flexible ways.
- We have changed the CMake targets exposed to the user, it now includes `HPX:hpx`, `HPX:wrap_main` (int main as the first HPX thread of the application, see *Starting the HPX runtime*), `HPX:plugin`, `HPX:component`. The CMake variables `HPX_INCLUDE_DIRS` and `HPX_LIBRARIES` are deprecated and will be removed in a future release, you should now link directly to the `HPX:hpx` CMake target.
- A new example is demonstrating how to create and use a wrapping executor (`quickstart/executor_with_thread_hooks.cpp`)
- A new example is demonstrating how to disable thread stealing during the execution of parallel algorithms (`quickstart/disable_thread_stealing_executor.cpp`)
- We now require for our CMake build system configuration files to be formatted using `cmake-format`.
- We have removed more dependencies on various Boost libraries.
- We have added an experimental option enabling unity builds of HPX using the `-DHPX_WITH_UNITY_BUILD=On` CMake option.

- Many bug fixes.

## Breaking changes

- *HPX* now requires a C++14 capable compiler. We have set the *HPX* C++ standard automatically to C++14 and if it needs to be set explicitly, it should be specified through the `CMAKE_CXX_STANDARD` setting as mandated by CMake. The `HPX_WITH_CXX*` variables are now deprecated and will be removed in the future.
- Building and using *HPX* is now supported only when using CMake V3.13 or later, Boost V1.64 or newer, and when compiling with clang V5, gcc V7, or VS2019, or later. Other compilers might still work but have not been tested thoroughly.
- We have added a `hpx::init_params` struct to pass parameters for *HPX* initialization e.g. the resource partitioner callback to initialize thread pools (*Using the resource partitioner*).
- The `all_to_all` algorithm is renamed to `all_gather`, and the new `all_to_all` algorithm is not compatible with the old one.
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`.

<sup>2427</sup> <https://github.com/TheHPXProject/hpx/issues/4519>

- Issue #4513<sup>2428</sup> - HPXConfig.cmake contains ill-formed paths when library paths use backslashes
- Issue #4507<sup>2429</sup> - User-polling introduced by MPI futures module should be more generally usable
- Issue #4506<sup>2430</sup> - Make sure force\_linking.hpp is not included in main module header
- Issue #4501<sup>2431</sup> - Fix compilation of PAPI tests
- Issue #4497<sup>2432</sup> - Add modules CI checks
- Issue #4489<sup>2433</sup> - Polymorphic executor
- Issue #4476<sup>2434</sup> - Use CMake targets defined by FindBoost
- Issue #4473<sup>2435</sup> - Add vcpkg installation instructions
- Issue #4470<sup>2436</sup> - Adapt hpx::future to C++20 co\_await
- Issue #4468<sup>2437</sup> - Compile error on Raspberry Pi 4
- Issue #4466<sup>2438</sup> - Compile error on Windows, current stable:
- Issue #4453<sup>2439</sup> - Installing HPX on fedora with dnf is not adding cmake files
- Issue #4448<sup>2440</sup> - New std::variant serialization broken
- Issue #4438<sup>2441</sup> - Add performance counter flag is monotonically increasing
- Issue #4436<sup>2442</sup> - Build problem: same code build and works with 1.4.0 but it doesn't with 1.4.1
- Issue #4429<sup>2443</sup> - Function descriptions not supported in distributed
- Issue #4423<sup>2444</sup> - `--hpx:ini=hpx.lock_detection=0` has no effect
- Issue #4422<sup>2445</sup> - Add performance counter metadata
- Issue #4419<sup>2446</sup> - Weird behavior for `--hpx:print-counter-interval` with large numbers
- Issue #4401<sup>2447</sup> - Create module repository
- Issue #4400<sup>2448</sup> - Command line options conflict related to performance counters
- Issue #4349<sup>2449</sup> - `--hpx:use-process-mask` option throw an exception on OS X
- Issue #4345<sup>2450</sup> - Move gh-pages branch out of hpx repo

- PR #4824<sup>2541</sup> - Add support for building master/release branches to Jenkins configuration
- PR #4821<sup>2542</sup> - Implement customization point for `hpx::copy` and `hpx::ranges::copy`
- PR #4819<sup>2543</sup> - Allow finding Boost components before finding HPX
- PR #4817<sup>2544</sup> - Adding range version of stable sort
- PR #4815<sup>2545</sup> - Fix a wrong `#ifdef` for IO/TIMER pools causing build errors
- PR #4814<sup>2546</sup> - Replace `hpx::function_nonsr` with `std::function` in error module
- PR #4809<sup>2547</sup> - Foreach adapt
- PR #4808<sup>2548</sup> - Make internal algorithms functions const
- PR #4807<sup>2549</sup> - Add Jenkins configuration for running on Piz Daint
- PR #4806<sup>2550</sup> - Update documentation links to new domain name
- PR #4805<sup>2551</sup> - Applying changes that resolve time complexity issues in sort
- PR #4803<sup>2552</sup> - Adding implementation of `stable_sort`
- PR #4802<sup>2553</sup> - Fix datapar header paths
- PR #4801<sup>2554</sup> - Replace `boost::shared_array<T>` with `std::shared_ptr<T[]>` if supported
- PR #4799<sup>2555</sup> - Fixing `#include` paths in compatibility headers
- PR #4798<sup>2556</sup> - Include the main module header (fixes partially #4488)
- PR #4797<sup>2557</sup> - Change cmake targets
- PR #4794<sup>2558</sup> - Removing 128bit integer emulation
- PR #4793<sup>2559</sup> - Make sure global variable is handled properly
- PR #4792<sup>2560</sup> - Replace `enable_if` with **HPX\_CONCEPT\_REQUIRES\_** and add `is_sentinel_for` constraint
- PR #4790<sup>2561</sup> - Move deprecation warnings from base template to template specializations for `result_of` etc. structs
- PR #4789<sup>2562</sup> - Fix hangs during assertion handling and distributed runtime construction
- PR #4788<sup>2563</sup> - Fixing inclusive transform scan algorithm to properly handle initial value

<sup>2701</sup> <https://github.com/TheHPXProject/hpx/pull/4540>

- PR #4538<sup>2702</sup> - Move channel documentation examples to examples directory
- PR #4536<sup>2703</sup> - Add generic allocator for execution policies
- PR #4534<sup>2704</sup> - Enable compatibility headers for thread\_executors module
- PR #4532<sup>2705</sup> - Fixing broken url in README.rst
- PR #4531<sup>2706</sup> - Update scripts
- PR #4530<sup>2707</sup> - Make sure module API docs show up in correct order
- PR #4529<sup>2708</sup> - Adding missing template code to module creation script
- PR #4528<sup>2709</sup> - Make sure version module uses HPX's binary dir, not the parent's
- PR #4527<sup>2710</sup> - Creating actions\_base and actions module
- PR #4526<sup>2711</sup> - Shared state for cv
- PR #4525<sup>2712</sup> - Changing sub-name sequencing for experimental namespace
- PR #4524<sup>2713</sup> - Add API guarantee notes to API reference documentation
- PR #4522<sup>2714</sup> - Enable and fix deprecation warnings in execution module
- PR #4521<sup>2715</sup> - Moves more miscellaneous files to modules
- PR #4520<sup>2716</sup> - Skip execution customization points when executor is known
- PR #4518<sup>2717</sup> - Module distributed lcos
- PR #4516<sup>2718</sup> - Fix various builds
- PR #4515<sup>2719</sup> - Replace backslashes by slashes in windows paths
- PR #4514<sup>2720</sup> - Adding polymorphic\_executor
- PR #4512<sup>2721</sup> - Adding C++20 jthread and stop\_token
- PR #4510<sup>2722</sup> - Attempt to fix APEX linking in external packages again
- PR #4508<sup>2723</sup> - Only test pull requests (not all branches) with GitHub actions
- PR #4505<sup>2724</sup> - Fix duplicate linking in tests (ODR violations)

- PR #4504<sup>2725</sup> - Fix C++ standard handling
- PR #4503<sup>2726</sup> - Add CMakeLists file check
- PR #4500<sup>2727</sup> - Fix .clang-format version requirement comment
- PR #4499<sup>2728</sup> - Attempting to fix hpx\_init linking on macOS
- PR #4498<sup>2729</sup> - Fix compatibility of *pool\_executor*
- PR #4496<sup>2730</sup> - Removing superfluous SPDX tags
- PR #4494<sup>2731</sup> - Module executors
- PR #4493<sup>2732</sup> - Pack traversal module
- PR #4492<sup>2733</sup> - Update copyright year in documentation
- PR #4491<sup>2734</sup> - Add missing current\_executor header
- PR #4490<sup>2735</sup> - Update GitHub actions configs
- PR #4487<sup>2736</sup> - Properly dispatch exceptions thrown from hpx\_main to be rethrown from hpx::init/hpx::stop
- PR #4486<sup>2737</sup> - Fixing an initialization order problem
- PR #4485<sup>2738</sup> - Move miscellaneous files to their rightful modules
- PR #4483<sup>2739</sup> - Clean up imported CMake target naming
- PR #4481<sup>2740</sup> - Add vcpkg installation instructions
- PR #4479<sup>2741</sup> - Add hints to allow to specify MIMALLOC\_ROOT
- PR #4478<sup>2742</sup> - Async modules
- PR #4475<sup>2743</sup> - Fix rp init changes
- PR #4474<sup>2744</sup> - Use #pragma once in headers
- PR #4472<sup>2745</sup> - Add more descriptive error message when using x86 coroutines on non-x86 platforms
- PR #4467<sup>2746</sup> - Add mimalloc find cmake script
- PR #4465<sup>2747</sup> - Add thread\_executors module

<sup>2747</sup> <https://github.com/TheHPXProject/hpx/pull/4465>

- PR #4464<sup>2748</sup> - Include module
- PR #4462<sup>2749</sup> - Merge hpx\_init and hpx\_wrap into one static library
- PR #4461<sup>2750</sup> - Making thread\_data test more realistic
- PR #4460<sup>2751</sup> - Suppress MPI warnings in version.cpp
- PR #4459<sup>2752</sup> - Make sure pkgconfig applications link with hpx\_init
- PR #4458<sup>2753</sup> - Added example demonstrating how to create and use a wrapping executor
- PR #4457<sup>2754</sup> - Fixing execution of thread exit functions
- PR #4456<sup>2755</sup> - Move backtrace files to debugging module
- PR #4455<sup>2756</sup> - Move deadlock\_detection and maintain\_queue\_wait\_times source files into schedulers module
- PR #4450<sup>2757</sup> - Fixing compilation with std::filesystem enabled
- PR #4449<sup>2758</sup> - Fixing build system to actually build variant test
- PR #4447<sup>2759</sup> - This fixes an obsolete #include
- PR #4446<sup>2760</sup> - Resume tasks where they were suspended
- PR #4444<sup>2761</sup> - Minor CUDA fixes
- PR #4443<sup>2762</sup> - Add missing tests to CircleCI config
- PR #4442<sup>2763</sup> - Adding a tag to all auto-generated files allowing for tools to visually distinguish those
- PR #4441<sup>2764</sup> - Adding performance counter type information
- PR #4440<sup>2765</sup> - Fixing MSVC build
- PR #4439<sup>2766</sup> - Link HPX::plugin and component privately in hpx\_setup\_target
- PR #4437<sup>2767</sup> - Adding a test that verifies the problem can be solved using a trait specialization
- PR #4434<sup>2768</sup> - Clean up Boost dependencies and copy string algorithms to new module
- PR #4433<sup>2769</sup> - Fixing compilation issues (!) if MPI parcelport is enabled
- PR #4431<sup>2770</sup> - Ignore warnings about name mangling changing

- PR #4430<sup>2771</sup> - Add performance\_counters module
- PR #4428<sup>2772</sup> - Don't add compatibility headers to module API reference
- PR #4426<sup>2773</sup> - Add currently failing tests on GitHub actions to blacklist
- PR #4425<sup>2774</sup> - Clean up and correct minimum required versions
- PR #4424<sup>2775</sup> - Making sure hpx.lock\_detection=0 works as advertized
- PR #4421<sup>2776</sup> - Making sure interval time stops underlying timer thread on termination
- PR #4417<sup>2777</sup> - Adding serialization support for std::variant (if available) and std::tuple
- PR #4415<sup>2778</sup> - Partially reverting changes applied by PR 4373
- PR #4414<sup>2779</sup> - Added documentation for the compiler-wrapper script hpxcxx.in in creating\_hpx\_projects.rst
- PR #4413<sup>2780</sup> - Merging from V1.4.1 release
- PR #4412<sup>2781</sup> - Making sure to issue a warning if a file specified using -hpx:options-file is not found
- PR #4411<sup>2782</sup> - Make test specific to HPX\_WITH\_SHARED\_PRIORITY\_SCHEDULER
- PR #4407<sup>2783</sup> - Adding minimal MPI executor
- PR #4405<sup>2784</sup> - Fix cross pool injection test, use default scheduler as fallback
- PR #4404<sup>2785</sup> - Fix a race condition and clean-up usage of scheduler mode
- PR #4399<sup>2786</sup> - Add more threading modules
- PR #4398<sup>2787</sup> - Add CODEOWNERS file
- PR #4395<sup>2788</sup> - Adding a parameter to auto\_chunk\_size allowing to control the amount of iterations to measure
- PR #4393<sup>2789</sup> - Use appropriate cache-line size defaults for different platforms
- PR #4391<sup>2790</sup> - Fixing use of allocator for C++20
- PR #4390<sup>2791</sup> - Making -hpx:help behavior consistent
- PR #4388<sup>2792</sup> - Change the resource partitioner initialization
- PR #4387<sup>2793</sup> - Fix roll\_release.sh

### HPX V1.4.1 (Feb 12, 2020)

#### General changes

This is a bugfix release. It contains the following changes:

- Fix compilation issues on Windows, macOS, FreeBSD, and with gcc 10
- Install missing pdb files on Windows
- Allow running tests using an installed version of *HPX*
- Skip MPI finalization if HPX has not initialized MPI
- Give a hard error when attempting to use IO counters on Windows

#### Closed issues

## HPX V1.4.0 (January 15, 2020)

### General changes

- We have added the collectives `all_to_all` and `all_reduce`.
- We have added APIs for resiliency, which allows replication and replay for failed tasks. See the *documentation* for more details.
- Components can now be checkpointed.
- Performance improvements to schedulers and coroutines. A significant change is the addition of stackless coroutines. These are to be used for tasks that do not need to be suspended and can reduce overheads noticeably in applications with short tasks. A stackless coroutine can be created with the new `stack_size_thread_stacksize_nostack`.
- We have added an implementation of `unique_any`, which is a non-copyable version of `any`.
- The `shared_priority_queue_scheduler` has been improved. It now has lower overheads than the default scheduler in many situations. Unlike the default scheduler it fully supports NUMA scheduling hints. Enable it with the command line option `--hpx:queuing=shared-priority`. This scheduler should still be considered experimental, but its use is encouraged in real applications to help us make it production ready.
- We have added the performance counters `background-receive-duration` and `background-receive-overhead` for inspecting the time and overhead spent on receiving parcels in the background.
- Compilation time has been further improved when `HPX_WITH_NETWORKING=OFF`.
- We no longer require compiled Boost dependencies in certain configurations. This requires at least Boost 1.70, compiling on x86 with GCC 9, clang (libc++) 9, or VS2019 in C++17 mode. The dependency on `Boost.Filesystem` can explicitly be turned on with `HPX_FILESYSTEM_WITH_BOOST_FILESYSTEM_COMPATIBILITY=ON` (it is off by default if the standard library supports `std::filesystem`). `Boost.ProgramOptions` has been copied into the HPX repository. We have a compatibility layer for users who must explicitly use

<sup>2874</sup> <https://github.com/TheHPXProject/hpx/pull/4376>

<sup>2875</sup> <https://github.com/TheHPXProject/hpx/pull/4357>

<sup>2876</sup> <https://github.com/TheHPXProject/hpx/pull/4353>

<sup>2877</sup> <https://github.com/TheHPXProject/hpx/pull/4343>

<sup>2878</sup> <https://github.com/TheHPXProject/hpx/pull/4337>

<sup>2879</sup> <https://github.com/TheHPXProject/hpx/pull/4335>

<sup>2880</sup> <https://github.com/TheHPXProject/hpx/pull/4315>

<sup>2881</sup> <https://github.com/TheHPXProject/hpx/pull/4310>

Boost.ProgramOptions instead of the ProgramOptions provided by HPX. To remove the dependency HPX\_PROGRAM\_OPTIONS\_WITH\_BOOST\_PROGRAM\_OPTIONS\_COMPATIBILITY must be explicitly set to OFF. This option will be removed in a future release. We have also removed several other header-only dependencies on Boost.

- It is now possible to use the process affinity mask set by tools like `numactl` and various batch environments with the command line option `--hpx:use-process-mask`. Enabling this option implies `--hpx:ignore-batch-env`.
- It is now possible to create standalone thread pools without starting the runtime. See the `standalone_thread_pool_executor.cpp` test in the `execution` module for an example.
- Tasks annotated with `hpx::util::annotated_function` now have their correct name when using APEX to generate OTF2 files.
- Cloning of APEX was defective in previous releases (it required manual intervention to check out the correct tag or branch). This has been fixed.
- The option `HPX_WITH_MORE_THAN_64_THREADS` is now ignored and will be removed in a future release. The value is instead derived directly from `HPX_WITH_MAX_CPU_COUNT` option.
- We have deprecated compiling in C++11 mode. The next release will require a C++14 capable compiler.
- We have deprecated support for the Vc library. This option will be replaced with SIMD support from the standard library in a future release.
- We have significantly refactored our CMake setup. This is intended to be a non-breaking change and will allow for using HPX through CMake targets in the future.
- We have continued modularizing the HPX library. In the process we have rearranged many header files into module-specific directories. All moved headers have compatibility headers which forward from the old location to the new location, together with a deprecation warning. The compatibility headers will eventually be removed.
- We now enforce formatting with `clang-format` on the majority of our source files.
- We have added SPDX license tags to all files.
- Many bugfixes.

## Breaking changes

- The `HPX_WITH_THREAD_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_UNWRAPPED_COMPATIBILITY` option and the associated compatibility layer has been removed.

## HPX V1.3.0 (May 23, 2019)

### General changes

- Performance improvements: the schedulers have significantly reduced overheads from removing false sharing and the parallel executor has been updated to create fewer futures.
- HPX now defaults to not turning on networking when running on one locality. This means that you can run multiple instances on the same system without adding command line options.
- Multiple issues reported by Clang sanitizers have been fixed.
- We have added (back) single-page HTML documentation and PDF documentation.
- We have started modularizing the HPX library. This is useful both for developers and users. In the long term users will be able to consume only parts of the HPX libraries if they do not require all the functionality that HPX currently provides.
- We have added an implementation of `function_ref`.
- The `barrier` and `latch` classes have gained a few additional member functions.

### Breaking changes

- Executable and library targets are now created without the `_exe` and `_lib` suffix respectively. For example, the target `1d_stencil_1_exe` is now simply called `1d_stencil_1`.
- We have removed the following deprecated functionality: `queue`, `scoped_unlock`, and support for input iterators in algorithms.
- We have turned off the compatibility layer for `unwrapped` by default. The functionality will be removed in the next release. The option can still be turned on using the [CMake](https://www.cmake.org)<sup>3249</sup> option `HPX_WITH_UNWRAPPED_SUPPORT`. Likewise, `inclusive_scan` compatibility overloads have been turned off by default. They can still be turned on with `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY`.
- The minimum compiler and dependency versions have been updated. We now support GCC from version 5 onwards, Clang from version 4 onwards, and Boost from version 1.61.0 onwards.
- The headers for preprocessor macros have moved as a result of the functionality being moved to a separate module. The old headers are deprecated and will be removed in a future version of HPX. You can turn off the warnings by setting `HPX_PREPROCESSOR_WITH_DEPRECATION_WARNINGS=OFF` or turn off the compatibility headers completely with `HPX_PREPROCESSOR_WITH_COMPATIBILITY_HEADERS=OFF`.

- PR #3782<sup>3368</sup> - Cherry-picked tuple and thread\_init\_data fixes from #3701
- PR #3781<sup>3369</sup> - Fix generic context coroutines after lazy stack allocation changes
- PR #3780<sup>3370</sup> - Rename hello world examples
- PR #3776<sup>3371</sup> - Sort algorithms now use the supplied chunker to determine the required minimal chunk size
- PR #3775<sup>3372</sup> - Disable Boost auto-linking
- PR #3774<sup>3373</sup> - Tag and push stable builds
- PR #3773<sup>3374</sup> - Enable migration of polymorphic components
- PR #3771<sup>3375</sup> - Fix link to stackoverflow in documentation
- PR #3770<sup>3376</sup> - Replacing constexpr if in brace-serialization code
- PR #3769<sup>3377</sup> - Fix SIGSEGV handler
- PR #3768<sup>3378</sup> - Adding flags to scheduler allowing to control thread stealing and idle back-off
- PR #3767<sup>3379</sup> - Fix help formatting in hpxrun.py
- PR #3765<sup>3380</sup> - Fix a couple of bugs in the thread test
- PR #3764<sup>3381</sup> - Workaround for SFINAE regression in msvc14.2
- PR #3762<sup>3382</sup> - Prevent MSVC from prematurely instantiating things
- PR #3761<sup>3383</sup> - Update python scripts to work with python 3
- PR #3760<sup>3384</sup> - Fix callable vtable for GCC4.9
- PR #3759<sup>3385</sup> - Rename PAGE\_SIZE to PAGE\_SIZE\_ because AppleClang
- PR #3755<sup>3386</sup> - Making sure locks are not held during suspension
- PR #3754<sup>3387</sup> - Disable more code if networking is not available/not enabled
- PR #3752<sup>3388</sup> - Move util::format implementation to source file
- PR #3751<sup>3389</sup> - Fixing problems with lcos::barrier and iostreams
- PR #3750<sup>3390</sup> - Change error message to take into account use\_guard\_page setting

<sup>3390</sup> <https://github.com/TheHPXProject/hpx/pull/3750>

- PR #3749<sup>3391</sup> - Fix lifetime problem in `run_as_hpx_thread`
- PR #3748<sup>3392</sup> - Fixed unusable behavior of the clang code analyzer.
- PR #3747<sup>3393</sup> - Added `PMIX_RANK` to the defaults of `HPX_WITH_PARCELPORTR_MPI_ENV`.
- PR #3745<sup>3394</sup> - Introduced `cache_aligned_data` and `cache_line_data` helper structure
- PR #3742<sup>3395</sup> - Remove more unused functionality from `util/logging`
- PR #3740<sup>3396</sup> - Fix includes in partitioned vector tests
- PR #3739<sup>3397</sup> - More fixes to make sure that `std::flush` really flushes all output
- PR #3737<sup>3398</sup> - Fix potential shutdown problems
- PR #3736<sup>3399</sup> - Fix `guided_pool_executor` after dataflow changes caused compilation fail
- PR #3734<sup>3400</sup> - Limiting executor
- PR #3732<sup>3401</sup> - More constrained bound constructors
- PR #3730<sup>3402</sup> - Attempt to fix deadlocks during component loading
- PR #3729<sup>3403</sup> - Add latch member function `count_up` and `reset`, requested by `hpxMP`
- PR #3728<sup>3404</sup> - Send even empty buffers on `hpx::endl` and `hpx::flush`
- PR #3727<sup>3405</sup> - Adding example demonstrating how to customize the memory management for a component
- PR #3726<sup>3406</sup> - Adding support for passing command line options through the `HPX_COMMANDLINE_OPTIONS` environment variable
- PR #3722<sup>3407</sup> - Document known broken OpenMPI builds
- PR #3716<sup>3408</sup> - Add barrier reset function, requested by `hpxMP` for reusing barrier
- PR #3715<sup>3409</sup> - More work on functions and `vtables`
- PR #3714<sup>3410</sup> - Generate single-page HTML, PDF, manpage from documentation
- PR #3713<sup>3411</sup> - Updating default APEX version to 2.1.2
- PR #3712<sup>3412</sup> - Update release procedure
- PR #3710<sup>3413</sup> - Fix the C++11 build, after #3704

<sup>3459</sup> <https://github.com/TheHPXProject/hpx/pull/3642>

- PR #3640<sup>3460</sup> - Dataflow now works with functions that return a reference
- PR #3637<sup>3461</sup> - Merging the executor-enabled overloads of `shared_future<>::then`
- PR #3633<sup>3462</sup> - Replace deprecated boost endian macros
- PR #3632<sup>3463</sup> - Add instructions on getting HPX to documentation
- PR #3631<sup>3464</sup> - Simplify parcel creation
- PR #3630<sup>3465</sup> - Small additions and fixes to release procedure
- PR #3629<sup>3466</sup> - Modular pp
- PR #3627<sup>3467</sup> - Implement `util::function_ref`
- PR #3626<sup>3468</sup> - Fix cancelable\_action\_client example
- PR #3625<sup>3469</sup> - Added automatic serialization for simple structs (see #3034)
- PR #3624<sup>3470</sup> - Updating the default order of priority for `thread_description`
- PR #3621<sup>3471</sup> - Update copyright year and other small formatting fixes
- PR #3620<sup>3472</sup> - Adding support for gitlab runner
- PR #3619<sup>3473</sup> - Store debug logs and core dumps on CircleCI
- PR #3618<sup>3474</sup> - Various optimizations
- PR #3617<sup>3475</sup> - Fix link to the gpg key (#2)
- PR #3615<sup>3476</sup> - Fix unused variable warnings with networking off
- PR #3614<sup>3477</sup> - Restructuring counter data in scheduler to reduce false sharing
- PR #3613<sup>3478</sup> - Adding support for gitlab runners
- PR #3610<sup>3479</sup> - Don't wait for `stop_condition` in main thread
- PR #3608<sup>3480</sup> - Add inline keyword to `invalid_thread_id` definition for nvcc
- PR #3607<sup>3481</sup> - Adding configuration key that allows one to explicitly add a directory to the component search path
- PR #3606<sup>3482</sup> - Add nvcc to exclude constexpress since is it not supported by nvcc

<sup>3482</sup> <https://github.com/TheHPXProject/hpx/pull/3606>

- PR #3605<sup>3483</sup> - Add `inline` to definition of checkpoint stream operators to fix link error
- PR #3604<sup>3484</sup> - Use format for string formatting
- PR #3603<sup>3485</sup> - Improve the error message for using to less `MAX_CPU_COUNT`
- PR #3602<sup>3486</sup> - Improve the error message for to small values of `MAX_CPU_COUNT`
- PR #3600<sup>3487</sup> - Parallel executor aggregated
- PR #3599<sup>3488</sup> - Making sure networking is disabled for default one-locality-runs
- PR #3596<sup>3489</sup> - Store thread exit functions in `forward_list` instead of `deque` to avoid allocations
- PR #3590<sup>3490</sup> - Fix typo/mistake in thread queue `cleanup_terminated`
- PR #3588<sup>3491</sup> - Fix formatting errors in `launching_and_configuring_hpx_applications.rst`
- PR #3586<sup>3492</sup> - Make `bind` propagate value category
- PR #3585<sup>3493</sup> - Extend Cmake for building `hpx` as distribution packages (refs #3575)
- PR #3584<sup>3494</sup> - Untangle function storage from object pointer
- PR #3582<sup>3495</sup> - Towards Modularized HPX
- PR #3580<sup>3496</sup> - Remove extra `||` in `merge.hpp`
- PR #3577<sup>3497</sup> - Partially revert “Remove vtable empty flag”
- PR #3576<sup>3498</sup> - Make sure empty startup/shutdown functions are not being used
- PR #3574<sup>3499</sup> - Make sure `DATAPAR` settings are conveyed to depending projects
- PR #3573<sup>3500</sup> - Make sure HPX is usable with latest released version of Vc (V1.4.1)
- PR #3572<sup>3501</sup> - Adding test ensuring ticket 3565 is fixed
- PR #3571<sup>3502</sup> - Make empty `[unique_]` function vtable non-dependent
- PR #3566<sup>3503</sup> - Fix compilation with dynamic bitset for CPU masks
- PR #3563<sup>3504</sup> - Drop `util::[unique_]function` target\_type
- PR #3562<sup>3505</sup> - Removing the target suffixes

## HPX V1.2.1 (Feb 19, 2019)

### General changes

This is a bugfix release. It contains the following changes:

- Fix compilation on ARM, s390x and 32-bit architectures.
- Fix a critical bug in the `future` implementation.
- Fix several problems in the CMake configuration which affects external projects.
- Add support for Boost 1.69.0.

### Closed issues

- Issue #3638<sup>3525</sup> - Build HPX 1.2 with boost 1.69
- Issue #3635<sup>3526</sup> - Non-deterministic crashing on Stampede2
- Issue #3550<sup>3527</sup> - `1>e:000workhpxsrcthrow_exception.cpp(54): error C2440: '<function-style-cast>': cannot convert from 'boost::system::error_code' to 'hpx::exception'`
- Issue #3549<sup>3528</sup> - HPX 1.2.0 does not build on i686, but release candidate did
- Issue #3511<sup>3529</sup> - Build on s390x fails
- Issue #3509<sup>3530</sup> - Build on armv7l fails

### Closed pull requests

- PR #3695<sup>3531</sup> - Don't install CMake templates and packaging files
- PR #3666<sup>3532</sup> - Fixing yet another race in `future_data`
- PR #3663<sup>3533</sup> - Fixing race between setting and getting the value inside `future_data`
- PR #3648<sup>3534</sup> - Adding timestamp option for S390x platform
- PR #3647<sup>3535</sup> - Blind attempt to fix warnings issued by gcc V9
- PR #3611<sup>3536</sup> - Include `GNUInstallDirs` earlier to have it available for subdirectories
- PR #3595<sup>3537</sup> - Use `GNUInstallDirs` lib path in `pkgconfig` config file
- PR #3593<sup>3538</sup> - Add `include(GNUInstallDirs)` to `HPXMacros.cmake`

## HPX V1.2.0 (Nov 12, 2018)

### General changes

Here are some of the main highlights and changes for this release:

- Thanks to the work of our Google Summer of Code student, Nikunj Gupta, we now have a new implementation of `hpx_main.hpp` on supported platforms (Linux, BSD and MacOS). This is intended to be a less fragile drop-in replacement for the old implementation relying on preprocessor macros. The new implementation does not require changes if you are using the `CMake`<sup>3543</sup> or `pkg-config`. The old behaviour can be restored by setting `HPX_WITH_DYNAMIC_HPX_MAIN=OFF` during `CMake`<sup>3544</sup> configuration. The implementation on Windows is unchanged.
- We have added functionality to allow passing scheduling hints to our schedulers. These will allow us to create executors that for example target a specific NUMA domain or allow for *HPX* threads to be pinned to a particular worker thread.
- We have significantly improved the performance of our futures implementation by making the shared state atomic.
- We have replaced Boostbook by Sphinx for our documentation. This means the documentation is easier to navigate with built-in search and table of contents. We have also added a quick start section and restructured the documentation to be easier to follow for new users.
- We have added a new option to the `--hpx:threads` command line option. It is now possible to use `cores` to tell *HPX* to only use one worker thread per core, unlike the existing option `all` which uses one worker thread per processing unit (processing unit can be a hyperthread if hyperthreads are available). The default value of `--hpx:threads` has also been changed to `cores` as this leads to better performance in most cases.
- All command line options can now be passed alongside configuration options when initializing *HPX*. This means that some options that were previously only available on the command line can now be set as configuration options.
- *HPXMP* is a portable, scalable, and flexible application programming interface using the OpenMP specification that supports multi-platform shared memory multiprocessing programming in C and C++. *HPXMP* can be enabled within *HPX* by setting `DHPX_WITH_HPMP=ON` during `CMake`<sup>3545</sup> configuration.
- Two new performance counters were added for measuring the time spent doing background work. `/threads/time/background-work-duration` returns the time spent doing background on a given thread or locality, while `/threads/time/background-overhead` returns the fraction of time spent doing background work with respect to the overall time spent running the scheduler. The new performance counters are disabled by default and can be turned on by setting `HPX_WITH_BACKGROUND_THREAD_COUNTERS=ON` during `CMake`<sup>3546</sup> configuration.

<sup>3539</sup> <https://github.com/TheHPXProject/hpx/pull/3591>

<sup>3540</sup> <https://github.com/TheHPXProject/hpx/pull/3558>

<sup>3541</sup> <https://github.com/TheHPXProject/hpx/pull/3555>

<sup>3542</sup> <https://github.com/TheHPXProject/hpx/pull/3551>

<sup>3543</sup> <https://www.cmake.org>

<sup>3544</sup> <https://www.cmake.org>

<sup>3545</sup> <https://www.cmake.org>

<sup>3546</sup> <https://www.cmake.org>

- The idling behaviour of *HPX* has been tweaked to allow for faster idling. This is useful in interactive applications where the *HPX* worker threads may not have work all the time. This behaviour can be tweaked and turned off as before with `HPX_WITH_THREAD_MANAGER_IDLE_BACKOFF=OFF` during [CMake](#)<sup>3547</sup> configuration.
- It is now possible to register callback functions for *HPX* worker thread events. Callbacks can be registered for starting and stopping worker threads, and for when errors occur.

## Breaking changes

- The implementation of `hpx_main.hpp` has changed. If you are using custom Makefiles you will need to make changes. Please see the documentation on *using Makefiles* for more details.
- The default value of `--hpx:threads` has changed from `all` to `cores`. The new option `cores` only starts one worker thread per core.
- We have dropped support for Boost 1.56 and 1.57. The minimal version of Boost we now test is 1.58.
- Our `boost::format`-based formatting implementation has been revised and replaced with a custom implementation. This changes the formatting syntax and requires changes if you are relying on `hpx::util::format` or `hpx::util::format_to`. The pull request for this change contains more information: [PR #3266](#)<sup>3548</sup>.
- The following deprecated options have now been completely removed:  
`HPX_WITH_ASYNC_FUNCTION_COMPATIBILITY`, `HPX_WITH_LOCAL_DATAFLOW`,  
`HPX_WITH_GENERIC_EXECUTION_POLICY`, `HPX_WITH_BOOST_CHRONO_COMPATIBILITY`,  
`HPX_WITH_EXECUTOR_COMPATIBILITY`, `HPX_WITH_EXECUTION_POLICY_COMPATIBILITY`, and  
`HPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY`.

- PR #3493<sup>3627</sup> - Remove deprecated options for 1.2.0 part 2
- PR #3492<sup>3628</sup> - Add CUDA\_LINK\_LIBRARIES\_KEYWORD to allow PRIVATE keyword in linkage t...
- PR #3491<sup>3629</sup> - Changing Base docker image
- PR #3490<sup>3630</sup> - Don't create tasks immediately with hpx::apply
- PR #3489<sup>3631</sup> - Remove deprecated options for 1.2.0
- PR #3488<sup>3632</sup> - Revert "Use BUILD\_INTERFACE generator expression to fix cmake flag exports"
- PR #3487<sup>3633</sup> - Revert "Fixing type attribute warning for transfer\_action"
- PR #3485<sup>3634</sup> - Use BUILD\_INTERFACE generator expression to fix cmake flag exports
- PR #3483<sup>3635</sup> - Fixing type attribute warning for transfer\_action
- PR #3481<sup>3636</sup> - Remove unused variables
- PR #3480<sup>3637</sup> - Towards a more lightweight transfer action
- PR #3479<sup>3638</sup> - Fix FLAGS - Use correct version of target\_compile\_options
- PR #3478<sup>3639</sup> - Making sure the application's exit code is properly propagated back to the OS
- PR #3476<sup>3640</sup> - Don't print docker credentials as part of the environment.
- PR #3473<sup>3641</sup> - Fixing invalid cmake code if no jemalloc prefix was given
- PR #3472<sup>3642</sup> - Attempting to work around recent clang test compilation failures
- PR #3471<sup>3643</sup> - Enable jemalloc on windows
- PR #3470<sup>3644</sup> - Updates readme
- PR #3468<sup>3645</sup> - Avoid hang if there is an exception thrown during startup
- PR #3467<sup>3646</sup> - Add compiler specific fallback attributes if C++17 attribute is not available
- PR #3466<sup>3647</sup> - - bugfix : fix compilation with llvm-7.0
- PR #3465<sup>3648</sup> - This patch adds various optimizations extracted from the thread\_local\_allocator work
- PR #3464<sup>3649</sup> - Check for forked repos in CircleCI docker push step

- PR #3392<sup>3696</sup> - Add performance counters background overhead and background work duration
- PR #3391<sup>3697</sup> - Adapt integration of HPXMP to latest build system changes
- PR #3390<sup>3698</sup> - Make AGAS measurements optional
- PR #3389<sup>3699</sup> - Fix deadlock during shutdown
- PR #3388<sup>3700</sup> - Add several functionalities allowing to optimize synchronous action invocation
- PR #3387<sup>3701</sup> - Add cmake option to opt out of fail-compile tests
- PR #3386<sup>3702</sup> - Adding support for boost::container::small\_vector to dataflow
- PR #3385<sup>3703</sup> - Adds Debug option for hpx initializing from main
- PR #3384<sup>3704</sup> - This hopefully fixes two tests that occasionally fail
- PR #3383<sup>3705</sup> - Making sure thread local storage is enable for hpxMP
- PR #3382<sup>3706</sup> - Fix usage of HPX\_CAPTURE together with default value capture [=]
- PR #3381<sup>3707</sup> - Replace undefined instantiations of uniform\_int\_distribution
- PR #3380<sup>3708</sup> - Add missing semicolons to uses of HPX\_COMPILER\_FENCE
- PR #3379<sup>3709</sup> - Fixing #3378
- PR #3377<sup>3710</sup> - Adding build system support to integrate hpxmp into hpx at the user's machine
- PR #3375<sup>3711</sup> - Replacing wrapper for \_\_libc\_start\_main with main
- PR #3374<sup>3712</sup> - Adds hpx\_wrap to HPX\_LINK\_LIBRARIES which links only when specified.
- PR #3373<sup>3713</sup> - Forcing cache settings in HPXConfig.cmake to guarantee updated values
- PR #3372<sup>3714</sup> - Fix some more c++11 build problems
- PR #3371<sup>3715</sup> - Adds HPX\_LINKER\_FLAGS to HPX applications without editing their source codes
- PR #3370<sup>3716</sup> - util::format: add type\_specifier<> specializations for %!s(MISSING) and %!l(MISSING)s
- PR #3369<sup>3717</sup> - Adding configuration option to allow explicit disable of the new hpx\_main feature on Linux
- PR #3368<sup>3718</sup> - Updates doc with recent hpx\_wrap implementation

- PR #3036<sup>3804</sup> - Switching to CircleCI 2.0

## HPX V1.1.0 (Mar 24, 2018)

### General changes

Here are some of the main highlights and changes for this release (in no particular order):

- We have changed the way *HPX* manages the processing units on a node. We do not longer implicitly bind all available cores to a single thread pool. The user has now full control over what processing units are bound to what thread pool, each with a separate scheduler. It is now also possible to create your own scheduler implementation and control what processing units this scheduler should use. We added the `hpx::resource::partitioner` that manages all available processing units and assigns resources to the used thread pools. Thread pools can be

<sup>3788</sup> <https://github.com/TheHPXProject/hpx/pull/3268>

<sup>3789</sup> <https://github.com/TheHPXProject/hpx/pull/3266>

<sup>3790</sup> <https://github.com/TheHPXProject/hpx/pull/3265>

<sup>3791</sup> <https://github.com/TheHPXProject/hpx/pull/3262>

<sup>3792</sup> <https://github.com/TheHPXProject/hpx/pull/3261>

<sup>3793</sup> <https://github.com/TheHPXProject/hpx/pull/3260>

<sup>3794</sup> <https://github.com/TheHPXProject/hpx/pull/3256>

<sup>3795</sup> <https://github.com/TheHPXProject/hpx/pull/3254>

<sup>3796</sup> <https://github.com/TheHPXProject/hpx/pull/3253>

<sup>3797</sup> <https://github.com/TheHPXProject/hpx/pull/3251>

<sup>3798</sup> <https://github.com/TheHPXProject/hpx/pull/3239>

<sup>3799</sup> <https://github.com/TheHPXProject/hpx/pull/3234>

<sup>3800</sup> <https://github.com/TheHPXProject/hpx/pull/3232>

<sup>3801</sup> <https://github.com/TheHPXProject/hpx/pull/3230>

<sup>3802</sup> <https://github.com/TheHPXProject/hpx/pull/3228>

<sup>3803</sup> <https://github.com/TheHPXProject/hpx/pull/3163>

<sup>3804</sup> <https://github.com/TheHPXProject/hpx/pull/3036>

now be suspended/resumed independently. This functionality helps in running *HPX* concurrently to code that is directly relying on [OpenMP](https://openmp.org/wp/)<sup>3805</sup> and/or [MPI](https://en.wikipedia.org/wiki/Message_Passing_Interface)<sup>3806</sup>.

- We have continued to implement various parallel algorithms. *HPX* now almost completely implements all of the parallel algorithms as specified by the [C++17 Standard](http://www.open-std.org/jtc1/sc22/wg21)<sup>3807</sup>. We have also continued to implement these algorithms for the distributed use case (for segmented data structures, such as `hpx::partitioned_vector`).
- Added a compatibility layer for `std::thread`, `std::mutex`, and `std::condition_variable` allowing for the code to use those facilities where available and to fall back to the corresponding Boost facilities otherwise. The [CMake](https://www.cmake.org)<sup>3808</sup> configuration option `-DHPX_WITH_THREAD_COMPATIBILITY=On` can be used to force using the Boost equivalents.
- The parameter sequence for the `hpx::parallel::transform_inclusive_scan` overload taking one iterator range has changed (again) to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to [CMake](https://www.cmake.org)<sup>3809</sup>.
- The parameter sequence for the `hpx::parallel::inclusive_scan` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY=On` to [CMake](https://www.cmake.org).
- Added a helper facility `hpx::local_new` which is equivalent to `hpx::new_` except that it creates components locally only. As a consequence, the used component constructor may accept non-serializable argument types and/or non-const references or pointers.
- Removed the (broken) component type `hpx::lcos::queue<T>`. The old type is still available at configure time by passing `-DHPX_WITH_QUEUE_COMPATIBILITY=On` to [CMake](https://www.cmake.org).
- The parallel algorithms adopted for C++17 restrict the iterator categories usable with those to at least forward iterators. Our implementation of the parallel algorithms was supporting input iterators (and output iterators) as well by simply falling back to sequential execution. We have now made our implementations conforming by requiring at least forward iterators. In order to enable the old behavior use the compatibility option `-DHPX_WITH_ALGORITHM_INPUT_ITERATOR_SUPPORT=On` on the [CMake](https://www.cmake.org)<sup>3810</sup> command line.
- We have added the functionalities allowing for LCOs being implemented using (simple) components. Before LCOs had to always be implemented using managed components.
- User defined components don't have to be default-constructible anymore. Return types from actions don't have to be default-constructible anymore either. Our serialization layer now in general supports non-default-constructible types.
- We have added a new launch policy `hpx::launch::lazy` that allows one to defer the decision on what launch policy to use to the point of execution. This policy is initialized with a function (object) that – when invoked – is expected to produce the desired launch policy.

<sup>3810</sup> <https://www.cmake.org>

## Breaking changes

- We have dropped support for the gcc compiler version V4.8. The minimal gcc version we now test on is gcc V4.9. The minimally required version of [CMake](https://www.cmake.org)<sup>3811</sup> is now V3.3.2.
- We have dropped support for the Visual Studio 2013 compiler version. The minimal Visual Studio version we now test on is Visual Studio 2015.5.
- We have dropped support for the Boost V1.51-V1.54. The minimal version of Boost we now test is Boost V1.55.
- We have dropped support for the `hpx::util::unwrapped` API. `hpx::util::unwrapped` will stay functional to some degree, until it finally gets removed in a later version of HPX. The functional usage of `hpx::util::unwrapped` should be changed to the new `hpx::util::unwrapping` function whereas the immediate usage should be replaced to `hpx::util::unwrap`.
- The performance counter names referring to properties as exposed by the threading subsystem have changes as those now additionally have to specify the thread-pool. See the corresponding documentation for more details.
- The overloads of `hpx::async` that invoke an action do not perform implicit unwrapping of the returned future anymore in case the invoked function does return a future in the first place. In this case `hpx::async` now returns a `hpx::future<future<T>>` making its behavior conforming to its local counterpart.
- We have replaced the use of `boost::exception_ptr` in our APIs with the equivalent `std::exception_ptr`. Please change your codes accordingly. No compatibility settings are provided.
- We have removed the compatibility settings for `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` as their life-cycle has reached its end.
- We have removed the experimental thread schedulers `hierarchy_scheduler`, `periodic_priority_scheduler` and `throttling_scheduler` in an effort to clean up and consolidate our thread schedulers.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #3250](#)<sup>3812</sup> - Apex refactoring with guides
- [PR #3249](#)<sup>3813</sup> - Updating People.qbk
- [PR #3246](#)<sup>3814</sup> - Assorted fixes for CUDA
- [PR #3245](#)<sup>3815</sup> - Apex refactoring with guides
- [PR #3242](#)<sup>3816</sup> - Modify task counting in `thread_queue.hpp`
- [PR #3240](#)<sup>3817</sup> - Fixed typos
- [PR #3238](#)<sup>3818</sup> - Readding accidentally removed `std::abort`
- [PR #3237](#)<sup>3819</sup> - Adding Pipeline example
- [PR #3236](#)<sup>3820</sup> - Fixing `memory_block`

- PR #3233<sup>3821</sup> - Make `schedule_thread` take suspended threads into account
- Issue #3226<sup>3822</sup> - `memory_block` is breaking, signaling SIGSEGV on a thread on creation and freeing
- PR #3225<sup>3823</sup> - Applying quick fix for `hwloc-2.0`
- Issue #3224<sup>3824</sup> - HPX counters crashing the application
- PR #3223<sup>3825</sup> - Fix returns when setting config entries
- Issue #3222<sup>3826</sup> - Errors linking `libhpx.so`
- Issue #3221<sup>3827</sup> - HPX on Mac OS X with `HWLoc 2.0.0` fails to run
- PR #3216<sup>3828</sup> - Reorder a variadic array to satisfy VS 2017 15.6
- PR #3214<sup>3829</sup> - Changed `prerequisites.qbk` to avoid confusion while building boost
- PR #3213<sup>3830</sup> - Relax locks for thread suspension to avoid holding locks when yielding
- PR #3212<sup>3831</sup> - Fix check in `sequenced_executor` test
- PR #3211<sup>3832</sup> - Use `preinit_array` to set `argc/argv` in `init_globally` example
- PR #3210<sup>3833</sup> - Adapted `parallel::search | search_n` for Ranges TS (see #1668)
- PR #3209<sup>3834</sup> - Fix locking problems during shutdown
- Issue #3208<sup>3835</sup> - `init_globally` throwing a run-time error
- PR #3206<sup>3836</sup> - Addition of new arithmetic performance counter “Count”
- PR #3205<sup>3837</sup> - Fixing return type calculation for `bulk_then_execute`
- PR #3204<sup>3838</sup> - Changing `std::rand()` to a better inbuilt PRNG generator
- PR #3203<sup>3839</sup> - Resolving problems during shutdown for VS2015
- PR #3202<sup>3840</sup> - Making sure resource partitioner is not accessed if its not valid
- PR #3201<sup>3841</sup> - Fixing `optional::swap`
- Issue #3200<sup>3842</sup> - `hpx::util::optional` fails
- PR #3199<sup>3843</sup> - Fix `sliding_semaphore` test

- PR #3069<sup>3959</sup> - Fix scheduling loop exit
- Issue #3068<sup>3960</sup> - `hpx::lcos::condition_variable` could be suspect to deadlocks
- PR #3067<sup>3961</sup> - `#ifdef` out `random_shuffle` deprecated in later c++
- PR #3066<sup>3962</sup> - Make coalescing test depend on coalescing library to ensure it gets built
- PR #3065<sup>3963</sup> - Workaround for `minimal_timed_async_executor_test` compilation failures, attempts to copy a deferred call (in unevaluated context)
- PR #3064<sup>3964</sup> - Fixing wrong condition in `wrapper_heap`
- PR #3062<sup>3965</sup> - Fix exception handling for `execution::seq`
- PR #3061<sup>3966</sup> - Adapt MSVC C++ mode handling to VS15.5
- PR #3060<sup>3967</sup> - Fix compiler problem in MSVC release mode
- PR #3059<sup>3968</sup> - Fixing #2931
- Issue #3058<sup>3969</sup> - `minimal_timed_async_executor_test_exe` fails to compile on master (d6f505c)
- PR #3057<sup>3970</sup> - Fix `stable_merge_2964` compilation problems
- PR #3056<sup>3971</sup> - Fix some build warnings caused by unused variables/unnecessary tests
- PR #3055<sup>3972</sup> - Update documentation for running tests
- Issue #3054<sup>3973</sup> - Assertion failure when using bulk `hpx::new_` in asynchronous mode
- PR #3052<sup>3974</sup> - Do not bind test running to `cmake` test build rule
- PR #3051<sup>3975</sup> - Fix HPX-Qt interaction in Qt example.
- Issue #3048<sup>3976</sup> - `nqueen` example fails occasionally
- PR #3047<sup>3977</sup> - Fixing #3044
- PR #3046<sup>3978</sup> - Add OS thread suspension
- PR #3042<sup>3979</sup> - PyCicle - first attempt at a build tool for checking PR's
- PR #3041<sup>3980</sup> - Fix a problem about asynchronous execution of `parallel::merge` and `parallel::partition`.
- PR #3040<sup>3981</sup> - Fix a mistake about exception handling in asynchronous execution of `scan_partitioner`.

## HPX V1.0.0 (Apr 24, 2017)

### General changes

Here are some of the main highlights and changes for this release (in no particular order):

- Added the facility `hpx::split_future` which allows one to convert a `future<tuple<Ts...>>` into a `tuple<future<Ts>...>`. This functionality is not available when compiling *HPX* with VS2012.
- Added a new type of performance counter which allows one to return a list of values for each invocation. We also added a first counter of this type which collects a histogram of the times between parcels being created.
- Added new LCOs: `hpx::lcos::channel` and `hpx::lcos::local::channel` which are very similar to the well known channel constructs used in the Go language.
- Added new performance counters reporting the amount of data handled by the networking layer on a action-by-action basis (please see [PR #2289](#)<sup>4421</sup> for more details).
- Added a new facility `hpx::lcos::barrier`, replacing the equally named older one. The new facility has a slightly changed API and is much more efficient. Most notable, the new facility exposes a (global) function `hpx::lcos::barrier::synchronize()` which represents a global barrier across all localities.
- We have started to add support for vectorization to our parallel algorithm implementations. This support depends on using an external library, currently either Vc Library or `|boost_simd|`. Please see [Issue #2333](#)<sup>4422</sup> for a list of currently supported algorithms. This is an experimental feature and its implementation and/or API might change in the future. Please see this [blog-post](#)<sup>4423</sup> for more information.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overload can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17. The old `inner_product` names can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- Added versions of `hpx::get_ptr` taking client side representations for component instances as their parameter (instead of a global id).
- Added the helper utility `hpx::performance_counters::performance_counter_set` helping to encapsulate a set of performance counters to be managed concurrently.
- All execution policies and related classes have been renamed to be consistent with the naming changes applied for C++17. All policies now live in the namespace `hpx::parallel::execution`. The old names can be still enabled at configure time by specifying `-DHPX_WITH_EXECUTION_POLICY_COMPATIBILITY=On` to CMake.
- The thread scheduling subsystem has undergone a major refactoring which results in significant performance improvements. We have also improved the performance of creating `hpx::future` and of various facilities handling those.

---

<sup>4419</sup> <https://github.com/TheHPXProject/hpx/issues/701>

<sup>4420</sup> <https://github.com/TheHPXProject/hpx/issues/528>

<sup>4421</sup> <https://github.com/TheHPXProject/hpx/pull/2289>

<sup>4422</sup> <https://github.com/TheHPXProject/hpx/issues/2333>

<sup>4423</sup> <http://stellar-group.org/2016/09/vectorized-cpp-parallel-algorithms-with-hpx/>

- We have consolidated all of the code in `HPX.Compute` related to the integration of CUDA. `hpx::partitioned_vector` has been enabled to be usable with `hpx::compute::vector` which allows one to place the partitions on one or more GPU devices.
- Added new performance counters exposing various internals of the thread scheduling subsystem, such as the current idle- and busy-loop counters and instantaneous scheduler utilization.
- Extended and improved the use of the ITTNotify hooks allowing to collect performance counter data and function annotation information from within the Intel Amplifier tool.

## Breaking changes

- We have dropped support for the gcc compiler versions V4.6 and 4.7. The minimal gcc version we now test on is gcc V4.8.
- We have removed (default) support for `boost::chrono` in interfaces, uses of it have been replaced with `std::chrono`. This facility can be still enabled at configure time by specifying `-DHPX_WITH_BOOST_CHRONO_COMPATIBILITY=On` to CMake.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17.
- the build options `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` are now disabled by default. Please change your code still depending on the deprecated interfaces.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #2596](#)<sup>4424</sup> - Adding apex data
- [PR #2595](#)<sup>4425</sup> - Remove obsolete file
- [Issue #2594](#)<sup>4426</sup> - FindOpenCL.cmake mismatch with the official cmake module
- [PR #2592](#)<sup>4427</sup> - First attempt to introduce `spmd_block` in `hpx`
- [Issue #2591](#)<sup>4428</sup> - Feature request: continuation (then) which does not require the callable object to take a future<R> as parameter
- [PR #2588](#)<sup>4429</sup> - Daint fixes
- [PR #2587](#)<sup>4430</sup> - Fixing `transfer_(continuation)_action::schedule`
- [PR #2585](#)<sup>4431</sup> - Work around MSVC having an ICE when compiling with `-Ob2`
- [PR #2583](#)<sup>4432</sup> - changing 7zip command to 7za in `roll_release.sh`

- Issue #475<sup>4746</sup> - Create a means of combining performance counters into querysets

## HPX V0.9.99 (Jul 15, 2016)

### General changes

As the version number of this release hints, we consider this release to be a preview for the upcoming *HPX* V1.0. All of the functionalities we set out to implement for V1.0 are in place; all of the features we wanted to have exposed are ready. We are very happy with the stability and performance of *HPX* and we would like to present this release to the community in order for us to gather broad feedback before releasing V1.0. We still expect for some minor details to change, but on the whole this release represents what we would like to have in a V1.0.

Overall, since the last release we have had almost 1600 commits while closing almost 400 tickets. These numbers reflect the incredible development activity we have seen over the last couple of months. We would like to express a big ‘Thank you!’ to all contributors and those who helped to make this release happen.

The most notable addition in terms of new functionality available with this release is the full implementation of object migration (i.e. the ability to transparently move *HPX* components to a different compute node). Additionally, this release of *HPX* cleans up many minor issues and some API inconsistencies.

Here are some of the main highlights and changes for this release (in no particular order):

- <sup>4732</sup> <https://github.com/TheHPXProject/hpx/pull/2232>
- <sup>4733</sup> <https://github.com/TheHPXProject/hpx/issues/2147>
- <sup>4734</sup> <https://github.com/TheHPXProject/hpx/issues/2109>
- <sup>4735</sup> <https://github.com/TheHPXProject/hpx/issues/1973>
- <sup>4736</sup> <https://github.com/TheHPXProject/hpx/issues/1864>
- <sup>4737</sup> <https://github.com/TheHPXProject/hpx/issues/1754>
- <sup>4738</sup> <https://github.com/TheHPXProject/hpx/issues/1655>
- <sup>4739</sup> <https://github.com/TheHPXProject/hpx/issues/1591>
- <sup>4740</sup> <https://github.com/TheHPXProject/hpx/issues/1401>
- <sup>4741</sup> <https://github.com/TheHPXProject/hpx/issues/1125>
- <sup>4742</sup> <https://github.com/TheHPXProject/hpx/issues/839>
- <sup>4743</sup> <https://github.com/TheHPXProject/hpx/issues/702>
- <sup>4744</sup> <https://github.com/TheHPXProject/hpx/issues/668>
- <sup>4745</sup> <https://github.com/TheHPXProject/hpx/issues/533>
- <sup>4746</sup> <https://github.com/TheHPXProject/hpx/issues/475>

- We have fixed a couple of issues in AGAS and the parcel layer which have caused hangs, segmentation faults at exit, and a slowdown of applications over time. Fixing those has significantly increased the overall stability and performance of distributed runs.
- We have started to add parallel algorithm overloads based on the C++ Extensions for Ranges (N4560<sup>4747</sup>) proposal. This also includes the addition of projections to the existing algorithms. Please see Issue #1668<sup>4748</sup> for a list of algorithms which have been adapted to N4560<sup>4749</sup>.
- We have implemented index-based parallel for-loops based on a corresponding standardization proposal (P0075R1<sup>4750</sup>). Please see Issue #2016<sup>4751</sup> for a list of available algorithms.
- We have added implementations for more parallel algorithms as proposed for the upcoming C++ 17 Standard. See Issue #1141<sup>4752</sup> for an overview of which algorithms are available by now.
- We have started to implement a new prototypical functionality with *HPX.Compute* which uniformly exposes some of the higher level APIs to heterogeneous architectures (currently CUDA). This functionality is an early preview and should not be considered stable. It may change considerably in the future.
- We have pervasively added (optional) executor arguments to all API functions which schedule new work. Executors are now used throughout the code base as the main means of executing tasks.
- Added `hpx::make_future<R>(future<T> &&)` allowing to convert a future of any type T into a future of any other type R, either based on default conversion rules of the embedded types or using a given explicit conversion function.
- We finally finished the implementation of transparent migration of components to another locality. It is now possible to trigger a migration operation without ‘stopping the world’ for the object to migrate. *HPX* will make sure that no work is being performed on an object before it is migrated and that all subsequently scheduled work for the migrated object will be transparently forwarded to the new locality. Please note that the global id of the migrated object does not change, thus the application will not have to be changed in any way to support this new functionality. Please note that this feature is currently considered experimental. See Issue #559<sup>4753</sup> and PR #1966<sup>4754</sup> for more details.
- The `hpx::dataflow` facility is now usable with actions. Similarly to `hpx::async`, actions can be specified as an explicit template argument (`hpx::dataflow<Action>(target, ...)`) or as the first argument (`hpx::dataflow(Action(), target, ...)`). We have also enabled the use of distribution policies as the target for dataflow invocations. Please see Issue #1265<sup>4755</sup> and PR #1912<sup>4756</sup> for more information.
- Adding overloads of `gather_here` and `gather_there` to accept the plain values of the data to gather (in addition to the existing overloads expecting futures).
- We have cleaned up and refactored large parts of the code base. This helped reducing compile and link times of *HPX* itself and also of applications depending on it. We have further decreased the dependency of *HPX* on the Boost libraries by replacing part of those with facilities available from the standard libraries.
- Wherever possible we have removed dependencies of our API on Boost by replacing those with the equivalent facility from the C++11 standard library.
- We have added new performance counters for parcel coalescing, file-IO, the AGAS cache, and overall scheduler time. Resetting performance counters has been overhauled and fixed.

---

<sup>4747</sup> <http://wg21.link/n4560>

<sup>4748</sup> <https://github.com/TheHPXProject/hpx/issues/1668>

<sup>4749</sup> <http://wg21.link/n4560>

<sup>4750</sup> <http://wg21.link/p0075r1>

<sup>4751</sup> <https://github.com/TheHPXProject/hpx/issues/2016>

<sup>4752</sup> <https://github.com/TheHPXProject/hpx/issues/1141>

<sup>4753</sup> <https://github.com/TheHPXProject/hpx/issues/559>

<sup>4754</sup> <https://github.com/TheHPXProject/hpx/pull/1966>

<sup>4755</sup> <https://github.com/TheHPXProject/hpx/issues/1265>

<sup>4756</sup> <https://github.com/TheHPXProject/hpx/pull/1912>

- We have introduced a generic client type `hpx::components::client<>` and added support for using it with `hpx::async`. This removes the necessity to implement specific client types for every component type without losing type safety. This deemphasizes the need for using the low level `hpx::id_type` for referencing (possibly remote) component instances. The plan is to deprecate the direct use of `hpx::id_type` in user code in the future.
- We have added a special iterator which supports automatic prefetching of one or more arrays for speeding up loop-like code (see `hpx::parallel::util::make_prefetcher_context()`).
- We have extended the interfaces exposed from executors (as proposed by [N4406](http://wg21.link/n4406)<sup>4757</sup>) to accept an arbitrary number of arguments.

## Breaking changes

- In order to move the dataflow facility to namespace `hpx` we added a definition of `hpx::dataflow` which might create ambiguities in existing codes. The previous definition of this facility (`hpx::lcos::local::dataflow`) has been deprecated and is available only if the constant `-DHPX_WITH_LOCAL_DATAFLOW_COMPATIBILITY=On` to `CMake`<sup>4758</sup> is defined at configuration time. Please explicitly qualify all uses of the dataflow facility if you enable this compatibility setting and encounter ambiguities.
- The adaptation of the C++ Extensions for Ranges ([N4560](http://wg21.link/n4560)<sup>4759</sup>) proposal imposes some breaking changes related to the return types of some of the parallel algorithms. Please see [Issue #1668](https://github.com/TheHPXProject/hpx/issues/1668)<sup>4760</sup> for a list of algorithms which have already been adapted.
- The facility `hpx::lcos::make_future_void()` has been replaced by `hpx::make_future<void>()`.
- We have removed support for Intel V13 and gcc 4.4.x.
- We have removed (default) support for the generic `hpx::parallel::execution_policy` because it was removed from the Parallelism TS (`__cpp11_n4104__`) while it was being added to the upcoming C++17 Standard. This facility can be still enabled at configure time by specifying `-DHPX_WITH_GENERIC_EXECUTION_POLICY=On` to `CMake`.
- Uses of `boost::shared_ptr` and related facilities have been replaced with `std::shared_ptr` and friends. Uses of `boost::unique_lock`, `boost::lock_guard` etc. have also been replaced by the equivalent (and equally named) tools available from the C++11 standard library.
- Facilities that used to expect an explicit `boost::unique_lock` now take an `std::unique_lock`. Additionally, `condition_variable` no longer aliases `condition_variable_any`; its interface now only works with `std::unique_lock<local::mutex>`.
- Uses of `boost::function`, `boost::bind`, `boost::tuple` have been replaced by the corresponding facilities in *HPX* (`hpx::util::function`, `hpx::util::bind`, and `hpx::util::tuple`, respectively).

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #2250<sup>4761</sup>](#) - change default chunker of parallel executor to static one
- [PR #2247<sup>4762</sup>](#) - HPX on ppc64le
- [PR #2244<sup>4763</sup>](#) - Fixing MSVC problems
- [PR #2238<sup>4764</sup>](#) - Fixing small typos
- [PR #2237<sup>4765</sup>](#) - Fixing small typos
- [PR #2234<sup>4766</sup>](#) - Fix broken add test macro when extra args are passed in
- [PR #2231<sup>4767</sup>](#) - Fixing possible race during future awaiting in serialization
- [PR #2230<sup>4768</sup>](#) - Fix stream nvcc
- [PR #2229<sup>4769</sup>](#) - Fixed run\_as\_hpx\_thread
- [PR #2228<sup>4770</sup>](#) - On prefetching\_test branch : adding prefetching\_iterator and related tests used for prefetching containers within lambda functions
- [PR #2227<sup>4771</sup>](#) - Support for HPXCL's opencil::event
- [PR #2226<sup>4772</sup>](#) - Preparing for release of V0.9.99
- [PR #2225<sup>4773</sup>](#) - fix issue when compiling components with hpxcxx
- [PR #2224<sup>4774</sup>](#) - Compute alloc fix
- [PR #2223<sup>4775</sup>](#) - Simplify promise
- [PR #2222<sup>4776</sup>](#) - Replace last uses of boost::function by util::function\_nonsr
- [PR #2221<sup>4777</sup>](#) - Fix config tests
- [PR #2220<sup>4778</sup>](#) - Fixing gcc 4.6 compilation issues
- [PR #2219<sup>4779</sup>](#) - nullptr support for [unique\_] function
- [PR #2218<sup>4780</sup>](#) - Introducing clang tidy
- [PR #2216<sup>4781</sup>](#) - Replace NULL with nullptr

## HPX V0.9.11 (Nov 11, 2015)

Our main focus for this release was the design and development of a coherent set of higher-level APIs exposing various types of parallelism to the application programmer. We introduced the concepts of an `executor`, which can be used to customize the `where` and `when` of execution of tasks in the context of parallelizing codes. We extended all APIs related to managing parallel tasks to support executors which gives the user the choice of either using one of the predefined executor types or to provide its own, possibly application specific, executor. We paid very close attention to align all of these changes with the existing C++ Standards documents or with the ongoing proposals for standardization.

This release is the first after our change to a new development policy. We switched all development to be strictly performed on branches only, all direct commits to our main branch (`master`) are prohibited. Any change has to go through a peer review before it will be merged to `master`. As a result the overall stability of our code base has significantly increased, the development process itself has been simplified. This change manifests itself in a large number of pull-requests which have been merged (please see below for a full list of closed issues and pull-requests). All in all for this release, we closed almost 100 issues and merged over 290 pull-requests. There have been over 1600 commits to the master branch since the last release.

## General changes

- We are moving into the direction of unifying managed and simple components. As such, the classes `hpx::components::component` and `hpx::components::component_base` have been added which currently just forward to the currently existing simple component facilities. The examples have been converted to only use those two classes.
- Added integration with the [CircleCI](#)<sup>5155</sup> hosted continuous integration service. This gives us constant and immediate feedback on the health of our master branch.
- The compiler configuration subsystem in the build system has been reimplemented. Instead of using `Boost.Config` we now use our own lightweight set of `cmake` scripts to determine the available language and library features supported by the used compiler.
- The API for creating instances of components has been consolidated. All component instances should be created using the `hpx::new_` only. It allows one to instantiate both, single component instances and multiple component instances. The placement of the created components can be controlled by special distribution policies. Please see the corresponding documentation outlining the use of `hpx::new_`.
- Introduced four new distribution policies which can be used with many API functions which traditionally expected to be used with a locality id. The new distribution policies are:
  - `hpx::components::default_distribution_policy` which tries to place multiple component instances as evenly as possible.

<sup>5150</sup> <https://github.com/TheHPXProject/hpx/issues/559>

<sup>5151</sup> <https://github.com/TheHPXProject/hpx/issues/449>

<sup>5152</sup> <https://github.com/TheHPXProject/hpx/issues/279>

<sup>5153</sup> <https://github.com/TheHPXProject/hpx/issues/224>

<sup>5154</sup> <https://github.com/TheHPXProject/hpx/issues/55>

<sup>5155</sup> <https://circleci.com/gh/TheHPXProject/hpx>

- `hpx::components::colocating_distribution_policy` which will refer to the locality where a given component instance is currently placed.
  - `hpx::components::binpacking_distribution_policy` which will place multiple component instances as evenly as possible based on any performance counter.
  - `hpx::components::target_distribution_policy` which allows one to represent a given locality in the context of a distribution policy.
- The new distribution policies can now be also used with `hpx::async`. This change also deprecates `hpx::async_colocated(id, ...)` which now is replaced by a distribution policy: `hpx::async(hpx::colocated(id), ...)`.
  - The `hpx::vector` and `hpx::unordered_map` data structures can now be used with the new distribution policies as well.
  - The parallel facility `hpx::parallel::task_region` has been renamed to `hpx::parallel::task_block` based on the changes in the corresponding standardization proposal [N4411](#)<sup>5156</sup>.
  - Added extensions to the parallel facility `hpx::parallel::task_block` allowing to combine a `task_block` with an execution policy. This implies a minor breaking change as the `hpx::parallel::task_block` is now a template.
  - Added new LCOs: `hpx::lcos::latch` and `hpx::lcos::local::latch` which semantically conform to the proposed `std::latch` (see [N4399](#)<sup>5157</sup>).
  - Added performance counters exposing data related to data transferred by input/output (filesystem) operations (thanks to Maciej Brodowicz).
  - Added performance counters allowing to track the number of action invocations (local and remote invocations).
  - Added new command line options `-hpx:print-counter-at` and `-hpx:reset-counters`.
  - The `hpx::vector` component has been renamed to `hpx::partitioned_vector` to make it explicit that the underlying memory is not contiguous.
  - Introduced a completely new and uniform higher-level parallelism API which is based on executors. All existing parallelism APIs have been adapted to this. We have added a large number of different executor types, such as a numa-aware executor, a this-thread executor, etc.
  - Added support for the MingW toolchain on Windows (thanks to Eric Lemanissier).
  - HPX now includes support for APEX, (Autonomic Performance Environment for eXascale). APEX is an instrumentation and software adaptation library that provides an interface to TAU profiling / tracing as well as runtime adaptation of HPX applications through policy definitions. For more information and documentation, please see <https://github.com/UO-OACISS/xpress-apex>. To enable APEX at configuration time, specify `-DHPX_WITH_APEX=On`. To also include support for TAU profiling, specify `-DHPX_WITH_TAU=On` and specify the `-DTAU_ROOT`, `-DTAU_ARCH` and `-DTAU_OPTIONS` cmake parameters.
  - We have implemented many more of the *Using parallel algorithms*. Please see [Issue #1141](#)<sup>5158</sup> for the list of all available parallel algorithms (thanks to Daniel Bourgeois and John Biddiscombe for contributing their work).

## Breaking changes

- We are moving into the direction of unifying managed and simple components. In order to stop exposing the old facilities, all examples have been converted to use the new classes. The breaking change in this release is that performance counters are now a `hpx::components::component_base` instead of `hpx::components::managed_component_base`.
- We removed the support for stackless threads. It turned out that there was no performance benefit when using stackless threads. As such, we decided to clean up our codebase. This feature was not documented.
- The CMake project name has changed from 'hpx' to 'HPX' for consistency and compatibility with naming conventions and other CMake projects. Generated config files go into `<prefix>/lib/cmake/HPX` and not `<prefix>/lib/cmake/hpx`.
- The macro `HPX_REGISTER_MINIMAL_COMPONENT_FACTORY` has been deprecated. Please use `HPX_REGISTER_COMPONENT` instead. The old macro will be removed in the next release.
- The obsolete `distributing_factory` and `binpacking_factory` components have been removed. The corresponding functionality is now provided by the `hpx::new_` API function in conjunction with the `hpx::default_layout` and `hpx::binpacking` distribution policies (`hpx::components::default_distribution_policy` and `hpx::components::binpacking_distribution_policy`).
- The API function `hpx::new_colocated` has been deprecated. Please use the consolidated API `hpx::new_` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of HPX if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The API function `hpx::async_colocated` has been deprecated. Please use the consolidated API `hpx::async` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of HPX if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The obsolete `remote_object` component has been removed.
- Replaced the use of Boost.Serialization with our own solution. While the new version is mostly compatible with Boost.Serialization, this change requires some minor code modifications in user code. For more information, please see the corresponding [announcement](#)<sup>5159</sup> on the `hpx-users@stellar.cct.lsu.edu` mailing list.
- The names used by cmake to influence various configuration options have been unified. The new naming scheme relies on all configuration constants to start with `HPX_WITH_...`, while the preprocessor constant which is used at build time starts with `HPX_HAVE_...`. For instance, the former cmake command line `-DHPX_MALLOC=...` now has to be specified as `-DHPX_WITH_MALLOC=...` and will cause the preprocessor constant `HPX_HAVE_MALLOC` to be defined. The actual name of the constant (i.e. `MALLOC`) has not changed. Please see the corresponding documentation for more details (*CMake options*).
- The `get_gid()` functions exposed by the component base classes `hpx::components::server::simple_component_base`, `hpx::components::server::managed_component_base`, and `hpx::components::server::fixed_component_base` have been replaced by two new functions: `get_unmanaged_id()` and `get_id()`. To enable the old function name for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.
- All functions which were named `get_gid()` but were returning `hpx::id_type` have been renamed to `get_id()`. To enable the old function names for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.

## HPX V0.9.10 (Mar 24, 2015)

### General changes

This is the 12th official release of *HPX*. It coincides with the 7th anniversary of the first commit to our source code repository. Since then, we have seen over 12300 commits amounting to more than 220000 lines of C++ code.

The major focus of this release was to improve the reliability of large scale runs. We believe to have achieved this goal as we now can reliably run *HPX* applications on up to ~24k cores. We have also shown that HPX can be used with success for symmetric runs (applications using both, host cores and Intel Xeon/Phi coprocessors). This is a huge step forward in terms of the usability of *HPX*. The main focus of this work involved isolating the causes of the segmentation faults at start up and shut down. Many of these issues were discovered to be the result of the suspension of threads which hold locks.

A very important improvement introduced with this release is the refactoring of the code representing our parcel-port implementation. Parcel- ports can now be implemented by 3rd parties as independent plugins which are dynamically loaded at runtime (static linking of parcel-ports is also supported). This refactoring also includes a massive improvement of the performance of our existing parcel-ports. We were able to significantly reduce the networking latencies

<sup>5562</sup> <https://github.com/TheHPXProject/hpx/issues/721>  
<sup>5563</sup> <https://github.com/TheHPXProject/hpx/issues/524>

and to improve the available networking bandwidth. Please note that in this release we disabled the `ibverbs` and `ipc` parcel ports as those have not been ported to the new plugin system yet (see [Issue #839](#)<sup>5564</sup>).

Another corner stone of this release is our work towards a complete implementation of `__cpp11_n4104__` (Working Draft, Technical Specification for C++ Extensions for Parallelism). This document defines a set of parallel algorithms to be added to the C++ standard library. We now have implemented about 75% of all specified parallel algorithms (see [[link hpx.manual.parallel.parallel\\_algorithms](#) Parallel Algorithms] for more details). We also implemented some extensions to `__cpp11_n4104__` allowing to invoke all of the algorithms asynchronously.

This release adds a first implementation of `hpx::vector` which is a distributed data structure closely aligned to the functionality of `std::vector`. The difference is that `hpx::vector` stores the data in partitions where the partitions can be distributed over different localities. We started to work on allowing to use the parallel algorithms with `hpx::vector`. At this point we have implemented only a few of the parallel algorithms to support distributed data structures (like `hpx::vector`) for testing purposes (see [Issue #1338](#)<sup>5565</sup> for a documentation of our progress).

## Breaking changes

With this release we put a lot of effort into changing the code base to be more compatible to C++11. These changes have caused the following issues for backward compatibility:

- **Move to Variadics**- All of the API now uses variadic templates. However, this change required to modify the argument sequence for some of the exiting API functions (`hpx::async_continue`, `hpx::apply_continue`, `hpx::when_each`, `hpx::wait_each`, synchronous invocation of actions).
- **Changes to Macros**- We also removed the macros `HPX_STD_FUNCTION` and `HPX_STD_TUPLE`. This shouldn't affect any user code as we replaced `HPX_STD_FUNCTION` with `hpx::util::function_nonser` which was the default expansion used for this macro. All `HPX` API functions which expect a `hpx::util::function_nonser` (or a `hpx::util::unique_function_nonser`) can now be transparently called with a compatible `std::function` instead. Similarly, `HPX_STD_TUPLE` was replaced by its default expansion as well: `hpx::util::tuple`.
- **Changes to `hpx::unique_future`**- `hpx::unique_future`, which was deprecated in the previous release for `hpx::future` is now completely removed from `HPX`. This completes the transition to a completely standards conforming implementation of `hpx::future`.
- **Changes to Supported Compilers**. Finally, in order to utilize more C++11 semantics, we have officially dropped support for GCC 4.4 and MSVC 2012. Please see our *Prerequisites* page for more details.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1402](#)<sup>5566</sup> - Internal `shared_future` serialization copies
- [Issue #1399](#)<sup>5567</sup> - Build takes unusually long time...
- [Issue #1398](#)<sup>5568</sup> - Tests using the scan partitioner are broken on at least gcc 4.7 and intel compiler
- [Issue #1397](#)<sup>5569</sup> - Completely remove `hpx::unique_future`
- [Issue #1396](#)<sup>5570</sup> - Parallel scan algorithms with different initial values

- Issue #680<sup>5675</sup> - Convert parcel ports into a plugin system
- Issue #582<sup>5676</sup> - Make exception thrown from HPX threads available from hpx::init
- Issue #504<sup>5677</sup> - Refactor Dataflow LCO to work with futures
- Issue #196<sup>5678</sup> - Don’t store copies of the locality network metadata in the gva table

## HPX V0.9.9 (Oct 31, 2014, codename Spooky)

### General changes

We have had over 1500 commits since the last release and we have closed over 200 tickets (bugs, feature requests, pull requests, etc.). These are by far the largest numbers of commits and resolved issues for any of the *HPX* releases so far. We are especially happy about the large number of people who contributed for the first time to *HPX*.

- We completed the transition from the older (non-conforming) implementation of `hpx::future` to the new and fully conforming version by removing the old code and by renaming the type `hpx::unique_future` to `hpx::future`. In order to maintain backwards compatibility with existing code which uses the type `hpx::unique_future` we support the configuration variable `HPX_UNIQUE_FUTURE_ALIAS`. If this variable is set to ON while running cmake it will additionally define a template alias for this type.

<sup>5673</sup> <https://github.com/TheHPXProject/hpx/issues/850>

<sup>5674</sup> <https://github.com/TheHPXProject/hpx/issues/763>

<sup>5675</sup> <https://github.com/TheHPXProject/hpx/issues/680>

<sup>5676</sup> <https://github.com/TheHPXProject/hpx/issues/582>

<sup>5677</sup> <https://github.com/TheHPXProject/hpx/issues/504>

<sup>5678</sup> <https://github.com/TheHPXProject/hpx/issues/196>

- We rewrote and significantly changed our build system. Please have a look at the new (now generated) documentation here: *Building HPX*. Please revisit your build scripts to adapt to the changes. The most notable changes are:
  - HPX\_NO\_INSTALL is no longer necessary.
  - For external builds, you need to set HPX\_DIR instead of HPX\_ROOT as described here: *Using HPX with CMake-based projects*.
  - IDEs that support multiple configurations (Visual Studio and XCode) can now be used as intended. that means no build dir.
  - Building HPX statically (without dynamic libraries) is now supported (-DHPX\_STATIC\_LINKING=On).
  - Please note that many variables used to configure the build process have been renamed to unify the naming conventions (see the section *CMake options* for more information).
  - This also fixes a long list of issues, for more information see [Issue #1204](#)<sup>5679</sup>.
- We started to implement various proposals to the C++ Standardization committee related to parallelism and concurrency, most notably [N4409](#)<sup>5680</sup> (Working Draft, Technical Specification for C++ Extensions for Parallelism), [N4411](#)<sup>5681</sup> (Task Region Rev. 3), and [N4313](#)<sup>5682</sup> (Working Draft, Technical Specification for C++ Extensions for Concurrency).
- We completely remodeled our automatic build system to run builds and unit tests on various systems and compilers. This allows us to find most bugs right as they were introduced and helps to maintain a high level of quality and compatibility. The newest build logs can be found at [HPX Buildbot Website](#)<sup>5683</sup>.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1296](#)<sup>5684</sup> - Rename make\_error\_future to make\_exceptional\_future, adjust to N4123
- [Issue #1295](#)<sup>5685</sup> - building issue
- [Issue #1293](#)<sup>5686</sup> - Transpose example
- [Issue #1292](#)<sup>5687</sup> - Wrong abs() function used in example
- [Issue #1291](#)<sup>5688</sup> - non-synchronized shift operators have been removed
- [Issue #1290](#)<sup>5689</sup> - RDTSCP is defined as true for Xeon Phi build
- [Issue #1289](#)<sup>5690</sup> - Fixing 1288
- [Issue #1288](#)<sup>5691</sup> - Add new performance counters
- [Issue #1287](#)<sup>5692</sup> - Hierarchy scheduler broken performance counters

<sup>5692</sup> <https://github.com/TheHPXProject/hpx/issues/1287>

- Issue #1286<sup>5693</sup> - Algorithm cleanup
- Issue #1285<sup>5694</sup> - Broken Links in Documentation
- Issue #1284<sup>5695</sup> - Uninitialized copy
- Issue #1283<sup>5696</sup> - missing boost::scoped\_ptr includes
- Issue #1282<sup>5697</sup> - Update documentation of build options for schedulers
- Issue #1281<sup>5698</sup> - reset idle rate counter
- Issue #1280<sup>5699</sup> - Bug when executing on Intel MIC
- Issue #1279<sup>5700</sup> - Add improved when\_all/wait\_all
- Issue #1278<sup>5701</sup> - Implement improved when\_all/wait\_all
- Issue #1277<sup>5702</sup> - feature request: get access to argc argv and variables\_map
- Issue #1276<sup>5703</sup> - Remove merging map
- Issue #1274<sup>5704</sup> - Weird (wrong) string code in papi.cpp
- Issue #1273<sup>5705</sup> - Sequential task execution policy
- Issue #1272<sup>5706</sup> - Avoid CMake name clash for Boost.Thread library
- Issue #1271<sup>5707</sup> - Updates on HPX Test Units
- Issue #1270<sup>5708</sup> - hpx/util/safe\_lexical\_cast.hpp is added
- Issue #1269<sup>5709</sup> - Added default value for “LIB” cmake variable
- Issue #1268<sup>5710</sup> - Memory Counters not working
- Issue #1266<sup>5711</sup> - FindHPX.cmake is not installed
- Issue #1263<sup>5712</sup> - apply\_remote test takes too long
- Issue #1262<sup>5713</sup> - Chrono cleanup
- Issue #1261<sup>5714</sup> - Need make install for papi counters and this builds all the examples
- Issue #1260<sup>5715</sup> - Documentation of Stencil example claims

<sup>5830</sup> <https://github.com/TheHPXProject/hpx/issues/1130>

- Issue #1129<sup>5831</sup> - Some fixes to the Build system on OS X
- Issue #1128<sup>5832</sup> - Action future args
- Issue #1127<sup>5833</sup> - Executor causes segmentation fault
- Issue #1124<sup>5834</sup> - Adding new API functions: `register_id_with_basename`, `unregister_id_with_basename`, `find_ids_from_basename`; adding test
- Issue #1123<sup>5835</sup> - Reduce nesting of try-catch construct in `encode_parcels`?
- Issue #1122<sup>5836</sup> - Client base fixes
- Issue #1121<sup>5837</sup> - Update `hpxrun.py.in`
- Issue #1120<sup>5838</sup> - HTTPS2 tests compile errors on v110 (VS2012)
- Issue #1119<sup>5839</sup> - Remove references to `boost::atomic` in accumulator example
- Issue #1118<sup>5840</sup> - Only build test `thread_pool_executor_1114_test` if `HPX_SCHEDULER` is set
- Issue #1117<sup>5841</sup> - `local_queue_executor` linker error on vc110
- Issue #1116<sup>5842</sup> - Disabled performance counter should give runtime errors, not invalid data
- Issue #1115<sup>5843</sup> - Compile error with Intel C++ 13.1
- Issue #1114<sup>5844</sup> - Default constructed executor is not usable
- Issue #1113<sup>5845</sup> - Fast compilation of logging causes ABI incompatibilities between different `NDEBUG` values
- Issue #1112<sup>5846</sup> - Using `thread_pool_executors` causes segfault
- Issue #1111<sup>5847</sup> - `hpx::threads::get_thread_data` always returns zero
- Issue #1110<sup>5848</sup> - Remove unnecessary null pointer checks
- Issue #1109<sup>5849</sup> - More tests adjustments
- Issue #1108<sup>5850</sup> - Clarify build rules for “`libboost_atomic-mt.so`”?
- Issue #1107<sup>5851</sup> - Remove unnecessary null pointer checks
- Issue #1106<sup>5852</sup> - `network_storage` benchmark improvements, adding legends to plots and tidying layout
- Issue #1105<sup>5853</sup> - Add more plot outputs and improve instructions doc

- Issue #209<sup>5903</sup> - Support multiple configurations in generated build files
- Issue #190<sup>5904</sup> - hpx::cout should be a std::ostream
- Issue #189<sup>5905</sup> - iostreams component should use startup/shutdown functions
- Issue #183<sup>5906</sup> - Use Boost.ICL for correctness in AGAS
- Issue #44<sup>5907</sup> - Implement real futures

## HPX V0.9.8 (Mar 24, 2014)

We have had over 800 commits since the last release and we have closed over 65 tickets (bugs, feature requests, etc.).

With the changes below, *HPX* is once again leading the charge of a whole new era of computation. By intrinsically breaking down and synchronizing the work to be done, *HPX* insures that application developers will no longer have to fret about where a segment of code executes. That allows coders to focus their time and energy to understanding the data dependencies of their algorithms and thereby the core obstacles to an efficient code. Here are some of the advantages of using *HPX*:

- *HPX* is solidly rooted in a sophisticated theoretical execution model – ParalleX
- *HPX* exposes an API fully conforming to the C++11 and the draft C++14 standards, extended and applied to distributed computing. Everything programmers know about the concurrency primitives of the standard C++ library is still valid in the context of *HPX*.
- It provides a competitive, high performance implementation of modern, future-proof ideas which gives an smooth migration path from today's mainstream techniques
- There is no need for the programmer to worry about lower level parallelization paradigms like threads or message passing; no need to understand pthreads, MPI, OpenMP, or Windows threads, etc.
- There is no need to think about different types of parallelism such as tasks, pipelines, or fork-join, task or data parallelism.
- The same source of your program compiles and runs on Linux, BlueGene/Q, Mac OS X, Windows, and Android.
- The same code runs on shared memory multi-core systems and supercomputers, on handheld devices and Intel® Xeon Phi™ accelerators, or a heterogeneous mix of those.

## General changes

- A major API breaking change for this release was introduced by implementing `hpx::future` and `hpx::shared_future` fully in conformance with the C++11 Standard<sup>5908</sup>. While `hpx::shared_future` is new and will not create any compatibility problems, we revised the interface and implementation of the existing `hpx::future`. For more details please see the [mailing list archive](#)<sup>5909</sup>. To avoid any incompatibilities for existing code we named the type which implements the `std::future` interface as `hpx::unique_future`. For the next release this will be renamed to `hpx::future`, making it full conforming to C++11 Standard<sup>5910</sup>.
- A large part of the code base of *HPX* has been refactored and partially re-implemented. The main changes were related to
  - The threading subsystem: these changes significantly reduce the amount of overheads caused by the schedulers, improve the modularity of the code base, and extend the variety of available scheduling algorithms.
  - The parcel subsystem: these changes improve the performance of the *HPX* networking layer, modularize the structure of the parcelports, and simplify the creation of new parcelports for other underlying networking libraries.
  - The API subsystem: these changes improved the conformance of the API to C++11 Standard, extend and unify the available API functionality, and decrease the overheads created by various elements of the API.
  - The robustness of the component loading subsystem has been improved significantly, allowing to more portably and more reliably register the components needed by an application as startup. This additionally speeds up general application initialization.
- We added new API functionality like `hpx::migrate` and `hpx::copy_component` which are the basic building blocks necessary for implementing higher level abstractions for system-wide load balancing, runtime-adaptive resource management, and object-oriented checkpointing and state-management.
- We removed the use of C++11 move emulation (using `Boost.Move`), replacing it with C++11 rvalue references. This is the first step towards using more and more native C++11 facilities which we plan to introduce in the future.
- We improved the reference counting scheme used by *HPX* which helps managing distributed objects and memory. This improves the overall stability of *HPX* and further simplifies writing real world applications.
- The minimal Boost version required to use *HPX* is now V1.49.0.
- This release coincides with the first release of HPXPI (V0.1.0), the first implementation of the [XPI specification](#)<sup>5911</sup>.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1086](#)<sup>5912</sup> - Expose internal `boost::shared_array` to allow user management of array lifetime
- [Issue #1083](#)<sup>5913</sup> - Make shell examples copyable in docs
- [Issue #1080](#)<sup>5914</sup> - `/threads{locality#*/total}/count/cumulative` broken
- [Issue #1079](#)<sup>5915</sup> - Build problems on OS X

<sup>5914</sup> <https://github.com/TheHPXProject/hpx/issues/1080>

<sup>5915</sup> <https://github.com/TheHPXProject/hpx/issues/1079>

- Issue #1078<sup>5916</sup> - Improve robustness of component loading
- Issue #1077<sup>5917</sup> - Fix a missing enum definition for ‘take’ mode
- Issue #1076<sup>5918</sup> - Merge Jb master
- Issue #1075<sup>5919</sup> - Unknown CMake command “add\_hpx\_pseudo\_target”
- Issue #1074<sup>5920</sup> - Implement `apply_continue_callback` and `apply_colocated_callback`
- Issue #1073<sup>5921</sup> - The new `apply_colocated` and `async_colocated` functions lead to automatic registered functions
- Issue #1071<sup>5922</sup> - Remove `deferred_packaged_task`
- Issue #1069<sup>5923</sup> - `serialize_buffer` with allocator fails at destruction
- Issue #1068<sup>5924</sup> - Coroutine include and forward declarations missing
- Issue #1067<sup>5925</sup> - Add allocator support to `util::serialize_buffer`
- Issue #1066<sup>5926</sup> - Allow for `MPI_Init` being called before HPX launches
- Issue #1065<sup>5927</sup> - AGAS cache isn’t used/populated on worker localities
- Issue #1064<sup>5928</sup> - Reorder includes to ensure `ws2` includes early
- Issue #1063<sup>5929</sup> - Add `hpx::runtime::suspend` and `hpx::runtime::resume`
- Issue #1062<sup>5930</sup> - Fix `async_continue` to properly handle return types
- Issue #1061<sup>5931</sup> - Implement `async_colocated` and `apply_colocated`
- Issue #1060<sup>5932</sup> - Implement minimal component migration
- Issue #1058<sup>5933</sup> - Remove `HPX_UTIL_TUPLE` from code base
- Issue #1057<sup>5934</sup> - Add performance counters for threading subsystem
- Issue #1055<sup>5935</sup> - Thread allocation uses two memory pools
- Issue #1053<sup>5936</sup> - Work stealing flawed
- Issue #1052<sup>5937</sup> - Fix a number of warnings
- Issue #1049<sup>5938</sup> - Fixes for TLS on OSX and more reliable test running

- Issue #1048<sup>5939</sup> - Fixing after 588 hang
- Issue #1047<sup>5940</sup> - Use port '0' for networking when using one locality
- Issue #1046<sup>5941</sup> - `composable_guard` test is broken when having more than one thread
- Issue #1045<sup>5942</sup> - Security missing headers
- Issue #1044<sup>5943</sup> - Native TLS on FreeBSD via `__thread`
- Issue #1043<sup>5944</sup> - `async` et.al. compute the wrong result type
- Issue #1042<sup>5945</sup> - `async` et.al. implicitly unwrap reference\_wrappers
- Issue #1041<sup>5946</sup> - Remove redundant costly Kleene stars from regex searches
- Issue #1040<sup>5947</sup> - CMake script regex match patterns has unnecessary kleenes
- Issue #1039<sup>5948</sup> - Remove use of `Boost.Move` and replace with `std::move` and real rvalue refs
- Issue #1038<sup>5949</sup> - Bump minimal required Boost to 1.49.0
- Issue #1037<sup>5950</sup> - Implicit unwrapping of futures in `async` broken
- Issue #1036<sup>5951</sup> - Scheduler hangs when user code attempts to “block” OS-threads
- Issue #1035<sup>5952</sup> - Idle-rate counter always reports 100% idle rate
- Issue #1034<sup>5953</sup> - Symbolic name registration causes application hangs
- Issue #1033<sup>5954</sup> - Application options read in from an options file generate an error message
- Issue #1032<sup>5955</sup> - `hpx::id_type` local reference counting is wrong
- Issue #1031<sup>5956</sup> - Negative entry in reference count table
- Issue #1030<sup>5957</sup> - Implement `condition_variable`
- Issue #1029<sup>5958</sup> - Deadlock in thread scheduling subsystem
- Issue #1028<sup>5959</sup> - HPX-thread cumulative count performance counters report incorrect value
- Issue #1027<sup>5960</sup> - Expose `hpx::thread_interrupted` error code as a separate exception type
- Issue #1026<sup>5961</sup> - Exceptions thrown in asynchronous calls can be lost if the value of the future is never queried

- [Issue #175<sup>5985</sup>](#) - Asynchronous AGAS API

## HPX V0.9.7 (Nov 13, 2013)

We have had over 1000 commits since the last release and we have closed over 180 tickets (bugs, feature requests, etc.).

### General changes

- Ported HPX to BlueGene/Q
- Improved HPX support for Xeon/Phi accelerators
- Reimplemented `hpx::bind`, `hpx::tuple`, and `hpx::function` for better performance and better compliance with the C++11 Standard. Added `hpx::mem_fn`.
- Reworked `hpx::when_all` and `hpx::when_any` for better compliance with the ongoing C++ standardization effort, added heterogeneous version for those functions. Added `hpx::when_any_swapped`.
- Added `hpx::copy` as a precursor for a migrate functionality
- Added `hpx::get_ptr` allowing to directly access the memory underlying a given component
- Added the `hpx::lcos::broadcast`, `hpx::lcos::reduce`, and `hpx::lcos::fold` collective operations
- Added `hpx::get_locality_name` allowing to retrieve the name of any of the localities for the application.
- Added support for more flexible thread affinity control from the HPX command line, such as new modes for `--hpx:bind` (balanced, scattered, compact), improved default settings when running multiple localities on the same node.
- Added experimental executors for simpler thread pooling and scheduling. This API may change in the future as it will stay aligned with the ongoing C++ standardization efforts.
- Massively improved the performance of the HPX serialization code. Added partial support for zero copy serialization of array and bitwise-copyable types.
- General performance improvements of the code related to threads and futures.

### Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1005<sup>5986</sup>](#) - Allow one to disable array optimizations and zero copy optimizations for each parcelport
- [Issue #1004<sup>5987</sup>](#) - Generate new HPX logo image for the docs
- [Issue #1002<sup>5988</sup>](#) - If MPI parcelport is not available, running HPX under mpirun should fail
- [Issue #1001<sup>5989</sup>](#) - Zero copy serialization raises assert
- [Issue #1000<sup>5990</sup>](#) - Can't connect to a HPX application running with the MPI parcelport from a non MPI parcelport locality
- [Issue #999<sup>5991</sup>](#) - Optimize `hpx::when_n`

<sup>5985</sup> <https://github.com/TheHPXProject/hpx/issues/175>

<sup>5986</sup> <https://github.com/TheHPXProject/hpx/issues/1005>

<sup>5987</sup> <https://github.com/TheHPXProject/hpx/issues/1004>

<sup>5988</sup> <https://github.com/TheHPXProject/hpx/issues/1002>

<sup>5989</sup> <https://github.com/TheHPXProject/hpx/issues/1001>

<sup>5990</sup> <https://github.com/TheHPXProject/hpx/issues/1000>

<sup>5991</sup> <https://github.com/TheHPXProject/hpx/issues/999>

- Issue #998<sup>5992</sup> - Fixed const-correctness
- Issue #997<sup>5993</sup> - Making `serialize_buffer::data()` type save
- Issue #996<sup>5994</sup> - Memory leak in `hpx::lcos::promise`
- Issue #995<sup>5995</sup> - Race while registering pre-shutdown functions
- Issue #994<sup>5996</sup> - `thread_rescheduling` regression test does not compile
- Issue #992<sup>5997</sup> - Correct comments and messages
- Issue #991<sup>5998</sup> - `setcap cap_sys_rawio=ep` for power profiling causes an HPX application to abort
- Issue #989<sup>5999</sup> - Jacobi hangs during execution
- Issue #988<sup>6000</sup> - `multiple_init` test is failing
- Issue #986<sup>6001</sup> - Can't call a function called "init" from "main" when using `<hpx/hpx_main.hpp>`
- Issue #984<sup>6002</sup> - Reference counting tests are failing
- Issue #983<sup>6003</sup> - `thread_suspension_executor` test fails
- Issue #980<sup>6004</sup> - Terminating HPX threads don't leave stack in virgin state
- Issue #979<sup>6005</sup> - Static scheduler not in documents
- Issue #978<sup>6006</sup> - Preprocessing limits are broken
- Issue #977<sup>6007</sup> - Make `tests.regressions.lcos.future_hang_on_get` shorter
- Issue #976<sup>6008</sup> - Wrong library order in `pkgconfig`
- Issue #975<sup>6009</sup> - Please reopen #963
- Issue #974<sup>6010</sup> - Option `pu-offset` ignored in `fixing_588` branch
- Issue #972<sup>6011</sup> - Cannot use MKL with HPX
- Issue #969<sup>6012</sup> - Non-existent INI files requested on the command line via `--hpx:config` do not cause warnings or errors.
- Issue #968<sup>6013</sup> - Cannot build examples in `fixing_588` branch
- Issue #967<sup>6014</sup> - Command line description of `--hpx:queuing` seems wrong

- Issue #966<sup>6015</sup> - `--hpx:print-bind` physical core numbers are wrong
- Issue #965<sup>6016</sup> - Deadlock when building in Release mode
- Issue #963<sup>6017</sup> - Not all worker threads are working
- Issue #962<sup>6018</sup> - Problem with SLURM integration
- Issue #961<sup>6019</sup> - `--hpx:print-bind` outputs incorrect information
- Issue #960<sup>6020</sup> - Fix cut and paste error in documentation of `get_thread_priority`
- Issue #959<sup>6021</sup> - Change link to `boost.atomic` in documentation to point to `boost.org`
- Issue #958<sup>6022</sup> - Undefined reference to `intrusive_ptr_release`
- Issue #957<sup>6023</sup> - Make tuple standard compliant
- Issue #956<sup>6024</sup> - Segfault with `a3382fb`
- Issue #955<sup>6025</sup> - `--hpx:nodes` and `--hpx:nodefiles` do not work with foreign nodes
- Issue #954<sup>6026</sup> - Make order of arguments for `hpx::async` and `hpx::broadcast` consistent
- Issue #953<sup>6027</sup> - Cannot use MKL with HPX
- Issue #952<sup>6028</sup> - `register_[pre_]shutdown_function` never throw
- Issue #951<sup>6029</sup> - Assert when number of threads is greater than hardware concurrency
- Issue #948<sup>6030</sup> - `HPX_HAVE_GENERIC_CONTEXT_COROUTINES` conflicts with `HPX_HAVE_FIBER_BASED_COROUTINES`
- Issue #947<sup>6031</sup> - Need `MPI_THREAD_MULTIPLE` for backward compatibility
- Issue #946<sup>6032</sup> - HPX does not call `MPI_Finalize`
- Issue #945<sup>6033</sup> - Segfault with `hpx::lcos::broadcast`
- Issue #944<sup>6034</sup> - OS X: assertion `pu_offset_ < hardware_concurrency` failed
- Issue #943<sup>6035</sup> - `#include <hpx/hpx_main.hpp>` does not work
- Issue #942<sup>6036</sup> - Make the BG/Q work with `-O3`
- Issue #940<sup>6037</sup> - Use separator when concatenating locality name

- [Issue #886](#)<sup>6084</sup> - Logging documentation is confusing
- [Issue #885](#)<sup>6085</sup> - Two threads are slower than one
- [Issue #884](#)<sup>6086</sup> - `is_callable` failing with member pointers in C++11
- [Issue #883](#)<sup>6087</sup> - Need help with `is_callable_test`
- [Issue #882](#)<sup>6088</sup> - `tests.regressions.lcos.future_hang_on_get` does not terminate
- [Issue #881](#)<sup>6089</sup> - `tests.regressions/block_matrix/matrix.hh` won't compile with GCC 4.8.1
- [Issue #880](#)<sup>6090</sup> - HPX does not work on OS X
- [Issue #878](#)<sup>6091</sup> - `future::unwrap` triggers assertion
- [Issue #877](#)<sup>6092</sup> - “make tests” has build errors on Ubuntu 12.10
- [Issue #876](#)<sup>6093</sup> - `tcmalloc` is used by default, even if it is not present
- [Issue #875](#)<sup>6094</sup> - `global_fixture` is defined in a header file
- [Issue #874](#)<sup>6095</sup> - Some tests take very long
- [Issue #873](#)<sup>6096</sup> - Add block-matrix code as regression test
- [Issue #872](#)<sup>6097</sup> - HPX documentation does not say how to run tests with detailed output
- [Issue #871](#)<sup>6098</sup> - All tests fail with “make test”
- [Issue #870](#)<sup>6099</sup> - Please explicitly disable serialization in classes that don't support it
- [Issue #868](#)<sup>6100</sup> - `boost_any` test failing
- [Issue #867](#)<sup>6101</sup> - Reduce the number of copies of `hpx::function` arguments
- [Issue #863](#)<sup>6102</sup> - Futures should not require a default constructor
- [Issue #862](#)<sup>6103</sup> - `value_or_error` shall not default construct its result
- [Issue #861](#)<sup>6104</sup> - `HPX_UNUSED` macro
- [Issue #860](#)<sup>6105</sup> - Add functionality to copy construct a component
- [Issue #859](#)<sup>6106</sup> - `hpx::endl` should flush

- [Issue #828](#)<sup>6130</sup> - Update future implementation to N3721 and N3722
- [Issue #827](#)<sup>6131</sup> - Enable MPI parcelport for bootstrapping whenever application was started using mpirun
- [Issue #826](#)<sup>6132</sup> - Support command line option `--hpx:print-bind` even if `--hpx::bind` was not used
- [Issue #825](#)<sup>6133</sup> - Memory counters give segfault when attempting to use thread wild cards or numbers only total works
- [Issue #824](#)<sup>6134</sup> - Enable lambda functions to be used with `hpx::async/hpx::apply`
- [Issue #823](#)<sup>6135</sup> - Using a hashing filter
- [Issue #822](#)<sup>6136</sup> - Silence unused variable warning
- [Issue #821](#)<sup>6137</sup> - Detect if a function object is callable with given arguments
- [Issue #820](#)<sup>6138</sup> - Allow wildcards to be used for performance counter names
- [Issue #819](#)<sup>6139</sup> - Make the AGAS symbolic name registry distributed
- [Issue #818](#)<sup>6140</sup> - Add `future::then()` overload taking an executor
- [Issue #817](#)<sup>6141</sup> - Fixed typo
- [Issue #815](#)<sup>6142</sup> - Create an lco that is performing an efficient broadcast of actions
- [Issue #814](#)<sup>6143</sup> - Papi counters cannot specify `thread#*` to get the counts for all threads
- [Issue #813](#)<sup>6144</sup> - Scoped unlock
- [Issue #811](#)<sup>6145</sup> - `simple_central_tuplespace_client` run error
- [Issue #810](#)<sup>6146</sup> - ostream error when `<<` any objects
- [Issue #809](#)<sup>6147</sup> - Optimize parcel serialization
- [Issue #808](#)<sup>6148</sup> - HPX applications throw exception when executed from the build directory
- [Issue #807](#)<sup>6149</sup> - Create performance counters exposing overall AGAS statistics
- [Issue #795](#)<sup>6150</sup> - Create timed `make_ready_future`
- [Issue #794](#)<sup>6151</sup> - Create heterogeneous `when_all/when_any/etc.`
- [Issue #721](#)<sup>6152</sup> - Make HPX usable for Xeon Phi

## **HPX V0.9.6 (Jul 30, 2013)**

We have had over 1200 commits since the last release and we have closed roughly 140 tickets (bugs, feature requests, etc.).

### **General changes**

The major new features in this release are:

- We further consolidated the API exposed by *HPX*. We aligned our APIs as much as possible with the existing [C++11 Standard](http://www.open-std.org/jtc1/sc22/wg21)<sup>6172</sup> and related proposals to the C++ standardization committee (such as [N3632](http://wg21.link/n3632)<sup>6173</sup> and [N3857](http://wg21.link/n3857)<sup>6174</sup>).
- We implemented a first version of a distributed AGAS service which essentially eliminates all explicit AGAS network traffic.
- We created a native ibverbs parcelport allowing to take advantage of the superior latency and bandwidth characteristics of Infiniband networks.
- We successfully ported *HPX* to the Xeon Phi platform.
- Support for the SLURM scheduling system was implemented.
- Major efforts have been dedicated to improving the performance counter framework, numerous new counters were implemented and new APIs were added.
- We added a modular parcel compression system allowing to improve bandwidth utilization (by reducing the overall size of the transferred data).
- We added a modular parcel coalescing system allowing to combine several parcels into larger messages. This reduces latencies introduced by the communication layer.
- Added an experimental executors API allowing to use different scheduling policies for different parts of the code. This API has been modelled after the Standards proposal [N3562](http://wg21.link/n3562)<sup>6175</sup>. This API is bound to change in the future, though.
- Added minimal security support for localities which is enforced on the parcelport level. This support is preliminary and experimental and might change in the future.
- We created a parcelport using low level MPI functions. This is in support of legacy applications which are to be gradually ported and to support platforms where MPI is the only available portable networking layer.
- We added a preliminary and experimental implementation of a tuple-space object which exposes an interface similar to such systems described in the literature (see for instance [The Linda Coordination Language](https://en.wikipedia.org/wiki/Linda_(coordination_language))<sup>6176</sup>).

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is again a very long list of newly implemented features and fixed issues.

- [Issue #806](#)<sup>6177</sup> - make (all) in examples folder does nothing
- [Issue #805](#)<sup>6178</sup> - Adding the introduction and fixing DOCTEST dependencies for Windows use
- [Issue #804](#)<sup>6179</sup> - Add stackless (non-suspendable) thread type
- [Issue #803](#)<sup>6180</sup> - Create proper serialization support functions for util::tuple
- [Issue #800](#)<sup>6181</sup> - Add possibility to disable array optimizations during serialization
- [Issue #798](#)<sup>6182</sup> - HPX\_LIMIT does not work for local dataflow
- [Issue #797](#)<sup>6183</sup> - Create a parcelport which uses MPI
- [Issue #796](#)<sup>6184</sup> - Problem with Large Numbers of Threads
- [Issue #793](#)<sup>6185</sup> - Changing dataflow test case to hang consistently
- [Issue #792](#)<sup>6186</sup> - CMake Error
- [Issue #791](#)<sup>6187</sup> - Problems with local::dataflow
- [Issue #790](#)<sup>6188</sup> - wait\_for() doesn't compile
- [Issue #789](#)<sup>6189</sup> - HPX with Intel compiler segfaults
- [Issue #788](#)<sup>6190</sup> - Intel compiler support
- [Issue #787](#)<sup>6191</sup> - Fixed SFINAE specializations
- [Issue #786](#)<sup>6192</sup> - Memory issues during benchmarking.
- [Issue #785](#)<sup>6193</sup> - Create an API allowing to register external threads with HPX
- [Issue #784](#)<sup>6194</sup> - util::plugin is throwing an error when a symbol is not found
- [Issue #783](#)<sup>6195</sup> - How does hpx::bind work?
- [Issue #782](#)<sup>6196</sup> - Added quotes around STRING REPLACE potentially empty arguments
- [Issue #781](#)<sup>6197</sup> - Make sure no exceptions propagate into the thread manager

<sup>6197</sup> <https://github.com/TheHPXProject/hpx/issues/781>

- [Issue #780](#)<sup>6198</sup> - Allow arithmetics performance counters to expand its parameters
- [Issue #779](#)<sup>6199</sup> - Test case for 778
- [Issue #778](#)<sup>6200</sup> - Swapping futures segfaults
- [Issue #777](#)<sup>6201</sup> - `hpx::lcos::details::when_XXX` don't restore completion handlers
- [Issue #776](#)<sup>6202</sup> - Compiler chokes on dataflow overload with launch policy
- [Issue #775](#)<sup>6203</sup> - Runtime error with local dataflow (copying futures?)
- [Issue #774](#)<sup>6204</sup> - Using local dataflow without explicit namespace
- [Issue #773](#)<sup>6205</sup> - Local dataflow with `unwrap`: functor operators need to be `const`
- [Issue #772](#)<sup>6206</sup> - Allow (remote) actions to return a future
- [Issue #771](#)<sup>6207</sup> - Setting `HPX_LIMIT` gives huge boost MPL errors
- [Issue #770](#)<sup>6208</sup> - Add launch policy to (local) dataflow
- [Issue #769](#)<sup>6209</sup> - Make compile time configuration information available
- [Issue #768](#)<sup>6210</sup> - `const` correctness problem in local dataflow
- [Issue #767](#)<sup>6211</sup> - Add launch policies to `async`
- [Issue #766](#)<sup>6212</sup> - Mark data structures for optimized (array based) serialization
- [Issue #765](#)<sup>6213</sup> - Align `hpx::any` with N3508: Any Library Proposal (Revision 2)
- [Issue #764](#)<sup>6214</sup> - Align `hpx::future` with newest N3558: A Standardized Representation of Asynchronous Operations
- [Issue #762](#)<sup>6215</sup> - added a human readable output for the ping pong example
- [Issue #761](#)<sup>6216</sup> - Ambiguous typename when constructing derived component
- [Issue #760](#)<sup>6217</sup> - Simple components can not be derived
- [Issue #759](#)<sup>6218</sup> - `make install` doesn't give a complete install
- [Issue #758](#)<sup>6219</sup> - Stack overflow when using `locking_hook<>`
- [Issue #757](#)<sup>6220</sup> - copy paste error; unsupported function overloading

## HPX V0.9.5 (Jan 16, 2013)

We have had over 1000 commits since the last release and we have closed roughly 150 tickets (bugs, feature requests, etc.).

### General changes

This release is continuing along the lines of code and API consolidation, and overall usability improvements. We dedicated much attention to performance and we were able to significantly improve the threading and networking subsystems.

We successfully ported *HPX* to the Android platform. *HPX* applications now not only can run on mobile devices, but we support heterogeneous applications running across architecture boundaries. At the Supercomputing Conference 2012 we demonstrated connecting Android tablets to simulations running on a Linux cluster. The Android tablet was used to query performance counters from the Linux simulation and to steer its parameters.

We successfully ported *HPX* to Mac OSX (using the Clang compiler). Thanks to Pyry Jähkölä for contributing the corresponding patches. Please see the section `macos_installation` for more details.

We made a special effort to make *HPX* usable in highly concurrent use cases. Many of the *HPX* API functions which possibly take longer than 100 microseconds to execute now can be invoked asynchronously. We added uniform support for composing futures which simplifies to write asynchronous code. *HPX* actions (function objects encapsulating possibly concurrent remote function invocations) are now well integrated with all other API facilities such like `hpx::bind`.

All of the API has been aligned as much as possible with established paradigms. *HPX* now mirrors many of the facilities as defined in the C++11 Standard, such as `hpx::thread`, `hpx::function`, `hpx::future`, etc.

A lot of work has been put into improving the documentation. Many of the API functions are documented now, concepts are explained in detail, and examples are better described than before. The new documentation index enables finding information with lesser effort.

This is the first release of *HPX* we perform after the move to [Github](#)<sup>6317</sup>. This step has enabled a wider participation from the community and further encourages us in our decision to release *HPX* as a true open source library (*HPX* is licensed under the very liberal [Boost Software License](#)<sup>6318</sup>).

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is by far the longest list of newly implemented features and fixed issues for any of HPX' releases so far.

- [Issue #666](#)<sup>6319</sup> - Segfault on calling `hpx::finalize` twice
- [Issue #665](#)<sup>6320</sup> - Adding declaration `num_of_cores`
- [Issue #662](#)<sup>6321</sup> - `pkgconfig` is building wrong
- [Issue #660](#)<sup>6322</sup> - Need `uninterrupt` function
- [Issue #659](#)<sup>6323</sup> - Move our logging library into a different namespace
- [Issue #658](#)<sup>6324</sup> - Dynamic performance counter types are broken
- [Issue #657](#)<sup>6325</sup> - HPX v0.9.5 (RC1) `hello_world` example segfaulting
- [Issue #656](#)<sup>6326</sup> - Define the affinity of `parcel-pool`, `io-pool`, and `timer-pool` threads
- [Issue #654](#)<sup>6327</sup> - Integrate the Boost `auto_index` tool with documentation
- [Issue #653](#)<sup>6328</sup> - Make HPX build on OS X + Clang + `libc++`
- [Issue #651](#)<sup>6329</sup> - Add fine-grained control for thread pinning
- [Issue #650](#)<sup>6330</sup> - Command line no error message when using `-hpx:(anything)`
- [Issue #645](#)<sup>6331</sup> - Command line aliases don't work in `[teletype]`@file`[c++]`
- [Issue #644](#)<sup>6332</sup> - Terminated threads are not always properly cleaned up
- [Issue #640](#)<sup>6333</sup> - `future_data<T>::set_on_completed_` used without locks
- [Issue #638](#)<sup>6334</sup> - `hpx` build with intel compilers fails on linux
- [Issue #637](#)<sup>6335</sup> - `-copy-dt-needed-entries` breaks with gold
- [Issue #635](#)<sup>6336</sup> - Boost V1.53 will add `Boost.Lockfree` and `Boost.Atomic`
- [Issue #633](#)<sup>6337</sup> - Re-add examples to final 0.9.5 release
- [Issue #632](#)<sup>6338</sup> - Example `thread_aware_timer` is broken
- [Issue #631](#)<sup>6339</sup> - FFT application throws error in `parcellayer`

- [Issue #599](#)<sup>6362</sup> - Enable locality specific command line options
- [Issue #598](#)<sup>6363</sup> - Need an API that accesses the performance counter reporting the system uptime
- [Issue #597](#)<sup>6364</sup> - compiling on ranger
- [Issue #595](#)<sup>6365</sup> - I need a place to store data in a thread self pointer
- [Issue #594](#)<sup>6366</sup> - 32/64 interoperability
- [Issue #593](#)<sup>6367</sup> - Warn if logging is disabled at compile time but requested at runtime
- [Issue #592](#)<sup>6368</sup> - Add optional argument value to `--hpx:list-counters` and `--hpx:list-counter-infos`
- [Issue #591](#)<sup>6369</sup> - Allow for wildcards in performance counter names specified with `--hpx:print-counter`
- [Issue #590](#)<sup>6370</sup> - Local promise semantic differences
- [Issue #589](#)<sup>6371</sup> - Create API to query performance counter names
- [Issue #587](#)<sup>6372</sup> - Add `get_num_localities` and `get_num_threads` to AGAS API
- [Issue #586](#)<sup>6373</sup> - Adjust local AGAS cache size based on number of localities
- [Issue #585](#)<sup>6374</sup> - Error while using counters in HPX
- [Issue #584](#)<sup>6375</sup> - counting argument size of actions, initial pass.
- [Issue #581](#)<sup>6376</sup> - Remove `RemoteResult` template parameter for `future<>`
- [Issue #580](#)<sup>6377</sup> - Add possibility to hook into actions
- [Issue #578](#)<sup>6378</sup> - Use angle brackets in HPX error dumps
- [Issue #576](#)<sup>6379</sup> - Exception incorrectly thrown when `--help` is used
- [Issue #575](#)<sup>6380</sup> - `HPX(bad_component_type)` with gcc 4.7.2 and boost 1.51
- [Issue #574](#)<sup>6381</sup> - `--hpx:connect` command line parameter not working correctly
- [Issue #571](#)<sup>6382</sup> - `hpx::wait()` (callback version) should pass the future to the callback function
- [Issue #570](#)<sup>6383</sup> - `hpx::wait` should operate on `boost::arrays` and `std::lists`
- [Issue #569](#)<sup>6384</sup> - Add a logging sink for Android

## HPX V0.9.0 (Jul 5, 2012)

We have had roughly 800 commits since the last release and we have closed approximately 80 tickets (bugs, feature requests, etc.).

### General changes

- Significant improvements made to the usability of *HPX* in large-scale, distributed environments.
- Renamed `hpx::lcos::packaged_task` to `hpx::lcos::packaged_action` to reflect the semantic differences to a `packaged_task` as defined by the [C++11 Standard](#)<sup>6475</sup>.
- *HPX* now exposes `hpx::thread` which is compliant to the C++11 `std::thread` type except that it (purely locally) represents an *HPX* thread. This new type does not expose any of the remote capabilities of the underlying *HPX*-thread implementation.
- The type `hpx::lcos::future` is now compliant to the C++11 `std::future<>` type. This type can be used to synchronize both, local and remote operations. In both cases the control flow will ‘return’ to the future in order to trigger any continuation.
- The types `hpx::lcos::local::promise` and `hpx::lcos::local::packaged_task` are now compliant to the C++11 `std::promise<>` and `std::packaged_task<>` types. These can be used to create a future representing local work only. Use the types `hpx::lcos::promise` and `hpx::lcos::packaged_action` to wrap any (possibly remote) action into a future.
- `hpx::thread` and `hpx::lcos::future` are now cancelable.
- Added support for sequential and logic composition of `hpx::lcos::futures`. The member function `hpx::lcos::future::when` permits futures to be sequentially composed. The helper functions `hpx::wait_all`, `hpx::wait_any`, and `hpx::wait_n` can be used to wait for more than one future at a time.
- *HPX* now exposes `hpx::apply` and `hpx::async` as the preferred way of creating (or invoking) any deferred work. These functions are usable with various types of functions, function objects, and actions and provide a uniform way to spawn deferred tasks.
- *HPX* now utilizes `hpx::util::bind` to (partially) bind local functions and function objects, and also actions. Remote bound actions can have placeholders as well.
- *HPX* continuations are now fully polymorphic. The class `hpx::actions::forwarding_continuation` is an example of how the user can write its own types of continuations. It can be used to execute any function as an continuation of a particular action.
- Reworked the action invocation API to be fully conformant to normal functions. Actions can now be invoked using `hpx::apply`, `hpx::async`, or using the `operator()` implemented on actions. Actions themselves can now be cheaply instantiated as they do not have any members anymore.
- Reworked the lazy action invocation API. Actions can now be directly bound using `hpx::util::bind` by passing an action instance as the first argument.
- A minimal *HPX* program now looks like this:

```
#include <hpx/hpx_init.hpp>

int hpx_main()
{
    return hpx::finalize();
}
```

(continues on next page)

<sup>6475</sup> <http://www.open-std.org/jtc1/sc22/wg21>

(continued from previous page)

```
int main()
{
    return hpx::init();
}
```

This removes the immediate dependency on the `Boost.Program_options`<sup>6476</sup> library.

---

**Note:** This minimal version of an *HPX* program does not support any of the default command line arguments (such as `-help`, or command line options related to PBS). It is suggested to always pass `argc` and `argv` to *HPX* as shown in the example below.

---

- In order to support those, but still not to depend on `Boost.Program_options`<sup>6477</sup>, the minimal program can be written as:

```
#include <hpx/hpx_init.hpp>

// The arguments for hpx_main can be left off, which very similar to the
// behavior of ``main()`` as defined by C++.
int hpx_main(int argc, char* argv[])
{
    return hpx::finalize();
}

int main(int argc, char* argv[])
{
    return hpx::init(argc, argv);
}
```

- Added performance counters exposing the number of component instances which are alive on a given locality.
- Added performance counters exposing then number of messages sent and received, the number of parcels sent and received, the number of bytes sent and received, the overall time required to send and receive data, and the overall time required to serialize and deserialize the data.
- Added a new component: `hpx::components::binpacking_factory` which is equivalent to the existing `hpx::components::distributing_factory` component, except that it equalizes the overall population of the components to create. It exposes two factory methods, one based on the number of existing instances of the component type to create, and one based on an arbitrary performance counter which will be queried for all relevant localities.
- Added API functions allowing to access elements of the diagnostic information embedded in the given exception: `hpx::get_locality_id`, `hpx::get_host_name`, `hpx::get_process_id`, `hpx::get_function_name`, `hpx::get_file_name`, `hpx::get_line_number`, `hpx::get_os_thread`, `hpx::get_thread_id`, and `hpx::get_thread_description`.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- [Issue #71](#)<sup>6478</sup> - GIDs that are not serialized via `handle_gid<>` should raise an exception
- [Issue #105](#)<sup>6479</sup> - Allow for `hpx::util::functions` to be registered in the AGAS symbolic namespace
- [Issue #107](#)<sup>6480</sup> - Nasty threadmanger race condition (reproducible in `sheneos_test`)
- [Issue #108](#)<sup>6481</sup> - Add millisecond resolution to *HPX* logs on Linux
- [Issue #110](#)<sup>6482</sup> - Shutdown hang in distributed with release build
- [Issue #116](#)<sup>6483</sup> - Don't use TSS for the applier and runtime pointers
- [Issue #162](#)<sup>6484</sup> - Move local synchronous execution shortcut from `hpx::function` to the applier
- [Issue #172](#)<sup>6485</sup> - Cache sources in CMake and check if they change manually
- [Issue #178](#)<sup>6486</sup> - Add an INI option to turn off ranged-based AGAS caching
- [Issue #187](#)<sup>6487</sup> - Support for disabling performance counter deployment
- [Issue #202](#)<sup>6488</sup> - Support for sending performance counter data to a specific file
- [Issue #218](#)<sup>6489</sup> - `boost.coroutines` allows different stack sizes, but stack pool is unaware of this
- [Issue #231](#)<sup>6490</sup> - Implement movable `boost::bind`
- [Issue #232](#)<sup>6491</sup> - Implement movable `boost::function`
- [Issue #236](#)<sup>6492</sup> - Allow binding `hpx::util::function` to actions
- [Issue #239](#)<sup>6493</sup> - Replace `hpx::function` with `hpx::util::function`
- [Issue #240](#)<sup>6494</sup> - Can't specify `RemoteResult` with `lcos::async`
- [Issue #242](#)<sup>6495</sup> - `REGISTER_TEMPLATE` support for plain actions
- [Issue #243](#)<sup>6496</sup> - `handle_gid<>` support for `hpx::util::function`
- [Issue #245](#)<sup>6497</sup> - `*_c_cache` code throws an exception if the queried GID is not in the local cache
- [Issue #246](#)<sup>6498</sup> - Undefined references in `dataflow/adaptiveId` example

- <sup>6537</sup> <https://github.com/TheHPXProject/hpx/issues/415>
- <sup>6538</sup> <https://github.com/TheHPXProject/hpx/issues/425>
- <sup>6539</sup> <https://github.com/TheHPXProject/hpx/issues/426>

### General changes

- *HPX* does not need to be installed anymore to be functional.

### Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this point release:

- [Issue #295<sup>6540</sup>](https://github.com/TheHPXProject/hpx/issues/295) - Don't require install path to be known at compile time.
- [Issue #371<sup>6541</sup>](https://github.com/TheHPXProject/hpx/issues/371) - Add `hpx::iostreams` to standard build.
- [Issue #384<sup>6542</sup>](https://github.com/TheHPXProject/hpx/issues/384) - Fix compilation with GCC 4.7.
- [Issue #390<sup>6543</sup>](https://github.com/TheHPXProject/hpx/issues/390) - Remove `keep_factory_alive` startup call from ShenEOS; add shutdown call to `H5close`.
- [Issue #393<sup>6544</sup>](https://github.com/TheHPXProject/hpx/issues/393) - Thread affinity control is broken.

### Bug fixes (commits)

Here is a list of the important commits included in this point release:

- `r7642` - External: Fix backtrace memory violation.
- **`r7775` - Components: Fix symbol visibility bug with component startup providers.** This prevents one components providers from overriding another components.
- `r7778` - Components: Fix startup/shutdown provider shadowing issues.

### HPX V0.8.0 (Mar 23, 2012)

We have had roughly 1000 commits since the last release and we have closed approximately 70 tickets (bugs, feature requests, etc.).

### General changes

- Improved PBS support, allowing for arbitrary naming schemes of node-hostnames.
- Finished verification of the reference counting framework.
- Implemented decrement merging logic to optimize the distributed reference counting system.
- Restructured the LCO framework. Renamed `hpx::lcos::eager_future<>` and `hpx::lcos::lazy_future<>` into `hpx::lcos::packaged_task` and `hpx::lcos::deferred_packaged_task`. Split `hpx::lcos::promise` into `hpx::lcos::packaged_task` and `hpx::lcos::future`. Added 'local' futures (in namespace `hpx::lcos::local`).
- Improved the general performance of local and remote action invocations. This (under certain circumstances) drastically reduces the number of copies created for each of the parameters and return values.

---

<sup>6540</sup> <https://github.com/TheHPXProject/hpx/issues/295>

<sup>6541</sup> <https://github.com/TheHPXProject/hpx/issues/371>

<sup>6542</sup> <https://github.com/TheHPXProject/hpx/issues/384>

<sup>6543</sup> <https://github.com/TheHPXProject/hpx/issues/390>

<sup>6544</sup> <https://github.com/TheHPXProject/hpx/issues/393>

- Reworked the performance counter framework. Performance counters are now created only when needed, which reduces the overall resource requirements. The new framework allows for much more flexible creation and management of performance counters. The new sine example application demonstrates some of the capabilities of the new infrastructure.
- Added a buildbot-based continuous build system which gives instant, automated feedback on each commit to SVN.
- Added more automated tests to verify proper functioning of *HPX*.
- Started to create documentation for *HPX* and its API.
- Added documentation toolchain to the build system.
- Added dataflow LCO.
- Changed default *HPX* command line options to have `hpx:` prefix. For instance, the former option `--threads` is now `--hpx:threads`. This has been done to make ambiguities with possible application specific command line options as unlikely as possible. See the section *HPX Command Line Options* for a full list of available options.
- Added the possibility to define command line aliases. The former short (one-letter) command line options have been predefined as aliases for backwards compatibility. See the section *HPX Command Line Options* for a detailed description of command line option aliasing.
- Network connections are now cached based on the connected host. The number of simultaneous connections to a particular host is now limited. Parcels are buffered and bundled if all connections are in use.
- Added more refined thread affinity control. This is based on the external library Portable Hardware Locality (HWLOC).
- Improved support for Windows builds with CMake.
- Added support for components to register their own command line options.
- Added the possibility to register custom startup/shutdown functions for any component. These functions are guaranteed to be executed by an *HPX* thread.
- Added two new experimental thread schedulers: `hierarchy_scheduler` and `periodic_priority_scheduler`. These can be activated by using the command line options `--hpx:queuing=hierarchy` or `--hpx:queuing=periodic`.

## Example applications

- [Graph500 performance benchmark](http://www.graph500.org/)<sup>6545</sup> (thanks to Matthew Anderson for contributing this application).
- [GTC \(Gyrokinetic Toroidal Code\)](http://www.nersc.gov/research-and-development/benchmarking-and-workload-characterization/nersc-6-benchmarks/gtc/)<sup>6546</sup>: a skeleton for particle in cell type codes.
- Random Memory Access: an example demonstrating random memory accesses in a large array
- [ShenEOS example](http://stellarcollapse.org/equationofstate)<sup>6547</sup>, demonstrating partitioning of large read-only data structures and exposing an interpolation API.
- Sine performance counter demo.
- Accumulator examples demonstrating how to write and use *HPX* components.
- Quickstart examples (like `hello_world`, `fibonacci`, `quicksort`, `factorial`, etc.) demonstrating simple *HPX* concepts which introduce some of the concepts in *HPX*.
- Load balancing and work stealing demos.

<sup>6545</sup> <http://www.graph500.org/>

<sup>6546</sup> <http://www.nersc.gov/research-and-development/benchmarking-and-workload-characterization/nersc-6-benchmarks/gtc/>

<sup>6547</sup> <http://stellarcollapse.org/equationofstate>

## API changes

- Moved all local LCOs into a separate namespace `hpx::lcos::local` (for instance, `hpx::lcos::local_mutex` is now `hpx::lcos::local::mutex`).
- Replaced `hpx::actions::function` with `hpx::util::function`. Cleaned up related code.
- Removed `hpx::traits::handle_gid` and moved handling of global reference counts into the corresponding serialization code.
- Changed terminology: `prefix` is now called `locality_id`, renamed the corresponding API functions (such as `hpx::get_prefix`, which is now called `hpx::get_locality_id`).
- Adding `hpx::find_remote_localities`, and `hpx::get_num_localities`.
- Changed performance counter naming scheme to make it more bash friendly. The new performance counter naming scheme is now

`/object{parentname#parentindex/instance#index}/counter#parameters`

- Added `hpx::get_worker_thread_num` replacing `hpx::threadmanager_base::get_thread_num`.
- Renamed `hpx::get_num_os_threads` to `hpx::get_os_threads_count`.
- Added `hpx::threads::get_thread_count`.
- Restructured the Futures sub-system, renaming types in accordance with the terminology used by the C++11 ISO standard.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- [Issue #31](#)<sup>6548</sup> - Specialize `handle_gid<>` for examples and tests
- [Issue #72](#)<sup>6549</sup> - Fix AGAS reference counting
- [Issue #104](#)<sup>6550</sup> - heartbeat throws an exception when decrefing the performance counter it's watching
- [Issue #111](#)<sup>6551</sup> - throttle causes an exception on the target application
- [Issue #142](#)<sup>6552</sup> - One failed component loading causes an unrelated component to fail
- [Issue #165](#)<sup>6553</sup> - Remote exception propagation bug in AGAS reference counting test
- [Issue #186](#)<sup>6554</sup> - Test credit exhaustion/splitting (e.g. `prepare_gid` and symbol NS)
- [Issue #188](#)<sup>6555</sup> - Implement remaining AGAS reference counting test cases
- [Issue #258](#)<sup>6556</sup> - No type checking of GIDs in stubs classes
- [Issue #271](#)<sup>6557</sup> - Seg fault/shared pointer assertion in distributed code

<sup>6557</sup> <https://github.com/TheHPXProject/hpx/issues/271>

- Issue #281<sup>6558</sup> - CMake options need descriptive text
- Issue #283<sup>6559</sup> - AGAS caching broken (gva\_cache needs to be rewritten with ICL)
- Issue #285<sup>6560</sup> - HPX\_INSTALL root directory not the same as CMAKE\_INSTALL\_PREFIX
- Issue #286<sup>6561</sup> - New segfault in dataflow applications
- Issue #289<sup>6562</sup> - Exceptions should only be logged if not handled
- Issue #290<sup>6563</sup> - c++11 tests failure
- Issue #293<sup>6564</sup> - Build target for component libraries
- Issue #296<sup>6565</sup> - Compilation error with Boost V1.49rc1
- Issue #298<sup>6566</sup> - Illegal instructions on termination
- Issue #299<sup>6567</sup> - gravity aborts with multiple threads
- Issue #301<sup>6568</sup> - Build error with Boost trunk
- Issue #303<sup>6569</sup> - Logging assertion failure in distributed runs
- Issue #304<sup>6570</sup> - Exception 'what' strings are lost when exceptions from decode\_parcel are reported
- Issue #306<sup>6571</sup> - Performance counter user interface issues
- Issue #307<sup>6572</sup> - Logging exception in distributed runs
- Issue #308<sup>6573</sup> - Logging deadlocks in distributed
- Issue #309<sup>6574</sup> - Reference counting test failures and exceptions
- Issue #311<sup>6575</sup> - Merge AGAS remote\_interface with the runtime\_support object
- Issue #314<sup>6576</sup> - Object tracking for id\_types
- Issue #315<sup>6577</sup> - Remove handle\_gid and handle credit splitting in id\_type serialization
- Issue #320<sup>6578</sup> - applier::get\_locality\_id() should return an error value (or throw an exception)
- Issue #321<sup>6579</sup> - Optimization for id\_types which are never split should be restored
- Issue #322<sup>6580</sup> - Command line processing ignored with Boost 1.47.0

## General changes

- Completely removed code related to deprecated AGAS V1, started to work on AGAS V2.1.
- Started to clean up and streamline the exposed APIs (see ‘API changes’ below for more details).
- Revamped and unified performance counter framework, added a lot of new performance counter instances for monitoring of a diverse set of internal *HPX* parameters (queue lengths, access statistics, etc.).
- Improved general error handling and logging support.
- Fixed several race conditions, improved overall stability, decreased memory footprint, improved overall performance (major optimizations include native TLS support and ranged-based AGAS caching).
- Added support for running *HPX* applications with PBS.
- Many updates to the build system, added support for gcc 4.5.x and 4.6.x, added C++11 support.
- Many updates to default command line options.
- Added many tests, set up buildbot for continuous integration testing.
- Better shutdown handling of distributed applications.

## Example applications

- quickstart/factorial and quickstart/fibonacci, future-recursive parallel algorithms.
- quickstart/hello\_world, distributed hello world example.
- quickstart/rma, simple remote memory access example
- quickstart/quicksort, parallel quicksort implementation.
- gtc, gyrokinetic torodial code.
- bfs, breadth-first-search, example code for a graph application.
- sheneos, partitioning of large data sets.
- accumulator, simple component example.
- balancing/os\_thread\_num, balancing/px\_thread\_phase, examples demonstrating load balancing and work stealing.

## API changes

- Added `hpx::find_all_localities`.
- Added `hpx::terminate` for non-graceful termination of applications.
- Added `hpx::lcos::async` functions for simpler asynchronous programming.
- Added new AGAS interface for handling of symbolic namespace (`hpx::agas::*`).
- Renamed `hpx::components::wait` to `hpx::lcos::wait`.
- Renamed `hpx::lcos::future_value` to `hpx::lcos::promise`.
- Renamed `hpx::lcos::recursive_mutex` to `hpx::lcos::local_recursive_mutex`, `hpx::lcos::mutex` to `hpx::lcos::local_mutex`
- Removed support for Boost versions older than V1.38, recommended Boost version is now V1.47 and newer.

- Removed `hpx::process` (this will be replaced by a real process implementation in the future).
- Removed non-functional LCO code (`hpx::lcos::dataflow`, `hpx::lcos::thunk`, `hpx::lcos::dataflow_variable`).
- Removed deprecated `hpx::naming::full_address`.

## Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- [Issue #28<sup>6597</sup>](#) - Integrate Windows/Linux CMake code for *HPX* core
- [Issue #32<sup>6598</sup>](#) - `hpx::cout()` should be `hpx::cout`
- [Issue #33<sup>6599</sup>](#) - AGAS V2 legacy client does not properly handle `error_code`
- [Issue #60<sup>6600</sup>](#) - AGAS: allow for `registerid` to optionally take ownership of the `gid`
- [Issue #62<sup>6601</sup>](#) - `adaptive1d` compilation failure in Fusion
- [Issue #64<sup>6602</sup>](#) - Parcel subsystem doesn't resolve domain names
- [Issue #83<sup>6603</sup>](#) - No error handling if no console is available
- [Issue #84<sup>6604</sup>](#) - No error handling if a hosted locality is treated as the bootstrap server
- [Issue #90<sup>6605</sup>](#) - Add general commandline option `-N`
- [Issue #91<sup>6606</sup>](#) - Add possibility to read command line arguments from file
- [Issue #92<sup>6607</sup>](#) - Always log exceptions/errors to the log file
- [Issue #93<sup>6608</sup>](#) - Log the command line/program name
- [Issue #95<sup>6609</sup>](#) - Support for distributed launches
- [Issue #97<sup>6610</sup>](#) - Attempt to create a bad component type in AMR examples
- [Issue #100<sup>6611</sup>](#) - `factorial` and `factorial_get` examples trigger AGAS component type assertions
- [Issue #101<sup>6612</sup>](#) - Segfault when `hpx::process::here()` is called in `fibonacci2`
- [Issue #102<sup>6613</sup>](#) - `unknown_component_address` in `int_object_semaphore_client`
- [Issue #114<sup>6614</sup>](#) - `marduk` raises assertion with default parameters

### 2.11.3 Namespace changes

#### HPX V1.9.0 Namespace changes

The latest release includes amongst others changes in the namespaces so that *HPX* facilities correspond to the C++ Standard Library. The old namespaces are deprecated. Below is a comprehensive list of the namespace changes.

Table 2.189: Namespace changes in V1.9.0

| Old namespace                                                | New namespace                                                    |
|--------------------------------------------------------------|------------------------------------------------------------------|
| <code>hpx::util::mem_fn</code>                               | <code>hpx::mem_fn</code>                                         |
| <code>hpx::util::invoke</code>                               | <code>hpx::invoke</code>                                         |
| <code>hpx::util::invoke_r</code>                             | <code>hpx::invoke_r</code>                                       |
| <code>hpx::util::invoke_fused</code>                         | <code>hpx::invoke_fused</code>                                   |
| <code>hpx::util::invoke_fused_r</code>                       | <code>hpx::invoke_fused_r</code>                                 |
| <code>hpx::util::unlock_guard</code>                         | <code>hpx::unlock_guard</code>                                   |
| <code>hpx::parallel::v1::reduce_by_key</code>                | <code>hpx::experimental::reduce_by_key</code>                    |
| <code>hpx::parallel::v1::sort_by_key</code>                  | <code>hpx::experimental::sort_by_key</code>                      |
| <code>hpx::parallel::task_canceled_exception</code>          | <code>hpx::experimental::task_canceled_exception</code>          |
| <code>hpx::parallel::task_block</code>                       | <code>hpx::experimental::task_block</code>                       |
| <code>hpx::parallel::define_task_block</code>                | <code>hpx::experimental::define_task_block</code>                |
| <code>hpx::parallel::define_task_block_restore_thread</code> | <code>hpx::experimental::define_task_block_restore_thread</code> |
| <code>hpx::execution::experimental::task_group</code>        | <code>hpx::experimental::task_group</code>                       |

## 2.12 Citing *HPX*

Please cite *HPX* whenever you use it for publications. Use our paper in The Journal of Open Source Software as the main citation for *HPX*: <sup>6673</sup>. Use the Zenodo entry for referring to the latest version of *HPX*: <sup>6674</sup>. Entries for citing specific versions of *HPX* can also be found at <sup>6675</sup>.

## 2.13 *HPX* users

A list of institutions and projects using *HPX* can be found on the *HPX Users*<sup>6676</sup> page.

## 2.14 About *HPX*

### 2.14.1 History

The development of High Performance ParalleX (*HPX*) began in 2007. At that time, Hartmut Kaiser became interested in the work done by the ParalleX group at the [Center for Computation and Technology \(CCT\)](#)<sup>6677</sup>, a multi-disciplinary research institute at [Louisiana State University \(LSU\)](#)<sup>6678</sup>. The ParalleX group was working to develop a new and experimental execution model for future high performance computing architectures. This model was christened ParalleX. The first implementations of ParalleX were crude, and many of those designs had to be discarded entirely. However, over time the team learned quite a bit about how to design a parallel, distributed runtime system which implements the concepts of ParalleX.

From the very beginning, this endeavour has been a group effort. In addition to a handful of interested researchers, there have always been graduate and undergraduate students participating in the discussions, design, and implementation of *HPX*. In 2011 we decided to formalize our collective research efforts by creating the [STE||AR](#)<sup>6679</sup> group (Systems Technology, Emergent Parallelism, and Algorithm Research). Over time, the team grew to include researchers around the country and the world. In 2014, the [STE||AR](#)<sup>6680</sup> Group was reorganized to become the international community it is today. This consortium of researchers aims to develop stable, sustainable, and scalable tools which will enable application developers to exploit the parallelism latent in the machines of today and tomorrow. Our goal of the *HPX* project is to create a high quality, freely available, open source implementation of ParalleX concepts for conventional and future systems by building a modular and standards conforming runtime system for SMP and distributed application environments. The API exposed by *HPX* is conformant to the interfaces defined by the C++ ISO Standard and adheres to the programming guidelines used by the [Boost](#)<sup>6681</sup> collection of C++ libraries. We steer the development of *HPX* with real world applications and aim to provide a smooth migration path for domain scientists.

To learn more about [STE||AR](#)<sup>6682</sup> and ParalleX, see *People* and *Why HPX?*.

## 2.14.2 People

The [STE||AR](https://stellar-group.org)<sup>6683</sup> Group (pronounced as stellar) stands for “Systems Technology, Emergent Parallelism, and Algorithm Research”. We are an international group of faculty, researchers, and students working at various institutions around the world. The goal of the [STE||AR](https://stellar-group.org)<sup>6684</sup> Group is to promote the development of scalable parallel applications by providing a community for ideas, a framework for collaboration, and a platform for communicating these concepts to the broader community.

Our work is focused on building technologies for scalable parallel applications. *HPX*, our general purpose C++ runtime system for parallel and distributed applications, is no exception. We use *HPX* for a broad range of scientific applications, helping scientists and developers to write code which scales better and shows better performance compared to more conventional programming models such as MPI.

*HPX* is based on *ParalleX* which is a new (and still experimental) parallel execution model aiming to overcome the limitations imposed by the current hardware and the techniques we use to write applications today. Our group focuses on two types of applications - those requiring excellent strong scaling, allowing for a dramatic reduction of execution time for fixed workloads and those needing highest level of sustained performance through massive parallelism. These applications are presently unable (through conventional practices) to effectively exploit a relatively small number of cores in a multi-core system. By extension, these application will not be able to exploit high-end exascale computing systems which are likely to employ hundreds of millions of such cores by the end of this decade.

Critical bottlenecks to the effective use of new generation high performance computing (HPC) systems include:

- *Starvation*: due to lack of usable application parallelism and means of managing it,
- *Overhead*: reduction to permit strong scalability, improve efficiency, and enable dynamic resource management,
- *Latency*: from remote access across system or to local memories,
- *Contention*: due to multicore chip I/O pins, memory banks, and system interconnects.

The *ParalleX* model has been devised to address these challenges by enabling a new computing dynamic through the application of message-driven computation in a global address space context with lightweight synchronization. The work on *HPX* is centered around implementing the concepts as defined by the *ParalleX* model. *HPX* is currently targeted at conventional machines, such as classical Linux based Beowulf clusters and SMP nodes.

We fully understand that the success of *HPX* (and *ParalleX*) is very much the result of the work of many people. To see a list of who is contributing see our tables below.

## Acknowledgements

Thanks also to the following people who contributed directly or indirectly to the project through discussions, pull requests, documentation patches, etc.

- Panos Syskakis for benchmarking and optimizing our parallel algorithms.
- Shreyas Atre, for contributing fixes to our implementation of senders/receivers and extending our coroutines integration with senders/receivers.
- Alexander Neumann, for contributing fixes to the cmake build system.
- Dimitra Karatza, for her work on refactoring the documentation and providing a new user-friendly environment during and after Google Season of Docs 2021.

- Srinivas Yadav, for his work on SIMD support in algorithms before and during Google Summer of Code 2021.
- Akhil Nair, for his work on adapting algorithms to C++20 before and during Google Summer of Code 2021.
- Alexander Toktarev, for updating the parallel algorithm customization points to use `tag_fallback_invoke` for the default implementations.
- Brice Goglin, for reporting and helping fix issues related to the integration of `hwloc` in *HPX*.
- Giannis Gonidelis, for his work on the ranges adaptation during the Google Summer of Code 2020.
- Auriane Reverdell ([Swiss National Supercomputing Centre](https://www.cscs.ch)<sup>6714</sup>), for her tireless work on refactoring our CMake setup and modularizing *HPX*.
- Christopher Hinz, for his work on refactoring our CMake setup.
- Weile Wei, for fixing *HPX* builds with CUDA on Summit.
- Severin Strobl, for fixing our CMake setup related to linking and adding new entry points to the *HPX* runtime.
- Rebecca Stobaugh, for her major documentation review and contributions during and after the 2019 Google Season of Documentation.
- Jan Melech, for adding automatic serialization of simple structs.
- Austin McCartney, for adding concept emulation of the Ranges TS bidirectional and random access iterator concepts.
- Marco Diers, reporting and fixing issues related PMIx.
- Maximilian Bremer, for reporting multiple issues and extending the component migration tests.
- Piotr Mikolajczyk, for his improvements and fixes to the set and count algorithms.
- Grant Rostig, for reporting several deficiencies on our web pages.
- Jakub Golinowski, for implementing an *HPX* backend for OpenCV and in the process improving documentation and reporting issues.
- Mikael Simberg ([Swiss National Supercomputing Centre](https://www.cscs.ch)<sup>6715</sup>), for his tireless help cleaning up and maintaining *HPX*.
- Tianyi Zhang, for his work on HPXMP.
- Shahrzad Shirzad, for her contributions related to Phylax.
- Christopher Ogle, for his contributions to the parallel algorithms.
- Surya Priy, for his work with statistic performance counters.
- Anushi Maheshwari, for her work on random number generation.
- Bruno Pitrus, for his work with parallel algorithms.
- Nikunj Gupta, for rewriting the implementation of `hpx_main.hpp` and for his fixes for tests.
- Christopher Taylor, for his interest in *HPX* and the fixes he provided. Chris also contributed support for RISC-V architectures.
- Shoshana Jakobovits, for her work on the resource partitioner.
- Denis Blank, who re-wrote our unwrapped function to accept plain values arbitrary containers, and properly deal with nested futures.
- Ajai V. George, who implemented several of the parallel algorithms.

---

<sup>6714</sup> <https://www.cscs.ch>

<sup>6715</sup> <https://www.cscs.ch>

- Taeguk Kwon, who worked on implementing parallel algorithms as well as adapting the parallel algorithms to the Ranges TS.
- Zach Byerly ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>6716</sup>), who in his work developing applications on top of *HPX* opened tickets and contributed to the *HPX* examples.
- Daniel Estermann, for his work porting *HPX* to the Raspberry Pi.
- Alireza Kheirkhahan ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>6717</sup>), who built and administered our local cluster as well as his work in distributed IO.
- Abhimanyu Rawat, who worked on stack overflow detection.
- David Pfander, who improved signal handling in *HPX*, provided his optimization expertise, and worked on incorporating the Vc vectorization into *HPX*.
- Denis Demidov, who contributed his insights with VexCL.
- Khalid Hasanov, who contributed changes which allowed to run *HPX* on 64Bit power-pc architectures.
- Zahra Khatami ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>6718</sup>), who contributed the prefetching iterators and the persistent auto chunking executor parameters implementation.
- Marcin Copik, who worked on implementing GPU support for C++AMP and HCC. He also worked on implementing a HCC backend for *HPX.Compute*.
- Minh-Khanh Do, who contributed the implementation of several segmented algorithms.
- Bibek Wagle ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>6719</sup>), who worked on fixing and analyzing the performance of the *parcel* coalescing plugin in *HPX*.
- Lukas Troska, who reported several problems and contributed various test cases allowing to reproduce the corresponding issues.
- Andreas Schaefer, who worked on integrating his library ([LibGeoDecomp](https://www.libgeodecomp.org/)<sup>6720</sup>) with *HPX*. He reported various problems and submitted several patches to fix issues allowing for a better integration with [LibGeoDecomp](https://www.libgeodecomp.org/)<sup>6721</sup>.
- Satyaki Upadhyay, who contributed several examples to *HPX*.
- Brandon Cordes, who contributed several improvements to the inspect tool.
- Harris Brakmic, who contributed an extensive build system description for building *HPX* with Visual Studio.
- Parsa Amini ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>6722</sup>), who refactored and simplified the implementation of AGAS in *HPX* and who works on its implementation and optimization.
- Luis Martinez de Bartolome who implemented a build system extension for *HPX* integrating it with the [Conan](https://www.conan.io/)<sup>6723</sup> C/C++ package manager.
- Vinay C Amatya ([Louisiana State University \(LSU\)](https://www.lsu.edu)<sup>6724</sup>), who contributed to the documentation and provided some of the *HPX* examples.
- Kevin Huck and Nick Chaimov ([University of Oregon](https://uoregon.edu/)<sup>6725</sup>), who contributed the integration of APEX (Autonomic Performance Environment for eXascale) with *HPX*.
- Francisco Jose Tapia, who helped with implementing the parallel sort algorithm for *HPX*.

<sup>6725</sup> <https://uoregon.edu/>

- Patrick Diehl, who worked on implementing CUDA support for our companion library targeting GPGPUs ([HPXCL](#)<sup>6726</sup>).
- Eric Lemanissier contributed fixes to allow compilation using the MingW toolchain.
- Nidhi Makhijani who helped cleaning up some enum consistencies in *HPX* and contributed to the resource manager used in the thread scheduling subsystem. She also worked on *HPX* in the context of the Google Summer of Code 2015.
- Larry Xiao, Devang Bacharwar, Marcin Copik, and Konstantin Kronfeldner who worked on *HPX* in the context of the Google Summer of Code program 2015.
- Daniel Bourgeois ([Center for Computation and Technology \(CCT\)](#)<sup>6727</sup>) who contributed to *HPX* the implementation of several parallel algorithms (as proposed by [N4313](#)<sup>6728</sup>).
- Anuj Sharma and Christopher Bross ([Department of Computer Science 3 - Computer Architecture](#)<sup>6729</sup>), who worked on *HPX* in the context of the [Google Summer of Code](#)<sup>6730</sup> program 2014.
- Martin Stumpf ([Department of Computer Science 3 - Computer Architecture](#)<sup>6731</sup>), who rebuilt our contiguous testing infrastructure (see the [HPX Buildbot Website](#)<sup>6732</sup>). Martin is also working on [HPXCL](#)<sup>6733</sup> (mainly all work related to [OpenCL](#)<sup>6734</sup>) and implementing an *HPX* backend for [POCL](#)<sup>6735</sup>, a portable computing language solution based on [OpenCL](#)<sup>6736</sup>.
- Grant Mercer ([University of Nevada, Las Vegas](#)<sup>6737</sup>), who helped creating many of the parallel algorithms (as proposed by [N4313](#)<sup>6738</sup>).
- Damond Howard ([Louisiana State University \(LSU\)](#)<sup>6739</sup>), who works on [HPXCL](#)<sup>6740</sup> (mainly all work related to [CUDA](#)<sup>6741</sup>).
- Christoph Junghans (Los Alamos National Lab), who helped making our buildsystem more portable.
- Antoine Tran Tan (Laboratoire de Recherche en Informatique, Paris), who worked on integrating *HPX* as a backend for [NT2](#)<sup>6742</sup>. He also contributed an implementation of an API similar to Fortran co-arrays on top of *HPX*.
- John Biddiscombe ([Swiss National Supercomputing Centre](#)<sup>6743</sup>), who helped with the BlueGene/Q port of *HPX*, implemented the parallel sort algorithm, and made several other contributions.
- Erik Schnetter (Perimeter Institute for Theoretical Physics), who greatly helped to make *HPX* more robust by submitting a large amount of problem reports, feature requests, and made several direct contributions.
- Mathias Gaunard (Metascale), who contributed several patches to reduce compile time warnings generated while compiling *HPX*.
- Andreas Buhr, who helped with improving our documentation, especially by suggesting some fixes for inconsistencies.

- Patricia Grubel ([New Mexico State University](https://www.nmsu.edu)<sup>6744</sup>), who contributed the description of the different *HPX* thread scheduler policies and is working on the performance analysis of our thread scheduling subsystem.
- Lars Viklund, whose wit, passion for testing, and love of odd architectures has been an amazing contribution to our team. He has also contributed platform specific patches for FreeBSD and MSVC12.
- Agustin Berge, who contributed patches fixing some very nasty hidden template meta-programming issues. He rewrote large parts of the API elements ensuring strict conformance with the C++ ISO Standard.
- Anton Bikineev for contributing changes to make using `boost::lexical_cast` safer, he also contributed a thread safety fix to the `iostreams` module. He also contributed a complete rewrite of the serialization infrastructure replacing `Boost.Serialization` inside *HPX*.
- Pyry Jähkölä, who contributed the Mac OS build system and build documentation on how to build *HPX* using Clang and `libc++`.
- Mario Mulansky, who created an *HPX* backend for his `Boost.Odeint` library, and who submitted several test cases allowing us to reproduce and fix problems in *HPX*.
- Rekha Raj, who contributed changes to the description of the Windows build instructions.
- Jeremy Kemp how worked on an *HPX* OpenMP backend and added regression tests.
- Alex Nagelberg for his work on implementing a C wrapper API for *HPX*.
- Chen Guo, helvihartmann, Nicholas Pezolano, and John West who added and improved examples in *HPX*.
- Joseph Kleinhenz, Markus Elfring, Kirill Kropivnyansky, Alexander Neundorff, Bryant Lam, and Alex Hirsch who improved our CMake.
- Tapasweni Pathak, Praveen Velliengiri, Jean-Loup Tastet, Michael Levine, Aalekh Nigam, HadrienG2, Prayag Verma, Islada, Alex Myczko, and Avyav Kumar who improved the documentation.
- Jayesh Badwaik, J. F. Bastien, Christoph Garth, Christopher Hinz, Brandon Kohn, Mario Lang, Maikel Nadolski, pierrele, hendrx, Dekken, woodmeister123, xaguilar, Andrew Kemp, Dylan Stark, Matthew Anderson, Jeremy Wilke, Jiazheng Yuan, CyberDrudge, david8dixon, Maxwell Reeser, Raffaele Solca, Marco Ippolito, Jules Penuchot, Weile Wei, Severin Strobl, Kor de Jong, albestro, Jeff Trull, Yuri Victorovich, and Gregor Daiss who contributed to the general improvement of *HPX*.

*HPX* Funding Acknowledgements<sup>6745</sup> lists current and past funding sources for *HPX*. Special thanks to [Google Summer of Code](https://developers.google.com/open-source/soc/)<sup>6746</sup> and [Google Season of Docs](https://developers.google.com/season-of-docs)<sup>6747</sup> for the continuous support they provide which helps us enhance both our code and our documentation.
