- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

### Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
bool hpx::equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

#### Note

Complexity: At most min(last1 - first1, last2 - first2) applications of the predicate *op*.

#### Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), *\*i* equals *\*(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to *std::equal\_to<>*

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

### Returns

The *equal* algorithm returns a *bool*. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename FwdIter1, typename FwdIter2>
```

```
bool hpx::equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

#### Note

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate *std::equal\_to*.

#### Note

The two ranges are considered equal if, for every iterator *i* in the range [first1, last1), *\*i* equals *\*(first2 + (i - first1))*. This overload of *equal* uses operator== to determine if two elements are equal.

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

### Returns

The *equal* algorithm returns a *bool*. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
bool hpx::equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range [first2, first2 + (last1 - first1)), and false otherwise.

#### Note

Complexity: At most *last1 - first1* applications of the predicate *op*.

#### Note

The two ranges are considered equal if, for every iterator *i* in the range [first1, last1), *\*i* equals *\*(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to *std::equal\_to*

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

### Returns

The *equal* algorithm returns a *bool*. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

### hpx::experimental::induction

Defined in header `hpx/algorithm.hpp`<sup>626</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename T>

```
constexpr hpx::parallel::detail::induction_stride_helper<T> hpx::experimental::induction(T &&value,
                                                                                          std::size_t stride)
```

The function template returns an induction object of unspecified type having a value type and encapsulating an initial *value* of that type and, optionally, a stride.

For each element in the input range, a looping algorithm over input sequence *S* computes an induction value from an induction variable and ordinal position *p* within *S* by the formula  $i + p * \text{stride}$  if a stride was specified or  $i + p$  otherwise. This induction value is passed to the element access function.

If the *value* argument to *induction* is a non-const lvalue, then that lvalue becomes the live-out object for the returned induction object. For each induction object that has a live-out object, the looping algorithm assigns the value of  $i + n * \text{stride}$  to the live-out object upon return, where *n* is the number of elements in the input range.

### Template Parameters

**T** – The value type to be used by the induction object.

### Parameters

- **value** – [in] The initial value to use for the induction object
- **stride** – [in] The (optional) stride to use for the induction object (default: 1)

### Returns

This returns an induction object with value type *T*, initial *value*, and (if specified) *stride*. If *T* is a lvalue of non-const type, *value* is used as the live-out object for the induction object; otherwise there is no live-out object.

<sup>626</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename T>
```

```
constexpr hpx::parallel::detail::induction_helper<T> hpx::experimental::induction(T &&value)
```

### ***hpx::experimental::reduction***

Defined in header *hpx/algorithm.hpp*<sup>627</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename T, typename Op>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, std::decay_t<Op>> hpx::experimental::reduction(T  
                                                    &var,  
                                                    T  
                                                    const  
                                                    &iden-  
                                                    tity,  
                                                    Op  
                                                    &&com-  
                                                    biner)
```

The function template returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, a combiner function object, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses reduction objects by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the reduction object's combiner operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*. The expression

```
var = combiner(var, var)
```

shall be well-formed.

**Note**

---

<sup>627</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation. For example if the combiner is `plus<T>`, incrementing the view would be consistent with the combiner but doubling it or assigning to it would not.

## Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

## Parameters

- **var** – [in,out] The live-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.
- **combiner** – [in] The binary function (object) used to perform a pairwise reduction on the elements.

## Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T, typename Op>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, std::decay_t<Op>> hpx::experimental::reduction(T
                                                                    &var,
                                                                    Op
                                                                    &&com-
                                                                    biner)
```

## **hpx::mismatch**

Defined in header `hpx/algorithm.hpp`<sup>628</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred>
```

<sup>628</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::pair<FwdIter1, FwdIter2>> hpx::mismatch(ExPolicy
&&pol-
icy,
FwdIter1
first1,
FwdIter1
last1,
FwdIter2
first2,
FwdIter2
last2,
Pred
&&op)

```

Returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2, last2). If last2 is not provided, it denotes first2 + (last1 - first1). Executed according to the policy.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate *op* or *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and  $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$  then no applications of the predicate *op* or *operator==* are made.

#### Note

The two ranges are considered mismatch if, for every iterator *i* in the range [first1, last1), *\*i* mismatches  $*(\text{first2} + (i - \text{first1}))$ . This overload of *mismatch* uses *operator==* to determine if two elements are mismatch.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential

form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

## Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1,FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::pair<FwdIter1,FwdIter2>` otherwise. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::pair<FwdIter1, FwdIter2>> hpx::mismatch(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               FwdIter1
                                                                                               first1,
                                                                                               FwdIter1
                                                                                               last1,
                                                                                               FwdIter2
                                                                                               first2,
                                                                                               FwdIter2
                                                                                               last2)
```

Returns the first mismatching pair of elements from two ranges: one defined by `[first1, last1)` and another defined by `[first2,last2)`. If `last2` is not provided, it denotes `first2 + (last1 - first1)`. Executed according to the policy.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and  $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$  then no applications of *operator==* are made.

**Note**

The two ranges are considered mismatch if, for every iterator *i* in the range  $[\text{first1}, \text{last1})$ , *\*i* mismatches  $*(\text{first2} + (i - \text{first1}))$ . This overload of *mismatch* uses *operator==* to determine if two elements are mismatch.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

### Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1,FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::pair<FwdIter1,FwdIter2>` otherwise. If no mismatches are found when the comparison reaches *last1* or *last2*, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred>
```

`hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::pair<FwdIter1, FwdIter2>> hpx::mismatch(ExPolicy  
&&pol-  
icy,  
FwdIter1  
first1,  
FwdIter1  
last1,  
FwdIter2  
first2,  
Pred  
&&op)`

Returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2, last2). If last2 is not provided, it denotes first2 + (last1 - first1). Executed according to the policy.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most last1 - first1 applications of the predicate *op* or *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and (last1 - first1) != (last2 - first2) then no applications of the predicate *op* or *operator==* are made.

#### Note

The two ranges are considered mismatch if, for every iterator *i* in the range [first1, last1), \**i* mismatches \*(first2 + (i - first1)). This overload of *mismatch* uses *operator==* to determine if two elements are mismatch.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

## Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1,FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::pair<FwdIter1,FwdIter2>` otherwise. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::pair<FwdIter1, FwdIter2>> hpx::mismatch(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               FwdIter1
                                                                                               first1,
                                                                                               FwdIter1
                                                                                               last1,
                                                                                               FwdIter2
                                                                                               first2)
```

Returns the first mismatching pair of elements from two ranges: one defined by [`first1`, `last1`) and another defined by [`first2`, `last2`). If `last2` is not provided, it denotes `first2 + (last1 - first1)`. Executed according to the policy.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $\text{last1} - \text{first1}$  applications of `operator==`. If `FwdIter1` and `FwdIter2` meet the requirements of *RandomAccessIterator* and  $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$  then no applications of `operator==` are made.

**Note**

The two ranges are considered mismatch if, for every iterator `i` in the range  $[\text{first1}, \text{last1})$ , `*i` mismatches `*(first2 + (i - first1))`. This overload of `mismatch` uses `operator==` to determine if two elements are mismatch.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

**Returns**

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::pair<FwdIter1, FwdIter2>` otherwise. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename FwdIter1, typename FwdIter2, typename Pred>
```

```
std::pair<FwdIter1, FwdIter2> hpx::mismatch(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2,
                                           Pred &&op)
```

Returns the first mismatching pair of elements from two ranges: one defined by  $[\text{first1},$

last1) and another defined by [first2,last2). If last2 is not provided, it denotes first2 + (last1 - first1).

**Note**

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate *op* or *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and  $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$  then no applications of the predicate *op* or *operator==* are made.

**Note**

The two ranges are considered mismatch if, for every iterator *i* in the range [first1,last1), *\*i* mismatches  $*(\text{first2} + (i - \text{first1}))$ . This overload of *mismatch* uses *operator==* to determine if two elements are mismatch.

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

### Returns

The *mismatch* algorithm returns a `std::pair<FwdIter1,FwdIter2>`. If no mismatches

are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename FwdIter1, typename FwdIter2>
```

```
std::pair<FwdIter1, FwdIter2> hpx::mismatch(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns the first mismatching pair of elements from two ranges: one defined by [`first1`, `last1`) and another defined by [`first2`, `last2`). If `last2` is not provided, it denotes `first2 + (last1 - first1)`.

#### Note

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and  $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$  then no applications of *operator==* are made.

#### Note

The two ranges are considered mismatch if, for every iterator *i* in the range [`first1`, `last1`), *\*i* mismatches *\*(first2 + (i - first1))*. This overload of *mismatch* uses *operator==* to determine if two elements are mismatch.

## Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

## Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

## Returns

The *mismatch* algorithm returns a *std::pair<FwdIter1, FwdIter2>*. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename FwdIter1, typename FwdIter2, typename Pred>
```

`std::pair<FwdIter1, FwdIter2> hpx::mismatch(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, Pred &&op)`

Returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2, last2). If last2 is not provided, it denotes first2 + (last1 - first1).

#### Note

Complexity: At most last1 - first1 applications of the predicate *op* or *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and (last1 - first1) != (last2 - first2) then no applications of the predicate *op* or *operator==* are made.

#### Note

The two ranges are considered mismatch if, for every iterator *i* in the range [first1, last1), *\*i* mismatches *\*(first2 + (i - first1))*. This overload of *mismatch* uses *operator==* to determine if two elements are mismatch.

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

### Returns

The *mismatch* algorithm returns a `std::pair<FwdIter1, FwdIter2>`. If no mismatches

are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename FwdIter1, typename FwdIter2>
```

```
std::pair<FwdIter1, FwdIter2> hpx::mismatch(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2)
```

Returns the first mismatching pair of elements from two ranges: one defined by [`first1`, `last1`) and another defined by [`first2`, `last2`). If `last2` is not provided, it denotes `first2 + (last1 - first1)`.

#### Note

Complexity: At most `last1 - first1` applications of `operator==`. If `FwdIter1` and `FwdIter2` meet the requirements of *RandomAccessIterator* and  $(last1 - first1) \neq (last2 - first2)$  then no applications of `operator==` are made.

#### Note

The two ranges are considered mismatch if, for every iterator `i` in the range [`first1`, `last1`), `*i` mismatches `*(first2 + (i - first1))`. This overload of `mismatch` uses `operator==` to determine if two elements are mismatch.

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

### Returns

The *mismatch* algorithm returns a `std::pair<FwdIter1, FwdIter2>`. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

## hpx::uninitialized\_default\_construct

Defined in header `hpx/algorithm.hpp`<sup>629</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::uninitialized_default_construct_n`

```
template<typename FwdIter>
```

```
void hpx::uninitialized_default_construct(FwdIter first, FwdIter last)
```

Constructs objects of type `typename iterator_traits<ForwardIt> ::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

**FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

### Returns

The `uninitialized_default_construct` algorithm returns nothing

```
template<typename ExPolicy, typename FwdIter>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> hpx::uninitialized_default_construct(ExPolicy  
                                                                                               &&policy,  
                                                                                               FwdIter  
                                                                                               first,  
                                                                                               FwdIter  
                                                                                               last)
```

Constructs objects of type `typename iterator_traits<ForwardIt> ::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects. Executed according to the policy.

---

<sup>629</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

### Returns

The *uninitialized\_default\_construct* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns nothing otherwise.

### **hpx::uninitialized\_default\_construct\_n**

Defined in header [hpx/algorithm.hpp](#)<sup>630</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::uninitialized\\_default\\_construct](#)

template<typename **FwdIter**, typename **Size**>

*FwdIter* **hpx::uninitialized\_default\_construct\_n**(*FwdIter* first, *Size* count)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by default-initialization. If an exception is thrown during the initialization, the function has no effects.

<sup>630</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

**Returns**

The *uninitialized\_default\_construct\_n* algorithm returns a returns *FwdIter*. The *uninitialized\_default\_construct\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Size>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::uninitialized_default_construct_n(ExPolicy
&&pol-
icy,
FwdIter
first,
Size
count)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by default-initialization. If an exception is thrown during the initialization, the function has no effects. Executed according to the policy.

The assignments in the parallel *uninitialized\_default\_construct\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_default\_construct\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

## Returns

The *uninitialized\_default\_construct\_n* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_default\_construct\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

## hpx::ends\_with

Defined in header `hpx/algorithm.hpp`<sup>631</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename InIter2, typename Pred = hpx::parallel::detail::equal_to>
```

```
bool hpx::ends_with(InIter1 first1, InIter1 last1, InIter2 first2, InIter2 last2, Pred &&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends\_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate.

## Template Parameters

- **InIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.

<sup>631</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **InIter2** – The type of the begin destination iterators used (deduced). This iterator type must meet the requirements of a input iterator.
- **Pred** – The binary predicate that compares the elements. This defaults to `hpx::parallel::detail::equal_to`.

#### Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Refers to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

#### Returns

The `ends_with` algorithm returns `bool`. The `ends_with` algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = ranges::equal_to>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ends_with(ExPolicy &&policy, FwdIter1  
first1, FwdIter1 last1,  
FwdIter2 first2, FwdIter2  
last2, Pred &&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2). Executed according to the policy.

The assignments in the parallel `ends_with` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `ends_with` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the begin destination iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Pred** – The binary predicate that compares the elements. This defaults to `ranges::equal_to`.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Refers to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

### Returns

The `ends_with` algorithm returns a `hpx::future<bool>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `bool` otherwise. The `ends_with` algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

## hpx::experimental::reduction\_multiplies

Defined in header `hpx/algorithm.hpp`<sup>632</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

template<typename T>

```
constexpr hpx::parallel::detail::reduction_helper<T, std::multiplies<T>> hpx::experimental::reduction_multiplies(T
&var)
```

The function template `reduction_multiplies` returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::multiplies{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the `reduction_multiplies` object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::multiplies{}` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

<sup>632</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

**Template Parameters**

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

**Parameters**

- **var** – [in,out] The live-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

**Returns**

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of *identity*, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename FwdIter, typename F = hpx::parallel::detail::less>
```

```
FwdIter hpx::min_element(FwdIter first, FwdIter last, F &&f)
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

---

<sup>633</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The comparisons in the parallel *min\_element* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

## Returns

The *min\_element* algorithm returns *FwdIter*. The *min\_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename F = hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::min_element(ExPolicy &&policy,
                                                                 FwdIter first, FwdIter last,
                                                                 F &&f)
```

Finds the smallest element in the range `[first, last)` using the given comparison function *f*. Executed according to the policy.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *min\_element* requires *F* to meet the requirements of *CopyConstructible*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

**Returns**

The *min\_element* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *min\_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

**hpx::max\_element**

Defined in header `hpx/algorithm.hpp`<sup>634</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

*FwdIter* **hpx::max\_element**(*FwdIter* first, *FwdIter* last, *F* &&f)

Finds the largest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min\_element* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if left argument is less than the right element. This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

### Returns

The *max\_element* algorithm returns *FwdIter*. The *max\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename F = hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::max_element(ExPolicy &&policy,
                                                                                      FwdIter first, FwdIter
                                                                                      last, F &&f)
```

Removes all elements satisfying specific criteria from the range Finds the largest element in the range [first, last) using the given comparison function *f*. Executed according to the policy.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max\_element* requires *F* to meet the requirements of *CopyConstructible*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if left argument is less than the right element. This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

**Returns**

The *max\_element* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *max\_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

## hpx::minmax\_element

Defined in header `hpx/algorithm.hpp`<sup>635</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

minmax\_element\_result<*FwdIter*> **hpx::minmax\_element**(*FwdIter* first, *FwdIter* last, *F* &&f)

Finds the largest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *minmax\_element* algorithm execute in sequential order in the calling thread.

### Note

Complexity: At most  $\max(\text{floor}(3/2 * (N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

## Returns

The *minmax\_element* algorithm returns a *minmax\_element\_result*<*FwdIter*>. The *minmax\_element* algorithm returns a pair consisting of an iterator to the smallest element as the min element and an iterator to the largest element as the max element. Returns

<sup>635</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

*minmax\_element\_result*<*FwdIter*>{*first*,*first*} if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

template<typename **ExPolicy**, typename **FwdIter**, typename **F** = *hpx::parallel::detail::less*>

*hpx::parallel::util::detail::algorithm\_result\_t*<*ExPolicy*, *minmax\_element\_result*<*FwdIter*>> **hpx::minmax\_element**(*ExPolicy* &&*policy*, *FwdIter* *first*, *FwdIter* *last*, *F* &&*f*)

Finds the largest element in the range [*first*, *last*) using the given comparison function *f*.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $\max(\text{floor}(3/2 * (N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax\_element* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **f** – The binary predicate which returns true if the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

## Returns

The *minmax\_element* algorithm returns a `hpx::future<minmax_element_result<FwdIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *minmax\_element\_result<FwdIter>* otherwise. The *minmax\_element* algorithm returns a pair consisting of an iterator to the smallest element as the min element and an iterator to the largest element as the max element. Returns `std::make_pair(first,first)` if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

## hpx::experimental::reduction\_plus

Defined in header `hpx/algorithm.hpp`<sup>636</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename T>

constexpr `hpx::parallel::detail::reduction_helper<T, std::plus<T>>` `hpx::experimental::reduction_plus(T &var)`

The function template *reduction\_plus* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::plus{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction\_plus* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::plus{}` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

<sup>636</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

**Template Parameters**

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

**Parameters**

- **var** – [in,out] The live-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

**Returns**

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of *identity*, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, std::plus<T>> hpx::experimental::reduction_plus(T
                                                                                               &var,
                                                                                               T
                                                                                               const
                                                                                               &iden-
                                                                                               tity)
```

***hpx::experimental::reduction\_bit\_xor***

Defined in header *hpx/algorithm.hpp*<sup>637</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_xor<T>> hpx::experimental::reduction_bit_xor(T
                                                                                                       &var)
```

The function template *reduction\_bit\_xor* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses *std::bit\_xor{}* as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

---

<sup>637</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

A parallel algorithm uses the *reduction\_bit\_xor* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_xor{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

#### Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

### Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

### Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

### Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of *identity*, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_xor<T>> hpx::experimental::reduction_bit_xor(T
                                                                    &var,
                                                                    T
                                                                    const
                                                                    &iden-
                                                                    tity)
```

## hpx::adjacent\_find

Defined in header `hpx/algorithm.hpp`<sup>638</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Pred = hpx::parallel::detail::equal_to>
```

```
InIter hpx::adjacent_find(InIter first, InIter last, Pred &&pred = Pred())
```

Searches the range [first, last) for two consecutive identical elements.

### Note

Complexity: Exactly the smaller of  $(result - first) + 1$  and  $(last - first) - 1$  application of the predicate where *result* is the value returned

## Template Parameters

- **InIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use.

## Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*.

## Returns

The *adjacent\_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Pred = hpx::parallel::detail::equal_to>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::adjacent_find(ExPolicy &&policy,
                                                                                      FwdIter first, FwdIter
                                                                                      last, Pred &&pred =
                                                                                      Pred())
```

Searches the range [first, last) for two consecutive identical elements. This version uses the given binary predicate *pred*

<sup>638</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent\_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

#### Note

Complexity: Exactly the smaller of  $(result - first) + 1$  and  $(last - first) - 1$  application of the predicate where *result* is the value returned

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

## Returns

The *adjacent\_find* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *adjacent\_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

## hpx::shift\_right

Defined in header `hpx/algorithm.hpp`<sup>639</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter, typename Size>
```

```
FwdIter hpx::shift_right(FwdIter first, FwdIter last, Size n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the end of the range. For every integer `i` in `[0, last - first - n)`, moves the element originally at position `first + i` to position `first`

- `n + i`.

The assignment operations in the parallel *shift\_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

### Note

Complexity: At most  $(last - first) - n$  assignments.

### Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **n** – Refers to the number of positions to shift.

## Returns

The *shift\_right* algorithm returns *FwdIter*. The *shift\_right* algorithm returns an iterator to the beginning of the resulting range. Specifically: If  $n$  is 0 or  $n \geq (last - first)$ , does nothing and returns *first* and *last* respectively. Otherwise returns *first* +  $n$ .

```
template<typename ExPolicy, typename FwdIter, typename Size>
```

---

<sup>639</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

*hpx::parallel::util::detail::algorithm\_result<ExPolicy, FwdIter>* *hpx::shift\_right*(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i. Executed according to the policy.

The assignment operations in the parallel *shift\_right* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift\_right* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most (last - first) - n assignments.

#### Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **n** – Refers to the number of positions to shift.

## Returns

The *shift\_right* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *shift\_right* algorithm returns an iterator to the beginning of the resulting range. Specifically: If *n* is 0, does nothing and returns *first*. If *n* >= (last - first), does nothing and returns *last*. Otherwise returns *first* + n.

## hpx::generate

Defined in header `hpx/algorithm.hpp`<sup>640</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::generate_n`

```
template<typename ExPolicy, typename FwdIter, typename F>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::generate(ExPolicy &&policy, FwdIter  
first, FwdIter last, F &&f)
```

Assign each element in range  $[first, last)$  a value generated by the given function object  $f$ . Executed according to the policy.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Exactly  $distance(first, last)$  invocations of  $f$  and assignments.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires  $F$  to meet the requirements of *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

---

<sup>640</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *generate* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise.

```
template<typename FwdIter, typename F>
```

```
void hpx::generate(FwdIter first, FwdIter last, F &&f)
```

Assign each element in range *[first, last)* a value generated by the given function object *f*.

### Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *generate* algorithm returns void.

## hpx::generate\_n

Defined in header `hpx/algorithm.hpp`<sup>641</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::generate*

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::generate_n(ExPolicy &&policy, FwdIter  
first, Size count, F &&f)
```

Assigns each element in range [*first*, *first*+) a value generated by the given function object *f*. Executed according to the policy.

The assignments in the parallel *generate\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Exactly *count* invocations of *f* and assignments, for *count* > 0.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.

---

<sup>641</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

```
Ret fun();
```

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *generate\_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. *generate\_n* algorithm returns iterator one past the last element assigned if count>0, first otherwise.

```
template<typename FwdIter, typename Size, typename F>
```

```
FwdIter hpx::generate_n(FwdIter first, Size count, F &&f)
```

Assigns each element in range [*first*, *first*+) a value generated by the given function object *f*.

#### Note

Complexity: Exactly *count* invocations of *f* and assignments, for count > 0.

### Template Parameters

- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

```
Ret fun();
```

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *generate\_n* algorithm returns a *FwdIter*. *generate\_n* algorithm returns iterator one past the last element assigned if count>0, first otherwise.

## hpx/parallel/algorithms/iota.hpp

Defined in header `hpx/parallel/algorithms/iota.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

### Functions

template<typename **FwdIter**, typename **Sent**, typename **T**>

void **iota**(*FwdIter* first, *Sent* last, *T* value)

Fills the range `[first, last)` with sequentially increasing values, starting with *value* and repetitively evaluating `++value`.

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Exactly `std::distance(first, last)` assignments and increments.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input or output iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **T** – The type of the value to be assigned (deduced). This type must be weakly incrementable.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

### Returns

The *iota* algorithm returns *void*.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **T**>

`hpx::parallel::util::detail::algorithm_result_t<ExPolicy> iota(ExPolicy &&policy, FwdIter first, Sent last, T value)`

Fills the range `[first, last)` with sequentially increasing values, starting with `value` and repetitively evaluating `++value`.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly `std::distance(first, last)` assignments and increments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **T** – The type of the value to be assigned (deduced). This type must be weakly incrementable.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

### Returns

The *iota* algorithm returns a `hpx::future<void>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *void* otherwise.

## hpx::transform\_inclusive\_scan

Defined in header [hpx/algorithm.hpp](#)<sup>642</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename OutIter, typename BinOp, typename UnOp>
```

```
OutIter hpx::transform_inclusive_scan(InIter first, InIter last, OutIter dest, BinOp &&binary_op, UnOp  
                                     &&unary_op)
```

Assigns through each iterator  $i$  in  $[\text{result}, \text{result} + (\text{last} - \text{first}))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *binary\_op* nor *unary\_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[\text{first}, \text{last})$  or  $[\text{result}, \text{result} + (\text{last} - \text{first}))$ .

The difference between *inclusive\_scan* and *transform\_inclusive\_scan* is that *transform\_inclusive\_scan* includes the  $i$ th input element in the  $i$ th sum.

### Note

Complexity:  $O(\text{last} - \text{first})$  applications of each of *binary\_op* and *unary\_op*.

### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$  when  $N$  is 1
- $\text{op}(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a1, \dots, aK), \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, aM, \dots, aN))$  where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of *binary\_op*.
- **UnOp** – The type of *unary\_op*.

## Parameters

---

<sup>642</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Binary *FunctionObject* that will be applied in to the result of *unary\_op*, the results of other *binary\_op*, and *init* if provided.
- **unary\_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary\_op*.

### Returns

The *transform\_inclusive\_scan* algorithm returns a *returns OutIter*. The *transform\_inclusive\_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename BinOp, typename UnOp>
```

```
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type hpx::transform_inclusive_scan(ExPolicy
                                                                                               &&policy,
                                                                                               FwdIter1
                                                                                               first,
                                                                                               FwdIter1
                                                                                               last,
                                                                                               FwdIter2
                                                                                               dest, BinOp
                                                                                               &&bi-
                                                                                               nary_op,
                                                                                               UnOp
                                                                                               &&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(op, conv(\*first), ..., conv(\*(first + (i - result)))). Executed according to the policy.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *binary\_op* nor *unary\_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The difference between *inclusive\_scan* and *transform\_inclusive\_scan* is that *transform\_inclusive\_scan* includes the *ith* input element in the *ith* sum.

#### Note

Complexity: O(last - first) applications of each of *binary\_op* and *unary\_op*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aK), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, aM, ..., aN)) where  $1 < K+1 = M \leq N$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **BinOp** – The type of *binary\_op*.
- **UnOp** – The type of *unary\_op*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Binary *FunctionObject* that will be applied in to the result of *unary\_op*, the results of other *binary\_op*, and *init* if provided.
- **unary\_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary\_op*.

**Returns**

The *transform\_inclusive\_scan* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *transform\_inclusive\_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename OutIter, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<InIter>::value_type>
```

```
OutIter hpx::transform_inclusive_scan(InIter first, InIter last, OutIter dest, BinOp &&binary_op, UnOp
&&unary_op, T init)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(op, init, conv(\*first), ..., conv(\*(first + (i - result))))).

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *binary\_op* nor *unary\_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The difference between *inclusive\_scan* and *transform\_inclusive\_scan* is that *transform\_inclusive\_scan* includes the *i*th input element in the *i*th sum. If *binary\_op* is not mathematically associative, the behavior of *transform\_inclusive\_scan* may be non-deterministic.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of each of *binary\_op* and *unary\_op*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>N</sub>) is defined as:

- *a*<sub>1</sub> when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>K</sub>), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>M</sub>, ..., *a*<sub>N</sub>)) where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of *binary\_op*.
- **UnOp** – The type of *unary\_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Binary *FunctionObject* that will be applied in to the result of *unary\_op*, the results of other *binary\_op*, and *init* if provided.
- **unary\_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary\_op*.
- **init** – The initial value for the generalized sum.

**Returns**

The *transform\_inclusive\_scan* algorithm returns a returns *OutIter*. The *transform\_inclusive\_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename BinOp, typename UnOp,
typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type hpx::transform_inclusive_scan(ExPolicy
&&policy,
FwdIter1
first,
FwdIter1
last,
FwdIter2
dest, BinOp
&&bi-
nary_op,
UnOp
&&unary_op,
T init)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(op, init, conv(\*first), ..., conv(\*(first + (i - result)))). Executed according to the policy.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *binary\_op* nor *unary\_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The difference between *inclusive\_scan* and *transform\_inclusive\_scan* is that *transform\_inclusive\_scan* includes the *i*th input element in the *i*th sum. If *binary\_op* is not mathematically associative, the behavior of *transform\_inclusive\_scan* may be non-deterministic.

**Note**

Complexity: O(last - first) applications of each of *binary\_op* and *unary\_op*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1

- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of *binary\_op*.
- **UnOp** – The type of *unary\_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Binary *FunctionObject* that will be applied in to the result of *unary\_op*, the results of other *binary\_op*, and *init* if provided.
- **unary\_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary\_op*.
- **init** – The initial value for the generalized sum.

## Returns

The *transform\_inclusive\_scan* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *transform\_inclusive\_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

## hpx::includes

Defined in header `hpx/algorithm.hpp`<sup>643</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred =
hpx::parallel::detail::less>
```

<sup>643</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool>::type hpx::includes(ExPolicy &&policy, FwdIter1
                                                                    first1, FwdIter1 last1,
                                                                    FwdIter2 first2, FwdIter2
                                                                    last2, Pred &&op = Pred())
```

Returns true if every element from the sorted range  $[first2, last2)$  is found within the sorted range  $[first1, last1)$ . Also returns true if  $[first2, last2)$  is empty. The version expects both ranges to be sorted with the user supplied binary predicate  $f$ . Executed according to the policy.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1 = \text{std::distance}(first1, last1)$  and  $N2 = \text{std::distance}(first2, last2)$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

### Returns

The *includes* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range  $[first2, last2)$  is found within the sorted range  $[first1, last1)$ . Also returns true if  $[first2, last2)$  is empty.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = hpx::parallel::detail::less>
```

```
bool hpx::includes(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns true if every element from the sorted range  $[first2, last2)$  is found within the sorted range  $[first1, last1)$ . Also returns true if  $[first2, last2)$  is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

#### Note

At most  $2*(N1+N2-1)$  comparisons, where  $N1 = \text{std::distance}(first1, last1)$  and  $N2 = \text{std::distance}(first2, last2)$ .

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

### Returns

The *includes* algorithm returns a *bool*. The *includes* algorithm returns true every element from the sorted range [*first2*, *last2*) is found within the sorted range [*first1*, *last1*). Also returns true if [*first2*, *last2*) is empty.

### hpx::partial\_sort

Defined in header `hpx/algorithm.hpp`<sup>644</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandIter, typename Comp = hpx::parallel::detail::less>
```

```
RandIter hpx::partial_sort(RandIter first, RandIter middle, RandIter last, Comp &&comp = Comp())
```

Places the first middle - first elements from the range [*first*, *last*) as sorted with respect to *comp* into the range [*first*, *middle*). The rest of the elements in the range [*middle*, *last*) are placed in an unspecified order.

#### Note

Complexity: Approximately  $(last - first) * \log(middle - first)$  comparisons.

### Template Parameters

- **RandIter** – The type of the source begin, middle, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). *Comp* defaults to `detail::less`.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to `bool`, yields true if the first

---

<sup>644</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

argument of the call is less than the second, and false otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. It defaults to `detail::less`.

### Returns

The *partial\_sort* algorithm returns a *RandIter* that refers to *last*.

```
template<typename ExPolicy, typename RandIter, typename Comp = hpx::parallel::detail::less>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, RandIter> hpx::partial_sort(ExPolicy &&policy, RandIter
                                                                    first, RandIter middle,
                                                                    RandIter last, Comp &&comp
                                                                    = Comp())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to `comp` into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

#### Note

Complexity: Approximately  $(last - first) * \log(middle - first)$  comparisons.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **RandIter** – The type of the source begin, middle, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). `Comp` defaults to `detail::less`.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. It defaults to `detail::less`.

### Returns

The *partial\_sort* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandIter* otherwise. The iterator returned refers to *last*.

## hpx::adjacent\_difference

Defined in header `hpx/algorithm.hpp`<sup>645</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter2 hpx::adjacent_difference(FwdIter1 first, FwdIter1 last, FwdIter2 dest)
```

Assigns each value in the range given by result its corresponding element in the range [first, last] and the one preceding it except \*result, which is assigned \*first.

### Note

Complexity: Exactly (last - first) - 1 application of the binary operator and (last - first) assignments.

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the input range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the output range (deduced). This iterator type must meet the requirements of a forward iterator.

### Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the sequence of elements the results will be assigned to.

### Returns

The *adjacent\_difference* algorithm returns a *FwdIter2*. The *adjacent\_difference* algorithm returns an iterator to the element past the last element written.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::adjacent_difference(ExPolicy  
                                                                                      &&policy,  
                                                                                      FwdIter1 first,  
                                                                                      FwdIter1 last,  
                                                                                      FwdIter2 dest)
```

Assigns each value in the range given by result its corresponding element in the range [first, last] and the one preceding it except \*result, which is assigned \*first. Executed according to the policy.

---

<sup>645</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The difference operations in the parallel *adjacent\_difference* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The difference operations in the parallel *adjacent\_difference* invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly (last - first) - 1 application of the binary operator and (last - first) assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the input range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the output range (deduced). This iterator type must meet the requirements of a forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the sequence of elements the results will be assigned to.

### Returns

The *adjacent\_difference* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *adjacent\_difference* algorithm returns an iterator to the element past the last element written.

```
template<typename FwdIter1, typename FwdIter2, typename Op>
```

```
FwdIter2 hpx::adjacent_difference(FwdIter1 first, FwdIter1 last, FwdIter2 dest, Op &&op)
```

Assigns each value in the range given by result its corresponding element in the range [first, last] and the one preceding it except \*result, which is assigned \*first

#### Note

Complexity: Exactly (last - first) - 1 application of the binary operator and (last - first) assignments.

## Template Parameters

- **FwdIter1** – The type of the source iterators used for the input range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the output range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *CopyConstructible*.

## Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the sequence of elements the results will be assigned to.
- **op** – The binary operator which returns the difference of elements. The signature should be equivalent to the following:

```
bool op(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter1* can be dereferenced and then implicitly converted to the dereferenced type of *dest*.

## Returns

The *adjacent\_difference* algorithm returns *FwdIter2*. The *adjacent\_difference* algorithm returns an iterator to the element past the last element written.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Op>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::adjacent_difference(ExPolicy  
                                                                 &&policy,  
                                                                 FwdIter1 first,  
                                                                 FwdIter1 last,  
                                                                 FwdIter2 dest,  
                                                                 Op &&op)
```

Assigns each value in the range given by *result* its corresponding element in the range *[first, last]* and the one preceding it except *\*result*, which is assigned *\*first*

The difference operations in the parallel *adjacent\_difference* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The difference operations in the parallel *adjacent\_difference* invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Exactly (last - first) - 1 application of the binary operator and (last - first) assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the input range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the output range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *CopyConstructible*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the sequence of elements the results will be assigned to.
- **op** – The binary operator which returns the difference of elements. The signature should be equivalent to the following:

```
bool op(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter1* can be dereferenced and then implicitly converted to the dereferenced type of *dest*.

**Returns**

The *adjacent\_difference* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *adjacent\_difference* algorithm returns an iterator to the element past the last element written.

## hpx::copy

Defined in header `hpx/algorithm.hpp`<sup>646</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::copy_n`
- `hpx::copy_if`

template<typename **ExPolicy**, typename **FwdIter1**, typename **FwdIter2**>

`hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::copy(ExPolicy &&policy, FwdIter1 first, FwdIter1 last, FwdIter2 dest)`

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Executed according to the policy.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

---

<sup>646</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Returns**

The *copy* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter2 hpx::copy(FwdIter1 first, FwdIter1 last, FwdIter2 dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *copy* algorithm returns a *FwdIter2*. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

**hpx::copy\_n**

Defined in header [hpx/algorithm.hpp](#)<sup>647</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::copy](#)
- [hpx::copy\\_if](#)

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2>
```

<sup>647</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

*hpx::parallel::util::detail::algorithm\_result\_t<ExPolicy, FwdIter2>* *hpx::copy\_n*(*ExPolicy* &&policy, *FwdIter1* first, *Size* count, *FwdIter2* dest)

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. Executed according to the policy.

The assignments in the parallel *copy\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

### Returns

The *copy\_n* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *copy\_n* algorithm returns Iterator in the destination range, pointing past the last element copied if count>0 or result otherwise.

```
template<typename FwdIter1, typename Size, typename FwdIter2>
```

```
FwdIter2 hpx::copy_n(FwdIter1 first, Size count, FwdIter2 dest)
```

Copies the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1.`, to another range beginning at `dest`.

#### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

## Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

## Returns

The *copy\_n* algorithm returns a *FwdIter2*. The *copy\_n* algorithm returns Iterator in the destination range, pointing past the last element copied if *count*>0 or result otherwise.

## hpx::copy\_if

Defined in header `hpx/algorithm.hpp`<sup>648</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::copy*
- *hpx::copy\_n*

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::copy_if(ExPolicy &&policy, FwdIter1
first, FwdIter1 last, FwdIter2
dest, Pred &&pred)
```

Copies the elements in the range, defined by `[first, last)`, to another range beginning at *dest*. Copies only the elements for which the predicate *f* returns true. The order of the elements that are not removed is preserved. Executed according to the policy.

<sup>648</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy\_if* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *copy\_if* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *copy\_if* algorithm returns output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename Pred>
```

```
FwdIter2 hpx::copy_if(FwdIter1 first, FwdIter1 last, FwdIter2 dest, Pred &&pred)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *f* returns true. The order of the elements that are not removed is preserved.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

### Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy\_if* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *copy\_if* algorithm returns a *FwdIter2*. The *copy\_if* algorithm returns output iterator to the element in the destination range, one past the last element copied.

## hpx::experimental::reduction\_bit\_and

Defined in header `hpx/algorithm.hpp`<sup>649</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename T>

constexpr `hpx::parallel::detail::reduction_helper<T, std::bit_and<T>>` `hpx::experimental::reduction_bit_and`(T &var)

The function template `reduction_bit_and` returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::bit_and{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the `reduction_bit_and` object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_and{}` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

### Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

## Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

## Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of `var`.

## Returns

This returns a reduction object of unspecified type having a value type of `T`. When the

<sup>649</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_and<T>> hpx::experimental::reduction_bit_and(T
                                                                    &var,
                                                                    T
                                                                    const
                                                                    &iden-
                                                                    tity)
```

### ***hpx::is\_sorted***

Defined in header `hpx/algorithm.hpp`<sup>650</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::is\_sorted\_until*

```
template<typename FwdIter, typename Pred = hpx::parallel::detail::less>
```

```
bool hpx::is_sorted(FwdIter first, FwdIter last, Pred &&pred = Pred())
```

Determines if the range [first, last) is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is\_sorted* algorithm executes in sequential order in the calling thread.

#### **Note**

Complexity: at most (N+S-1) comparisons where *N* = distance(first, last). *S* = number of partitions

### **Template Parameters**

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use.

### **Parameters**

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.

<sup>650</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

`bool pred(const Type &a, const Type &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *is\_sorted* algorithm returns a *bool*. The *is\_sorted* algorithm returns true if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

```
template<typename ExPolicy, typename FwdIter, typename Pred = hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::is_sorted(ExPolicy &&policy, FwdIter first,  
                                                                    FwdIter last, Pred &&pred =  
                                                                    Pred())
```

Determines if the range [first, last) is sorted. Uses *pred* to compare elements. Executed according to the policy.

The comparison operations in the parallel *is\_sorted* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is\_sorted* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most (N+S-1) comparisons where *N* = distance(first, last). *S* = number of partitions

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is\_sorted* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *is\_sorted* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task\_execution\_policy* and returns *bool* otherwise. The *is\_sorted* algorithm returns a *bool* if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

### hpx::is\_sorted\_until

Defined in header `hpx/algorithm.hpp`<sup>651</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::is\_sorted*

```
template<typename FwdIter, typename Pred = hpx::parallel::detail::less>
```

```
FwdIter hpx::is_sorted_until(FwdIter first, FwdIter last, Pred &&pred = Pred())
```

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is\_sorted\_until* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: at most  $(N+S-1)$  comparisons where  $N$  = distance(first, last).  $S$  = number of partitions

### Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.

<sup>651</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Pred** – The type of an optional function/function object to use.

### Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *is\_sorted\_until* algorithm returns a *FwdIter*. The *is\_sorted\_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Pred = hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::is_sorted_until(ExPolicy  
                                                                                       &&policy, FwdIter  
                                                                                       first, FwdIter last,  
                                                                                       Pred &&pred =  
                                                                                       Pred())
```

Returns the first element in the range `[first, last)` that is not sorted. Uses a predicate to compare elements or the less than operator. Executed according to the policy.

The comparison operations in the parallel *is\_sorted\_until* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is\_sorted\_until* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most  $(N+S-1)$  comparisons where  $N$  = distance(first, last).  $S$  = number of partitions

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is\_sorted\_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

## Returns

The *is\_sorted\_until* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *is\_sorted\_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

## hpx::make\_heap

Defined in header `hpx/algorithm.hpp`<sup>652</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename RndIter, typename Comp>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> hpx::make_heap(ExPolicy &&policy, RndIter first,
                                                                    RndIter last, Comp &&comp)
```

Constructs a *max heap* in the range `[first, last)`. Executed according to the policy.

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy*

<sup>652</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RndIter** – The type of the source iterators used for algorithm. This iterator must meet the requirements for a random access iterator.
- **Comp** – Comparison function object (i.e. an object that satisfies the requirements of Compare) which returns true if the first argument is less than the second. The signature of the comparison function should be equivalent to the following:

```
bool cmp(const Type1 &a, const Type2 &b);
```

While the signature does not need to have `const &`, the function must not modify the objects passed to it and must be able to accept all values of type (possibly *const*) *Type1* and *Type2* regardless of value category (thus, *Type1 &* is not allowed, nor is *Type1* unless for *Type1* a move is equivalent to a copy. The types *Type1* and *Type2* must be such that an object of type *RandomIt* can be dereferenced and then implicitly converted to both of them.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *make\_heap* algorithm returns a *hpx::future<void>* if the execution policy is of type *task\_execution\_policy* and returns *void* otherwise.

```
template<typename ExPolicy, typename RndIter>
```

`hpx::parallel::util::detail::algorithm_result_t<ExPolicy> hpx::make_heap(ExPolicy &&policy, RndIter first, RndIter last)`

Constructs a *max heap* in the range [first, last). Uses the operator < for comparisons. Executed according to the policy.

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most (3\*N) comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RndIter** – The type of the source iterators used for algorithm. This iterator must meet the requirements for a random access iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.

### Returns

The *make\_heap* algorithm returns a `hpx::future<void>` if the execution policy is of type *task\_execution\_policy* and returns *void* otherwise.

template<typename **RndIter**, typename **Comp**>

void `hpx::make_heap(RndIter first, RndIter last, Comp &&comp)`

Constructs a *max heap* in the range [first, last).

#### Note

Complexity: at most (3\*N) comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

### Template Parameters

- **RndIter** – The type of the source iterators used for algorithm. This iterator must meet the requirements for a random access iterator.
- **Comp** – Comparison function object (i.e. an object that satisfies the requirements of Compare) which returns true if the first argument is less than the second. The signature of the comparison function should be equivalent to the following:

```
bool cmp(const Type1 &a, const Type2 &b);
```

While the signature does not need to have `const &`, the function must not modify the objects passed to it and must be able to accept all values of type (possibly *const*) *Type1* and *Type2* regardless of value category (thus, *Type1* & is not allowed, nor is *Type1* unless for *Type1* a move is equivalent to a copy. The types *Type1* and *Type2* must be such that an object of type *RandomIt* can be dereferenced and then implicitly converted to both of them.

### Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *make\_heap* algorithm returns a *void*.

```
template<typename RndIter>
```

```
void hpx::make_heap(RndIter first, RndIter last)
```

Constructs a *max heap* in the range [first, last).

#### Note

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

### Template Parameters

**RndIter** – The type of the source iterators used for algorithm. This iterator must meet the requirements for a random access iterator.

### Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.

### Returns

The *make\_heap* algorithm returns a *void*.

## hpx/parallel/algorithms/transform\_reduce\_binary.hpp

Defined in header `hpx/parallel/algorithms/transform_reduce_binary.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

### hpx::set\_union

Defined in header `hpx/algorithm.hpp`<sup>653</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =
    hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter3> hpx::set_union(ExPolicy &&policy, FwdIter1
    first1, FwdIter1 last1,
    FwdIter2 first2, FwdIter2
    last2, FwdIter3 dest, Pred
    &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, then all *m* elements will be copied from *[first1, last1)* to *dest*, preserving order, and then exactly  $\text{std::max}(n-m, 0)$  elements will be copied from *[first2, last2)* to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

<sup>653</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Op** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

**Returns**

The *set\_union* algorithm returns a `hpx::future<FwdIter3>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter3* otherwise. The *set\_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =
    hpx::parallel::detail::less>
FwdIter3 hpx::set_union(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, FwdIter3 dest, Pred
    &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), then all *m* elements will be copied from [*first1*, *last1*) to *dest*, preserving order, and then exactly  $\text{std::max}(n-m, 0)$  elements will be copied from [*first2*, *last2*) to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

## Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Op** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

## Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

### Returns

The *set\_union* algorithm returns a *FwdIter3*. The *set\_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

### hpx::lexicographical\_compare

Defined in header `hpx/algorithm.hpp`<sup>654</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename InIter2, typename Pred = hpx::parallel::detail::less>
```

```
bool hpx::lexicographical_compare(InIter1 first1, InIter1 last1, InIter2 first2, InIter2 last2, Pred &&pred)
```

Checks if the first range `[first1, last1)` is lexicographically less than the second range `[first2, last2)`. uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(first1, last)$  and  $N2 = \text{std::distance}(first2, last2)$ .

#### Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

### Template Parameters

<sup>654</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **InIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to

### Returns

The *lexicographically\_compare* algorithm returns a *bool* if the execution policy object is not passed in. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred =
    hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::lexicographical_compare(ExPolicy
    &&policy,
    FwdIter1 first1,
    FwdIter1 last1,
    FwdIter2 first2,
    FwdIter2 last2,
    Pred &&pred)
```

Checks if the first range [first1, last1) is lexicographically less than the second range [first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(\text{first1}, \text{last})$  and  $N2 = \text{std::distance}(\text{first2}, \text{last2})$ .

**Note**

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to

## Returns

The *lexicographically\_compare* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

## hpx::set\_intersection

Defined in header [hpx/algorithm.hpp](#)<sup>655</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =  
hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter3> hpx::set_intersection(ExPolicy &&policy,  
FwdIter1 first1,  
FwdIter1 last1,  
FwdIter2 first2,  
FwdIter2 last2,  
FwdIter3 dest, Pred  
&&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [first1, last1) and [first2, last2). This algorithm expects both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), the first *std::min(m, n)* elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

## Template Parameters

<sup>655</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator with sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

### Returns

The *set\_intersection* algorithm returns a `hpx::future<FwdIter3>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter3* otherwise. The *set\_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =  
hpx::parallel::detail::less>
```

```
FwdIter3 hpx::set_intersection(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, FwdIter3 dest,  
                             Pred &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *pred*.

If some element is found  $m$  times in  $[first1, last1)$  and  $n$  times in  $[first2, last2)$ , the first  $\text{std::min}(m, n)$  elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

### Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator with sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

### Returns

The *set\_intersection* algorithm returns a *FwdIter3*. The *set\_intersection* algorithm

returns the output iterator to the element in the destination range, one past the last element copied.

### hpx::transform\_exclusive\_scan

Defined in header `hpx/algorithm.hpp`<sup>656</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename OutIter, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<InIter>::value_type>
```

```
OutIter hpx::transform_exclusive_scan(InIter first, InIter last, OutIter dest, T init, BinOp &&binary_op,
UnOp &&unary_op)
```

Transforms each element in the range `[first, last)` with *unary\_op*, then computes an exclusive prefix sum operation using *binary\_op* over the resulting range, with *init* as the initial value, and writes the results to the range beginning at *dest*. “exclusive” means that the *i*-th input element is not included in the *i*-th sum. Formally, assigns through each iterator *i* in `[dest, d_first + (last - first))` the value of the generalized noncommutative sum of *init*, *unary\_op*(*\*j*)... for every *j* in `[first, first + (i - d_first))` over *binary\_op*, where generalized noncommutative sum `GNSUM(op, a1, ..., a N)` is defined as follows:

- if  $N=1$ ,  $a_1$
- if  $N > 1$ ,  $op(GNSUM(op, a_1, \dots, a_K), GNSUM(op, a_M, \dots, a_N))$  for any  $K$  where  $1 < K+1 = M \leq N$  In other words, the summation operations may be performed in arbitrary order, and the behavior is nondeterministic if *binary\_op* is not associative.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *unary\_op* nor *binary\_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of *transform\_exclusive\_scan* may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of each of *binary\_op* and *unary\_op*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a_1$  when  $N$  is 1
- $op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a_1, \dots, a_K), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a_M, \dots, a_N))$  where  $1 < K+1 = M \leq N$ .

<sup>656</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of *binary\_op*.
- **UnOp** – The type of *unary\_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary\_op** – Binary *FunctionObject* that will be applied to the result of *unary\_op*, the results of other *binary\_op*, and *init*.
- **unary\_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary\_op*.

## Returns

The *transform\_exclusive\_scan* algorithm returns a *returns OutIter*. The *transform\_exclusive\_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename BinOp, typename UnOp,
typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type hpx::transform_exclusive_scan(ExPolicy
&&policy,
FwdIter1
first,
FwdIter1
last,
FwdIter2
dest, T init,
BinOp
&&binary_op,
UnOp
&&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, conv(\*first), ..., conv(\*(first + (i - result) - 1))). Executed according to the policy.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *unary\_op* nor *binary\_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[first, last)$  or  $[result, result + (last - first))$ .

The behavior of *transform\_exclusive\_scan* may be non-deterministic for a non-associative predicate.

**Note**

Complexity:  $O(last - first)$  applications of each of *binary\_op* and *unary\_op*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aK*), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *aM*, ..., *aN*)) where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of *binary\_op*.
- **UnOp** – The type of *unary\_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **init** – The initial value for the generalized sum.
- **binary\_op** – Binary *FunctionObject* that will be applied in to the result of *unary\_op*, the results of other *binary\_op*, and *init*.
- **unary\_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary\_op*.

### Returns

The *transform\_exclusive\_scan* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *transform\_exclusive\_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

### hpx::uninitialized\_fill

Defined in header `hpx/algorithm.hpp`<sup>657</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::uninitialized_fill_n`

```
template<typename FwdIter, typename T>
```

```
void hpx::uninitialized_fill(FwdIter first, FwdIter last, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

#### Note

Complexity: Linear in the distance between *first* and *last*

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

### Returns

The *uninitialized\_fill* algorithm returns nothing

<sup>657</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename FwdIter, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> hpx::uninitialized_fill(ExPolicy &&policy, FwdIter  
first, FwdIter last, T const  
&value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects. Executed according to the policy.

The initializations in the parallel *uninitialized\_fill* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The initializations in the parallel *uninitialized\_fill* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear in the distance between *first* and *last*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *uninitialized\_fill* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns nothing otherwise.

## hpx::uninitialized\_fill\_n

Defined in header `hpx/algorithm.hpp`<sup>658</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::uninitialized_fill`

template<typename **FwdIter**, typename **Size**, typename **T**>

*FwdIter* **hpx::uninitialized\_fill\_n**(*FwdIter* first, *Size* count, *T* const &value)

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

### Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

### Returns

The *uninitialized\_fill\_n* algorithm returns a returns *FwdIter*. The *uninitialized\_fill\_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**, typename **T**>

*hpx::parallel::util::detail::algorithm\_result\_t*<*ExPolicy*, *FwdIter*> **hpx::uninitialized\_fill\_n**(*ExPolicy* &&policy, *FwdIter* first, *Size* count, *T* const &value)

<sup>658</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Copies the given *value* value to the first *count* elements in an uninitialized memory area beginning at *first*. If an exception is thrown during the initialization, the function has no effects. Executed according to the policy.

The initializations in the parallel *uninitialized\_fill\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The initializations in the parallel *uninitialized\_fill\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *uninitialized\_fill\_n* algorithm returns a `hpx::future<FwdIter>`, if the execution policy is of type *sequenced\_policy* or *parallel\_task\_policy* and returns `FwdIter` otherwise. The *uninitialized\_fill\_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

## hpx::move

Defined in header `hpx/algorithm.hpp`<sup>659</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::move(ExPolicy &&policy, FwdIter1 first,  
                                                                    FwdIter1 last, FwdIter2 dest)
```

Moves the elements in the range [first, last), to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move. Executed according to the policy.

The move assignments in the parallel *move* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The move assignments in the parallel *move* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* move assignments.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the move assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

## Returns

The *move* algorithm returns a `hpx::future<FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise.

<sup>659</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The *move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter2 hpx::move(FwdIter1 first, FwdIter1 last, FwdIter2 dest)
```

Moves the elements in the range [first, last), to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

**Note**

Complexity: Performs exactly *last - first* move assignments.

**Template Parameters**

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *move* algorithm returns a *FwdIter2*. The *move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

**hpx::destroy**

Defined in header `hpx/algorithm.hpp`<sup>660</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::destroy_n`

```
template<typename ExPolicy, typename FwdIter>
```

```
util::detail::algorithm_result_t<ExPolicy> hpx::destroy(ExPolicy &&policy, FwdIter first, FwdIter last)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range [first, last). Executed according to the policy.

---

<sup>660</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* operations.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

### Returns

The *destroy* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *void* otherwise.

template<typename **FwdIter**>

void *hpx::destroy*(*FwdIter* first, *FwdIter* last)

Destroys objects of type typename iterator\_traits<ForwardIt>::value\_type in the range [first, last).

#### Note

Complexity: Performs exactly *last - first* operations.

### Template Parameters

**FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

## Returns

The *destroy* algorithm returns a *void*

## hpx::destroy\_n

Defined in header `hpx/algorithm.hpp`<sup>661</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::destroy*

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>

*util::detail::algorithm\_result\_t<ExPolicy, FwdIter>* **hpx::destroy\_n**(*ExPolicy* &&policy, *FwdIter* first, *Size* count)

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, first + count)`. Executed according to the policy.

The operations in the parallel *destroy\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

---

<sup>661</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Returns**

The *destroy\_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *destroy\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename FwdIter, typename Size>
```

```
FwdIter hpx::destroy_n(FwdIter first, Size count)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, first + count)`.

**Note**

Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

**Returns**

The *destroy\_n* algorithm returns a *FwdIter*. The *destroy\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

**hpx::experimental::reduction\_min**

Defined in header `hpx/algorithm.hpp`<sup>662</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::min_of<T>> hpx::experimental::reduction_min(T &var)
```

The function template *reduction\_min* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::min_of{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

<sup>662</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

A parallel algorithm uses the *reduction\_min* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::min_of{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

**Note**

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

**Template Parameters**

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

**Parameters**

- **var** – [in,out] The live-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

**Returns**

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of *identity*, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::min_of<T>> hpx::experimental::reduction_min(  
    &var,  
    T  
    const  
    &iden-  
    tity)
```

## hpx::rotate

Defined in header `hpx/algorithm.hpp`<sup>663</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::rotate_copy`

template<typename **FwdIter**>

*FwdIter* **hpx::rotate**(*FwdIter* first, *FwdIter* new\_first, *FwdIter* last)

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element new\_first becomes the first element of the new range and new\_first - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Linear in the distance between *first* and *last*.

### Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

## Template Parameters

**FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **new\_first** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

## Returns

The *rotate* algorithm returns a *FwdIter*. The *rotate* algorithm returns the iterator to the new location of the element pointed by first, equal to first + (last - new\_first).

template<typename **ExPolicy**, typename **FwdIter**>

<sup>663</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

*hpx::parallel::util::detail::algorithm\_result\_t<ExPolicy, FwdIter>* **hpx::rotate**(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* new\_first, *FwdIter* last)

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element new\_first becomes the first element of the new range and new\_first - 1 becomes the last element. Executed according to the policy.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear in the distance between *first* and *last*.

**Note**

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **new\_first** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

### Returns

The *rotate* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *rotate* algorithm returns the iterator equal to first + (last - new\_first).

## hpx::rotate\_copy

Defined in header `hpx/algorithm.hpp`<sup>664</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::rotate`

template<typename **FwdIter**, typename **OutIter**>

*OutIter* `hpx::rotate_copy`(*FwdIter* first, *FwdIter* new\_first, *FwdIter* last, *OutIter* dest\_first)

Copies the elements from the range [first, last), to another range beginning at *dest\_first* in such a way, that the element *new\_first* becomes the first element of the new range and *new\_first* - 1 becomes the last element.

The assignments in the parallel *rotate\_copy* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **OutIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a output iterator.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **new\_first** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest\_first** – Refers to the begin of the destination range.

## Returns

The *rotate\_copy* algorithm returns a output iterator, The *rotate\_copy* algorithm returns the output iterator to the element past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **FwdIter2**>

<sup>664</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::rotate_copy(ExPolicy &&policy,  
                                                                 FwdIter1 first, FwdIter1  
                                                                 new_first, FwdIter1 last,  
                                                                 FwdIter2 dest_first)
```

Copies the elements from the range `[first, last)`, to another range beginning at `dest_first` in such a way, that the element `new_first` becomes the first element of the new range and `new_first - 1` becomes the last element. Executed according to the policy.

The assignments in the parallel `rotate_copy` algorithm execute in sequential order in the calling thread.

The assignments in the parallel `rotate_copy` algorithm execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly `last - first` assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **new\_first** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest\_first** – Refers to the begin of the destination range.

**Returns**

The `rotate_copy` algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type `parallel_task_policy` and returns `FwdIter2` otherwise. The `rotate_copy` algorithm returns the output iterator to the element past the last element copied.

## hpx::uninitialized\_move

Defined in header `hpx/algorithm.hpp`<sup>665</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::uninitialized_move_n`

template<typename **InIter**, typename **FwdIter**>

*FwdIter* **hpx::uninitialized\_move**(*InIter* first, *InIter* last, *FwdIter* dest)

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

## Returns

The *uninitialized\_move* algorithm returns *FwdIter*. The *uninitialized\_move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **FwdIter1**, typename **FwdIter2**>

*hpx::parallel::util::detail::algorithm\_result\_t<ExPolicy, FwdIter2>* **hpx::uninitialized\_move**(*ExPolicy* &&policy, *FwdIter1* first, *FwdIter1* last, *FwdIter2* dest)

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state. Executed according to the policy.

<sup>665</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *uninitialized\_move* algorithm returns a *hpx::future<FwdIter2>*, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *uninitialized\_move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

**hpx::uninitialized\_move\_n**

Defined in header [hpx/algorithm.hpp](#)<sup>666</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::uninitialized\\_move](#)

```
template<typename InIter, typename Size, typename FwdIter>
```

---

<sup>666</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

`std::pair<InIter, FwdIter> hpx::uninitialized_move_n(InIter first, Size count, FwdIter dest)`

Moves the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1.`, to another range beginning at `dest`. If an exception is thrown during the initialization, some objects in `[first, first + count)` are left in a valid but unspecified state.

#### Note

Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

### Returns

The *uninitialized\_move\_n* algorithm returns a `std::pair<InIter, FwdIter>`. The *uninitialized\_move\_n* algorithm returns A pair whose first element is an iterator to the element past the last element moved in the source range, and whose second element is an iterator to the element past the last element moved in the destination range.

`template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2>`

`parallel::util::detail::algorithm_result<ExPolicy, std::pair<FwdIter1, FwdIter2>>::type hpx::uninitialized_move_n(ExPolicy &&policy, FwdIter1 first, Size count, FwdIter2 dest)`

Moves the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1.`, to another range beginning at `dest`. If an exception is thrown during the initialization, some objects in `[first, first + count)` are left in a valid but unspecified state. Executed according to the policy.

The assignments in the parallel *uninitialized\_move\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_move\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *uninitialized\_move\_n* algorithm returns a `hpx::future<std::pair<FwdIter1,FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::pair<FwdIter1,FwdIter2>` otherwise. The *uninitialized\_move\_n* algorithm returns A pair whose first element is an iterator to the element past the last element moved in the source range, and whose second element is an iterator to the element past the last element moved in the destination range.

## hpx::fill

Defined in header `hpx/algorithm.hpp`<sup>667</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::fill_n`

template<typename **ExPolicy**, typename **FwdIter**, typename **T**>

`util::detail::algorithm_result_t<ExPolicy> hpx::fill(ExPolicy &&policy, FwdIter first, FwdIter last, T value)`

Assigns the given value to the elements in the range [first, last). Executed according to the policy.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be assigned (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

## Returns

The *fill* algorithm returns a `hpx::future<void>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

<sup>667</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename FwdIter, typename T>
void hpx::fill(FwdIter first, FwdIter last, T value)
```

Assigns the given value to the elements in the range [first, last).

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *fill* algorithm returns a *void*.

**hpx::fill\_n**

Defined in header [hpx/algorithm.hpp](#)<sup>668</sup>.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [hpx::fill](#)

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::fill_n(ExPolicy &&policy, FwdIter first, Size count, T value)
```

Assigns the given value value to the first count elements in the range beginning at first if count > 0. Does nothing otherwise. Executed according to the policy.

The comparisons in the parallel *fill\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

---

<sup>668</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *count* assignments, for *count* > 0.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *fill\_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

```
template<typename FwdIter, typename Size, typename T>
```

```
FwdIter hpx::fill_n(FwdIter first, Size count, T value)
```

Assigns the given value *value* to the first *count* elements in the range beginning at *first* if *count* > 0. Does nothing otherwise.

**Note**

Complexity: Performs exactly *count* assignments, for *count* > 0.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

### Returns

The *fill\_n* algorithm returns a *FwdIter*.

### hpx::count

Defined in header [hpx/algorithm.hpp](#)<sup>669</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::count\\_if](#)

```
template<typename ExPolicy, typename FwdIter, typename T>
```

```
util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<FwdIter>::difference_type>::type hpx::count(ExPolicy  
                                                         &&pol-  
                                                         icy,  
                                                         FwdIter  
                                                         first,  
                                                         FwdIter  
                                                         last,  
                                                         T  
                                                         const  
                                                         &value)
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*. Executed according to the policy.

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* comparisons.

#### Note

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

---

<sup>669</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **FwdIter** – The type of the source iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to search for (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.

## Returns

The *count* algorithm returns a *hpx::future<difference\_type>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *std::iterator\_traits<FwdIterB>::difference\_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename InIter, typename T>
```

```
std::iterator_traits<InIter>::difference_type hpx::count(InIter first, InIter last, T const &value)
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

### Note

Complexity: Performs exactly *last - first* comparisons.

## Template Parameters

- **InIter** – The type of the source iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to search for (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.

## Returns

The *count* algorithm returns a *difference\_type* (where *difference\_type* is defined by *std::iterator\_traits<Iter>::difference\_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

## hpx::count\_if

Defined in header `hpx/algorithm.hpp`<sup>670</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::count*

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

*util::detail::algorithm\_result<ExPolicy, typename std::iterator\_traits<FwdIter>::difference\_type>::type* **hpx::count\_if**(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *F* &&f)

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true. Executed according to the policy.

### Note

Complexity: Performs exactly *last - first* applications of the predicate.

### Note

The assignments in the parallel *count\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

### Note

The assignments in the parallel *count\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

## Template Parameters

---

<sup>670</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count\_if* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *count\_if* algorithm returns *hpx::future<difference\_type>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *std::iterator\_traits<FwdIter>::difference\_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename InIter, typename F>
```

```
std::iterator_traits<InIter>::difference_type hpx::count_if(InIter first, InIter last, F &&f)
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

#### Note

Complexity: Performs exactly *last - first* applications of the predicate.

### Template Parameters

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count\_if* requires *F* to meet the requirements of *CopyConstructible*.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

## Returns

The *count\_if* algorithm returns *difference\_type* (where a *difference\_type* is defined by *std::iterator\_traits<Iter>::difference\_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

## hpx::experimental::for\_each\_index

Defined in header `hpx/algorithm.hpp`<sup>671</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **Mapping**, typename **Fun**>

constexpr void **hpx::experimental::for\_each\_index**(*Mapping* const &mapping, *Fun* fun)

Calls *fun* with every multidimensional index in the domain of *mapping* (i.e., its extents), in sequential order.

If *fun* returns a result, the result is ignored.

The layout mapping is a hint; implementations are encouraged to choose an iteration order that performs well for the given mapping.

### Note

Complexity: Applies *fun* exactly the product of all extents of *mapping* times.

## Template Parameters

- **Mapping** – A type meeting the layout mapping requirements. Must expose *index\_type*, *extents\_type*, *static rank()*, and *extents()*.
- **Fun** – The type of the function/function object to use (deduced). *Fun* must meet *Copy-Constructible* and be invocable with exactly *Mapping::rank()* arguments of type *Mapping::index\_type*.

---

<sup>671</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Parameters

- **mapping** – The layout mapping whose extents define the iteration domain.
- **fun** – Callable invoked as `fun(i0, i1, ...)` for every multidimensional index in the domain.

template<typename **ExPolicy**, typename **Mapping**, typename **Fun**>

*hpx::parallel::util::detail::algorithm\_result\_t<ExPolicy>* *hpx::experimental::for\_each\_index*(*ExPolicy* &&policy, *Mapping* const &mapping, *Fun* fun)

Calls *fun* with every multidimensional index in the domain of *mapping* (i.e., its extents), executed according to *policy*.

If *fun* returns a result, the result is ignored.

### Note

Complexity: Applies *fun* exactly the product of all extents of *mapping* times.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced).
- **Mapping** – A type meeting the layout mapping requirements. Must meet *CopyConstructible*.
- **Fun** – The type of the function/function object to use (deduced). Must meet *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for scheduling.
- **mapping** – The layout mapping whose extents define the iteration domain.
- **fun** – Callable invoked as `fun(i0, i1, ...)` for every multidimensional index in the domain.

## Returns

*hpx::future<void>* if the execution policy is *sequenced\_task\_policy* or *parallel\_task\_policy*, *void* otherwise.

## hpx::reduce

Defined in header `hpx/algorithm.hpp`<sup>672</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter, typename F, typename T = typename
std::iterator_traits<FwdIter>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::reduce(ExPolicy &&policy, FwdIter first,
FwdIter last, T init, F &&f)
```

Returns GENERALIZED\_SUM(f, init, \*first, ..., \*(first + (last - first) - 1)). Executed according to the policy.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate  $f$ .

### Note

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)), where:
  - b1, ..., bN may be any permutation of a1, ..., aN and
  - $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

<sup>672</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *reduce* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1* *Ret* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to any of those types.

### Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter, typename T = typename
std::iterator_traits<FwdIter>::value_type>
```

```
util::detail::algorithm_result_t<ExPolicy, T> hpx::reduce(ExPolicy &&policy, FwdIter first, FwdIter last, T init)
```

Returns GENERALIZED\_SUM(+, init, \*first, ..., \*(first + (last - first) - 1)). Executed according to the policy.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the operator+().

**Note**

GENERALIZED\_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(+, b1, ..., bK), GENERALIZED\_SUM(+, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

**Returns**

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<FwdIter>::value_type>::type hpx::reduce(ExPolicy
&&pol-
icy,
FwdIter
first,
FwdIter
last)
```

Returns GENERALIZED\_SUM(+, T(), \*first, ..., \*(first + (last - first) - 1)). Executed according to the policy.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the operator+().

#### Note

The type of the initial value (and the result type) *T* is determined from the *value\_type* of the used *FwdIter*.

#### Note

GENERALIZED\_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(+, b1, ..., bK), GENERALIZED\_SUM(+, bM, ..., bN)), where:
  - b1, ..., bN may be any permutation of a1, ..., aN and
  - $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

## Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise (where *T* is the *value\_type* of *FwdIter*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename FwdIter, typename F, typename T = typename std::iterator_traits<FwdIter>::value_type>
```

```
T hpx::reduce(FwdIter first, FwdIter last, T init, F &&f)
```

Returns GENERALIZED\_SUM(*f*, *init*, \**first*, ..., \*(*first* + (*last* - *first*) - 1)). Executed according to the policy.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *f*.

#### Note

GENERALIZED\_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED\_SUM(*op*, *b1*, ..., *bK*), GENERALIZED\_SUM(*op*, *bM*, ..., *bN*)), where:
- *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
- $1 < K+1 = M \leq N$ .

### Template Parameters

- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *reduce* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1 Ret* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to any of those types.

### Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range `[first, last)`.

```
template<typename FwdIter, typename T = typename std::iterator_traits<FwdIter>::value_type>
```

```
T hpx::reduce(FwdIter first, FwdIter last, T init)
```

Returns `GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1))`. Executed according to the policy.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the operator`+`.

#### Note

`GENERALIZED_SUM(+, a1, ..., aN)` is defined as follows:

- `a1` when `N` is 1
- `op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN))`, where:
  - `b1, ..., bN` may be any permutation of `a1, ..., aN` and
  - `1 < K+1 = M <= N`.

### Template Parameters

- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

### Returns

The *reduce* algorithm returns a *T*. The *reduce* algorithm returns the result of the gen-

eralized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename FwdIter>
```

```
std::iterator_traits<FwdIter>::value_type hpx::reduce(FwdIter first, FwdIter last)
```

Returns GENERALIZED\_SUM(+, T(), \*first, ..., \*(first + (last - first) - 1)). Executed according to the policy.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the operator+().

**Note**

The type of the initial value (and the result type) *T* is determined from the *value\_type* of the used *FwdIter*.

**Note**

GENERALIZED\_SUM(+, *a*1, ..., *a**N*) is defined as follows:

- *a*1 when *N* is 1
- op(GENERALIZED\_SUM(+, *b*1, ..., *b**K*), GENERALIZED\_SUM(+, *b**M*, ..., *b**N*)), where:
  - *b*1, ..., *b**N* may be any permutation of *a*1, ..., *a**N* and
  - $1 < K+1 = M \leq N$ .

**Template Parameters**

**FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of an input iterator.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

**Returns**

The *reduce* algorithm returns *T* (where *T* is the *value\_type* of *FwdIter*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

## hpx::find

Defined in header `hpx/algorithm.hpp`<sup>673</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::find_if`
- `hpx::find_if_not`
- `hpx::find_end`
- `hpx::find_first_of`

template<typename **ExPolicy**, typename **FwdIter**, typename **T**>

`util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::find(ExPolicy &&policy, FwdIter first, FwdIter last, T const &val)`

Returns the first element in the range [first, last) that is equal to value. Executed according to the policy.

The comparison operations in the parallel *find* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: At most last - first applications of the operator==().

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to find (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

<sup>673</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **val** – the value to compare the elements to

### Returns

The *find* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *find* algorithm returns the first element in the range [first,last) that is equal to *val*. If no such element in the range of [first,last) is equal to *val*, then the algorithm returns *last*.

```
template<typename InIter, typename T>
```

```
InIter hpx::find(InIter first, InIter last, T const &val)
```

Returns the first element in the range [first, last) that is equal to value. Executed according to the policy.

#### Note

Complexity: At most last - first applications of the operator==().

### Template Parameters

- **InIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to find (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **val** – the value to compare the elements to

### Returns

The *find* algorithm returns a *InIter*. The *find* algorithm returns the first element in the range [first,last) that is equal to *val*. If no such element in the range of [first,last) is equal to *val*, then the algorithm returns *last*.

### hpx::find\_if

Defined in header [hpx/algorithm.hpp](#)<sup>674</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::find*
- *hpx::find\_if\_not*
- *hpx::find\_end*

---

<sup>674</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- `hpx::find_first_of`

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

`util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::find_if(ExPolicy &&policy, FwdIter first, FwdIter last, F &&f)`

Returns the first element in the range [first, last) for which predicate *f* returns true. Executed according to the policy.

The comparison operations in the parallel *find\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most last - first applications of the predicate.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns true for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *find\_if* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise.

The *find\_if* algorithm returns the first element in the range [first,last) that satisfies the predicate *f*. If no such element exists that satisfies the predicate *f*, the algorithm returns *last*.

```
template<typename InIter, typename F>
```

```
InIter hpx::find_if(InIter first, InIter last, F &&f)
```

Returns the first element in the range [first, last) for which predicate *f* returns true.

**Note**

Complexity: At most last - first applications of the predicate.

**Template Parameters**

- **InIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns true for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type*.

**Returns**

The *find\_if* algorithm returns a *InIter*. The *find\_if* algorithm returns the first element in the range [first,last) that satisfies the predicate *f*. If no such element exists that satisfies the predicate *f*, the algorithm returns *last*.

## hpx::find\_if\_not

Defined in header `hpx/algorithm.hpp`<sup>675</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::find`
- `hpx::find_if`
- `hpx::find_end`
- `hpx::find_first_of`

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

`util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::find_if_not(ExPolicy &&policy, FwdIter first, FwdIter last, F &&f)`

Returns the first element in the range [first, last) for which predicate *f* returns false. Executed according to the policy.

The comparison operations in the parallel *find\_if\_not* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find\_if\_not* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: At most last - first applications of the predicate.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

<sup>675</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns false for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *find\_if\_not* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *find\_if\_not* algorithm returns the first element in the range `[first, last)` that does **not** satisfy the predicate *f*. If no such element exists that does not satisfy the predicate *f*, the algorithm returns *last*.

```
template<typename FwdIter, typename F>
```

```
FwdIter hpx::find_if_not(FwdIter first, FwdIter last, F &&f)
```

Returns the first element in the range `[first, last)` for which predicate *f* returns false.

#### Note

Complexity: At most last - first applications of the predicate.

### Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns false for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

## Returns

The *find\_if\_not* algorithm returns a *FwdIter*. The *find\_if\_not* algorithm returns the first element in the range [first, last) that does **not** satisfy the predicate *f*. If no such element exists that does not satisfy the predicate *f*, the algorithm returns *last*.

## hpx::find\_end

Defined in header [hpx/algorithm.hpp](#)<sup>676</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::find](#)
- [hpx::find\\_if](#)
- [hpx::find\\_if\\_not](#)
- [hpx::find\\_first\\_of](#)

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_end(ExPolicy &&policy, FwdIter1 first1,  
                                                                FwdIter1 last1, FwdIter2 first2, FwdIter2  
                                                                last2, Pred &&op = Pred())
```

Returns the last subsequence of elements [first2, last2) found in the range [first, last) using the given predicate *op* to compare elements. Executed according to the policy.

The comparison operations in the parallel *find\_end* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find\_end* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *find\_end* is available if the user decides to provide the algorithm their own predicate *op*.

### Note

Complexity: at most  $S \cdot (N - S + 1)$  comparisons where  $S = \text{distance}(\text{first2}, \text{last2})$  and  $N = \text{distance}(\text{first1}, \text{last1})$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

<sup>676</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *replace* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

`bool pred(const Type1 &a, const Type2 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

## Returns

The *find\_end* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *find\_end* algorithm returns an iterator to the beginning of the last subsequence `[first2, last2)` in range `[first, last)`. If the length of the subsequence `[first2, last2)` is greater than the length of the range `[first1, last1)`, *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_end(ExPolicy &&policy, FwdIter1 first1,  
                                                                FwdIter1 last1, FwdIter2 first2, FwdIter2  
                                                                last2)
```

Returns the last subsequence of elements `[first2, last2)` found in the range `[first, last)`. Elements are compared using `operator==`. Executed according to the policy.

The comparison operations in the parallel *find\_end* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find\_end* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most  $S \cdot (N - S + 1)$  comparisons where  $S = \text{distance}(\text{first2}, \text{last2})$  and  $N = \text{distance}(\text{first1}, \text{last1})$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.

## Returns

The *find\_end* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *find\_end* algorithm returns an iterator to the beginning of the last subsequence  $[\text{first2}, \text{last2})$  in range  $[\text{first}, \text{last})$ . If the length of the subsequence  $[\text{first2}, \text{last2})$  is greater than the length of the range  $[\text{first1}, \text{last1})$ , *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
FwdIter1 hpx::find_end(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns the last subsequence of elements  $[\text{first2}, \text{last2})$  found in the range  $[\text{first}, \text{last})$  using the given predicate *op* to compare elements.

This overload of *find\_end* is available if the user decides to provide the algorithm their own predicate *op*.

**Note**

Complexity: at most  $S \cdot (N - S + 1)$  comparisons where  $S = \text{distance}(\text{first2}, \text{last2})$  and  $N = \text{distance}(\text{first1}, \text{last1})$ .

**Template Parameters**

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *replace* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`

**Parameters**

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

**Returns**

The *find\_end* algorithm returns a *FwdIter1*. The *find\_end* algorithm returns an iterator to the beginning of the last subsequence `[first2, last2)` in range `[first, last)`. If the length of the subsequence `[first2, last2)` is greater than the length of the range `[first1, last1)`, *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter1 hpx::find_end(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns the last subsequence of elements `[first2, last2)` found in the range `[first, last)`. Elements are compared using *operator==*.

**Note**

Complexity: at most  $S \cdot (N - S + 1)$  comparisons where  $S = \text{distance}(\text{first2}, \text{last2})$  and  $N = \text{distance}(\text{first1}, \text{last1})$ .

**Template Parameters**

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.

**Returns**

The *find\_end* algorithm returns a *FwdIter1*. The *find\_end* algorithm returns an iterator to the beginning of the last subsequence [first2, last2) in range [first, last). If the length of the subsequence [first2, last2) is greater than the length of the range [first1, last1), *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

**hpx::find\_first\_of**

Defined in header [hpx/algorithm.hpp](#)<sup>677</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_first_of(ExPolicy &&policy, FwdIter1 first,  
                                                                    FwdIter1 last, FwdIter2 s_first,  
                                                                    FwdIter2 s_last, Pred &&op = Pred())
```

<sup>677</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses binary predicate *op* to compare elements. Executed according to the policy.

The comparison operations in the parallel *find\_first\_of* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find\_first\_of* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *find\_first\_of* is available if the user decides to provide the algorithm their own predicate *op*.

**Note**

Complexity: at most  $(S \cdot N)$  comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{distance}(first, last)$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

### Returns

The *find\_first\_of* algorithm returns a *hpx::future<FwdIter1>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter1* otherwise. The *find\_first\_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_first_of(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 s_first,
                                                                    FwdIter2 s_last)
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Elements are compared using *operator==*. Executed according to the policy.

The comparison operations in the parallel *find\_first\_of* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find\_first\_of* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most  $(S \cdot N)$  comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{distance}(first, last)$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.

### Returns

The *find\_first\_of* algorithm returns a *hpx::future<FwdIter1>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter1* otherwise. The *find\_first\_of* algorithm returns an iterator to the first element in the range [first, last) that is equal to an element from the range [s\_first, s\_last). If the length of the subsequence [s\_first, s\_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
```

```
FwdIter1 hpx::find_first_of(FwdIter1 first, FwdIter1 last, FwdIter2 s_first, FwdIter2 s_last, Pred &&op =  
    Pred())
```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses binary predicate *op* to compare elements.

This overload of *find\_first\_of* is available if the user decides to provide the algorithm their own predicate *op*.

#### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{distance}(first, last)$ .

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`

### Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

### Returns

The *find\_first\_of* algorithm returns a *FwdIter1*. The *find\_first\_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter1 hpx::find_first_of(FwdIter1 first, FwdIter1 last, FwdIter2 s_first, FwdIter2 s_last)
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Elements are compared using *operator==*.

#### Note

Complexity: at most  $(S*N)$  comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{distance}(first, last)$ .

### Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.

- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.

### Returns

The *find\_first\_of* algorithm returns a *FwdIter1*. The *find\_first\_of* algorithm returns an iterator to the first element in the range [first, last) that is equal to an element from the range [s\_first, s\_last). If the length of the subsequence [s\_first, s\_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

### hpx::uninitialized\_relocate

Defined in header [hpx/algorithm.hpp](#)<sup>678</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::uninitialized\\_relocate\\_n](#)

```
template<typename InIter1, typename InIter2, typename FwdIter>
```

```
FwdIter hpx::uninitialized_relocate(InIter1 first, InIter2 last, FwdIter dest)
```

Relocates the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

The assignments in the parallel *uninitialized\_relocate* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: time: O(n), space: O(1) 1) For “trivially relocatable” underlying types (T) and a contiguous iterator range [first, last): std::distance(first, last)\*sizeof(T) bytes are copied. 2) For “trivially relocatable” underlying types (T) and a non-contiguous iterator range [first, last): std::distance(first, last) memory copies of sizeof(T) bytes each are performed. 3) For “non-trivially relocatable” underlying types (T): std::distance(first, last) move assignments and destructions are performed.

#### Note

Declare a type as “trivially relocatable” using the HPX\_DECLARE\_TRIVIALY\_RELOCATABLE macros found in <hpx/type\_support/is\_trivially\_relocatable.hpp>.

### Template Parameters

---

<sup>678</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **InIter1** – The type of the source iterator first (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the source iterator last (deduced). This iterator type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

### Returns

The *uninitialized\_relocate* algorithm returns *FwdIter*. The *uninitialized\_relocate* algorithm returns the output iterator to the element in the destination range, one past the last element relocated.

```
template<typename ExPolicy, typename InIter1, typename InIter2, typename FwdIter>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::uninitialized_relocate(ExPolicy
&&policy,
InIter1 first,
InIter2 last,
FwdIter dest)
```

Relocates the elements in the range defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

The assignments in the parallel *uninitialized\_relocate* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: time: O(n), space: O(1) 1) For “trivially relocatable” underlying types (T) and a contiguous iterator range [first, last): std::distance(first, last)\*sizeof(T) bytes are copied. 2) For “trivially relocatable” underlying types (T) and a non-contiguous iterator range [first, last): std::distance(first, last) memory copies of sizeof(T) bytes each are performed. 3) For “non-trivially relocatable” underlying types (T): std::distance(first, last) move assignments and destructions are performed.

#### Note

```
Declare a type as “trivially relocatable” using the  
HPX_DECLARE_TRIVIALY_RELOCATABLE macros found in  
<hpx/type_support/is_trivially_relocatable.hpp>.
```

#### Note

Parallel execution requires both *first* and *dest* to be contiguous iterators. If either iterator is non-contiguous, the algorithm cannot determine whether the source and destination ranges overlap, and will silently fall back to sequential execution regardless of the execution policy provided.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter1** – The type of the source iterator first (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the source iterator last (deduced). This iterator type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range. The assignments in the parallel *uninitialized\_relocate\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

### Returns

The *uninitialized\_relocate* algorithm returns a *hpx::future<FwdIter>*, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_relocate* algorithm returns the output iterator to the element in the destination range, one past the last element relocated.

## hpx::uninitialized\_relocate\_n

Defined in header `hpx/algorithm.hpp`<sup>679</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::uninitialized_relocate`

template<typename **InIter**, typename **Size**, typename **FwdIter**>

*FwdIter* **hpx::uninitialized\_relocate\_n**(*InIter* first, *Size* count, *FwdIter* dest)

Relocates the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

The assignments in the parallel *uninitialized\_relocate\_n* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

### Note

Complexity: time:  $O(n)$ , space:  $O(1)$  1) For “trivially relocatable” underlying types (T) and a contiguous iterator range [first, first+count):  $\text{count} * \text{sizeof}(T)$  bytes are copied. 2) For “trivially relocatable” underlying types (T) and a non-contiguous iterator range [first, first+count):  $\text{count}$  memory copies of  $\text{sizeof}(T)$  bytes each are performed. 3) For “non-trivially relocatable” underlying types (T):  $\text{count}$  move assignments and destructions are performed.

### Note

Declare a type as “trivially relocatable” using the `HPX_DECLARE_TRIVIALY_RELOCATABLE` macros found in `<hpx/type_support/is_trivially_relocatable.hpp>`.

## Template Parameters

- **InIter** – The type of the source iterator first (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to relocate.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

## Parameters

<sup>679</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

### Returns

The *uninitialized\_relocate\_n* algorithm returns *FwdIter*. The *uninitialized\_relocate\_n* algorithm returns the output iterator to the element in the destination range, one past the last element relocated.

```
template<typename ExPolicy, typename InIter, typename Size, typename FwdIter>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::uninitialized_relocate_n(ExPolicy  
                                                                 &&policy,  
                                                                 InIter first,  
                                                                 Size count,  
                                                                 FwdIter  
                                                                 dest)
```

Relocates the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

The assignments in the parallel *uninitialized\_relocate\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_relocate\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: time:  $O(n)$ , space:  $O(1)$  1) For “trivially relocatable” underlying types (T) and a contiguous iterator range [first, first+count):  $\text{count} * \text{sizeof}(T)$  bytes are copied. 2) For “trivially relocatable” underlying types (T) and a non-contiguous iterator range [first, first+count):  $\text{count}$  memory copies of  $\text{sizeof}(T)$  bytes each are performed. 3) For “non-trivially relocatable” underlying types (T):  $\text{count}$  move assignments and destructions are performed.

#### Note

Declare a type as “trivially relocatable” using the `HPX_DECLARE_TRIVIALY_RELOCATABLE` macros found in `<hpx/type_support/is_trivially_relocatable.hpp>`.

**Note**

Parallel execution requires both *first* and *dest* to be contiguous iterators. If either iterator is non-contiguous, the algorithm cannot determine whether the source and destination ranges overlap, and will silently fall back to sequential execution regardless of the execution policy provided.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter** – The type of the source iterator first (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to relocate.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *uninitialized\_relocate\_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_relocate\_n* algorithm returns the output iterator to the element in the destination range, one past the last element relocated.

**hpx::remove\_copy**

Defined in header [hpx/algorithm.hpp](#)<sup>680</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::remove\\_copy\\_if](#)

```
template<typename InIter, typename OutIter, typename T = typename std::iterator_traits<InIter>::value_type>
```

```
OutIter hpx::remove_copy(InIter first, InIter last, OutIter dest, T const &value)
```

Copies the elements in the range, defined by [first, last), to another range beginning at

<sup>680</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

*dest*. Copies only the elements for which the comparison operator returns false when compare to value. The order of the elements that are not removed is preserved.

Effects: Copies all the elements referred to by the iterator it in the range [first,last) for which the following corresponding conditions do not hold: *\*it == value*

The assignments in the parallel *remove\_copy* algorithm execute in sequential order in the calling thread.

**Note**

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*, here comparison operator.

**Template Parameters**

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type that the result of dereferencing *FwdIter1* is compared to.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **value** – Value to be removed.

**Returns**

The *remove\_copy* algorithm returns an *OutIter*. The *remove\_copy* algorithm returns the iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T = typename  
std::iterator_traits<InIter>::value_type>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::remove_copy(ExPolicy &&policy,  
FwdIter1 first, FwdIter1  
last, FwdIter2 dest, T const  
&value)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the comparison operator returns false when compare to value. The order of the elements that are not removed is preserved. Executed according to the policy.

Effects: Copies all the elements referred to by the iterator it in the range [first,last) for which the following corresponding conditions do not hold: *\*it == value*

The assignments in the parallel *remove\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*, here comparison operator.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type that the result of dereferencing FwdIter1 is compared to.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **value** – Value to be removed.

## Returns

The *remove\_copy* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *remove\_copy* algorithm returns the iterator to the element past the last element copied.

## hpx::remove\_copy\_if

Defined in header [hpx/algorithm.hpp](#)<sup>681</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::remove\\_copy](#)

<sup>681</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename InIter, typename OutIter, typename Pred>
```

```
OutIter hpx::remove_copy_if(InIter first, InIter last, OutIter dest, Pred &&pred)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *pred* returns false. The order of the elements that are not removed is preserved.

Effects: Copies all the elements referred to by the iterator *it* in the range [first,last) for which the following corresponding conditions do not hold: INVOKE(pred, \*it) != false.

The assignments in the parallel *remove\_copy\_if* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements to be removed. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *remove\_copy\_if* algorithm returns an *OutIter*. The *remove\_copy\_if* algorithm returns the iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::remove_copy_if(ExPolicy &&policy,
                                                                 FwdIter1 first,
                                                                 FwdIter1 last,
                                                                 FwdIter2 dest, Pred
                                                                 &&pred)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *pred* returns false. The order of the elements that are not removed is preserved. Executed according to the policy.

Effects: Copies all the elements referred to by the iterator it in the range [first,last) for which the following corresponding conditions do not hold: INVOKE(pred, \*it) != false.

The assignments in the parallel *remove\_copy\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove\_copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_copy\_if* requires *Pred* to meet the requirements of *CopyConstructible*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns

*true* for the elements to be removed. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *remove\_copy\_if* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *remove\_copy\_if* algorithm returns the iterator to the element past the last element copied.

### hpx::set\_difference

Defined in header [hpx/algorithm.hpp](#)<sup>682</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =  
hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter3> hpx::set_difference(ExPolicy &&policy,  
                                             FwdIter1 first1,  
                                             FwdIter1 last1,  
                                             FwdIter2 first2,  
                                             FwdIter2 last2,  
                                             FwdIter3 dest, Pred  
                                             &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range *[first1, last1)* and not present in the range *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

Equivalent elements are treated individually, that is, if some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

---

<sup>682</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdaded/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

**Returns**

The *set\_difference* algorithm returns a `hpx::future<FwdIter3>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter3* otherwise. The *set\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =
    hpx::parallel::detail::less>
```

```
FwdIter3 hpx::set_difference(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, FwdIter3 dest,
    Pred &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range  $[first1, last1)$  and not present in the range  $[first2, last2)$ . This algorithm expects both input ranges to be sorted with the given binary predicate *pred*.

Equivalent elements are treated individually, that is, if some element is found  $m$  times in  $[first1, last1)$  and  $n$  times in  $[first2, last2)$ , it will be copied to *dest* exactly  $\text{std::max}(m-n, 0)$  times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

### Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

### Returns

The *set\_difference* algorithm returns a *FwdIter3*. The *set\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

### hpx::reduce\_by\_key

Defined in header `hpx/algorithm.hpp`<sup>683</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

#### Warning

doxygenfunction: Cannot find function “hpx::reduce\_by\_key” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

### hpx::nth\_element

Defined in header `hpx/algorithm.hpp`<sup>684</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Pred = hpx::parallel::detail::less>
```

```
void hpx::nth_element(RandomIt first, RandomIt nth, RandomIt last, Pred &&pred = Pred())
```

*nth\_element* is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element. Executed according to the policy.

The comparison operations in the parallel *nth\_element* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Linear in `std::distance(first, last)` on average.  $O(N)$  applications of the predicate, and  $O(N \log N)$  swaps, where  $N = last - first$ .

### Template Parameters

- **RandomIt** – The type of the source begin, *nth*, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.

<sup>683</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

<sup>684</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Pred** – Comparison function object which returns true if the first argument is less than the second. This defaults to `std::less<>`.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to *Type*. This defaults to `std::less<>`.

### Returns

The *nth\_element* algorithms returns nothing.

```
template<typename ExPolicy, typename RandomIt, typename Pred = hpx::parallel::detail::less>
```

```
void hpx::nth_element(ExPolicy &&policy, RandomIt first, RandomIt nth, RandomIt last, Pred &&pred =  
    Pred())
```

*nth\_element* is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth\_element* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *nth\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in `std::distance(first, last)` on average.  $O(N)$  applications of the predicate, and  $O(N \log N)$  swaps, where  $N = \text{last} - \text{first}$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **RandomIt** – The type of the source begin, nth, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second. This defaults to `std::less<>`.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to *Type*. This defaults to `std::less<>`.

### Returns

The *nth\_element* algorithms returns nothing.

## hpx::remove

Defined in header `hpx/algorithm.hpp`<sup>685</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::remove\_if*

```
template<typename FwdIter, typename T = typename std::iterator_traits<FwdIter>::value_type>
```

```
FwdIter hpx::remove(FwdIter first, FwdIter last, T const &value)
```

Removes all elements satisfying specific criteria from the range `[first, last)` and returns a past-the-end iterator for the new end of the range. This version removes all elements that are equal to *value*.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator `==()`.

<sup>685</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

### Returns

The *remove* algorithm returns a *FwdIter*. The *remove* algorithm returns the iterator to the new end of the range.

```
template<typename ExPolicy, typename FwdIter, typename T = typename  
std::iterator_traits<FwdIter>::value_type>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::remove(ExPolicy &&policy, FwdIter first,  
                                         FwdIter last, T const &value)
```

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements that are equal to *value*. Executed according to the policy.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator==().

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

## Returns

The *remove* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *remove* algorithm returns the iterator to the new end of the range.

## hpx::remove\_if

Defined in header [hpx/algorithm.hpp](#)<sup>686</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::remove](#)

template<typename **FwdIter**, typename **Pred**>

*FwdIter* **hpx::remove\_if**(*FwdIter* first, *FwdIter* last, *Pred* &&pred)

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements for which predicate *pred* returns true.

The assignments in the parallel *remove\_if* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_if* requires *Pred* to meet the requirements of *CopyConstructible*.

## Parameters

<sup>686</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *remove\_if* algorithm returns a *FwdIter*. The *remove\_if* algorithm returns the iterator to the new end of the range.

```
template<typename ExPolicy, typename FwdIter, typename Pred>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::remove_if(ExPolicy &&policy, FwdIter  
first, FwdIter last, Pred  
&&pred)
```

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements for which predicate *pred* returns true. Executed according to the policy.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_if* requires *Pred* to meet the requirements of *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

## Returns

The *remove\_if* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *remove\_if* algorithm returns the iterator to the new end of the range.

## hpx::reverse

Defined in header `hpx/algorithm.hpp`<sup>687</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::reverse_copy`

```
template<typename BidirIter>
```

```
void hpx::reverse(BidirIter first, BidirIter last)
```

Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Linear in the distance between *first* and *last*.

## Template Parameters

**BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.

<sup>687</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

### Returns

The *reverse* algorithm returns *void*.

```
template<typename ExPolicy, typename BidirIter>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, void> hpx::reverse(ExPolicy &&policy, BidirIter first,  
                                                                    BidirIter last)
```

Reverses the order of the elements in the range [first, last). Behaves as if applying *std::iter\_swap* to every pair of iterators first+i, (last-i) - 1 for each non-negative  $i < (last - first) / 2$ . Executed according to the policy.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in the distance between *first* and *last*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

### Returns

The *reverse* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *void* otherwise.

## hpx::reverse\_copy

Defined in header `hpx/algorithm.hpp`<sup>688</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::reverse`

template<typename **BidirIter**, typename **OutIter**>

*OutIter* `hpx::reverse_copy`(*BidirIter* first, *BidirIter* last, *OutIter* dest)

Copies the elements from the range [first, last) to another range beginning at dest in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment  $*(dest + (last - first) - 1 - i) = *(first + i)$  once for each non-negative  $i < (last - first)$ . If the source and destination ranges (that is, [first, last) and [dest, dest+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse\_copy* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the begin of the destination range.

## Returns

The *reverse\_copy* algorithm returns an *OutIter*. The *reverse\_copy* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **BidirIter**, typename **FwdIter**>

*hpx::parallel::util::detail::algorithm\_result\_t*<*ExPolicy*, *FwdIter*> `hpx::reverse_copy`(*ExPolicy* &&policy, *BidirIter* first, *BidirIter* last, *FwdIter* dest)

<sup>688</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Copies the elements from the range `[first, last)` to another range beginning at `dest` in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment  $*(dest + (last - first) - 1 - i) = *(first + i)$  once for each non-negative  $i < (last - first)$ . If the source and destination ranges (that is, `[first, last)` and `[dest, dest+(last-first))` respectively) overlap, the behavior is undefined. Executed according to the policy.

The assignments in the parallel *reverse\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the begin of the destination range.

### Returns

The *reverse\_copy* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *reverse\_copy* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

## hpx::experimental::sort\_by\_key

Defined in header `hpx/algorithm.hpp`<sup>689</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename KeyIter, typename ValueIter, typename Compare = detail::less>
```

```
util::detail::algorithm_result_t<ExPolicy, sort_by_key_result<KeyIter, ValueIter>> hpx::experimental::sort_by_key(ExPolicy
&&pol-
icy,
KeyIter
key_first,
KeyIter
key_last,
Val-
ueIter
value_first,
Com-
pare
&&comp
=
Com-
pare())
```

Sorts one range of data using keys supplied in another range. The key elements in the range `[key_first, key_last)` are sorted in ascending order with the corresponding elements in the value range moved to follow the sorted order. The algorithm is not stable, the order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`). Executed according to the policy.

A sequence is sorted with respect to a comparator *comp* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, *(i + n), *i) == false`.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

<sup>689</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

applies user-provided function objects.

- **KeyIter** – The type of the key iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **ValueIter** – The type of the value iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Compare** – The type of the function/function object to use (deduced).

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **key\_first** – Refers to the beginning of the sequence of key elements the algorithm will be applied to.
- **key\_last** – Refers to the end of the sequence of key elements the algorithm will be applied to.
- **value\_first** – Refers to the beginning of the sequence of value elements the algorithm will be applied to, the range of elements must match [key\_first, key\_last)
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.

#### Returns

The *sort\_by\_key* algorithm returns a `hpx::future<sort_by_key_result<KeyIter, ValueIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *otherwise*. The algorithm returns a pair holding an iterator pointing to the first element after the last element in the input key sequence and an iterator pointing to the first element after the last element in the input value sequence.

### hpx::replace

Defined in header `hpx/algorithm.hpp`<sup>690</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::replace\_if*
- *hpx::replace\_copy*
- *hpx::replace\_copy\_if*

`template<typename InIter, typename T = typename std::iterator_traits<InIter>::value_type>`

`void hpx::replace(InIter first, InIter last, T const &old_value, T const &new_value)`

Replaces all elements satisfying specific criteria with *new\_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator it in the range [first, last) with *new\_value*, when the following corresponding conditions hold: *\*it == old\_value*

---

<sup>690</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the old and new values to replace (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.

## Returns

The *replace* algorithm returns a *void*.

```
template<typename ExPolicy, typename FwdIter, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, void> hpx::replace(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter last, T const &old_value, T
                                                                    const &new_value)
```

Replaces all elements satisfying specific criteria with *new\_value* in the range [first, last). Executed according to the policy.

Effects: Substitutes elements referred by the iterator it in the range [first, last) with *new\_value*, when the following corresponding conditions hold: *\*it == old\_value*

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the old and new values to replace (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.

## Returns

The *replace* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *void* otherwise.

## hpx::replace\_if

Defined in header [hpx/algorithm.hpp](#)<sup>691</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::replace](#)
- [hpx::replace\\_copy](#)
- [hpx::replace\\_copy\\_if](#)

template<typename **Iter**, typename **Pred**, typename **T** = typename *std::iterator\_traits<Iter>::value\_type*>

void [hpx::replace\\_if](#)(*Iter* first, *Iter* last, *Pred* &&pred, *T* const &new\_value)

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new\_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator *it* in the range [first, last) with *new\_value*, when the following corresponding conditions hold: *INVOKE*(f, \*it) != false

The assignments in the parallel *replace\_if* algorithm execute in sequential order in the calling thread.

---

<sup>691</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *last - first* applications of the predicate.

**Template Parameters**

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.

**Returns**

The *replace\_if* algorithm returns *void*.

```
template<typename ExPolicy, typename FwdIter, typename Pred, typename T = typename
std::iterator_traits<FwdIter>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, void> hpx::replace_if(ExPolicy &&policy, FwdIter
first, FwdIter last, Pred &&pred,
T const &new_value)
```

Replaces all elements satisfying specific criteria (for which predicate *f* returns true) with *new\_value* in the range [first, last). Executed according to the policy.

Effects: Substitutes elements referred by the iterator *it* in the range [first, last) with *new\_value*, when the following corresponding conditions hold: `INVOKE(f, *it) != false`

The assignments in the parallel *replace\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* applications of the predicate.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.

**Returns**

The *replace\_if* algorithm returns a `hpx::future<void>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *void* otherwise.

## hpx::replace\_copy

Defined in header `hpx/algorithm.hpp`<sup>692</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::replace`
- `hpx::replace_if`
- `hpx::replace_copy_if`

template<typename **InIter**, typename **OutIter**, typename **T** = typename `std::iterator_traits<OutIter>::value_type`>

*OutIter* **hpx::replace\_copy**(*InIter* first, *InIter* last, *OutIter* dest, *T* const &old\_value, *T* const &new\_value)

Copies the all elements from the range [first, last) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*.

Effects: Assigns to every iterator it in the range [result, result + (last - first)) either *new\_value* or *\*(first + (it - result))* depending on whether the following corresponding condition holds: *\*(first + (i - result)) == old\_value*

The assignments in the parallel *replace\_copy* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *last - first* applications of the predicate.

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the old and new values (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.

<sup>692</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Returns

The *replace\_copy* algorithm returns an *OutIter*. The *replace\_copy* algorithm returns the Iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T = typename
std::iterator_traits<FwdIter2>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::replace_copy(ExPolicy &&policy,
FwdIter1 first, FwdIter1
last, FwdIter2 dest, T
const &old_value, T
const &new_value)
```

Copies the all elements from the range [first, last) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*. Executed according to the policy.

Effects: Assigns to every iterator it in the range [result, result + (last - first)) either *new\_value* or  $*(first + (it - result))$  depending on whether the following corresponding condition holds:  $*(first + (i - result)) == old\_value$

The assignments in the parallel *replace\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* applications of the predicate.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the old and new values (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.

### Returns

The *replace\_copy* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *replace\_copy* algorithm returns the Iterator to the element past the last element copied.

### hpx::replace\_copy\_if

Defined in header [hpx/algorithm.hpp](#)<sup>693</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::replace](#)
- [hpx::replace\\_if](#)
- [hpx::replace\\_copy](#)

```
template<typename InIter, typename OutIter, typename Pred, typename T = typename
std::iterator_traits<OutIter>::value_type>
```

```
OutIter hpx::replace_copy_if(InIter first, InIter last, OutIter dest, Pred &&pred, T const &new_value)
```

Copies the all elements from the range [first, last) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*.

Effects: Assigns to every iterator it in the range [result, result + (last - first)) either *new\_value* or *\*(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(f, *(first + (i - result))) != false`

The assignments in the parallel *replace\_copy\_if* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* applications of the predicate.

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

<sup>693</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.

### Returns

The *replace\_copy\_if* algorithm returns an *OutIter*. The *replace\_copy\_if* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred, typename T = typename  
std::iterator_traits<FwdIter2>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::replace_copy_if(ExPolicy &&policy,  
                                             FwdIter1 first,  
                                             FwdIter1 last,  
                                             FwdIter2 dest, Pred  
                                             &&pred, T const  
                                             &new_value)
```

Copies the all elements from the range [first, last) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*.

Effects: Assigns to every iterator it in the range [result, result + (last - first)) either *new\_value* or *\*(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(f, *(first + (i - result))) != false`

The assignments in the parallel *replace\_copy\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace\_copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* applications of the predicate.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *replace\_copy\_if* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.

**Returns**

The *replace\_copy\_if* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *replace\_copy\_if* algorithm returns the iterator to the element in the destination range, one past the last element copied.

## hpx::sort

Defined in header `hpx/algorithm.hpp`<sup>694</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
void hpx::sort(RandomIt first, RandomIt last, Comp &&comp, Proj &&proj = Proj())
```

Sorts the elements in the range `[first, last)` in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

*comp* has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

## Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the `INVOKE` operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

## Returns

The *sort* algorithm returns *void*.

---

<sup>694</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename RandomIt, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> hpx::sort(ExPolicy &&policy, RandomIt first, RandomIt last, Comp &&comp, Proj &&proj)
```

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()). Executed according to the policy.

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, \*(i + n)), INVOKE(proj, \*i)) == false.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

## Returns

The *sort* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *void* otherwise.

## hpx::partition

Defined in header [hpx/algorithm.hpp](#)<sup>695</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::stable\\_partition](#)
- [hpx::partition\\_copy](#)

template<typename **FwdIter**, typename **Pred**, typename **Proj** = *hpx::identity*>

*FwdIter* **hpx::partition**(*FwdIter* first, *FwdIter* last, *Pred* &&pred, *Proj* &&proj = *Proj*())

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: At most  $2 * (last - first)$  swaps. Exactly *last - first* applications of the predicate and projection.

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

<sup>695</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *partition* algorithm returns *FwdIter*. The *partition* algorithm returns the iterator to the first element of the second group.

```
template<typename ExPolicy, typename FwdIter, typename Pred, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::partition(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter last, Pred &&pred, Proj
                                                                    &&proj = Proj())
```

Reorders the elements in the range `[first, last)` in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 * (last - first)$  swaps. Exactly *last - first* applications of the predicate and projection.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *partition* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *parallel\_task\_policy* and returns *FwdIter* otherwise. The *partition* algorithm returns the iterator to the first element of the second group.

### hpx::stable\_partition

Defined in header `hpx/algorithm.hpp`<sup>696</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::partition`
- `hpx::partition_copy`

```
template<typename BidirIter, typename F, typename Proj = hpx::identity>
```

```
BidirIter hpx::stable_partition(BidirIter first, BidirIter last, F &&f, Proj &&proj = Proj())
```

Permutes the elements in the range [first, last) such that there exists an iterator *i* such that for every iterator *j* in the range [first, *i*) `INVOKE(f, INVOKE (proj, *j)) != false`, and for every iterator *k* in the range [*i*, last), `INVOKE(f, INVOKE (proj, *k)) == false`

The invocations of *f* in the parallel *stable\_partition* algorithm invoked without an execution policy object executes in sequential order in the calling thread.

#### Note

Complexity: At most  $(last - first) * \log(last - first)$  swaps, but only linear number of swaps if there is enough extra memory. Exactly *last - first* applications of the predicate and projection.

### Template Parameters

---

<sup>696</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

## Returns

The *stable\_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range [first, *i*), *f*(\*j) != false INVOKE(*f*, INVOKE(*proj*, \*j)) != false, and for every iterator *k* in the range [*i*, last), *f*(\*k) == false INVOKE(*f*, INVOKE(*proj*, \*k)) == false. The relative order of the elements in both groups is preserved.

```
template<typename ExPolicy, typename BidirIter, typename F, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, BidirIter> hpx::stable_partition(ExPolicy &&policy,  
                                                                 BidirIter first, BidirIter  
                                                                 last, F &&f, Proj &&proj  
                                                                 = Proj())
```

Permutes the elements in the range [first, last) such that there exists an iterator *i* such that for every iterator *j* in the range [first, *i*) INVOKE(*f*, INVOKE(*proj*, \*j)) != false, and for every iterator *k* in the range [*i*, last), INVOKE(*f*, INVOKE(*proj*, \*k)) == false

The invocations of *f* in the parallel *stable\_partition* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The invocations of *f* in the parallel *stable\_partition* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $(\text{last} - \text{first}) * \log(\text{last} - \text{first})$  swaps, but only linear number of swaps if there is enough extra memory. Exactly *last - first* applications of the predicate and projection.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

**Returns**

The *stable\_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range [first, *i*),  $f(*j) \neq \text{false}$  INVOKE(*f*, INVOKE(*proj*, *\*j*))  $\neq \text{false}$ , and for every iterator *k* in the range [*i*, last),  $f(*k) == \text{false}$  INVOKE(*f*, INVOKE(*proj*, *\*k*))  $== \text{false}$ . The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel\_task\_policy* the algorithm returns a *future<>* referring to this iterator.

## hpx::partition\_copy

Defined in header `hpx/algorithm.hpp`<sup>697</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::partition`
- `hpx::stable_partition`

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred, typename Proj =
hpx::identity>
std::pair<FwdIter2, FwdIter3> hpx::partition_copy(FwdIter1 first, FwdIter1 last, FwdIter2 dest_true, FwdIter3
dest_false, Pred &&pred, Proj &&proj = Proj())
```

Copies the elements in the range, defined by [first, last), to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest\_true*. The rest of the elements are copied to the range beginning at *dest\_false*. The order of the elements is preserved.

The assignments in the parallel *partition\_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

## Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

<sup>697</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

`bool pred(const Type &a);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *partition\_copy* algorithm returns `std::pair<OutIter1, OutIter2>`. The *partition\_copy* algorithm returns the pair of the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred,  
typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, std::pair<FwdIter2, FwdIter3>> hpx::partition_copy(ExPolicy  
                                                    &&pol-  
                                                    icy,  
                                                    FwdIter1  
                                                    first,  
                                                    FwdIter1  
                                                    last,  
                                                    FwdIter2  
                                                    dest_true,  
                                                    FwdIter3  
                                                    dest_false,  
                                                    Pred  
                                                    &&pred,  
                                                    Proj  
                                                    &&proj  
                                                    =  
                                                    Proj())
```

Copies the elements in the range, defined by [first, last), to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred*, are copied to the range beginning at *dest\_true*. The rest of the elements are copied to the range beginning at *dest\_false*. The order of the elements is preserved.

The assignments in the parallel *partition\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *partition\_copy* algorithm returns a `hpx::future<std::pair<OutIter1, OutIter2>>` if the execution policy is of type *parallel\_task\_policy* and returns `std::pair<OutIter1, OutIter2>` otherwise. The *partition\_copy* algorithm returns the pair of the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

**hpx::transform\_reduce**

Defined in header `hpx/algorithm.hpp`<sup>698</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter, typename T, typename Reduce, typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy,  
                                         FwdIter first, FwdIter last,  
                                         T init, Reduce &&red_op,  
                                         Convert &&conv_op)
```

Returns `GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1)))`. Executed according to the policy.

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *red\_op* and *conv\_op*.

**Note**

`GENERALIZED_SUM(op, a1, ..., aN)` is defined as follows:

- $a1$  when  $N$  is 1
- $op(GENERALIZED\_SUM(op, b1, \dots, bK), GENERALIZED\_SUM(op, bM, \dots, bN))$ ,  
where:
- $b1, \dots, bN$  may be any permutation of  $a1, \dots, aN$  and

<sup>698</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

$$1 < K+1 = M \leq N.$$

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv\_op* can be implicitly converted to any of those types.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

## Returns

The *transform\_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel\_task\_policy* and returns *T* otherwise. The *transform\_reduce* algorithm returns the result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range [first, last).

```
template<typename InIter, typename T, typename Reduce, typename Convert>
```

`T hpx::transform_reduce(InIter first, InIter last, T init, Reduce &&red_op, Convert &&conv_op)`

Returns GENERALIZED\_SUM(red\_op, init, conv\_op(\*first), ..., conv\_op(\*(first + (last - first) - 1))).

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *red\_op* and *conv\_op*.

#### Note

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)), where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv\_op* can be implicitly converted to any of those types.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_reduce* algorithm returns a *T*. The *transform\_reduce* algorithm returns the result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy,
                                                                 FwdIter1 first1, FwdIter1
                                                                 last1, FwdIter2 first2, T
                                                                 init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*. Executed according to the policy.

The operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications each of *reduce* and *transform*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return values (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

### Returns

The *transform\_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise.

template<typename **InIter1**, typename **InIter2**, typename **T**>

*T* **hpx::transform\_reduce**(*InIter1* first1, *InIter1* last1, *InIter2* first2, *T* init)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications each of *reduce* and *transform*.

### Template Parameters

- **InIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as return values (deduced).

### Parameters

- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

### Returns

The *transform\_reduce* algorithm returns a *T*.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T, typename Reduce,
typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy,
                                                                    FwdIter1 first1, FwdIter1
                                                                    last1, FwdIter2 first2, T init,
                                                                    Reduce &&red_op, Convert
                                                                    &&conv_op)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`. Executed according to the policy.

The operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications each of *reduce* and *transform*.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

- **red\_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *red\_op*.

### Returns

The *transform\_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise.

```
template<typename InIter1, typename InIter2, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(ExPolicy &&policy, InIter1 first1, InIter1 last1, InIter2 first2, T init, Reduce  
                        &&red_op, Convert &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications each of *reduce* and *transform*.

### Template Parameters

- **InIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as return values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

### Parameters

- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.

- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *red\_op*.

## Returns

The *transform\_reduce* algorithm returns a *T*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Iter
                                                                    first, Sent last, T init,
                                                                    Reduce &&red_op, Convert
                                                                    &&conv_op)
```

Returns GENERALIZED\_SUM(*red\_op*, *init*, *conv\_op*(\**first*), ..., *conv\_op*\*(*first* + (*last* - *first*) - 1))).

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

## Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *red\_op* and *conv\_op*.

**Note**

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv\_op* can be implicitly converted to any of those types.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *parallel\_task\_policy* and returns *T* otherwise. The *transform\_reduce* algorithm returns the result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range `[first, last)`.

```
template<typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(Iter first, Sent last, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns `GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1)))`.

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *red\_op* and *conv\_op*.

#### Note

`GENERALIZED_SUM(op, a1, ..., aN)` is defined as follows:

- $a_1$  when  $N$  is 1
- $op(GENERALIZED\_SUM(op, b_1, \dots, b_K), GENERALIZED\_SUM(op, b_M, \dots, b_N))$ , where:
- $b_1, \dots, b_N$  may be any permutation of  $a_1, \dots, a_N$  and
- $1 < K+1 = M \leq N$ .

### Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

## Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv\_op* can be implicitly converted to any of those types.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

## Returns

The *transform\_reduce* algorithm returns *T*. The *transform\_reduce* algorithm returns the result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Iter  
                                                                    first, Sent last, Iter2 first2, T  
                                                                    init)
```

Returns GENERALIZED\_SUM(red\_op, init, conv\_op(\*first), ..., conv\_op(\*(first + (last - first) - 1))).

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary

predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *red\_op* and *conv\_op*.

#### Note

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

### Returns

The *transform\_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel\_task\_policy* and returns *T* otherwise. The *transform\_reduce* algorithm returns the result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename Iter2, typename T>
```

```
T hpx::transform_reduce(Iter first, Sent last, Iter2 first2, T init)
```

Returns GENERALIZED\_SUM(*red\_op*, *init*, *conv\_op*(\**first*), ..., *conv\_op*(\*(*first* + (*last* - *first*) - 1))).

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

**Note**

Complexity:  $O(\textit{last} - \textit{first})$  applications of the predicates *red\_op* and *conv\_op*.

**Note**

GENERALIZED\_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED\_SUM(*op*, *b1*, ..., *bK*), GENERALIZED\_SUM(*op*, *bM*, ..., *bN*)), where:
  - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
  - $1 < K+1 = M \leq N$ .

**Template Parameters**

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

**Returns**

The *transform\_reduce* algorithm returns *T*. The *transform\_reduce* algorithm returns the

result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T, typename Reduce,
typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Iter
first, Sent last, Iter2 first2, T
init, Reduce &&red_op,
Convert &&conv_op)
```

Returns GENERALIZED\_SUM(red\_op, init, conv\_op(\*first), ..., conv\_op(\*(first + (last - first) - 1))).

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *red\_op* and *conv\_op*.

#### Note

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.

- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv\_op* can be implicitly converted to any of those types.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel\_task\_policy* and returns *T* otherwise. The *transform\_reduce* algorithm returns the result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(Iter first, Sent last, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED\_SUM(red\_op, init, conv\_op(\*first), ..., conv\_op(\*(first + (last - first) - 1))).

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *red\_op* and *conv\_op*.

#### Note

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

### Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

### Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv\_op* can be implicitly converted to any of those types.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_reduce* algorithm returns *T*. The *transform\_reduce* algorithm returns the result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename T, typename Reduce, typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Rng
&&rng, T init, Reduce
&&red_op, Convert
&&conv_op)
```

Returns GENERALIZED\_SUM(red\_op, init, conv\_op(\*first), ..., conv\_op(\*(first + (last - first) - 1))).

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *red\_op* and *conv\_op*.

#### Note

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv\_op* can be implicitly converted to any of those types.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

## Returns

The *transform\_reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *parallel\_task\_policy* and returns *T* otherwise. The *transform\_reduce* algorithm

returns the result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range [first, last).

template<typename **Rng**, typename **T**, typename **Reduce**, typename **Convert**>

*T* **hpx::transform\_reduce**(*Rng* &&rng, *T* init, *Reduce* &&red\_op, *Convert* &&conv\_op)

Returns GENERALIZED\_SUM(red\_op, init, conv\_op(\*first), ..., conv\_op(\*(first + (last - first) - 1))).

The difference between *transform\_reduce* and *accumulate* is that the behavior of *transform\_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *red\_op* and *conv\_op*.

#### Note

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)), where:
  - b1, ..., bN may be any permutation of a1, ..., aN and
  - $1 < K+1 = M \leq N$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv\_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv\_op* can be implicitly converted to any of those types.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_reduce* algorithm returns *T*. The *transform\_reduce* algorithm returns the result of the generalized sum over the values returned from *conv\_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Rng
&&rng, Iter2 first2, T init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

The operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op2*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **T** – The type of the value to be used as return) values (deduced).

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

#### Returns

The *transform\_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise.

```
template<typename Rng, typename Iter2, typename T>
```

```
T hpx::transform_reduce(Rng &&rng, Iter2 first2, T init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op2*.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

#### Returns

The *transform\_reduce* algorithm returns *T*.

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Rng &&rng, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`.

The operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform\_reduce* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op2*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

### Returns

The *transform\_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise.

```
template<typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(Rng &&rng, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op2*.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red\_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv\_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

### Returns

The *transform\_reduce* algorithm returns *T*.

### hpx::is\_heap

Defined in header `hpx/algorithm.hpp`<sup>699</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::is_heap_until`

```
template<typename ExPolicy, typename RandIter, typename Comp = hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::is_heap(ExPolicy &&policy, RandIter first,
                                                                    RandIter last, Comp &&comp =
                                                                    Comp())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using `operator<()`). Executed according to the policy.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in the distance between *first* and *last*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.

<sup>699</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Comp** – The type of the function/function object to use (deduced).

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

#### Returns

The *is\_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *is\_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename RandIter, typename Comp = hpx::parallel::detail::less>
```

```
bool hpx::is_heap(RandIter first, RandIter last, Comp &&comp = Comp())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

#### Note

Complexity: Linear in the distance between *first* and *last*.

#### Template Parameters

- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

## Returns

The *is\_heap* a *bool*. The *is\_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

## hpx::is\_heap\_until

Defined in header `hpx/algorithm.hpp`<sup>700</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::is\_heap*

```
template<typename ExPolicy, typename RandIter, typename Comp = hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, RandIter> hpx::is_heap_until(ExPolicy &&policy,
                                                                 RandIter first, RandIter
                                                                 last, Comp &&comp =
                                                                 Comp())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()). Executed according to the policy.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Linear in the distance between *first* and *last*.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

<sup>700</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

#### Returns

The *is\_heap\_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandIter* otherwise. The *is\_heap\_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename RandIter, typename Comp = hpx::parallel::detail::less>
```

```
RandIter hpx::is_heap_until(RandIter first, RandIter last, Comp &&comp = Comp())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

#### Note

Complexity: Linear in the distance between *first* and *last*.

#### Template Parameters

- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

#### Returns

The *is\_heap\_until* algorithm returns a *RandIter*. The *is\_heap\_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

## hpx::experimental::for\_loop

Defined in header `hpx/algorithm.hpp`<sup>701</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::experimental::for_loop_strided`
- `hpx::experimental::for_loop_n`
- `hpx::experimental::for_loop_n_strided`

```
template<typename I, typename ...Args>
```

```
void hpx::experimental::for_loop(std::decay_t<I> first, I last, Args&&... args)
```

The `for_loop` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *Move-Constructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

<sup>701</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

**Template Parameters**

- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename I, typename ...Args>
```

```
auto hpx::experimental::for_loop(ExPolicy &&policy, std::decay_t<I> first, I last, Args&&... args)
```

The `for_loop` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *Move-Constructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last - first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

#### Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

### Returns

The `for_loop` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

### `hpx::experimental::for_loop_strided`

Defined in header `hpx/algorithm.hpp`<sup>702</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::experimental::for_loop`
- `hpx::experimental::for_loop_n`
- `hpx::experimental::for_loop_n_strided`

template<typename **I**, typename **S**, typename ...**Args**>

void `hpx::experimental::for_loop_strided`(`std::decay_t<I>` first, `I` last, `S` stride, `Args&&...` args)

The `for_loop_strided` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *Move-Constructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

---

<sup>702</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Complexity: Applies  $f$  exactly once for each element of the input sequence.

Remarks: If  $f$  returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

#### Note

The order of the elements of the input sequence is important for determining ordinal position of an application of  $f$ , even though the applications themselves may be unordered.

## Template Parameters

- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if **I** has integral type or meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename I, typename S, typename ...Args>
```

```
auto hpx::experimental::for_loop_strided(ExPolicy &&policy, std::decay_t<I> first, I last, S stride,  
                                         Args&&... args)
```

The `for_loop_strided` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the

Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *Move-Constructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last - first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

#### Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if *I* has integral type or meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

## Returns

The `for_loop_strided` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

## `hpx::experimental::for_loop_n`

Defined in header `hpx/algorithm.hpp`<sup>703</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::experimental::for_loop`
- `hpx::experimental::for_loop_strided`
- `hpx::experimental::for_loop_n_strided`

```
template<typename I, typename Size, typename ...Args>
```

```
void hpx::experimental::for_loop_n(I first, Size size, Args&&... args)
```

The `for_loop_n` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop_n` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

<sup>703</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *Move-Constructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last - first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

**Note**

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

**Note**

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

## Template Parameters

- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **size** – Refers to the number of items the algorithm will be applied to.

- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename I, typename Size, typename ...Args>
```

```
auto hpx::experimental::for_loop_n(ExPolicy &&policy, I first, Size size, Args&&... args)
```

The `for_loop_n` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *Move-Constructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last - first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using `advance` and `distance`.

**Note**

The order of the elements of the input sequence is important for determining ordinal position of an application of  $f$ , even though the applications themselves may be unordered.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **size** – Refers to the number of items the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

**Returns**

The `for_loop_n` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

## hpx::experimental::for\_loop\_n\_strided

Defined in header `hpx/algorithm.hpp`<sup>704</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::experimental::for_loop`

```

The `for_loop_n_strided` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one

element invocable element-access function,  $f$ .  $f$  shall meet the requirements of *Move-Constructible*.

Effects: Applies  $f$  to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding  $f$ , an additional argument is passed to each application of  $f$  as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of  $f$  in the input sequence.

Complexity: Applies  $f$  exactly once for each element of the input sequence.

Remarks: If  $f$  returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

#### Note

The order of the elements of the input sequence is important for determining ordinal position of an application of  $f$ , even though the applications themselves may be unordered.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **size** – Refers to the number of items the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if *I* has integral type or meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

`<ignored> pred(I const& a, ...);`

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

### Returns

The `for_loop_n_strided` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

### `hpx::set_symmetric_difference`

Defined in header `hpx/algorithm.hpp`<sup>705</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =  
hpx::parallel::detail::less>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter3>::type hpx::set_symmetric_difference(ExPolicy  
                                                    &&pol-  
                                                    icy,  
                                                    FwdIter1  
                                                    first1,  
                                                    FwdIter1  
                                                    last1,  
                                                    FwdIter2  
                                                    first2,  
                                                    FwdIter2  
                                                    last2,  
                                                    FwdIter3  
                                                    dest,  
                                                    Pred  
                                                    &&op  
                                                    =  
                                                    Pred())
```

Constructs a sorted range beginning at `dest` consisting of all elements present in either of the sorted ranges `[first1, last1)` and `[first2, last2)`, but not in both of them are copied to the range beginning at `dest`. The resulting range is also sorted. This algorithm expects

---

<sup>705</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly `std::abs(m-n)` times. If *m*>*n*, then the last *m-n* of those elements are copied from [first1,last1), otherwise the last *n-m* elements are copied from [first2,last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

### Returns

The *set\_symmetric\_difference* algorithm returns a `hpx::future<FwdIter3>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter3* otherwise. The *set\_symmetric\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =
hpx::parallel::detail::less>
```

```
FwdIter3 hpx::set_symmetric_difference(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2,
FwdIter3 dest, Pred &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::abs(m-n)` times. If *m*>*n*, then the last *m-n* of those elements are copied from *[first1, last1)*, otherwise the last *n-m* elements are copied from *[first2, last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

### Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.

- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

### Returns

The *set\_symmetric\_difference* algorithm returns a *FwdIter3*. The *set\_symmetric\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

### hpx::for\_each

Defined in header `hpx/algorithm.hpp`<sup>706</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::for\_each\_n*

```
template<typename InIter, typename F>
```

```
F hpx::for_each(InIter first, InIter last, F &&f)
```

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

<sup>706</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

**Note**

Complexity: Applies *f* exactly *last - first* times.

**Template Parameters**

- **InIter** – The type of the source begin and end iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). *F* must meet requirements of *MoveConstructible*.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

**Returns**

*f*.

```
template<typename ExPolicy, typename FwdIter, typename F>
```

```
util::detail::algorithm_result_t<ExPolicy, void> hpx::for_each(ExPolicy &&policy, FwdIter first, FwdIter last, F  
&&f)
```

Applies *f* to the result of dereferencing every iterator in the range [first, last). Executed according to the policy.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for\_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Applies *f* exactly *last - first* times.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin and end iterator used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for\_each* requires *F* to meet the requirements of *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

## Returns

The *for\_each* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns void otherwise.

## hpx::for\_each\_n

Defined in header [hpx/algorithm.hpp](#)<sup>707</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::for\\_each](#)

<sup>707</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename InIter, typename Size, typename F>
```

```
InIter hpx::for_each_n(InIter first, Size count, F &&f)
```

Applies  $f$  to the result of dereferencing every iterator in the range  $[first, first + count)$ , starting from  $first$  and proceeding to  $first + count - 1$ .

If  $f$  returns a result, the result is ignored.

If the type of  $first$  satisfies the requirements of a mutable iterator,  $f$  may apply non-constant functions through the dereferenced iterator.

**Note**

Complexity: Applies  $f$  exactly  $count$  times.

**Template Parameters**

- **InIter** – The type of the source begin and end iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply  $f$  to.
- **F** – The type of the function/function object to use (deduced).  $F$  must meet requirements of *MoveConstructible*.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at  $first$  the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by  $[first, last)$ . The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

**Returns**

$first + count$  for non-negative values of  $count$  and  $first$  for negative values.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F>
```

```
util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::for_each_n(ExPolicy &&policy, FwdIter first, Size  
count, F &&f)
```

Applies  $f$  to the result of dereferencing every iterator in the range  $[first, first + count)$ , starting from  $first$  and proceeding to  $first + count - 1$ . Executed according to the policy.

If  $f$  returns a result, the result is ignored.

If the type of  $first$  satisfies the requirements of a mutable iterator,  $f$  may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for\_each\_n* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Applies  $f$  exactly *count* times.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply  $f$  to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for\_each\_n* requires  $F$  to meet the requirements of *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

## Returns

The *for\_each\_n* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of

type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. It returns *first + count* for non-negative values of *count* and *first* for negative values.

### `hpx::experimental::reduction_max`

Defined in header `hpx/algorithm.hpp`<sup>708</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename T>

```
constexpr hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::max_of<T>> hpx::experimental::reduction_max(T  
&var)
```

The function template *reduction\_max* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::max_of{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction\_max* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::max_of{}` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

#### Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

### Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

### Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

---

<sup>708</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Returns**

This returns a reduction object of unspecified type having a value type of  $T$ . When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

```
constexpr hpx::parallel::detail::reduction_helper< $T$ , hpx::parallel::detail::max_of< $T$ >> hpx::experimental::reduction_max( $T$ 
&var,
 $T$ 
const
&iden-
tity)
```

***hpx::all\_of***

Defined in header [hpx/algorithm.hpp](#)<sup>709</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::any\_of*
- *hpx::none\_of*

```
template<typename ExPolicy, typename FwdIter, typename F>
```

```
util::detail::algorithm_result_t<ExPolicy, bool> hpx::all_of(ExPolicy &&policy, FwdIter first, FwdIter last,  $F$ 
&&f)
```

Checks if unary predicate  $f$  returns true for all elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most *last - first* applications of the predicate  $f$

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.

<sup>709</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *all\_of* requires *F* to meet the requirements of *CopyConstructible*.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

#### Returns

The *all\_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *all\_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename InIter, typename F>
```

```
bool hpx::all_of(InIter first, InIter last, F &&f)
```

Checks if unary predicate *f* returns true for all elements in the range [first, last).

#### Note

Complexity: At most *last - first* applications of the predicate *f*

#### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *all\_of* requires *F* to meet the requirements of *CopyConstructible*.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *all\_of* algorithm returns a *bool*. The *all\_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

### hpx::any\_of

Defined in header `hpx/algorithm.hpp`<sup>710</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::all\_of*
- *hpx::none\_of*

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

*util::detail::algorithm\_result\_t*<*ExPolicy*, bool> *hpx::any\_of*(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *F* &&f)

Checks if unary predicate *f* returns true for at least one element in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most *last - first* applications of the predicate *f*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

<sup>710</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *any\_of* requires *F* to meet the requirements of *CopyConstructible*.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

#### Returns

The *any\_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *any\_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename InIter, typename F>
```

```
bool hpx::any_of(InIter first, InIter last, F &&f)
```

Checks if unary predicate *f* returns true for at least one element in the range [first, last).

#### Note

Complexity: At most *last - first* applications of the predicate *f*

#### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *any\_of* requires *F* to meet the requirements of *CopyConstructible*.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *any\_of* algorithm returns a *bool*. The *any\_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

### hpx::none\_of

Defined in header `hpx/algorithm.hpp`<sup>711</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::all\_of*
- *hpx::any\_of*

template<typename **ExPolicy**, typename **FwdIter**, typename **F**>

*util::detail::algorithm\_result\_t*<*ExPolicy*, bool> **hpx::none\_of**(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *F* &&f)

Checks if unary predicate *f* returns true for no elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most *last - first* applications of the predicate *f*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

<sup>711</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

#### Returns

The *none\_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *none\_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename InIter, typename F>
```

```
bool hpx::none_of(InIter first, InIter last, F &&f)
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

#### Note

Complexity: At most *last - first* applications of the predicate *f*

#### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

### Returns

The *none\_of* algorithm returns a *bool*. The *none\_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

### hpx::transform

Defined in header `hpx/algorithm.hpp`<sup>712</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter1, typename FwdIter2, typename F>
```

```
FwdIter2 hpx::transform(FwdIter1 first, FwdIter1 last, FwdIter2 dest, F &&f)
```

Applies the given function *f* to the range [first, last) and stores the result in another range, beginning at *dest*.

#### Note

Complexity: Exactly *last - first* applications of *f*

### Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

<sup>712</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *transform* algorithm returns a *FwdIter2*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename F>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::transform(ExPolicy &&policy, FwdIter1 first,  
                                                                    FwdIter1 last, FwdIter2 dest, F  
                                                                    &&f)
```

Applies the given function *f* to the range [first, last) and stores the result in another range, beginning at dest. Executed according to the policy.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly *last - first* applications of *f*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *transform* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename F>
```

```
FwdIter3 hpx::transform(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter3 dest, F &&f)
```

Applies the given function *f* to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest.

#### Note

Complexity: Exactly *last - first* applications of *f*

### Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators for the second range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *transform* algorithm returns a *FwdIter3*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename F>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter3> hpx::transform(ExPolicy &&policy, FwdIter1  
first1, FwdIter1 last1, FwdIter2  
first2, FwdIter3 dest, F &&f)
```

Applies the given function *f* to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest. Executed according to the policy.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly *last - first* applications of *f*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators for the second range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *Copy-Constructible*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *transform* algorithm returns a *hpx::future<FwdIter3>* if the execution policy is of type *parallel\_task\_policy* and returns *FwdIter3* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

### hpx::ranges::shift\_left

Defined in header [hpx/algorithm.hpp](#)<sup>713</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter, typename Sent, typename Size>
```

<sup>713</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

*FwdIter* *hpx::ranges::shift\_left*(*FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift\_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: At most (last - first) - n assignments.

#### Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

### Returns

The *shift\_left* algorithm returns *FwdIter*. The *shift\_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::shift_left(ExPolicy  
                                                                                      &&policy, FwdIter  
                                                                                      first, Sent last, Size  
                                                                                      n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift\_left* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift\_left* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most (last - first) - n assignments.

#### Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

## Returns

The *shift\_left* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *shift\_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename Rng, typename Size>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::shift_left(Rng &&rng, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- *n*), moves the element originally at position *first* + *n* + *i* to position *first* + *i*.

The assignment operations in the parallel *shift\_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note**

Complexity: At most  $(\text{last} - \text{first}) - n$  assignments.

**Note**

The type of dereferenced `std::ranges::iterator_t<Rng>` must meet the requirements of *MoveAssignable*.

**Template Parameters**

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

**Parameters**

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

**Returns**

The *shift\_left* algorithm returns `std::ranges::iterator_t<Rng>`. The *shift\_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename Rng, typename Size>
```

```
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::shift_left(ExPolicy  
                                                                                               &&pol-  
                                                                                               icy,  
                                                                                               Rng  
                                                                                               &&rng,  
                                                                                               Size  
                                                                                               n)
```

Shifts the elements in the range [*first*, *last*) by *n* positions towards the beginning of the range. For every integer *i* in [0, *last* - *first*

- *n*), moves the element originally at position *first* + *n* + *i* to position *first* + *i*.

The assignment operations in the parallel *shift\_left* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift\_left* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most (last - first) - n assignments.

#### Note

The type of dereferenced `std::ranges::iterator_t<Rng>` must meet the requirements of *MoveAssignable*.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

## Returns

The *shift\_left* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. The *shift\_left* algorithm returns an iterator to the end of the resulting range.

## hpx::ranges::exclusive\_scan

Defined in header `hpx/algorithm.hpp`<sup>714</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename T = typename
std::iterator_traits<InIter>::value_type, typename Op = std::plus<T>>
```

```
exclusive_scan_result<InIter, OutIter> hpx::ranges::exclusive_scan(InIter first, Sent last, OutIter dest, T init,
                                                                    Op &&op = Op())
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, \*first, ..., \*(first + (i - result) - 1)).

<sup>714</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>N</sub>) is defined as:

- *a*<sub>1</sub> when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>K</sub>), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>M</sub>, ..., *a*<sub>N</sub>)) where  $1 < K+1 = M \leq N$ .

**Template Parameters**

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

**Returns**

The *exclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename T = typename
std::iterator_traits<FwdIter1>::value_type, typename Op = std::plus<T>>
```

```
parallel::util::detail::algorithm_result<ExPolicy, exclusive_scan_result<FwdIter1, FwdIter2>>::type hpx::ranges::exclusive_scan(ExF
&&
icy,
Fwd
first
Sen
last
Fwd
dest
T
init,
Op
&&
=
Op
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, \*first, ..., \*(first + (i - result) - 1)).

The reduce operations in the parallel *exclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>N</sub>) is defined as:

- *a*<sub>1</sub> when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>K</sub>), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>M</sub>, ..., *a*<sub>N</sub>)) where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

`Ret fun(const Type1 &a, const Type1 &b);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

## Returns

The *exclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `util::in_out_result<FwdIter1, FwdIter2>` otherwise. The *exclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type, typename Op = std::plus<T>>
exclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::exclusive_scan(Rng &&rng, O dest, T
init, Op &&op = Op())
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, ..., *(first + (i - result) - 1))`

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate `std::plus<T>`.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, a1, ..., aK)
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, aM, ..., aN) where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

### Returns

The *exclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type, typename Op = std::plus<T>>
parallel::util::detail::algorithm_result<ExPolicy, exclusive_scan_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::exclusive_scan
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(+, init, \*first, ..., \*(first + (i - result) - 1))

The reduce operations in the parallel *exclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate `std::plus<T>`.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(+, *a*1, ..., *a**N*) is defined as:

- *a*1 when *N* is 1
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, *a*1, ..., *a**K*)
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, *a**M*, ..., *a**N*) where  $1 < K+1 = M \leq N$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

#### Returns

The *exclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *exclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

### hpx::ranges::swap\_ranges

Defined in header `hpx/algorithm.hpp`<sup>715</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename Sent1, typename InIter2, typename Sent2>
```

```
swap_ranges_result<InIter1, InIter2> hpx::ranges::swap_ranges(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2)
```

Exchanges elements between range `[first1, last1)` and another range starting at *first2*.

The swap operations in the parallel *swap\_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

<sup>715</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**Complexity: Linear in the distance between *first1* and *last1***Template Parameters**

- **InIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for InIter2.

**Parameters**

- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

**Returns**

The *swap\_ranges* algorithm returns *swap\_ranges\_result<InIter1, InIter2>*. The *swap\_ranges* algorithm returns in\_in\_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<FwdIter1, FwdIter2>>::type hpx::ranges::swap_ranges(ExPolicy  
&&pol-  
icy,  
FwdIter1  
first1,  
Sent1  
last1,  
FwdIter2  
first2,  
Sent2  
last2)
```

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap\_ranges* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap\_ranges* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in the distance between *first1* and *last1*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for FwdIter2.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

### Returns

The *swap\_ranges* algorithm returns a `hpx::future<swap_ranges_result<FwdIter1, FwdIter2>>` if the execution policy is of type *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *swap\_ranges* algorithm returns *in\_in\_result* with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename Rng1, typename Rng2>
```

```
swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>> hpx::ranges::swap_ranges(Rng1
&&rng1,
Rng2
&&rng2)
```

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap\_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note**

Complexity: Linear in the distance between *first1* and *last1*

**Template Parameters**

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

**Returns**

The *swap\_ranges* algorithm returns *swap\_ranges\_result*<std::ranges::iterator\_t<Rng1>, std::ranges::iterator\_t<Rng1>>. The *swap\_ranges* algorithm returns in *in\_result* with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

template<typename **ExPolicy**, typename **Rng1**, typename **Rng2**>

*parallel::util::detail::algorithm\_result*<*ExPolicy*, *swap\_ranges\_result*<std::ranges::iterator\_t<*Rng1*>, std::ranges::iterator\_t<*Rng2*>>> *hpx::r*

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap\_ranges* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap\_ranges* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear in the distance between *first1* and *last1*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

#### Returns

The `swap_ranges` algorithm returns a `hpx::future<swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>>` if the execution policy is of type `parallel_task_policy` and returns `swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>` otherwise. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with `first1` and the second element as the iterator to the element past the last element exchanged in the range beginning with `first2`.

### hpx::ranges::stable\_sort

Defined in header `hpx/algorithm.hpp`<sup>716</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
RandomIt hpx::ranges::stable_sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range `[first, last)` in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

`comp` has to induce a strict weak ordering on the values.

The assignments in the parallel `stable_sort` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

<sup>716</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **RandomIt**.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – **comp** is a callable object. The return value of the INVOKE operation applied to an object of type **Comp**, when contextually converted to **bool**, yields **true** if the first argument of the call is less than the second, and **false** otherwise. It is assumed that **comp** will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

## Returns

The *stable\_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type hpx::ranges::stable_sort(ExPolicy  
                                                                                      &&policy,  
                                                                                      RandomIt first,  
                                                                                      Sent last, Comp  
                                                                                      &&comp =  
                                                                                      Comp(), Proj  
                                                                                      &&proj =  
                                                                                      Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object **comp** (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **RandomIt**.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – **comp** is a callable object. The return value of the INVOKE operation applied to an object of type **Comp**, when contextually converted to **bool**, yields **true** if the first argument of the call is less than the second, and **false** otherwise. It is assumed that **comp** will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

## Returns

The *stable\_sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::stable_sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range  $[\text{first}, \text{last})$  in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object **comp** (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that  $i +$

*n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

*comp* has to induce a strict weak ordering on the values.

The assignments in the parallel *stable\_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note**

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the `INVOKE` operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The *stable\_sort* algorithm returns *std::ranges::iterator\_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::stable_sort(ExPolicy  
                                                                                                     &&pol-  
                                                                                                     icy,  
                                                                                                     Rng  
                                                                                                     &&rng,  
                                                                                                     Comp  
                                                                                                     &&comp  
                                                                                                     =  
                                                                                                     Comp(),  
                                                                                                     Proj  
                                                                                                     &&proj  
                                                                                                     =  
                                                                                                     Proj())
```

Sorts the elements in the range `[first, last)` in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the `INVOKE` operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *stable\_sort* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. It returns *last*.

## hpx::ranges::unique

Defined in header `hpx/algorithm.hpp`<sup>717</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::unique_copy`

```
template<typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
subrange_t<FwdIter, Sent> hpx::ranges::unique(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj =
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range `[first, last)` and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

---

<sup>717</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *unique* algorithm returns *subrange\_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename
Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::unique(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
last,
Pred
&&pred
=
Pred(),
Proj
&&proj
=
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

executes the assignments.

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

`bool pred(const Type1 &a, const Type2 &b);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *unique* algorithm returns *subrange\_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>> hpx::ranges::unique(Rng &&rng, Pred  
&&pred = Pred(),  
Proj &&proj =  
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note**

Complexity: Performs not more than  $N$  assignments, exactly  $N - 1$  applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where  $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$ .

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *unique* algorithm returns `subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>`. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> hpx::ranges::u
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs not more than *N* assignments, exactly *N* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where *N* = `std::distance(begin(rng), end(rng))`.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *unique* algorithm returns a `hpx::future <subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced\_task\_policy*

or *parallel\_task\_policy* and returns *subrange\_t<std::ranges::iterator\_t<Rng>, std::ranges::iterator\_t<Rng>>* otherwise. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

### hpx::ranges::unique\_copy

Defined in header `hpx/algorithm.hpp`<sup>718</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::unique*

```
template<typename InIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename Proj =
hpx::identity>
unique_copy_result<InIter, O> hpx::ranges::unique_copy(InIter first, Sent last, O dest, Pred &&pred = Pred(),
Proj &&proj = Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique\_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique\_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

<sup>718</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

`bool pred(const Type &a, const Type &b);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *unique\_copy* algorithm returns a `unique_copy_result<InIter, O>`. The *unique\_copy* algorithm returns an `in_out_result` with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename O, typename Pred =  
ranges::equal_to, typename Proj = hpx::identity>  
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<FwdIter, O>>::type hpx::ranges::unique_copy(ExPolicy  
                                                                 &&pol-  
                                                                 icy,  
                                                                 FwdIter  
                                                                 first,  
                                                                 Sent  
                                                                 last,  
                                                                 O  
                                                                 dest,  
                                                                 Pred  
                                                                 &&pred  
                                                                 =  
                                                                 Pred(),  
                                                                 Proj  
                                                                 &&proj  
                                                                 =  
                                                                 Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique\_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *unique\_copy* algorithm returns returns a *hpx::future< unique\_copy\_result<FwdIter, O>>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *unique\_copy\_result<FwdIter, O>* otherwise. The *unique\_copy* algorithm returns an *in\_out\_result* with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
unique_copy_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::unique_copy(Rng &&rng, O dest, Pred
&&pred = Pred(), Proj
&&proj = Proj())
```

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique\_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = `std::distance(begin(rng), end(rng))`.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique\_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *unique\_copy* algorithm returns *unique\_copy\_result*< `std::ranges::iterator_t<Rng>`,

O>. The *unique\_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::unique_copy(ExP  
&&  
icy,  
Rng  
&&  
O  
dest  
Pred  
&&  
=  
Pred  
Proj  
&&  
=  
Proj
```

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = *std::distance*(*begin*(*rng*), *end*(*rng*)).

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique\_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal\_to*<>

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *unique\_copy* algorithm returns a `hpx::future<unique_copy_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *unique\_copy\_result<std::ranges::iterator\_t<Rng>, O>* otherwise. The *unique\_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

### hpx::ranges::merge

Defined in header `hpx/algorithm.hpp`<sup>719</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::inplace\_merge*

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Comp =  
hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

---

<sup>719</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

*hpx::parallel::util::detail::algorithm\_result<ExPolicy, hpx::ranges::merge\_result<std::ranges::iterator\_t<Rng1>, std::ranges::iterator\_t<Rng2>*

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$  applications of the comparison *comp* and the each projection.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.

- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first range of elements the algorithm will be applied to.
- **rng2** – Refers to the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

#### Returns

The *merge* algorithm returns a `hpx::future<merge_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `merge_result<Iter1, Iter2, Iter3>` otherwise. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename  
Iter3, typename Comp = hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```

hpx::parallel::util::detail::algorithm_result<ExPolicy, hpx::ranges::merge_result<Iter1, Iter2, Iter3>>::type hpx::ranges::merge(ExPolicy
&&pol-
icy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Iter3
dest,
Comp
&&comp
=
Comp(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())

```

Merges two sorted ranges `[first1, last1)` and `[first2, last2)` into one sorted range beginning at `dest`. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$  applications of the comparison *comp* and the each projection.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an random access iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for *Iter2*.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

### Returns

The *merge* algorithm returns a `hpx::future<merge_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *merge\_result<Iter1, Iter2, Iter3>* otherwise. The *merge* algorithm returns the tuple of

the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Comp = hpx::ranges::less, typename Proj1 =  
hpx::identity, typename Proj2 = hpx::identity>  
hpx::ranges::merge_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::merge(Rng1  
                                                                &&rng1,  
                                                                Rng2  
                                                                &&rng2,  
                                                                Iter3  
                                                                dest,  
                                                                Comp  
                                                                &&comp  
                                                                =  
                                                                Comp(),  
                                                                Proj1  
                                                                &&proj1  
                                                                =  
                                                                Proj1(),  
                                                                Proj2  
                                                                &&proj2  
                                                                =  
                                                                Proj2())
```

Merges two sorted ranges [*first1*, *last1*) and [*first2*, *last2*) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$  applications of the comparison *comp* and the each projection.

## Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to *std::less*<>
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to *hpx::identity*

## Parameters

- **rng1** – Refers to the first range of elements the algorithm will be applied to.
- **rng2** – Refers to the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

## Returns

The *merge* algorithm returns *merge\_result<Iter1, Iter2, Iter3>*. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Comp
= hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::ranges::merge_result<Iter1, Iter2, Iter3> hpx::ranges::merge(Iter1 first1, Sent1 last1, Iter2 first2, Sent2
last2, Iter3 dest, Comp &&comp = Comp(),
Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Merges two sorted ranges `[first1, last1)` and `[first2, last2)` into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

### Note

Complexity: Performs  $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$  applications of the comparison *comp* and the each projection.

## Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a random access iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter1*.

- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

### Returns

The *merge* algorithm returns *merge\_result<Iter1, Iter2, Iter3>*. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

## hpx::ranges::inplace\_merge

Defined in header [hpx/algorithm.hpp](#)<sup>720</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::merge](#)

template<typename **ExPolicy**, typename **Rng**, typename **Iter**, typename **Comp** = [hpx::ranges::less](#), typename **Proj** = [hpx::identity](#)>

[hpx::parallel::util::detail::algorithm\\_result\\_t<ExPolicy, Iter>](#) [hpx::ranges::inplace\\_merge](#)([ExPolicy](#) &&policy, [Rng](#) &&rng, [Iter](#) middle, [Comp](#) &&comp = [Comp\(\)](#), [Proj](#) &&proj = [Proj\(\)](#))

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

The assignments in the parallel *inplace\_merge* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *inplace\_merge* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs O(std::distance(first, last)) applications of the comparison *comp* and the each projection.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace\_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

---

<sup>720</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range of elements the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *inplace\_merge* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. The *inplace\_merge* algorithm returns the source iterator *last*

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::inplace_merge(ExPolicy
&&policy, Iter
first, Iter middle,
Sent last, Comp
&&comp =
Comp(), Proj
&&proj = Proj())
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

The assignments in the parallel *inplace\_merge* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *inplace\_merge* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first}, \text{last}))$  applications of the comparison *comp* and the each projection.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace\_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *inplace\_merge* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. The *inplace\_merge* algorithm returns the source iterator *last*

```
template<typename Rng, typename Iter, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
```

```
Iter hpx::ranges::inplace_merge(Rng &&rng, Iter middle, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

**Note**

Complexity: Performs  $O(\text{std::distance}(\text{first}, \text{last}))$  applications of the comparison *comp* and the each projection.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace\_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **rng** – Refers to the range of elements the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *inplace\_merge* algorithm returns *Iter*. The *inplace\_merge* algorithm returns the source iterator *last*

```
template<typename Iter, typename Sent, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
```

```
Iter hpx::ranges::inplace_merge(Iter first, Iter middle, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Merges two consecutive sorted ranges `[first, middle)` and `[middle, last)` into one sorted range `[first, last)`. The order of equivalent elements in each of the original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

**Note**

Complexity: Performs  $O(\text{std::distance}(\text{first}, \text{last}))$  applications of the comparison *comp* and the each projection.

### Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace\_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *inplace\_merge* algorithm *Iter*. The *inplace\_merge* algorithm returns the source iterator *last*

### `hpx::ranges::search`

Defined in header `hpx/algorithm.hpp`<sup>721</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::search_n`

```
template<typename FwdIter, typename Sent, typename FwdIter2, typename Sent2, typename Pred =
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

<sup>721</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
FwdIter hpx::ranges::search(FwdIter first, Sent last, FwdIter2 s_first, Sent2 s_last, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S$  = distance(s\_first, s\_last) and  $N$  = distance(first, last).

### Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

### Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

### Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename FwdIter2, typename Sent2,
        typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::search(ExPolicy &&policy,
                                                                                   FwdIter first, Sent last,
                                                                                   FwdIter2 s_first, Sent2
                                                                                   s_last, Pred &&op =
                                                                                   Pred(), Proj1 &&proj1 =
                                                                                   Proj1(), Proj2 &&proj2 =
                                                                                   Proj2())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most  $(S*N)$  comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{distance}(first, last)$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

### Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range

[first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
```

```
std::ranges::iterator_t<Rng1> hpx::ranges::search(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S$  = distance(s\_first, s\_last) and  $N$  = distance(first, last).

### Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng2*.

### Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

### Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s\_first, s\_last) in range [first, last). If the length of the subsequence [s\_first, s\_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng1>> hpx::ranges::search(ExPolicy
&&pol-
icy,
Rng1
&&rng1,
Rng2
&&rng2,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S$  = distance(s\_first, s\_last) and  $N$  = distance(first, last).

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner

in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng2*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

### Returns

The *search* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

## hpx::ranges::search\_n

Defined in header `hpx/algorithm.hpp`<sup>722</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::search`

```
template<typename FwdIter, typename FwdIter2, typename Sent2, typename Pred = hpx::ranges::equal_to,
        typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
FwdIter hpx::ranges::search_n(FwdIter first, std::size_t count, FwdIter2 s_first, Sent2 s_last, Pred &&op =
                               Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search\_n* algorithm execute in sequential order in the calling thread.

### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S$  = distance(s\_first, s\_last) and  $N$  = count.

## Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

## Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.

<sup>722</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

### Returns

The *search\_n* algorithm returns *FwdIter*. The *search\_n* algorithm returns an iterator to the beginning of the last subsequence [s\_first, s\_last) in range [first, first+count). If the length of the subsequence [s\_first, s\_last) is greater than the length of the range [first, first+count), *first* is returned. Additionally, if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename ExPolicy, typename FwdIter, typename FwdIter2, typename Sent2, typename Pred =  
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::search_n(ExPolicy  
    &&policy,  
    FwdIter first,  
    std::size_t count,  
    FwdIter2 s_first,  
    Sent2 s_last, Pred  
    &&op = Pred(),  
    Proj1 &&proj1 =  
    Proj1(), Proj2  
    &&proj2 =  
    Proj2())
```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: at most  $(S*N)$  comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{count}$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

### Returns

The *search\_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search\_n* algorithm returns an iterator to the beginning of the last subsequence [s\_first, s\_last) in range [first, first+count). If the length of the subsequence [s\_first, s\_last) is greater than the length of the range [first, first+count), *first* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
```

```
std::ranges::iterator_t<Rng1> hpx::ranges::search_n(Rng1 &&rng1, std::size_t count, Rng2 &&rng2, Pred
&&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: at most (S\*N) comparisons where *S* = distance(s\_first, s\_last) and *N* = distance(first, last).

### Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal\_to<>*
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

### Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.

- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

### Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [*s\_first*, *s\_last*) in range [*first*, *last*). If the length of the subsequence [*s\_first*, *s\_last*) is greater than the length of the range [*first*, *last*), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename  
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng1>> hpx::ranges::search_n(ExPolicy  
                                                         &&pol-  
                                                         icy,  
                                                         Rng1  
                                                         &&rng1,  
                                                         std::size_t  
                                                         count,  
                                                         Rng2  
                                                         &&rng2,  
                                                         Pred  
                                                         &&op  
                                                         =  
                                                         Pred(),  
                                                         Proj1  
                                                         &&proj1  
                                                         =  
                                                         Proj1(),  
                                                         Proj2  
                                                         &&proj2  
                                                         =  
                                                         Proj2())
```

Searches the range [*first*, *last*) for any elements in the range [*s\_first*, *s\_last*). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution

policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: at most  $(S*N)$  comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{distance}(first, last)$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

## Returns

The *search* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `task_execution_policy` and returns `FwdIter` otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

## hpx::ranges::is\_partitioned

Defined in header `hpx/algorithm.hpp`<sup>723</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter, typename Sent, typename Pred, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_partitioned(FwdIter first, Sent last, Pred &&pred, Proj &&proj = Proj())
```

Determines if the range `[first, last)` is partitioned.

### Note

Complexity: at most  $(N)$  predicate evaluations where  $N = \text{distance}(\text{first}, \text{last})$ .

## Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

## Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

<sup>723</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

### Returns

The *is\_partitioned* algorithm returns *bool*. The *is\_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is\_partitioned* returns false. If the range [first, last) contains less than two elements, the function is always true.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_partitioned(ExPolicy  
                                                    &&policy,  
                                                    FwdIter first,  
                                                    Sent last, Pred  
                                                    &&pred, Proj  
                                                    &&proj =  
                                                    Proj())
```

Determines if the range [first, last) is partitioned.

The predicate operations in the parallel *is\_partitioned* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is\_partitioned* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most (N) predicate evaluations where  $N = \text{distance}(\text{first}, \text{last})$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *Copy-Constructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *is\_partitioned* algorithm returns a `hpx::future<bool>` if the execution policy is of type *task\_execution\_policy* and returns *bool* otherwise. The *is\_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is\_partitioned* returns false. If the range [*first*, *last*) contains less than two elements, the function is always true.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_partitioned(Rng &&rng, Pred &&pred, Proj &&proj = Proj())
```

Determines if the range *rng* is partitioned.

#### Note

Complexity: at most (*N*) predicate evaluations where *N* = `std::size(rng)`.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

### Returns

The *is\_partitioned* algorithm returns *bool*. The *is\_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is\_partitioned* returns false. If the range *rng* contains less than two elements, the function is always true.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_partitioned(ExPolicy  
                                                                 &&policy, Rng  
                                                                 &&rng, Pred  
                                                                 &&pred, Proj  
                                                                 &&proj =  
                                                                 Proj())
```

Determines if the range [first, last) is partitioned.

The predicate operations in the parallel *is\_partitioned* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is\_partitioned* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most (*N*) predicate evaluations where *N* = `std::size(rng)`.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *Copy-Constructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *is\_partitioned* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task\_execution\_policy* and returns *bool* otherwise. The *is\_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is\_partitioned* returns false. If the range *rng* contains less than two elements, the function is always true.

### hpx::ranges::starts\_with

Defined in header [hpx/algorithm.hpp](#)<sup>724</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred =  
ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
bool hpx::ranges::starts_with(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1  
                             &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts\_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

### Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter1*.

<sup>724</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Iter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

### Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

### Returns

The *starts\_with* algorithm returns *bool*. The *starts\_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,  
typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::starts_with(ExPolicy &&policy,  
                                                FwdIter1 first1, Sent1  
                                                last1, FwdIter2 first2,  
                                                Sent2 last2, Pred  
                                                &&pred = Pred(),  
                                                Proj1 &&proj1 =  
                                                Proj1(), Proj2  
                                                &&proj2 = Proj2())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts\_with* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts\_with* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear: at most  $\min(N1, N2)$  applications of the predicate and both projections.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

### Returns

The `starts_with` algorithm returns a `hpx::future<bool>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `bool` otherwise. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
```

```
bool hpx::ranges::starts_with(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 =
    Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range `rng2` matches the prefix of the first range `rng1`.

The assignments in the parallel `starts_with` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

### Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

## Returns

The *starts\_with* algorithm returns *bool*. The *starts\_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ranges::starts_with(ExPolicy
&&policy, Rng1
&&rng1, Rng2
&&rng2, Pred
&&pred =
Pred(), Proj1
&&proj1 =
Proj1(), Proj2
&&proj2 =
Proj2())
```

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts\_with* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts\_with* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

### Returns

The `starts_with` algorithm returns a `hpx::future<bool>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `bool` otherwise. The `starts_with` algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

### `hpx::ranges::uninitialized_copy`

Defined in header `hpx/algorithm.hpp`<sup>725</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_copy_n`

template<typename **InIter**, typename **Sent1**, typename **FwdIter**, typename **Sent2**>

`hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_copy(InIter first1, Sent1 last1, FwdIter first2, Sent2 last2)`

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel `uninitialized_copy` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

---

<sup>725</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

#### Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

#### Returns

The *uninitialized\_copy* algorithm returns an *in\_out\_result<InIter, FwdIter>*. The *uninitialized\_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>>::type hpx::ranges::uninitialized
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns**

The *uninitialized\_copy* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `in_out_result<InIter, FwdIter>` otherwise. The *uninitialized\_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

template<typename **Rng1**, typename **Rng2**>

`hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator,`

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized\_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

### Parameters

- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

### Returns

The *uninitialized\_copy* algorithm returns an *in\_out\_result*<typename `hpx::traits::range_traits<Rng1>::iterator_type`, typename `hpx::traits::range_traits<Rng2>::iterator_type`>. The *uninitialized\_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, ty
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

## Returns

The *uninitialized\_copy* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The *uninitialized\_copy* algorithm returns the input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

## `hpx::ranges::uninitialized_copy_n`

Defined in header `hpx/algorithm.hpp`<sup>726</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_copy`

`template<typename InIter, typename Size, typename FwdIter, typename Sent2>`

`hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_copy_n(InIter first1, Size count, FwdIter first2, Sent2 last2)`

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized\_copy\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

---

<sup>726</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

**Parameters**

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns**

The *uninitialized\_copy\_n* algorithm returns *in\_out\_result<InIter, FwdIter>*. The *uninitialized\_copy\_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type hpx::ranges::uninitialized_copy_n(
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized\_copy\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_copy\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

**Returns**

The *uninitialized\_copy\_n* algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *uninitialized\_copy\_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::partial\_sort\_copy

Defined in header `hpx/algorithm.hpp`<sup>727</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent1, typename RandIter, typename Sent2, typename Comp =
ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
partial_sort_copy_result<InIter, RandIter> hpx::ranges::partial_sort_copy(InIter first, Sent1 last, RandIter
                                                                    r_first, Sent2 r_last, Comp
                                                                    &&comp = Comp(), Proj1
                                                                    &&proj1 = Proj1(), Proj2
                                                                    &&proj2 = Proj2())
```

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r\_first, r\_last). At most r\_last - r\_first of the elements are placed sorted to the range [r\_first, r\_first + n) where n is the number of elements to sort (n = min(last - first, r\_last - r\_first)).

The assignments in the parallel *partial\_sort\_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity:  $O(N \log(\min(D, N)))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  and  $D = \text{std::distance}(\text{r\_first}, \text{r\_last})$  comparisons.

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **RandIter** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent2** – The type of the destination sentinel (deduced). This sentinel type must be a sentinel for RandIter.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

<sup>727</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to the sentinel value denoting the end of the sequence of elements the algorithm will be applied to.
- **r\_first** – Refers to the beginning of the destination range.
- **r\_last** – Refers to the sentinel denoting the end of the destination range.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate `comp` is invoked.

### Returns

The *partial\_sort\_copy* algorithm returns a *partial\_sort\_copy\_result*<*InIter*, *RandIter*>. The algorithm returns {last, result\_first + N}.

```
template<typename ExPolicy, typename FwdIter, typename Sent1, typename RandIter, typename Sent2,  
typename Comp = ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, partial_sort_copy_result<FwdIter, RandIter>> hpx::ranges::partial_sort_copy(Ex
```

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r\_first, r\_last). At most `r_last - r_first` of the elements are placed sorted to the range [r\_first, r\_first + n) where n is the number of elements to sort (`n = min(last - first, r_last - r_first)`).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(\min(D, N)))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  and  $D = \text{std::distance}(\text{r\_first}, \text{r\_last})$  comparisons.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **RandIter** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent2** – The type of the destination sentinel (deduced). This sentinel type must be a sentinel for RandIter.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the sentinel value denoting the end of the sequence of elements the algorithm will be applied to.
- **r\_first** – Refers to the beginning of the destination range.
- **r\_last** – Refers to the sentinel denoting the end of the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.

- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate *comp* is invoked.

### Returns

The *partial\_sort\_copy* algorithm returns a `hpx::future<partial_sort_copy_result<FwdIter, RandIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *partial\_sort\_copy\_result<FwdIter, RandIter>* otherwise. The algorithm returns {last, result\_first + N}.

```
template<typename Rng1, typename Rng2, typename Comp = ranges::less, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
```

```
partial_sort_copy_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>> hpx::ranges::partial_sort_copy(Rng1
&&rng1,
Rng2
&&rng2,
Comp
&&comp
=
Comp(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r\_first, r\_last). At most r\_last - r\_first of the elements are placed sorted to the range [r\_first, r\_first + n) where n is the number of elements to sort (n = min(last - first, r\_last - r\_first)).

The assignments in the parallel *partial\_sort\_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity:  $O(N \log(\min(D, N)))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  and  $D = \text{std::distance}(\text{r\_first}, \text{r\_last})$  comparisons.

### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of a random iterator.

- **Comp** – The type of the function/function object to use (deduced). `Comp` defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

### Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate `comp` is invoked.

### Returns

The `partial_sort_copy` algorithm returns `partial_sort_copy_result<range_iterator_t<Rng1>, range_iterator_t<Rng2>>`. The algorithm returns `{last, result_first + N}`.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Comp = ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, partial_sort_copy_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>>> h
```

Sorts some of the elements in the range `[first, last)` in ascending order, storing the result in the range `[r_first, r_last)`. At most `r_last - r_first` of the elements are placed sorted to the range `[r_first, r_first + n)` where `n` is the number of elements to sort (`n = min(last - first, r_last - r_first)`).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity:  $O(N \log(\min(D, N)))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  and  $D = \text{std::distance}(\text{r\_first}, \text{r\_last})$  comparisons.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of a random iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate `comp` is invoked.

**Returns**

The *partial\_sort\_copy* algorithm returns a `hpx::future<partial_sort_copy_result<range_iterator_t<Rng1>, range_iterator_t<Rng2>>>` if the execution policy

is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *partial\_sort\_copy\_result*<*range\_iterator\_t*<*Rng1*>, *range\_iterator\_t*<*Rng2*>> otherwise. The algorithm returns {last, result\_first + N}.

### hpx::ranges::inclusive\_scan

Defined in header `hpx/algorithm.hpp`<sup>728</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename Op = std::plus<typename
std::iterator_traits<InIter>::value_type>>
```

```
inclusive_scan_result<InIter, OutIter> hpx::ranges::inclusive_scan(InIter first, Sent last, OutIter dest, Op
&&op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(op, \*first, ..., \*(first + (i - result))).

The reduce operations in the parallel *inclusive\_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, a1, ..., aK)
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, aM, ..., aN) where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.

<sup>728</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

## Returns

The *inclusive\_scan* algorithm returns `util::in_out_result<InIter, OutIter>`. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Op =  
std::plus<typename std::iterator_traits<FwdIter1>::value_type>>
```

```
parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<FwdIter1, FwdIter2>>::type hpx::ranges::inclusive_scan(ExP  
    &&  
    icality,  
    FwdIter1,  
    first,  
    Sent,  
    last,  
    FwdIter2,  
    dest,  
    Op,  
    &&
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(`op, *first, ..., *(first + (i - result))`).

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
- GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aK)
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, aM, ..., aN) where  $1 < K+1 = M \leq N$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

**Returns**

The *inclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<FwdIter1,`

*FwdIter2*>> if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *util::in\_out\_result*<*FwdIter1*, *FwdIter2*> otherwise. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename Op = std::plus<typename  
hpx::traits::range_traits<Rng>::value_type>>
```

```
inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::inclusive_scan(Rng &&rng, O dest, Op  
                                         &&op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(op, \*first, ..., \*(first + (i - result))).

The reduce operations in the parallel *inclusive\_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(+, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, *a1*, ..., *aK*)
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, *aM*, ..., *aN*) where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

### Returns

The *inclusive\_scan* algorithm returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>`. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename Op = std::plus<typename  
hpx::traits::range_traits<Rng>::value_type>>
```

```
parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::inclusive_scan
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- $a_1$  when *N* is 1

- GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aK)
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, aM, ..., aN) where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

### Returns

The *inclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied

```
template<typename InIter, typename Sent, typename OutIter, typename Op, typename T = typename
std::iterator_traits<InIter>::value_type>
```

```
inclusive_scan_result<InIter, OutIter> hpx::ranges::inclusive_scan(InIter first, Sent last, OutIter dest, Op
&&op, T init)
```

Assigns through each iterator *i* in  $[result, result + (last - first))$  the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(op, init, \*first, ..., \*(first + (i - result))).

The reduce operations in the parallel *inclusive\_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>N</sub>) is defined as:

- *a*<sub>1</sub> when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>K</sub>), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>M</sub>, ..., *a*<sub>N</sub>)) where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

**Returns**

The *inclusive\_scan* algorithm returns *util::in\_out\_result<InIter, OutIter>*. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Op, typename
T = typename std::iterator_traits<FwdIter1>::value_type>
```

```
parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<FwdIter1, FwdIter2>>::type hpx::ranges::inclusive_scan(ExP
```

```
&&
icy,
InIt
first
Sen
last,
Out
Iter
dest
Op
&&
T
init,
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(op, init, \*first, ..., \*(first + (i - result))).

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aK), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, aM, ..., aN)) where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

## Returns

The *inclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<InIter, OutIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `util::in_out_result<InIter, OutIter>` otherwise. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename Op, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::inclusive_scan(Rng &&rng, O dest, Op
&&op, T init)
```

Assigns through each iterator *i* in  $[result, result + (last - first))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>N</sub>) is defined as:

- *a*<sub>1</sub> when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>1</sub>, ..., *a*<sub>K</sub>), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a*<sub>M</sub>, ..., *a*<sub>N</sub>)) where  $1 < K+1 = M \leq N$ .

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

**Returns**

The *inclusive\_scan* algorithm returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>`. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename Op, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::inclusive_scan
```

Assigns through each iterator  $i$  in  $[\text{result}, \text{result} + (\text{last} - \text{first}))$  the value of GENERALIZED\_NONCOMMUTATIVE\_SUM( $\text{op}$ ,  $\text{init}$ ,  $*\text{first}$ , ...,  $*(\text{first} + (i - \text{result}))$ ).

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the  $i$ th input element in the  $i$ th sum. If  $\text{op}$  is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate  $\text{op}$ .

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM( $\text{op}$ ,  $a_1$ , ...,  $a_N$ ) is defined as:

- $a_1$  when  $N$  is 1
- $\text{op}(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a_1, \dots, a_K), \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a_M, \dots, a_N))$  where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

`Ret fun(const Type1 &a, const Type1 &b);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

### Returns

The *inclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied

### `hpx::ranges::uninitialized_value_construct`

Defined in header `hpx/algorithm.hpp`<sup>729</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_value_construct_n`

template<typename **FwdIter**, typename **Sent**>

*FwdIter* `hpx::ranges::uninitialized_value_construct`(*FwdIter* first, *Sent* last)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

---

<sup>729</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

**Returns**

The *uninitialized\_value\_construct* algorithm returns a returns *FwdIter*. The *uninitialized\_value\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Sent>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_value_construct(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
last)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

### Returns

The *uninitialized\_value\_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_value\_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **Rng**>

*hpx::traits::range\_traits<Rng>::iterator\_type* *hpx::ranges::uninitialized\_value\_construct*(*Rng* &&rng)

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

**Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

### Parameters

**rng** – Refers to the range to which will be value constructed.

### Returns

The *uninitialized\_value\_construct* algorithm returns a *hpx::traits::range\_traits<Rng>::iterator\_type*. The *uninitialized\_value\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename Rng>
```

```
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::uninitiali
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be value constructed

### Returns

The *uninitialized\_value\_construct* algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `typename hpx::traits::range_traits<Rng>::iterator_type` otherwise. The *uninitialized\_value\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

## hpx::ranges::uninitialized\_value\_construct\_n

Defined in header `hpx/algorithm.hpp`<sup>730</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_value_construct`

template<typename **FwdIter**, typename **Size**>

*FwdIter* `hpx::ranges::uninitialized_value_construct_n`(*FwdIter* first, *Size* count)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct_n` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

## Returns

The `uninitialized_value_construct_n` algorithm returns a `FwdIter`. The `uninitialized_value_construct_n` algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>

---

<sup>730</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

*hpx::parallel::util::detail::algorithm\_result\_t<ExPolicy, FwdIter>* *hpx::ranges::uninitialized\_value\_construct\_n*(*ExPolicy* &&policy, *FwdIter* first, *Size* count)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_value\_construct\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

### Returns

The *uninitialized\_value\_construct\_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_value\_construct\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

## hpx::ranges::equal

Defined in header `hpx/algorithm.hpp`<sup>731</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename  
Pred = equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::equal(ExPolicy &&policy, Iter1  
first1, Sent1 last1, Iter2 first2,  
Sent2 last2, Pred &&op =  
Pred(), Proj1 &&proj1 =  
Proj1(), Proj2 &&proj2 =  
Proj2())
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate *f*.

### Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), *\*i* equals *\*(first2 + (i - first1))*. This overload of equal uses operator== to determine if two elements are equal.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).

<sup>731</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

## Returns

The *equal* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::equal(ExPolicy &&policy, Rng1
&&rng1, Rng2 &&rng2,
Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Returns true if the range `[first1, last1)` is equal to the range starting at `first2`, and false otherwise.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most *last1 - first1* applications of the predicate *f*.

**Note**

The two ranges are considered equal if, for every iterator *i* in the range `[first1,last1)`, *\*i* equals *\*(first2 + (i - first1))*. This overload of *equal* uses `operator==` to determine if two elements are equal.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred = equal_to,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
bool hpx::ranges::equal(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&op = Pred(), Proj1 &&proj1
                        = Proj1(), Proj2 &&proj2 = Proj2())
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

#### Note

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate *f*.

#### Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), *\*i* equals *\*(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

### Template Parameters

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

- **Proj1** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
bool hpx::ranges::equal(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise.

#### Note

Complexity: At most *last1 - first1* applications of the predicate *f*.

**Note**

The two ranges are considered equal if, for every iterator *i* in the range `[first1,last1)`, `*i` equals `*(first2 + (i - first1))`. This overload of `equal` uses `operator==` to determine if two elements are equal.

**Template Parameters**

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

**Parameters**

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

**Returns**

The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

**hpx::ranges::mismatch**

Defined in header `hpx/algorithm.hpp`<sup>732</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**, typename **Sent2**, typename **Pred** = equal\_to, typename **Proj1** = *hpx::identity*, typename **Proj2** = *hpx::identity*>

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, mismatch_result<Iter1, Iter2>>::type hpx::ranges::mismatch(ExPolicy
&&pol-
icy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Returns true if the range [first1, last1) is mismatch to the range [first2, last2), and false otherwise.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate *f*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and  $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$  then no applications of the predicate *f* are made.

<sup>732</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

The two ranges are considered mismatch if, for every iterator  $i$  in the range  $[first1, last1)$ ,  $*i$  mismatches  $*(first2 + (i - first1))$ . This overload of `mismatch` uses `operator==` to determine if two elements are mismatch.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *mismatch* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *mismatch* algorithm returns true if the elements in the two ranges are mismatch, otherwise it returns false. If the length of the range [first1, last1) does not mismatch the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 =  
hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, mismatch_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type, Pred, Proj1, Proj2>>
```

Returns `std::pair` with iterators to the first two non-equivalent elements.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most *last1 - first1* applications of the predicate *f*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::pair<FwdIter1, FwdIter2>` otherwise. The *mismatch* algorithm returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2, last2).

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred = equal_to,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
mismatch_result<Iter1, Iter2> hpx::ranges::mismatch(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred
&&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Returns true if the range `[first1, last1)` is mismatch to the range `[first2, last2)`, and false otherwise.

**Note**

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate  $f$ . If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and  $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$  then no applications of the predicate  $f$  are made.

**Note**

The two ranges are considered mismatch if, for every iterator  $i$  in the range `[first1, last1)`,  $*i$  mismatches  $*(\text{first2} + (i - \text{first1}))$ . This overload of *mismatch* uses `operator==` to determine if two elements are mismatch.

### Template Parameters

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *mismatch* algorithm returns *bool*. The *mismatch* algorithm returns true if the elements in the two ranges are mismatch, otherwise it returns false. If the length of the range `[first1, last1)` does not mismatch the length of the range `[first2, last2)`, it returns false.

```
template<typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
mismatch_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type> hpx::r
```

Returns `std::pair` with iterators to the first two non-equivalent elements.

#### Note

Complexity: At most *last1 - first1* applications of the predicate *f*.

### Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

## Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

## Returns

The *mismatch* algorithm returns `std::pair<FwdIter1, FwdIter2>`. The *mismatch* algorithm returns the first mismatching pair of elements from two ranges: one defined by `[first1, last1)` and another defined by `[first2, last2)`.

## `hpx::ranges::uninitialized_default_construct`

Defined in header `hpx/algorithm.hpp`<sup>733</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_default_construct_n`

template<typename **FwdIter**, typename **Sent**>

*FwdIter* `hpx::ranges::uninitialized_default_construct`(*FwdIter* first, *Sent* last)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

---

<sup>733</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

### Returns

The *uninitialized\_default\_construct* algorithm returns a returns *FwdIter*. The *uninitialized\_default\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Sent>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_default_construct(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
last)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

**Returns**

The *uninitialized\_default\_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_default\_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename Rng>
```

```
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::uninitialized_default_construct(Rng  
                                                                                       &&rng)
```

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

**Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

**rng** – Refers to the range to which will be default constructed.

**Returns**

The *uninitialized\_default\_construct* algorithm returns a *hpx::traits::range\_traits<Rng>::iterator\_type*. The *uninitialized\_default\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename Rng>
```

```
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::uninitiali
```

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be default constructed

**Returns**

The *uninitialized\_default\_construct* algorithm returns a *hpx::future<typename hpx::traits::range\_traits<Rng>::iterator\_type>*, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *typename hpx::traits::range\_traits<Rng>::iterator\_type* otherwise. The *uninitialized\_default\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

## hpx::ranges::uninitialized\_default\_construct\_n

Defined in header `hpx/algorithm.hpp`<sup>734</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_default_construct`

template<typename **FwdIter**, typename **Size**>

*FwdIter* `hpx::ranges::uninitialized_default_construct_n`(*FwdIter* first, *Size* count)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct_n` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

### Returns

The `uninitialized_default_construct_n` algorithm returns a returns *FwdIter*. The `uninitialized_default_construct_n` algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>

---

<sup>734</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

`parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::uninitialized_default_construct_n(ExPolicy &&policy, FwdIter first, Size count)`

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_default_construct_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `uninitialized_default_construct_n` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

## Returns

The `uninitialized_default_construct_n` algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter` otherwise. The `uninitialized_default_construct_n` algorithm returns the iterator to the element in the source range, one past the last element constructed.

## hpx::ranges::ends\_with

Defined in header `hpx/algorithm.hpp`<sup>735</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred =  
ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
bool hpx::ranges::ends_with(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1  
                             &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends\_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

## Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of optional projection function for the destination range. This defaults to *hpx::identity*

## Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.

---

<sup>735</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

### Returns

The *ends\_with* algorithm returns *bool*. The *ends\_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ranges::ends_with(ExPolicy &&policy,
                                                                                      FwdIter1 first1, Sent1
                                                                                      last1, FwdIter2 first2,
                                                                                      Sent2 last2, Pred
                                                                                      &&pred = Pred(), Proj1
                                                                                      &&proj1 = Proj1(),
                                                                                      Proj2 &&proj2 =
                                                                                      Proj2())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends\_with* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *ends\_with* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.

- **FwdIter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

### Returns

The `ends_with` algorithm returns a `hpx::future<bool>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `bool` otherwise. The `ends_with` algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
bool hpx::ranges::ends_with(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(),
                             Proj2 &&proj2 = Proj2())
```

Checks whether the second range `rng2` matches the suffix of the first range `rng1`.

The assignments in the parallel `ends_with` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

## Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

## Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate is invoked.

## Returns

The *ends\_with* algorithm returns *bool*. The *ends\_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ranges::ends_with(ExPolicy &&policy,
                                                                                               Rng1 &&rng1,
                                                                                               Rng2 &&rng2, Pred
                                                                                               &&pred = Pred(),
                                                                                               Proj1 &&proj1 =
                                                                                               Proj1(), Proj2
                                                                                               &&proj2 = Proj2())
```

Checks whether the second range *rng2* matches the suffix of the first range *rng1*.

The assignments in the parallel *ends\_with* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *ends\_with* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear: at most  $\min(N1, N2)$  applications of the predicate and both projections.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

**Returns**

The *ends\_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *ends\_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

## hpx::ranges::min\_element

Defined in header `hpx/algorithm.hpp`<sup>736</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::max_element`
- `hpx::ranges::minmax_element`

```
template<typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less, typename Proj =
hpx::identity>
```

```
FwdIter hpx::ranges::min_element(FwdIter first, Sent last, F &&f = F(), Proj &&proj = Proj())
```

Finds the smallest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *min\_element* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

## Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

<sup>736</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *min\_element* algorithm returns *FwdIter*. The *min\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::min_element(Rng &&rng, F &&f = F(), Proj &&proj = Proj())
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min\_element* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *min\_element* algorithm returns a *hpx::traits::range\_iterator*<Rng>::type otherwise. The *min\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less,
typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::min_element(ExPolicy
&&policy,
FwdIter first,
Sent last, F &&f
= F(), Proj
&&proj = Proj())
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *min\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *min\_element* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *min\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename Rng, typename F = hpx::parallel::detail::less, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::min_element(ExPolicy
&&pol-
icy,
Rng
&&rng,
F
&&f
=
F(),
Proj
&&proj
=
Proj())
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `min_element` requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The `min_element` algorithm returns a `hpx::future<hpx::traits::range_iterator<Rng>::type>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns *FwdIter* otherwise. The `min_element` algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

## hpx::ranges::max\_element

Defined in header `hpx/algorithm.hpp`<sup>737</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::min_element`
- `hpx::ranges::minmax_element`

```
template<typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
FwdIter hpx::ranges::max_element(FwdIter first, Sent last, F &&f = F(), Proj &&proj = Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel `max_element` algorithm execute in sequential order in the calling thread.

<sup>737</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *max\_element* algorithm returns a *FwdIter*. The *max\_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::max_element(Rng &&rng, F &&f = F(), Proj &&proj = Proj())
```

Finds the greatest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *max\_element* algorithm execute in sequential order in the calling thread.

**Note**

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *max\_element* algorithm returns a *hpx::traits::range\_iterator<Rng>::type* otherwise. The *max\_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less,
typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::max_element(ExPolicy
&&policy,
FwdIter first,
Sent last, F &&f
= F(), Proj
&&proj = Proj())
```

Finds the greatest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for **FwdIter**.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *max\_element* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *max\_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::max_element(ExPolicy
&&pol-
icy,
Rng
&&rng,
F
&&f
=
F(),
Proj
&&proj
=
Proj())

```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *max\_element* algorithm returns a `hpx::future<hpx::traits::range_iterator<Rng>::type>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *max\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

### hpx::ranges::minmax\_element

Defined in header `hpx/algorithm.hpp`<sup>738</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::min_element`
- `hpx::ranges::max_element`

```
template<typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less, typename Proj =
hpx::identity>
```

```
minmax_element_result<FwdIter> hpx::ranges::minmax_element(FwdIter first, Sent last, F &&f = F(), Proj
&&proj = Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The assignments in the parallel *minmax\_element* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: At most  $\max(\text{floor}(3/2 * (N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

<sup>738</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *minmax\_element* algorithm returns a *minmax\_element\_result*<*FwdIter*, *FwdIter*>. The *minmax\_element* algorithm returns a *min\_max\_result* consisting of an iterator to the smallest element as the min element and an iterator to the greatest element as the max element. Returns *minmax\_element\_result*{first, first} if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
minmax_element_result<std::ranges::iterator_t<Rng>> hpx::ranges::minmax_element(Rng &&rng, F &&f =  
F(), Proj &&proj =  
Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The assignments in the parallel *minmax\_element* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: At most  $\max(\text{floor}(3/2 * (N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *minmax\_element* algorithm returns a *minmax\_element\_result*<*hpx::traits::range\_iterator*<*Rng*>::type, *hpx::traits::range\_iterator*<*Rng*>::type>. The *minmax\_element* algorithm returns a *min\_max\_result* consisting of an range iterator to the smallest element as the min element and an range iterator to the greatest element as the max element. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less,  
typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, minmax_element_result<FwdIter>> hpx::ranges::minmax_element(ExPolicy  
&&pol-  
icy,  
FwdIter  
first,  
Sent  
last,  
F  
&&f  
=  
F(),  
Proj  
&&proj  
=  
Proj()
```

Finds the greatest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $\max(\text{floor}(3/2*(N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to *std::less*. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *minmax\_element* algorithm returns a *minmax\_element\_result<FwdIter, FwdIter>*. The *minmax\_element* algorithm returns a *min\_max\_result* consisting of an iterator to the smallest element as the min element and an iterator to the greatest element as the max element. Returns *minmax\_element\_result{first, first}* if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename ExPolicy, typename Rng, typename F = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, minmax_element_result<std::ranges::iterator_t<Rng>>> hpx::ranges::minmax_e
```

Finds the greatest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $\max(\text{floor}(3/2 * (N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *minmax\_element* algorithm returns a *minmax\_element\_result*<*hpx::traits::range\_iterator*<*Rng*>::type, *hpx::traits::range\_iterator*<*Rng*>::type>. The *minmax\_element* algorithm returns a *min\_max\_result* consisting of an range iterator to the smallest element as the min element and an range iterator to the greatest element as the max element. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

## hpx::ranges::adjacent\_find

Defined in header `hpx/algorithm.hpp`<sup>739</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **FwdIter**, typename **Sent**, typename **Proj** = *hpx::identity*, typename **Pred** = *detail::equal\_to*>

*FwdIter* *hpx::ranges::adjacent\_find*(*FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Searches the range [first, last) for two consecutive identical elements.

### Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

## Template Parameters

- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use.

## Parameters

<sup>739</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *adjacent\_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Proj = hpx::identity, typename Pred  
= detail::equal_to>
```

```
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::adjacent_find(ExPolicy  
                                                    &&policy,  
                                                    FwdIter first,  
                                                    Sent last, Pred  
                                                    &&pred =  
                                                    Pred(), Proj  
                                                    &&proj =  
                                                    Proj())
```

Searches the range [first, last) for two consecutive identical elements. This version uses the given binary predicate *pred*

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent\_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

#### Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `adjacent_find` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns `true` if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types `Type1` must be such that objects of type `FwdIter` can be dereferenced and then implicitly converted to `Type1`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The `adjacent_find` algorithm returns a `hpx::future<InIter>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `InIter` otherwise. The `adjacent_find` algorithm returns an iterator to the first of the identical elements. If no such elements are found, `last` is returned.

```
template<typename Rng, typename Proj = hpx::identity, typename Pred = detail::equal_to>
```

```
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::adjacent_find(Rng &&rng, Pred &&pred =  
Pred(), Proj &&proj = Proj())
```

Searches the range `rng` for two consecutive identical elements.

#### Note

Complexity: Exactly the smaller of  $(\text{result} - \text{std::begin}(\text{rng})) + 1$  and  $(\text{std::begin}(\text{rng}) - \text{std::end}(\text{rng}) - 1)$  applications of the predicate where *result* is the value returned

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *adjacent\_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename Pred = detail::equal_to>
```

```
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::adjacent_f
```

Searches the range *rng* for two consecutive identical elements.

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent\_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

**Note**

Complexity: Exactly the smaller of  $(\text{result} - \text{std::begin}(\text{rng})) + 1$  and  $(\text{std::begin}(\text{rng}) - \text{std::end}(\text{rng})) - 1$  applications of the predicate where *result* is the value returned

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *adjacent\_find* algorithm returns a *hpx::future<InIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *InIter* otherwise. The *adjacent\_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

**hpx::ranges::shift\_right**

Defined in header `hpx/algorithm.hpp`<sup>740</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **FwdIter**, typename **Sent**, typename **Size**>

<sup>740</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

*FwdIter* *hpx::ranges::shift\_right*(*FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift\_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: At most (last - first) - n assignments.

#### Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

### Returns

The *shift\_right* algorithm returns *FwdIter*. The *shift\_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::shift_right(ExPolicy  
                                                                                      &&policy,  
                                                                                      FwdIter first,  
                                                                                      Sent last, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- $n + i$ .

The assignment operations in the parallel *shift\_right* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift\_right* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $(\text{last} - \text{first}) - n$  assignments.

#### Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

## Returns

The *shift\_right* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *shift\_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename Rng, typename Size>
```

`std::ranges::iterator_t<Rng> hpx::ranges::shift_right(Rng &&rng, Size n)`

Shifts the elements in the range [first, last) by *n* positions towards the end of the range. For every integer *i* in [0, last - first - *n*), moves the element originally at position first + *i* to position first

- *n* + *i*.

The assignment operations in the parallel *shift\_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: At most (last - first) - *n* assignments.

#### Note

The type of dereferenced `std::ranges::iterator_t<Rng>` must meet the requirements of *MoveAssignable*.

### Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

### Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

### Returns

The *shift\_right* algorithm returns `std::ranges::iterator_t<Rng>`. The *shift\_right* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **Rng**, typename **Size**>

`parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::shift_right(ExPolicy &&policy, Rng &&rng, Size n)`

Shifts the elements in the range [first, last) by *n* positions towards the end of the range. For every integer *i* in [0, last - first - *n*), moves the element originally at position first + *i* to position first

- *n* + *i*.

The assignment operations in the parallel *shift\_right* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift\_right* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most (last - first) - n assignments.

#### Note

The type of dereferenced `std::ranges::iterator_t<Rng>` must meet the requirements of *MoveAssignable*.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

## Returns

The *shift\_right* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. The *shift\_right* algorithm returns an iterator to the end of the resulting range.

## hpx::ranges::generate

Defined in header [hpx/algorithm.hpp](#)<sup>741</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::generate\\_n](#)

template<typename **ExPolicy**, typename **Rng**, typename **F**>

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::generate(ExPolicy
                                                                                               &&policy,
                                                                                               Rng
                                                                                               &&rng,
                                                                                               F
                                                                                               &&f)
```

Assign each element in range [first, last) a value generated by the given function object *f*

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

<sup>741</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *replace\_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::generate(ExPolicy &&policy, Iter  
first, Sent last, F &&f)
```

Assign each element in range [first, last) a value generated by the given function object *f*

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source end iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

Ret `fun()`;

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *replace\_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. It returns *last*.

template<typename **Rng**, typename **F**>

*std::ranges::iterator\_t<Rng>* *hpx::ranges::generate*(*Rng* &&rng, *F* &&f)

Assign each element in range [first, last) a value generated by the given function object *f*

#### Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

Ret `fun()`;

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *replace\_if* algorithm returns *last*.

template<typename **Iter**, typename **Sent**, typename **F**>

*Iter* *hpx::ranges::generate*(*Iter* first, *Sent* last, *F* &&f)

Assign each element in range [first, last) a value generated by the given function object *f*

**Note**

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

**Template Parameters**

- **Iter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source end iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

**Returns**

The *replace\_if* algorithm returns *last*.

**hpx::ranges::generate\_n**

Defined in header `hpx/algorithm.hpp`<sup>742</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::generate`

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::generate_n(ExPolicy
&&policy, FwdIter
first, Size count, F
&&f)
```

Assigns each element in range [first, first+count) a value generated by the given function object *g*.

<sup>742</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *generate\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Exactly *count* invocations of *f* and assignments, for *count* > 0.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

Ret `fun()`;

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

**Returns**

The *replace\_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. It returns *last*.

```
template<typename FwdIter, typename Size, typename F>
```

```
FwdIter hpx::ranges::generate_n(FwdIter first, Size count, F &&f)
```

Assigns each element in range [first, first+count) a value generated by the given function object *g*.

**Note**

Complexity: Exactly *count* invocations of *f* and assignments, for *count* > 0.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

```
Ret fun();
```

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

**Returns**

The *replace\_if* algorithm returns *last*.

**hpx/parallel/container\_algorithms/iota.hpp**

Defined in header `hpx/parallel/container_algorithms/iota.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

## Functions

```
template<typename FwdIter, typename Sent, typename T>
```

```
iota_result<FwdIter, T> iota(FwdIter first, Sent last, T value)
```

Fills the range [first, last) with sequentially increasing values, starting with *value* and repetitively evaluating ++*value*.

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

### Note

Complexity: Exactly *std::distance(first, last)* assignments and increments.

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input or output iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

## Returns

The *iota* algorithm returns a *hpx::ranges::iota\_result* containing the final iterator and the final value.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, iota_result<FwdIter, T>> iota(ExPolicy  
                                                                 &&policy,  
                                                                 FwdIter first,  
                                                                 Sent last, T  
                                                                 value)
```

Fills the range [first, last) with sequentially increasing values, starting with *value* and repetitively evaluating ++*value*.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Exactly `std::distance(first, last)` assignments and increments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

**Returns**

The *iota* algorithm returns a `hpx::future<iota_result>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *iota\_result* otherwise.

```
template<typename Range, typename T>
```

```
iota_result<typename hpx::traits::range_traits<Range>::iterator_type, T> iota(Range &&r, T value)
```

Fills the range *r* with sequentially increasing values, starting with *value* and repetitively evaluating `++value`.

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note**

Complexity: Exactly `std::ranges::distance(r)` assignments and increments.

**Template Parameters**

- **Range** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input or output iterator
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

**Parameters**

- **r** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

**Returns**

The *iota* algorithm returns a `hpx::ranges::iota_result` containing the final iterator and

the final value.

```
template<typename ExPolicy, typename Range, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, iota_result<typename hpx::traits::range_traits<Range>::iterator_type, T>> iota(Ex  
&  
ic;  
Range  
&  
T  
va
```

Fills the range *r* with sequentially increasing values, starting with *value* and repetitively evaluating ++*value*.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly *std::ranges::distance(r)* assignments and increments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Range** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **r** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

### Returns

The *iota* algorithm returns a *hpx::future<iota\_result>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *iota\_result* otherwise.

## hpx::ranges::transform\_inclusive\_scan

Defined in header `hpx/algorithm.hpp`<sup>743</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp>
```

```
transform_inclusive_scan_result<InIter, OutIter> hpx::ranges::transform_inclusive_scan(InIter first, Sent
last, OutIter
dest, BinOp
&&binary_op,
UnOp
&&unary_op)
```

Assigns through each iterator  $i$  in  $[result, result + (last - first))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[first, last)$  or  $[result, result + (last - first))$ .

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

### Note

Complexity:  $O(last - first)$  applications of the predicates `op` and `conv`.

### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$  when  $N$  is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

<sup>743</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

#### Returns

The *transform\_inclusive\_scan* algorithm returns *transform\_inclusive\_scan\_result<InIter, OutIter>*. The *transform\_inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp,  
typename UnOp>
```

```
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type hpx::ranges::transform_incl
```

Assigns through each iterator  $i$  in  $[result, result + (last - first))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[first, last)$  or  $[result, result + (last - first))$ .

The behavior of *transform\_inclusive\_scan* may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(last - first)$  applications of the predicates *op* and *conv*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$  when  $N$  is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

## Returns

The *transform\_inclusive\_scan* algorithm returns a `hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *transform\_inclusive\_result<FwdIter1, FwdIter2>* otherwise. The *transform\_inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp>
```

```
transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::transform_inclusive_scan(Rng
&&rng,
O
dest,
BinOp
&&binary_op,
UnOp
&&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(op, conv(\*first), ..., conv(\*(first + (i - result)))).

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be

dereferenced and then implicitly converted to `Type`. The type `R` must be such that an object of this type can be implicitly converted to `T`.

### Returns

The `transform_inclusive_scan` algorithm returns a `transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>`. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp>
```

```
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type hpx::ranges::t
```

Assigns through each iterator `i` in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates `op` and `conv`.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a_1$  when  $N$  is 1
- $op(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, a_1, \dots, a_K), \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, a_M, \dots, a_N))$  where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of

the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp, typename T =  
typename std::iterator_traits<InIter>::value_type>  
transform_inclusive_scan_result<InIter, OutIter> hpx::ranges::transform_inclusive_scan(InIter first, Sent  
last, OutIter  
dest, BinOp  
&&binary_op,  
UnOp  
&&unary_op, T  
init)
```

Assigns through each iterator  $i$  in  $[result, result + (last - first))$  the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, conv(\*first), ..., conv(\*(first + (i - result))))).

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[first, last)$  or  $[result, result + (last - first))$ .

The behavior of *transform\_inclusive\_scan* may be non-deterministic for a non-associative predicate.

**Note**

Complexity:  $O(last - first)$  applications of the predicates *op* and *conv*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aK), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, aM, ..., aN) where  $1 < K+1 = M \leq N$ ).

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.

- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

#### Returns

The *transform\_inclusive\_scan* algorithm returns *transform\_inclusive\_scan\_result<InIter, OutIter>*. The *transform\_inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp,
typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>
```

`parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>>::type` `hpx::ranges::transform_incl`

Assigns through each iterator  $i$  in  $[\text{result}, \text{result} + (\text{last} - \text{first}))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[\text{first}, \text{last})$  or  $[\text{result}, \text{result} + (\text{last} - \text{first}))$ .

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates `op` and `conv`.

**Note**

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a_1$  when  $N$  is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

### Returns

The *transform\_inclusive\_scan* algorithm returns a `hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *transform\_inclusive\_result<FwdIter1, FwdIter2>* otherwise. The *transform\_inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```

template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::transform_inclusive_scan(Rng
&&rng,
O
dest,
BinOp
&&binary_op,
UnOp
&&unary_op,
T
init)

```

Assigns through each iterator  $i$  in  $[\text{result}, \text{result} + (\text{last} - \text{first}))$  the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, conv(\*first), ..., conv(\*(first + (i - result)))).

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[\text{first}, \text{last})$  or  $[\text{result}, \text{result} + (\text{last} - \text{first}))$ .

The behavior of *transform\_inclusive\_scan* may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aK), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, aM, ..., aN) where  $1 < K+1 = M \leq N$ ).

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

## Returns

The `transform_inclusive_scan` algorithm returns a `transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>`. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T =
typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type hpx::ranges::t
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of *transform\_inclusive\_scan* may be non-deterministic for a non-associative predicate.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aK*), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *aM*, ..., *aN*)) where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

## Returns

The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_scan_result< std::ranges::iterator_t<Rng>, O>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::includes

Defined in header `hpx/algorithm.hpp`<sup>744</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::includes(ExPolicy &&policy, Iter1
first1, Sent1 last1, Iter2
first2, Sent2 last2, Pred
&&op = Pred(), Proj1
&&proj1 = Proj1(),
Proj2 &&proj2 =
Proj2())
```

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

The comparison operations in the parallel `includes` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

<sup>744</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1 = \text{std::distance}(\text{first1}, \text{last1})$  and  $N2 = \text{std::distance}(\text{first2}, \text{last2})$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *includes* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range `[first2, last2)` is found within the sorted range `[first1, last1)`. Also returns true if `[first2, last2)` is empty.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::includes(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Returns true if every element from the sorted range `[first2, last2)` is found within the sorted range `[first1, last1)`. Also returns true if `[first2, last2)` is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

#### Note

At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1 = \text{std::distance}(\text{first1}, \text{last1})$  and  $N2 = \text{std::distance}(\text{first2}, \text{last2})$ .

### Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`

- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::parallel::detail::less,  
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::includes(ExPolicy &&policy,  
                                             Rng1 &&rng1, Rng2  
                                             &&rng2, Pred &&op =  
                                             Pred(), Proj1 &&proj1 =  
                                             Proj1(), Proj2 &&proj2  
                                             = Proj2())
```

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in

an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

At most  $2*(N1+N2-1)$  comparisons, where  $N1 = \text{std::distance}(\text{first1}, \text{last1})$  and  $N2 = \text{std::distance}(\text{first2}, \text{last2})$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

## Returns

The *includes* algorithm returns a `hpx::future<bool>` if the execution policy is of type

*sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::parallel::detail::less, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::includes(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(),
                          Proj2 &&proj2 = Proj2())
```

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

#### Note

At most  $2*(N1+N2-1)$  comparisons, where  $N1 = \text{std::distance}(\text{first1}, \text{last1})$  and  $N2 = \text{std::distance}(\text{first2}, \text{last2})$ .

### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

### hpx::ranges::partial\_sort

Defined in header `hpx/algorithm.hpp`<sup>745</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
RandomIt hpx::ranges::partial_sort(RandomIt first, RandomIt middle, Sent last, Comp &&comp = Comp(),
                                   Proj &&proj = Proj())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The assignments in the parallel *partial\_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Approximately (last - first) \* log(middle - first) comparisons.

### Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

<sup>745</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. Comp defaults to detail::less.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate comp is invoked.

#### Returns

The *partial\_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename  
Proj = hpx::identity>  
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type hpx::ranges::partial_sort(ExPolicy  
                                                    &&policy,  
                                                    RandomIt first,  
                                                    RandomIt  
                                                    middle, Sent  
                                                    last, Comp  
                                                    &&comp =  
                                                    Comp(), Proj  
                                                    &&proj =  
                                                    Proj())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Approximately (last - first) \* log(middle - first) comparisons.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.

- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. Comp defaults to `detail::less`.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *partial\_sort* algorithm returns a `hpx::future<RandomIt>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::partial_sort(Rng &&rng, std::ranges::iterator_t<Rng> middle,
                                                       Comp &&comp = Comp(), Proj &&proj = Proj())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The assignments in the parallel *partial\_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Approximately  $(\text{last} - \text{first}) * \log(\text{middle} - \text{first})$  comparisons.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to *bool*, yields *true* if the first argument of the call is less than the second, and *false* otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator. *Comp* defaults to *detail::less*.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *partial\_sort* algorithm returns *std::ranges::iterator\_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::partial_sort(ExPolicy  
                                                                                                     &&pol-  
                                                                                                     icy,  
                                                                                                     Rng  
                                                                                                     &&rng,  
                                                                                                     std::ranges::iterator_t<Rng>  
                                                                                                     mid-  
                                                                                                     dle,  
                                                                                                     Comp  
                                                                                                     &&comp  
                                                                                                     =  
                                                                                                     Comp(),  
                                                                                                     Proj  
                                                                                                     &&proj  
                                                                                                     =  
                                                                                                     Proj())
```

Sorts the elements in the range *[first, last)* in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i + n* is a valid iterator pointing to an element of the sequence, and *INVOKE(comp, INVOKE(proj, \*(i + n)), INVOKE(proj, \*i)) == false*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`;
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. Comp defaults to `detail::less`.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

**Returns**

The `partial_sort` algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `std::ranges::iterator_t<Rng>` otherwise. It returns `last`.

**hpx::ranges::adjacent\_difference**

Defined in header `hpx/algorithm.hpp`<sup>746</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter1, typename FwdIter2, typename Sent>
```

```
FwdIter2 hpx::ranges::adjacent_difference(FwdIter1 first, Sent last, FwdIter2 dest)
```

Searches the range `[first, last)` for two consecutive identical elements.

<sup>746</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Exactly the smaller of  $(\text{result} - \text{first}) + 1$  and  $(\text{last} - \text{first}) - 1$  application of the predicate where *result* is the value returned

**Template Parameters**

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename Rng, typename FwdIter2>
```

```
FwdIter2 hpx::ranges::adjacent_difference(Rng &&rng, FwdIter2 dest)
```

Searches the *rng* for two consecutive identical elements.

**Note**

Complexity: Exactly the smaller of  $(\text{result} - \text{first}) + 1$  and  $(\text{last} - \text{first}) - 1$  application of the predicate where *result* is the value returned

**Template Parameters**

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               FwdIter1
                                                                                               first,
                                                                                               Sent
                                                                                               last,
                                                                                               FwdIter2
                                                                                               dest)
```

Searches the range [first, last) for two consecutive identical elements.

**Note**

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename Rng, typename FwdIter2>
```

*hpx::parallel::util::detail::algorithm\_result\_t<ExPolicy, FwdIter2>* *hpx::ranges::adjacent\_difference*(*ExPolicy* &&policy, *Rng* &&rng, *FwdIter2* dest)

Searches the *rng* for two consecutive identical elements.

**Note**

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements.

template<typename **FwdIter1**, typename **Sent**, typename **FwdIter2**, typename **Op**>

*FwdIter2* *hpx::ranges::adjacent\_difference*(*FwdIter1* first, *Sent* last, *FwdIter2* dest, *Op* &&op)

Searches the range [first, last) for two consecutive identical elements.

**Note**

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

**Template Parameters**

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *CopyConstructible*.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type *iterator\_traits<InputIt>::value\_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

#### Returns

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename Rng, typename FwdIter2, typename Op>
```

```
FwdIter2 hpx::ranges::adjacent_difference(Rng &&rng, FwdIter2 dest, Op &&op)
```

Searches the *rng* for two consecutive identical elements.

#### Template Parameters

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *CopyConstructible*.

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type `iterator_traits<InputIt>::value_type` can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Op>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy  
                                                                 &&pol-  
                                                                 icy,  
                                                                 FwdIter1  
                                                                 first,  
                                                                 Sent  
                                                                 last,  
                                                                 FwdIter2  
                                                                 dest,  
                                                                 Op  
                                                                 &&op)
```

Searches the range [first, last) for two consecutive identical elements.

#### Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *CopyConstructible*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type `iterator_traits<InputIt>::value_type` can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

## Returns

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename Rng, typename FwdIter2, typename Op>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               Rng
                                                                                               &&rng,
                                                                                               FwdIter2
                                                                                               dest,
                                                                                               Op
                                                                                               &&op)
```

Searches the *rng* for two consecutive identical elements.

### Note

Complexity: Exactly the smaller of  $(\text{result} - \text{first}) + 1$  and  $(\text{last} - \text{first}) - 1$  application of the predicate where *result* is the value returned

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *CopyConstructible*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

`Ret fun(const Type1 &a, const Type2 &b);`

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type *iterator\_traits<InputIt>::value\_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements.

### hpx::ranges::copy

Defined in header `hpx/algorithm.hpp`<sup>747</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::copy\_n*
- *hpx::ranges::copy\_if*

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter**>

*parallel::util::detail::algorithm\_result<ExPolicy, ranges::copy\_result<FwdIter1, FwdIter>>::type* **hpx::ranges::copy**(*ExPolicy* &&policy, *FwdIter1* iter, *Sent1* sent, *FwdIter* dest)

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

---

<sup>747</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

### Returns

The *copy* algorithm returns a `hpx::future<ranges::copy_result<FwdIter1, FwdIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::copy_result<FwdIter1, FwdIter>` otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter>>>::typ
```

Copies the elements in the range *rng* to another range beginning at *dest*.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *copy* algorithm returns a `hpx::future<ranges::copy_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::copy_result<iterator_t<Rng>, FwdIter2>` otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter>
```

```
ranges::copy_result<FwdIter1, FwdIter> hpx::ranges::copy(FwdIter1 iter, Sent1 sent, FwdIter dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

**Note**

Complexity: Performs exactly *last* - *first* assignments.

**Template Parameters**

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.

- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

#### Parameters

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

#### Returns

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter>
```

```
ranges::copy_result<typename hp::traits::range_traits<Rng>::iterator_type, FwdIter> hp::ranges::copy(Rng
&&rng,
FwdIter
dest)
```

Copies the elements in the range *rng* to another range beginning at *dest*.

#### Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

#### Returns

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::copy\_n

Defined in header `hpx/algorithm.hpp`<sup>748</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::copy`
- `hpx::ranges::copy_if`

template<typename **ExPolicy**, typename **FwdIter1**, typename **Size**, typename **FwdIter2**>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_n_result<FwdIter1, FwdIter2>>::type` `hpx::ranges::copy_n(ExPolicy &&policy, FwdIter1 first, Size count, FwdIter2 dest)`

Copies the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1`, to another range beginning at `dest`.

The assignments in the parallel `copy_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `copy_n` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

<sup>748</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

## Returns

The *copy\_n* algorithm returns a `hpx::future<ranges::copy_n_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::copy_n_result<FwdIter1, FwdIter2>` otherwise. The *copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Size, typename FwdIter2>
```

```
ranges::copy_n_result<FwdIter1, FwdIter2> hpx::ranges::copy_n(FwdIter1 first, Size count, FwdIter2 dest)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest.

### Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

## Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

## Returns

The *copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::copy\_if

Defined in header [hpx/algorithm.hpp](#)<sup>749</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::copy](#)
- [hpx::ranges::copy\\_n](#)

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter**, typename **Pred**,

sent,  
[FwdIter](#)  
dest,  
[Pred](#)  
&&pred  
[Proj](#)  
&&proj  
=  
[Proj](#)())

Copies the elements in the range, defined by [first, last) to another range beginning at *dest*. The order of the elements that are not removed is preserved.

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for FwdIter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

---

<sup>749</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *copy\_if* algorithm returns a `hpx::future<ranges::copy_if_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::copy_if_result<iterator_t<Rng>, FwdIter2>` otherwise. The *copy\_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

template<typename **ExPolicy**, typename **Rng**, typename **FwdIter**, typename **Pred**, typename **Proj** = *hpx::identity*>

*hpx::parallel::util::detail::algorithm\_result<ExPolicy, ranges::copy\_if\_result<typename *hpx::traits::range\_traits<Rng>::iterator\_type, FwdIter**

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

`bool pred(const Type1 &a, const Type1 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *copy\_if* algorithm returns a `hpx::future<ranges::copy_if_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::copy_if_result<iterator_t<Rng>, FwdIter2>` otherwise. The *copy\_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter, typename Pred, typename Proj =  
hpx::identity>  
ranges::copy_if_result<FwdIter1, FwdIter> hpx::ranges::copy_if(FwdIter1 iter, Sent1 sent, FwdIter dest, Pred  
                                                                &&pred, Proj &&proj = Proj())
```

Copies the elements in the range, defined by [first, last) to another range beginning at *dest*. The order of the elements that are not removed is preserved.

### Template Parameters

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `FwdIter1`.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *copy\_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter, typename Pred, typename Proj = hpx::identity>
```

```
ranges::copy_if_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter> hpx::ranges::copy_if(Rng
&&rng,
FwdIter
dest,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *copy\_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

#### `hpx::ranges::is_sorted`

Defined in header `hpx/algorithm.hpp`<sup>750</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::is_sorted_until`

```
template<typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_sorted(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Determines if the range [first, last) is sorted. Uses *pred* to compare elements.

The comparison operations in the parallel *is\_sorted* algorithm executes in sequential order in the calling thread.

#### Note

Complexity: at most  $(N+S-1)$  comparisons where  $N$  = distance(first, last).  $S$  = number of partitions

#### Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.

---

<sup>750</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *is\_sorted* algorithm returns a *bool*. The *is\_sorted* algorithm returns true if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less,
typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_sorted(ExPolicy &&policy,
                                                                                   FwdIter first, Sent last,
                                                                                   Pred &&pred = Pred(),
                                                                                   Proj &&proj = Proj())
```

Determines if the range [first, last) is sorted. Uses *pred* to compare elements.

The comparison operations in the parallel *is\_sorted* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is\_sorted* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most  $(N+S-1)$  comparisons where  $N$  = distance(first, last).  $S$  = number of partitions

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is\_sorted* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *is\_sorted* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task\_execution\_policy* and returns *bool* otherwise. The *is\_sorted* algorithm returns a *bool* if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

```
template<typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_sorted(Rng &&rng, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Determines if the range *rng* is sorted. Uses *pred* to compare elements.

The comparison operations in the parallel *is\_sorted* algorithm executes in sequential order in the calling thread.

**Note**

Complexity: at most  $(N+S-1)$  comparisons where  $N = \text{size}(\text{rng})$ .  $S$  = number of partitions

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *is\_sorted* algorithm returns a *bool*. The *is\_sorted* algorithm returns true if each element in the *rng* satisfies the predicate passed. If the range *rng* contains less than two elements, the function always returns true.

```
template<typename ExPolicy, typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_sorted(ExPolicy &&policy,  
                                             Rng &&rng, Pred  
                                             &&pred = Pred(), Proj  
                                             &&proj = Proj())
```

Determines if the range *rng* is sorted. Uses *pred* to compare elements.

The comparison operations in the parallel *is\_sorted* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is\_sorted* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: at most  $(N+S-1)$  comparisons where  $N = \text{size}(\text{rng})$ .  $S$  = number of partitions

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is\_sorted* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *is\_sorted* algorithm returns a `hpx::future<bool>` if the execution policy is of type *task\_execution\_policy* and returns *bool* otherwise. The *is\_sorted* algorithm returns a *bool* if each element in the range *rng* satisfies the predicate passed. If the range *rng* contains less than two elements, the function always returns true.

**hpx::ranges::is\_sorted\_until**

Defined in header `hpx/algorithm.hpp`<sup>751</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::is_sorted`

<sup>751</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
FwdIter hpx::ranges::is_sorted_until(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is\_sorted\_until* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: at most  $(N+S-1)$  comparisons where  $N$  = distance(first, last).  $S$  = number of partitions

### Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *is\_sorted\_until* algorithm returns a *FwdIter*. The *is\_sorted\_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less,
typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::is_sorted_until(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               FwdIter
                                                                                               first,
                                                                                               Sent last,
                                                                                               Pred
                                                                                               &&pred
                                                                                               =
                                                                                               Pred(),
                                                                                               Proj
                                                                                               &&proj
                                                                                               =
                                                                                               Proj())
```

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is\_sorted\_until* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is\_sorted\_until* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most (N+S-1) comparisons where *N* = distance(first, last). *S* = number of partitions

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is\_sorted\_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *is\_sorted\_until* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *is\_sorted\_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::is_sorted_until(Rng &&rng, Pred &&pred = Pred(), Proj  
                                                         &&proj = Proj())
```

Returns the first element in the range *rng* that is not sorted. Uses a predicate to compare elements or the less than operator.

#### Note

Complexity: at most  $(N+S-1)$  comparisons where  $N = \text{size}(\text{rng})$ .  $S = \text{number of partitions}$

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is\_sorted\_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *is\_sorted\_until* returns *FwdIter*. The *is\_sorted\_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename ExPolicy, typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::is_sorted_until(ExPolicy  
                                                                                                     &&pol-  
                                                                                                     icy,  
                                                                                                     Rng  
                                                                                                     &&rng,  
                                                                                                     Pred  
                                                                                                     &&pred  
                                                                                                     =  
                                                                                                     Pred(),  
                                                                                                     Proj  
                                                                                                     &&proj  
                                                                                                     =  
                                                                                                     Proj())
```

Returns the first element in the range *rng* that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is\_sorted\_until* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is\_sorted\_until* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most  $(N+S-1)$  comparisons where  $N = \text{size}(\text{rng})$ .  $S$  = number of partitions

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is\_sorted\_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *is\_sorted\_until* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *is\_sorted\_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

### hpx::ranges::make\_heap

Defined in header [hpx/algorithm.hpp](#)<sup>752</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::make_heap(ExPolicy &&policy, Iter
first, Sent last, Comp
&&comp, Proj &&proj
= Proj{ })
```

Constructs a *max heap* in the range `[first, last)`.

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

<sup>752</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The *make\_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp, typename Proj = hpx::identity>
```

```

hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::make_heap(ExPolicy
&&pol-
icy,
Rng
&&rng,
Comp
&&comp,
Proj
&&proj
=
Proj{ })

```

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *make\_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::make_heap(ExPolicy &&policy, Iter  
first, Sent last, Proj  
&&proj = Proj{ })
```

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most (3\*N) comparisons where *N* = distance(first, last).

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The *make\_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::make_heap(ExPolicy
&&pol-
icy,
Rng
&&rng,
Proj
&&proj
=
Proj{})
```

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The *make\_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type

*sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename Iter, typename Sent, typename Comp, typename Proj = hpx::identity>
```

```
Iter hpx::ranges::make_heap(Iter first, Sent last, Comp &&comp, Proj &&proj = Proj{})
```

Constructs a *max heap* in the range [first, last).

#### Note

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

### Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *make\_heap* algorithm returns *Iter*. It returns *last*.

```
template<typename Rng, typename Comp, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::make_heap(Rng &&rng, Comp &&comp, Proj &&proj = Proj{})
```

Constructs a *max heap* in the range [first, last).

**Note**

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The `make_heap` algorithm returns *Iter*. It returns *last*.

```
template<typename Iter, typename Sent, typename Proj = hpx::identity>
```

```
Iter hpx::ranges::make_heap(Iter first, Sent last, Proj &&proj = Proj{ })
```

Constructs a *max heap* in the range `[first, last)`.

**Note**

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The *make\_heap* algorithm returns *Iter*. It returns *last*.

```
template<typename Rng, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::make_heap(Rng &&rng, Proj &&proj = Proj{})
```

Constructs a *max heap* in the range [first, last).

**Note**

Complexity: at most (3\*N) comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The *make\_heap* algorithm returns *Iter*. It returns *last*.

***hpx::ranges::set\_union***

Defined in header *hpx/algorithm.hpp*<sup>753</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename  
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =  
hpx::identity>
```

---

<sup>753</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```

hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<Iter1, Iter2, Iter3>>::type hpx::ranges::set_union(ExPolicy
&&pol-
icy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())

```

Constructs a sorted range beginning at `dest` consisting of all elements present in one or both sorted ranges `[first1, last1)` and `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

If some element is found  $m$  times in `[first1, last1)` and  $n$  times in `[first2, last2)`, then all  $m$  elements will be copied from `[first1, last1)` to `dest`, preserving order, and then exactly  $\text{std::max}(n-m, 0)$  elements will be copied from `[first2, last2)` to `dest`, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_union* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_union* algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. The *set\_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3>>
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, then all *m* elements will be copied from *[first1, last1)* to *dest*, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from *[first2, last2)* to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_union* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

**Returns**

The *set\_union* algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set\_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
set_union_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::set_union(Rng1
&&rng1,
Rng2
&&rng2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), then all *m* elements will be copied from [*first1*, *last1*) to *dest*, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from [*first2*, *last2*) to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

**Note**

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

**Template Parameters**

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_union* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_union* algorithm returns `ranges::set_union_result<Iter1, Iter2, Iter3>`. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set\_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

### `hpx::ranges::lexicographical_compare`

Defined in header `hpx/algorithm.hpp`<sup>754</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename Sent1, typename InIter2, typename Sent2, typename Proj1 =  
hpx::identity, typename Proj2 = hpx::identity, typename Pred = hpx::parallel::detail::less>  
bool hpx::ranges::lexicographical_compare(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2, Pred  
                                         &&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 =  
                                         Proj2())
```

---

<sup>754</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Checks if the first range [first1, last1) is lexicographically less than the second range [first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(\text{first1}, \text{last})$  and  $N2 = \text{std::distance}(\text{first2}, \text{last2})$ .

#### Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

### Template Parameters

- **InIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for FwdIter1. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for FwdIter2. This defaults to `hpx::identity`

## Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

## Returns

The *lexicographically\_compare* algorithm returns *bool*. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,  
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity, typename Pred = hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::lexicographical_compare(ExPolicy  
                                                    &&pol-  
                                                    icy,  
                                                    FwdIter1  
                                                    first1,  
                                                    Sent1  
                                                    last1,  
                                                    FwdIter2  
                                                    first2,  
                                                    Sent2  
                                                    last2,  
                                                    Pred  
                                                    &&pred  
                                                    =  
                                                    Pred(),  
                                                    Proj1  
                                                    &&proj1  
                                                    =  
                                                    Proj1(),  
                                                    Proj2  
                                                    &&proj2  
                                                    =  
                                                    Proj2())
```

Checks if the first range [first1, last1) is lexicographically less than the second range

[first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(\text{first1}, \text{last})$  and  $N2 = \text{std::distance}(\text{first2}, \text{last2})$ .

#### Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

- **Proj1** – The type of an optional projection function for FwdIter1. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for FwdIter2. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *lexicographically\_compare* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```
template<typename Rng1, typename Rng2, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity,  
typename Pred = hpx::parallel::detail::less>
```

```
bool hpx::ranges::lexicographical_compare(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1  
                                         &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks if the first range rng1 is lexicographically less than the second range rng2. uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(\text{std::begin}(\text{rng1}), \text{std::end}(\text{rng1}))$  and  $N2 = \text{std::distance}(\text{std::begin}(\text{rng2}), \text{std::end}(\text{rng2}))$ .

**Note**

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

**Template Parameters**

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for elements of the second range. This defaults to `hpx::identity`

**Parameters**

- **rng1** – Refers to the sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

**Returns**

The *lexicographically\_compare* algorithm returns *bool*. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```

template<typename ExPolicy, typename Rng1, typename Rng2, typename Proj1 = hpx::identity, typename Proj2
= hpx::identity, typename Pred = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::lexicographical_compare(ExPolicy
&&pol-
icy,
Rng1
&&rng1,
Rng2
&&rng2,
Pred
&&pred
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())

```

Checks if the first range *rng1* is lexicographically less than the second range *rng2*. uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(\text{std::begin}(\text{rng1}), \text{std::end}(\text{rng1}))$  and  $N2 = \text{std::distance}(\text{std::begin}(\text{rng2}), \text{std::end}(\text{rng2}))$ .

#### Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other

- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for elements of the second range. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *lexicographically\_compare* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

## hpx::ranges::set\_intersection

Defined in header [hpx/algorithm.hpp](#)<sup>755</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename  
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =  
hpx::identity>  
hpx::parallel::util::detail::algorithm\_result<ExPolicy, set_intersection_result<Iter1, Iter2, Iter3>>::type hpx::ranges::set\_intersection
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

<sup>755</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_intersection* algorithm returns a `hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>` otherwise. The *set\_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =  
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_intersection_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, It
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_intersection* algorithm returns a `hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>`. The *set\_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred
= hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_intersection_result<Iter1, Iter2, Iter3> hpx::ranges::set_intersection(Iter1 first1, Sent1 last1, Iter2 first2,
                                                                    Sent2 last2, Iter3 dest, Pred &&op
                                                                    = Pred(), Proj1 &&proj1 =
                                                                    Proj1(), Proj2 &&proj2 = Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

### Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.

- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for `Iter2`.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_intersection` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

### Returns

The `set_intersection` algorithm returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>`. The `set_intersection` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
set_intersection_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::set_intersection(Rng1
&&rng1,
Rng2
&&rng2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, the first  $\text{std::min}(m, n)$  elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

**Note**

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

**Template Parameters**

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

## Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

## Returns

The *set\_intersection* algorithm returns *ranges::set\_intersection\_result<Iter1, Iter2, Iter3>*, where *Iter1* is *range\_iterator\_t<Rng1>* and *Iter2* is *range\_iterator\_t<Rng2>*. The *set\_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::transform\_exclusive\_scan

Defined in header [hpx/algorithm.hpp](#)<sup>756</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp, typename T =
typename std::iterator_traits<InIter>::value_type>
```

```
transform_exclusive_scan_result<InIter, OutIter> hpx::ranges::transform_exclusive_scan(InIter first, Sent
last, OutIter
dest, T init,
BinOp
&&binary_op,
UnOp
&&unary_op)
```

Assigns through each iterator *i* in  $[result, result + (last - first))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))`.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

<sup>756</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of `transform_exclusive_scan` may be non-deterministic for a non-associative predicate.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

**Note**

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_exclusive\_scan* algorithm returns *transform\_exclusive\_scan\_result<InIter, OutIter>*. The *transform\_exclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp,  
typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>
```

```
parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_result<FwdIter1, FwdIter2>>::type hpx::ranges::transform_excl
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, conv(\*first), ..., conv(\*(first + (i - result) - 1))).

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform\_exclusive\_scan* may be non-deterministic for a non-associative predicate.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aK*), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *aM*, ..., *aN*)) where  $1 < K+1 = M \leq N$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The `transform_exclusive_scan` algorithm returns a `hpx::future<transform_exclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_exclusive_result<FwdIter1, FwdIter2>` otherwise. The `transform_exclusive_scan` algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
transform_exclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::transform_exclusive_scan(Rng
&&rng,
O
dest,
T
init,
BinOp
&&binary_op,
UnOp
&&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1)))`.

The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of `transform_exclusive_scan` may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

**Note**

GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aK), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, aM, ..., aN) where  $1 < K+1 = M \leq N$ .

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

**Returns**

The *transform\_exclusive\_scan* algorithm returns a *transform\_exclusive\_scan\_result*< std::ranges::iterator\_t<Rng>, O>. The *transform\_exclusive\_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T =
typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type hpx::ranges::t
```

Assigns through each iterator  $i$  in  $[\text{result}, \text{result} + (\text{last} - \text{first}))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1)))`.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[\text{first}, \text{last})$  or  $[\text{result}, \text{result} + (\text{last} - \text{first}))$ .

The behavior of *transform\_exclusive\_scan* may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$  when  $N$  is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

`Ret fun(const Type1 &a, const Type1 &b);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

`R fun(const Type &a);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The `transform_exclusive_scan` algorithm returns a `hpx::future<transform_exclusive_scan_result< std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_exclusive_scan_result< std::ranges::iterator_t<Rng>, O>` otherwise. The `transform_exclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::uninitialized\_fill

Defined in header `hpx/algorithm.hpp`<sup>757</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_fill_n`

template<typename **FwdIter**, typename **Sent**, typename **T**>

*FwdIter* `hpx::ranges::uninitialized_fill`(*FwdIter* first, *Sent* last, *T* const &value)

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the ranges *uninitialized\_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

### Note

Complexity: Linear in the distance between *first* and *last*

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **T** – The type of the value to be assigned (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

## Returns

The *uninitialized\_fill* algorithm returns a *FwdIter*. The *uninitialized\_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **T**>

<sup>757</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_fill(ExPolicy
                                                                 &&pol-
                                                                 icy,
                                                                 FwdIter
                                                                 first,
                                                                 Sent
                                                                 last, T
                                                                 const
                                                                 &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_fill* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_fill* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in the distance between *first* and *last*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

### Returns

The *uninitialized\_fill* algorithm returns a returns *FwdIter*. The *uninitialized\_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename Rng, typename T>
```

```
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::uninitialized_fill(Rng &&rng, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Linear in the distance between *first* and *last*

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

### Returns

The *uninitialized\_fill* algorithm returns a *hpx::traits::range\_traits<Rng>::iterator\_type*. The *uninitialized\_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename T>
```

```
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::uninitial
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_fill* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_fill* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear in the distance between *first* and *last*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

**Returns**

The `uninitialized_fill` algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `typename hpx::traits::range_traits<Rng>::iterator_type` otherwise. The `uninitialized_fill` algorithm returns the iterator to one past the last element filled in the range.

**`hpx::ranges::uninitialized_fill_n`**

Defined in header `hpx/algorithm.hpp`<sup>758</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_fill`

`template<typename FwdIter, typename Size, typename T>`

`FwdIter hpx::ranges::uninitialized_fill_n(FwdIter first, Size count, T const &value)`

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at *first*. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_fill_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

---

<sup>758</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *uninitialized\_fill\_n* algorithm returns a *FwdIter*. The *uninitialized\_fill\_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_fill_n(ExPolicy
&&pol-
icy,
FwdIter
first,
Size
count,
T
const
&value)
```

Copies the given *value* value to the first *count* elements in an uninitialized memory area beginning at *first*. If an exception is thrown during the initialization, the function has no effects.

The assignments in the *parallel\_uninitialized\_fill\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the *parallel\_uninitialized\_fill\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *uninitialized\_fill\_n* algorithm returns a *hpx::future<FwdIter>*, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_fill\_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

**hpx::ranges::move**

Defined in header [hpx/algorithm.hpp](#)<sup>759</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

template<typename **ExPolicy**, typename **Iter1**, typename **Sent1**, typename **Iter2**>

*hpx::parallel::util::detail::algorithm\_result<ExPolicy, move\_result<Iter1, Iter2>>::type* **hpx::ranges::move**(*ExPolicy* &&policy, *Iter1* first, *Sent1* last, *Iter2* dest)

---

<sup>759</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

### Returns

The *move* algorithm returns a `hpx::future<ranges::move_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::move_result<iterator_t<Rng>, FwdIter2>` otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename Rng, typename Iter2>
```

`hpx::parallel::util::detail::algorithm_result<ExPolicy, move_result<std::ranges::iterator_t<Rng>, Iter2>>>::type hpx::ranges::move(ExPolicy, Rng, Rng, Iter2, Iter2, dest)`

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

### Returns

The *move* algorithm returns a `hpx::future<ranges::move_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::move_result<iterator_t<Rng>, FwdIter2>` otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Iter1, typename Sent1, typename Iter2>
```

```
move_result<Iter1, Iter2> hpx::ranges::move(Iter1 first, Sent1 last, Iter2 dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

#### Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

### Template Parameters

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

### Returns

The *move* algorithm returns `ranges::move_result<iterator_t<Rng>, FwdIter2>`. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Rng, typename Iter2>
```

```
move_result<std::ranges::iterator_t<Rng>, Iter2> hpx::ranges::move(Rng &&rng, Iter2 dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

#### Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

## Returns

The *move* algorithm returns a `ranges::move_result<iterator_t<Rng>, FwdIter2>`. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

## `hpx::ranges::destroy`

Defined in header `hpx/algorithm.hpp`<sup>760</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::destroy_n`

template<typename **ExPolicy**, typename **Rng**>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>>> hpx::ranges::destroy(ExPolicy  
&&policy,  
Rng  
&&rng)`

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* operations.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

<sup>760</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

## Returns

The *destroy* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *void* otherwise.

```
template<typename ExPolicy, typename Iter, typename Sent>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::destroy(ExPolicy &&policy, Iter
first, Sent last)
```

Destroys objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the range [first, last).

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* operations.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

## Returns

The *destroy* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *void* otherwise.

```
template<typename Rng>
```

*hpx::traits::range\_iterator*<*Rng*>::type *hpx::ranges::destroy*(*Rng* &&rng)

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

**Note**

Complexity: Performs exactly *last - first* operations.

**Template Parameters**

**Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

**rng** – Refers to the sequence of elements the algorithm will be applied to.

**Returns**

The *destroy* algorithm returns *void*.

template<typename **Iter**, typename **Sent**>

*Iter* *hpx::ranges::destroy*(*Iter* first, *Sent* last)

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

**Note**

Complexity: Performs exactly *last - first* operations.

**Template Parameters**

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

**Returns**

The *destroy* algorithm returns *void*.

## hpx::ranges::destroy\_n

Defined in header [hpx/algorithm.hpp](#)<sup>761</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::destroy](#)

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>

[hpx::parallel::util::detail::algorithm\\_result<ExPolicy, FwdIter>::type](#) [hpx::ranges::destroy\\_n](#)(*ExPolicy* &&policy, *FwdIter* first, *Size* count)

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, first + count)`.

The operations in the `parallel destroy_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The operations in the `parallel destroy_n` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

<sup>761</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Returns**

The *destroy\_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *destroy\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename FwdIter, typename Size>
```

```
FwdIter hpx::ranges::destroy_n(FwdIter first, Size count)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, first + count)`.

**Note**

Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

**Returns**

The *destroy\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

**hpx::ranges::rotate**

Defined in header `hpx/algorithm.hpp`<sup>762</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::rotate\_copy*

```
template<typename FwdIter, typename Sent>
```

```
subrange_t<FwdIter, Sent> hpx::ranges::rotate(FwdIter first, FwdIter middle, Sent last)
```

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements

---

<sup>762</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

in the range `[first, last)` in such a way that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Linear in the distance between *first* and *last*.

#### Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

## Returns

The *rotate* algorithm returns a *subrange\_t<FwdIter, Sent>*. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

```
template<typename ExPolicy, typename FwdIter, typename Sent>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::rotate(ExPolicy
&&pol-
icy,
FwdIter
first,
FwdIter
mid-
dle,
Sent
last)
```

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range `[first, last)` in such a way that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear in the distance between *first* and *last*.

**Note**

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

### Returns

The *rotate* algorithm returns a `hpx::future<subrange_t<FwdIter, Sent>>` if the execution policy is of type *parallel\_task\_policy* and returns a `subrange_t<FwdIter, Sent>` otherwise. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

```
template<typename Rng>
```

```
subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>> hpx::ranges::rotate(Rng &&rng,  
                                                                                      std::ranges::iterator_t<Rng>  
                                                                                      middle)
```

Uses *rng* as the source range, as if using `util::begin(rng)` as *first* and `ranges::end(rng)` as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the

elements in the range `[first, last)` in such a way that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Linear in the distance between *first* and *last*.

#### Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

### Template Parameters

**Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

### Returns

The *rotate* algorithm returns a `subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>`. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

```
template<typename ExPolicy, typename Rng>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> hpx::ranges::rotate
```

Uses *rng* as the source range, as if using `util::begin(rng)` as *first* and `ranges::end(rng)` as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range `[first, last)` in such a way that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered

fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear in the distance between *first* and *last*.

**Note**

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

### Returns

The *rotate* algorithm returns a `hpx::future <subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *subrange\_t<std::ranges::iterator\_t<Rng>, std::ranges::iterator\_t<Rng>>*. otherwise. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

### `hpx::ranges::rotate_copy`

Defined in header `hpx/algorithm.hpp`<sup>763</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::rotate`

template<typename **FwdIter**, typename **Sent**, typename **OutIter**>

`rotate_copy_result<FwdIter, OutIter> hpx::ranges::rotate_copy(FwdIter first, FwdIter middle, Sent last, OutIter dest_first)`

Copies the elements from the range `[first, last)`, to another range beginning at *dest\_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

---

<sup>763</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *rotate\_copy* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest\_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

## Returns

The *rotate\_copy* algorithm returns a *rotate\_copy\_result*<FwdIter, OutIter>. The *rotate\_copy* algorithm returns the output iterator to the element past the last element copied.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent**, typename **FwdIter2**>

```
parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<FwdIter1, FwdIter2>>::type hpx::ranges::rotate_copy(ExPolicy
&&policy,
FwdIter1
first,
FwdIter1
middle,
Sent
last,
FwdIter2
dest_first)
```

Copies the elements from the range [first, last), to another range beginning at *dest\_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest\_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

**Returns**

The *rotate\_copy* algorithm returns `hpx::future< rotate_copy_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *rotate\_copy\_result<FwdIter1, FwdIter2>* otherwise. The *rotate\_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename Rng, typename OutIter>
```

```
rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::rotate_copy(Rng &&rng,  
                                         std::ranges::iterator_t<Rng>  
                                         middle, OutIter  
                                         dest_first)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last), to another range beginning at *dest\_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate\_copy* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last* - *first* assignments.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest\_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

### Returns

The *rotate* algorithm returns a *rotate\_copy\_result<std::ranges::iterator\_t<Rng>, OutIter>*. The *rotate\_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename ExPolicy, typename Rng, typename OutIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>> hpx::ranges::rotate_copy
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last), to another range beginning at *dest\_first* in such a way, that the element *new\_first* becomes the first element of the new range and *new\_first* - 1 becomes the last element.

The assignments in the parallel *rotate\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest\_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

**Returns**

The *rotate\_copy* algorithm returns a `hpx::future<rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>>` if the execution policy is of type *parallel\_task\_policy* and returns *rotate\_copy\_result<std::ranges::iterator\_t<Rng>, OutIter>* otherwise. The *rotate\_copy* algorithm returns the output iterator to the element past the last element copied.

**`hpx::ranges::uninitialized_move`**

Defined in header `hpx/algorithm.hpp`<sup>764</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_move_n`

---

<sup>764</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>
```

```
hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_move(InIter first1, Sent1 last1,
                                                                                   FwdIter first2, Sent2
                                                                                   last2)
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

### Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

### Returns

The *uninitialized\_move* algorithm returns an *in\_out\_result<InIter, FwdIter>*. The *uninitialized\_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

`parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type hpx::ranges::uninitialized`

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.

- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

### Returns

The *uninitialized\_move* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `in_out_result<InIter, FwdIter>` otherwise. The *uninitialized\_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Rng1, typename Rng2>
```

```
hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

### Parameters

- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

### Returns

The *uninitialized\_move* algorithm returns an `in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>`. The *uninitialized\_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
```

`parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, ty`

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

### Returns

The *uninitialized\_move* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `in_out_result< type-name hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The *uninitialized\_move* algorithm returns the input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

## hpx::ranges::uninitialized\_move\_n

Defined in header `hpx/algorithm.hpp`<sup>765</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_move`

template<typename **InIter**, typename **Size**, typename **FwdIter**, typename **Sent2**>

`hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_move_n(InIter first1, Size count, FwdIter first2, Sent2 last2)`

Moves the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1`, to another range beginning at `dest`. If an exception is thrown during the initialization, some objects in `[first, first + count)` are left in a valid but unspecified state.

The assignments in the parallel `uninitialized_move_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

## Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.

## Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

<sup>765</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

### Returns

The *uninitialized\_move\_n* algorithm returns *in\_out\_result<InIter, FwdIter>*. The *uninitialized\_move\_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>>::type hpx::ranges::uninitialized_move_n(
```

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_move\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *count* movements, if count > 0, no move operations otherwise.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

## Returns

The *uninitialized\_move\_n* algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *uninitialized\_move\_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

## hpx::ranges::fill

Defined in header `hpx/algorithm.hpp`<sup>766</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fill_n`

```
template<typename ExPolicy, typename Rng, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::fill(E
```

Assigns the given value to the elements in the range [first, last).

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* assignments.

<sup>766</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

### Returns

The *fill* algorithm returns a `hpx::future<void>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

```
template<typename ExPolicy, typename Iter, typename Sent, typename T = typename  
std::iterator_traits<Iter>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, Iter>::type hpx::ranges::fill(ExPolicy &&policy, Iter  
first, Sent last, T const  
&value)
```

Assigns the given value to the elements in the range [first, last).

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **T** – The type of the value to be assigned (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **value** – The value to be assigned.

## Returns

The *fill* algorithm returns a `hpx::future<void>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

```
template<typename Rng, typename T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::fill(Rng &&rng, T const &value)
```

Assigns the given value to the elements in the range [first, last).

### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

## Returns

The *fill* algorithm returns *void*.

```
template<typename Iter, typename Sent, typename T = typename std::iterator_traits<Iter>::value_type>
```

```
Iter hpx::ranges::fill(Iter first, Sent last, T const &value)
```

Assigns the given value to the elements in the range [first, last).

### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **T** – The type of the value to be assigned (deduced).

## Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **value** – The value to be assigned.

## Returns

The *fill* algorithm returns *void*.

## `hpx::ranges::fill_n`

Defined in header `hpx/algorithm.hpp`<sup>767</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fill`

```
template<typename ExPolicy, typename Rng, typename T = typename  
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::fill_n(ExPolicy  
                                                                 &&pol-  
                                                                 icy,  
                                                                 Rng  
                                                                 &&rng,  
                                                                 T  
                                                                 const  
                                                                 &value)
```

Assigns the given value `value` to the first `count` elements in the range beginning at `first` if `count > 0`. Does nothing otherwise.

The comparisons in the `parallel_fill_n` algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the `parallel_fill_n` algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

## Template Parameters

---

<sup>767</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

### Returns

The *fill\_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T = typename
std::iterator_traits<FwdIter>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::fill_n(ExPolicy &&policy,
FwdIter first, Size
count, T const
&value)
```

Assigns the given value *value* to the first *count* elements in the range beginning at first if *count* > 0. Does nothing otherwise.

The comparisons in the parallel *fill\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *count* assignments, for *count* > 0.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

### Returns

The *fill\_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

```
template<typename Rng, typename T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::fill_n(Rng &&rng, T const &value)
```

Assigns the given value *value* to the first *count* elements in the range beginning at *first* if *count* > 0. Does nothing otherwise.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

### Returns

The *fill\_n* algorithm returns an output iterator that compares equal to last.

```
template<typename FwdIter, typename Size, typename T = typename std::iterator_traits<FwdIter>::value_type>
```

```
FwdIter hpx::ranges::fill_n(Iterator first, Size count, T const &value)
```

Assigns the given value *value* to the first *count* elements in the range beginning at *first* if *count* > 0. Does nothing otherwise.

#### Note

Complexity: Performs exactly *count* assignments, for *count* > 0.

### Template Parameters

- **Iterator** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **Size** – The type of the argument specifying the number of elements to apply  $f$  to.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

### Returns

The *fill\_n* algorithm returns an output iterator that compares equal to last.

### hpx::ranges::count

Defined in header [hpx/algorithm.hpp](#)<sup>768</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::count\\_if](#)

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator\_t<Rng>, Proj>::value_type>
hpx::parallel::util::detail::algorithm\_result<ExPolicy, typename std::iterator\_traits<typename hpx::traits::range\_traits<Rng>::iterator_type>::
```

Returns the number of elements in the range [first, last) satisfying a specific criteria.  
This version counts the elements that are equal to the given *value*.

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* comparisons.

<sup>768</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *count* algorithm returns a *hpx::future<difference\_type>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *std::iterator\_traits<FwdIter>::difference\_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Proj = hpx::identity, typename T =  
typename hpx::parallel::traits::projected<Iter, Proj>::value_type>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<Iter>::difference_type>::type hpx::ranges::count(ExPolicy,  
&&  
icy  
Iter  
firs  
Sent  
last  
T  
con  
&v  
Pro  
&&  
=  
Pro
```

Returns the number of elements in the range [first, last) satisfying a specific criteria.  
This version counts the elements that are equal to the given *value*.

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* comparisons.

#### Note

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *count* algorithm returns a *hpx::future<difference\_type>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *std::iterator\_traits<FwdIter>::difference\_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
```

```

std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::difference_type hpx::ranges::count(Rng
                                                                                                     &&rng,
                                                                                                     T
                                                                                                     const
                                                                                                     &value,
                                                                                                     Proj
                                                                                                     &&proj
                                                                                                     =
                                                                                                     Proj())

```

Returns the number of elements in the range [first, last) satisfying a specific criteria.  
This version counts the elements that are equal to the given *value*.

#### Note

Complexity: Performs exactly *last - first* comparisons.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

```

template<typename Iter, typename Sent, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<Iter, Proj>::value_type>
std::iterator_traits<Iter>::difference_type hpx::ranges::count(Iter first, Sent last, T const &value, Proj &&proj
                                                                = Proj())

```

Returns the number of elements in the range [first, last) satisfying a specific criteria.  
This version counts the elements that are equal to the given *value*.

#### Note

Complexity: Performs exactly *last - first* comparisons.

### Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

#### `hpx::ranges::count_if`

Defined in header `hpx/algorithm.hpp`<sup>769</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::count`

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::
```

Returns the number of elements in the range `[first, last)` satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

#### Note

Complexity: Performs exactly *last - first* applications of the predicate.

<sup>769</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

The assignments in the parallel *count\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

**Note**

The assignments in the parallel *count\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count\_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *count\_if* algorithm returns *hpx::future<difference\_type>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *std::iterator\_traits<FwdIter>::difference\_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

`hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<Iter>::difference_type>::type hpx::ranges::count_if`

Returns the number of elements in the range `[first, last)` satisfying a specific criteria. This version counts elements for which predicate `f` returns true.

#### Note

Complexity: Performs exactly *last - first* applications of the predicate.

#### Note

The assignments in the parallel *count\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

#### Note

The assignments in the parallel *count\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count\_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *count\_if* algorithm returns *hpx::future<difference\_type>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *std::iterator\_traits<FwdIter>::difference\_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```
std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::difference_type hpx::ranges::count_if(Rng  
                                                                 &&rng,  
                                                                 F  
                                                                 &&f,  
                                                                 Proj  
                                                                 &&proj  
                                                                 =  
                                                                 Proj())
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

#### Note

Complexity: Performs exactly *last - first* applications of the predicate.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count\_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
std::iterator_traits<Iter>::difference_type hpx::ranges::count_if(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

### Note

Complexity: Performs exactly *last - first* applications of the predicate.

## Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count\_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

### hpx::ranges::reduce

Defined in header `hpx/algorithm.hpp`<sup>770</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, FwdIter
first, Sent last, T init, F &&f)
```

Returns GENERALIZED\_SUM(f, init, \*first, ..., \*(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *f*.

#### Note

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and

<sup>770</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

$$1 < K+1 = M \leq N.$$

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy\_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

## Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename F, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, Rng
&&rng, T init, F &&f)
```

Returns GENERALIZED\_SUM(f, init, \*first, ..., \*(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *f*.

**Note**

GENERALIZED\_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED\_SUM(*op*, *b1*, ..., *bK*), GENERALIZED\_SUM(*op*, *bM*, ..., *bN*)), where:
  - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
  - $1 < K+1 = M \leq N$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy\_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const&*. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

### Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, FwdIter
first, Sent last, T init)
```

Returns GENERALIZED\_SUM(+, init, \*first, ..., \*(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the operator+().

#### Note

GENERALIZED\_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(+, b1, ..., bK), GENERALIZED\_SUM(+, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

#### Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying `operator+()`) over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename Rng, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, Rng
&&rng, T init)
```

Returns GENERALIZED\_SUM(+, init, \*first, ..., \*(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the `operator+()`.

#### Note

GENERALIZED\_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- `op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN))`, where:
- b1, ..., bN may be any permutation of a1, ..., aN and

---

$$1 < K+1 = M \leq N.$$

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

### Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying `operator+()`) over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename FwdIter, typename Sent>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<FwdIter>::value_type>::type hpx::ranges::reduce(E
&
ic
F
fi
Se
la
```

Returns `GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1))`.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the `operator+()`.

**Note**

The type of the initial value (and the result type)  $T$  is determined from the `value_type` of the used `FwdIterB`.

**Note**

`GENERALIZED_SUM(+, a1, ..., aN)` is defined as follows:

- $a_1$  when  $N$  is 1
- $\text{op}(\text{GENERALIZED\_SUM}(+, b_1, \dots, b_K), \text{GENERALIZED\_SUM}(+, b_{M+1}, \dots, b_N))$ , where:
  - $b_1, \dots, b_N$  may be any permutation of  $a_1, \dots, a_N$  and
  - $1 < K+1 = M \leq N$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

**Returns**

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns  $T$  otherwise (where  $T$  is the `value_type` of `FwdIterB`). The *reduce* algorithm returns the result of the generalized sum (applying operator`+`()) over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename Rng>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::
```

Returns `GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1))`.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the operator+().

#### Note

The type of the initial value (and the result type)  $T$  is determined from the `value_type` of the used *FwdIterB*.

#### Note

GENERALIZED\_SUM(+,  $a_1, \dots, a_N$ ) is defined as follows:

- $a_1$  when  $N$  is 1
- $\text{op}(\text{GENERALIZED\_SUM}(+, b_1, \dots, b_K), \text{GENERALIZED\_SUM}(+, b_M, \dots, b_N))$ , where:
  - $b_1, \dots, b_N$  may be any permutation of  $a_1, \dots, a_N$  and
  - $1 < K+1 = M \leq N$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

## Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns  $T$  otherwise (where  $T$  is the `value_type` of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename FwdIter, typename Sent, typename F, typename T = typename
std::iterator_traits<FwdIter>::value_type>
```

```
T hpx::ranges::reduce(FwdIter first, Sent last, T init, F &&f)
```

Returns GENERALIZED\_SUM(*f*, *init*, \**first*, ..., \*(*first* + (*last* - *first*) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *f*.

#### Note

GENERALIZED\_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED\_SUM(*op*, *b1*, ..., *bK*), GENERALIZED\_SUM(*op*, *bM*, ..., *bN*)),  
where:
- *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
- $1 < K+1 = M \leq N$ .

### Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy\_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1 Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

### Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename Rng, typename F, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
T hpx::ranges::reduce(Rng &&rng, T init, F &&f)
```

Returns GENERALIZED\_SUM(f, init, \*first, ..., \*(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *f*.

#### Note

GENERALIZED\_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(op, b1, ..., bK), GENERALIZED\_SUM(op, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy\_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

### Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range `[first, last)`.

```
template<typename FwdIter, typename Sent, typename T = typename std::iterator_traits<FwdIter>::value_type>
```

```
T hpx::ranges::reduce(FwdIter first, Sent last, T init)
```

Returns `GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1))`.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the operator`+`.

#### Note

`GENERALIZED_SUM(+, a1, ..., aN)` is defined as follows:

- `a1` when `N` is 1
- `op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN))`, where:
  - `b1, ..., bN` may be any permutation of `a1, ..., aN` and
  - `1 < K+1 = M <= N`.

### Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **init** – The initial value for the generalized sum.

#### Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename Rng, typename T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
T hpx::ranges::reduce(Rng &&rng, T init)
```

Returns GENERALIZED\_SUM(+, init, \*first, ..., \*(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the operator+().

#### Note

GENERALIZED\_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(+, b1, ..., bK), GENERALIZED\_SUM(+, bM, ..., bN)),  
where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

#### Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename FwdIter, typename Sent>
```

`std::iterator_traits<FwdIter>::value_type hpx::ranges::reduce(FwdIter first, Sent last)`

Returns GENERALIZED\_SUM(+, T(), \*first, ..., \*(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the operator+().

**Note**

The type of the initial value (and the result type) *T* is determined from the `value_type` of the used *FwdIterB*.

**Note**

GENERALIZED\_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(+, b1, ..., bK), GENERALIZED\_SUM(+, bM, ..., bN)), where:
  - b1, ..., bN may be any permutation of a1, ..., aN and
  - $1 < K+1 = M \leq N$ .

## Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

## Returns

The *reduce* algorithm returns *T* (where T is the `value_type` of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

template<typename **Rng**>

`std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::value_type hpx::ranges::reduce(Rng &&rng)`

Returns GENERALIZED\_SUM(+, T(), \*first, ..., \*(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the operator+().

#### Note

The type of the initial value (and the result type) *T* is determined from the value\_type of the used *FwdIterB*.

#### Note

GENERALIZED\_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED\_SUM(+, b1, ..., bK), GENERALIZED\_SUM(+, bM, ..., bN)), where:
- b1, ..., bN may be any permutation of a1, ..., aN and
- $1 < K+1 = M \leq N$ .

### Template Parameters

**Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

### Parameters

**rng** – Refers to the sequence of elements the algorithm will be applied to.

### Returns

The *reduce* algorithm returns *T* (where T is the value\_type of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

- [hpx::ranges::fold\\_right\\_last](#)
- [hpx::ranges::fold\\_left\\_with\\_iter](#)
- [hpx::ranges::fold\\_left\\_first\\_with\\_iter](#)

template<typename **InIter**, typename **Sent**, typename **T**, typename **F**>

auto [hpx::ranges::fold\\_left](#)(*InIter* first, *Sent* last, *T* init, *F* f)

Left-folds a range of elements using a binary operator.

#### Note

Complexity: Exactly N applications of the binary operator, where N = std::distance(first, last).

### Template Parameters

- **InIter** – The type of the source begin iterator (deduced). This iterator must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **T** – The type of the initial value.

---

<sup>780</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

<sup>781</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the binary function object.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

#### Returns

The result of left-folding the range.

```
template<typename Rng, typename T, typename F>
```

```
auto hpx::ranges::fold_left(Rng &&rng, T init, F f)
```

Left-folds a range of elements using a binary operator.

#### Note

Complexity: Exactly N applications of the binary operator, where N = `std::distance(begin(rng), end(rng))`.

#### Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

#### Returns

The result of left-folding the range.

#### `hpx::ranges::fold_left_first`

Defined in header `hpx/algorithm.hpp`<sup>782</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::fold_left`

<sup>782</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- *hpx::ranges::fold\_right*
- *hpx::ranges::fold\_right\_last*
- *hpx::ranges::fold\_left\_with\_iter*
- *hpx::ranges::fold\_left\_first\_with\_iter*

template<typename **InIter**, typename **Sent**, typename **F**>

auto *hpx::ranges::fold\_left\_first*(*InIter* first, *Sent* last, *F* f)

Left-folds a range using the first element as the initial value.

#### Note

Complexity: Exactly N-1 applications of the binary operator, where N = std::distance(first, last).

### Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

### Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

### Returns

An optional containing the fold result, or std::nullopt if the range is empty.

template<typename **Rng**, typename **F**>

auto *hpx::ranges::fold\_left\_first*(*Rng* &&rng, *F* f)

Left-folds a range using the first element as the initial value.

### Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

### Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

### Returns

An optional containing the fold result, or std::nullopt if the range is empty.

## hpx::ranges::fold\_right

Defined in header `hpx/algorithm.hpp`<sup>783</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fold_left`
- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right_last`
- `hpx::ranges::fold_left_with_iter`
- `hpx::ranges::fold_left_first_with_iter`

template<typename **BidIter**, typename **Sent**, typename **T**, typename **F**>

auto `hpx::ranges::fold_right`(*BidIter* first, *Sent* last, *T* init, *F* f)

Right-folds a range of elements using a binary operator.

### Note

Complexity: Exactly N applications of the binary operator.

## Template Parameters

- **BidIter** – The type of the source begin iterator (deduced). This iterator must meet the requirements of a bidirectional iterator.
- **Sent** – The type of the source sentinel (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

## Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

## Returns

The result of right-folding the range.

template<typename **Rng**, typename **T**, typename **F**>

auto `hpx::ranges::fold_right`(*Rng* &&rng, *T* init, *F* f)

Right-folds a range of elements using a binary operator.

<sup>783</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

### Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

### Parameters

- **rng** – Refers to the sequence of elements.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

### Returns

The result of right-folding the range.

### `hpx::ranges::fold_right_last`

Defined in header `hpx/algorithm.hpp`<sup>784</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::fold_left`
- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right`
- `hpx::ranges::fold_left_with_iter`
- `hpx::ranges::fold_left_first_with_iter`

template<typename **BidIter**, typename **Sent**, typename **F**>

auto `hpx::ranges::fold_right_last`(*BidIter* first, *Sent* last, *F* f)

Right-folds a range using the last element as the initial value.

### Template Parameters

- **BidIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

### Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

---

<sup>784</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Returns**

An optional containing the fold result, or `std::nullopt` if the range is empty.

```
template<typename Rng, typename F>
```

```
auto hpx::ranges::fold_right_last(Rng &&rng, F f)
```

Right-folds a range using the last element as the initial value.

**Template Parameters**

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

**Parameters**

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

**Returns**

An optional containing the fold result, or `std::nullopt` if the range is empty.

**`hpx::ranges::fold_left_with_iter`**

Defined in header `hpx/algorithm.hpp`<sup>785</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fold_left`
- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right`
- `hpx::ranges::fold_right_last`
- `hpx::ranges::fold_left_first_with_iter`

```
template<typename InIter, typename Sent, typename T, typename F>
```

```
auto hpx::ranges::fold_left_with_iter(InIter first, Sent last, T init, F f) ->
    fold_left_with_iter_result<InIter,
    std::decay_t<std::invoke_result_t<F&, T,
    std::iter_reference_t<InIter>>>>
```

Left-folds a range and returns both the result and the end iterator.

**Template Parameters**

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **T** – The type of the initial value.

<sup>785</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the binary function object.

#### Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

#### Returns

A `fold_left_with_iter_result` containing the end iterator and the fold result.

template<typename **Rng**, typename **T**, typename **F**>

```
auto hpx::ranges::fold_left_with_iter(Rng &&rng, T init, F f) ->
    fold_left_with_iter_result<std::ranges::iterator_t<Rng>,
    std::decay_t<std::invoke_result_t<F&, T,
    std::ranges::range_reference_t<Rng>>>>
```

Left-folds a range and returns both the result and the end iterator.

#### Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

#### Parameters

- **rng** – Refers to the sequence of elements.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

#### Returns

A `fold_left_with_iter_result` containing the end iterator and the fold result.

### **`hpx::ranges::fold_left_first_with_iter`**

Defined in header `hpx/algorithm.hpp`<sup>786</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::fold_left`

- `hpx::ranges::fold_right`
- `hpx::ranges::fold_right_last`
- `hpx::ranges::fold_left_with_iter`

---

<sup>786</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename InIter, typename Sent, typename F>
```

```
auto hpx::ranges::fold_left_first_with_iter(InIter first, Sent last, F f) ->
    fold_left_first_with_iter_result<InIter,
    hpx::optional<std::decay_t<std::invoke_result_t<F&,
    std::iter_reference_t<InIter>,
    std::iter_reference_t<InIter>>>>>
```

Left-folds a range using the first element and returns both an optional result and the end iterator.

#### Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

#### Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

#### Returns

A `fold_left_first_with_iter_result` containing the end iterator and an optional with the fold result.

```
template<typename Rng, typename F>
```

```
auto hpx::ranges::fold_left_first_with_iter(Rng &&rng, F f) ->
    fold_left_first_with_iter_result<std::ranges::iterator_t<Rng>,
    hpx::optional<std::decay_t<std::invoke_result_t<F&,
    std::ranges::range_reference_t<Rng>,
    std::ranges::range_reference_t<Rng>>>>>
```

Left-folds a range using the first element and returns both an optional result and the end iterator.

#### Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

#### Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

#### Returns

A `fold_left_first_with_iter_result` containing the end iterator and an optional with the fold result.

## hpx::ranges::set\_difference

Defined in header `hpx/algorithm.hpp`<sup>787</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename  
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =  
hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<Iter1, Iter3>>::type hpx::ranges::set_difference(ExPolicy  
&&pol-  
icy,  
Iter1  
first1,  
Sent1  
last1,  
Iter2  
first2,  
Sent2  
last2,  
Iter3  
dest,  
Pred  
&&op  
=  
Pred(),  
Proj1  
&&proj  
=  
Proj1(),  
Proj2  
&&proj  
=  
Proj2()
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range  $[first1, last1)$  and not present in the range  $[first2, last2)$ . This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in  $[first1, last1)$  and *n* times in  $[first2, last2)$ , it will be copied to *dest* exactly  $\text{std::max}(m-n, 0)$  times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

---

<sup>787</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_difference* algorithm returns a `hpx::future<ranges::set_difference_result<Iter1, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::set_difference_result<Iter1, Iter3>` otherwise. The *set\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =  
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<std::ranges::iterator_t<Rng1>, Iter3>> hpx::ranges::set_diff
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range *[first1, last1)* and not present in the range *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_difference* algorithm returns a `hpx::future<ranges::set_difference_result<Iter1, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::set_difference_result<Iter1, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>`. The *set\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred
= hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
set_difference_result<Iter1, Iter3> hpx::ranges::set_difference(Iter1 first1, Sent1 last1, Iter2 first2, Sent2
last2, Iter3 dest, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 =
Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range *[first1, last1)* and not present in the range *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

### Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for *Iter2*.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

## Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

## Returns

The *set\_difference* algorithm returns `ranges::set_difference_result<Iter1, Iter3>`. The *set\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_difference_result<std::ranges::iterator_t<Rng1>, Iter3> hpx::ranges::set_difference(Rng1 &&rng1,
                                                                                      Rng2 &&rng2, Iter3
                                                                                      dest, Pred &&op =
                                                                                      Pred(), Proj1
                                                                                      &&proj1 = Proj1(),
                                                                                      Proj2 &&proj2 =
                                                                                      Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the

range `[first1, last1)` and not present in the range `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in `[first1, last1)` and *n* times in `[first2, last2)`, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

**Note**

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

**Template Parameters**

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_difference* algorithm returns *ranges::set\_difference\_result<Iter1, Iter3>*, where *Iter1* is *range\_iterator\_t<Rng1>* and *Iter2* is *range\_iterator\_t<Rng2>*. The *set\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::nth\_element

Defined in header [hpx/algorithm.hpp](#)<sup>788</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Pred = hpx::parallel::detail::less, typename Proj =
hpx::identity>
RandomIt hpx::ranges::nth_element(RandomIt first, RandomIt nth, Sent last, Pred &&pred = Pred(), Proj
&&proj = Proj())
```

*nth\_element* is a partial sorting algorithm that rearranges elements in *[first, last)* such that the element pointed at by *nth* is changed to whatever element would occur in that position if *[first, last)* were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth\_element* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Linear in *std::distance(first, last)* on average. *O(N)* applications of the predicate, and *O(N log N)* swaps, where *N* = *last* - *first*.

### Template Parameters

- **RandomIt** – The type of the source begin, *nth*, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *RandomIt*.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

<sup>788</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to `hpx::identity`.

### Returns

The *nth\_element* algorithm returns *RandomIt*. The *nth\_element* algorithm returns an iterator equal to `last`.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Pred = hpx::parallel::detail::less,
        typename Proj = hpx::identity>
parallel::util::detail::algorithm_result_t<ExPolicy, RandomIt> hpx::ranges::nth_element(ExPolicy &&policy,
                                                                                      RandomIt first,
                                                                                      RandomIt nth, Sent
                                                                                      last, Pred &&pred =
                                                                                      Pred(), Proj &&proj
                                                                                      = Proj())
```

*nth\_element* is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth\_element* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *nth\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Linear in `std::distance(first, last)` on average.  $O(N)$  applications of the predicate, and  $O(N \log N)$  swaps, where  $N = \text{last} - \text{first}$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

executes the assignments.

- **RandomIt** – The type of the source begin, nth, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to Type. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to *hpx::identity*.

## Returns

The *partition* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *parallel\_task\_policy* and returns *RandomIt* otherwise. The *nth\_element* algorithm returns an iterator equal to last.

```
template<typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::nth_element(Rng &&rng, std::ranges::iterator_t<Rng> nth, Pred
&&pred = Pred(), Proj &&proj = Proj())
```

*nth\_element* is a partial sorting algorithm that rearranges elements in [first, last) such that the element pointed at by *nth* is changed to whatever element would occur in that position if [first, last) were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth\_element* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note**

Complexity: Linear in `std::distance(first, last)` on average.  $O(N)$  applications of the predicate, and  $O(N \log N)$  swaps, where  $N = \text{last} - \text{first}$ .

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to `hpx::identity`.

**Returns**

The *nth\_element* algorithm returns `std::ranges::iterator_t<Rng>`. The *nth\_element* algorithm returns an iterator equal to last.

```
template<typename ExPolicy, typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```

parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::nth_element(ExPolicy
&&pol-
icy,
Rng
&&rng,
std::ranges::iterator_t<Rng>
nth,
Pred
&&pred
=
Pred(),
Proj
&&proj
=
Proj())

```

`nth_element` is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by `nth` is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new `nth` element are less than or equal to the elements after the new `nth` element.

The comparison operations in the parallel `nth_element` invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `nth_element` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in `std::distance(first, last)` on average.  $O(N)$  applications of the predicate, and  $O(N \log N)$  swaps, where  $N = \text{last} - \text{first}$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point

- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to Type. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to `hpx::identity`.

### Returns

The *partition* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *parallel\_task\_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. The *nth\_element* algorithm returns an iterator equal to last.

### hpx::ranges::remove

Defined in header `hpx/algorithm.hpp`<sup>789</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::remove_if`

template<typename **Iter**, typename **Sent**, typename **Proj** = `hpx::identity`, typename **T** = typename `hpx::parallel::traits::projected<Iter, Proj>::value_type`>

subrange\_t<*Iter*, *Sent*> `hpx::ranges::remove`(*Iter* first, *Sent* last, *T* const &value, *Proj* &&proj = *Proj*())

Removes all elements that are equal to *value* from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator `==()` and the projection *proj*.

### Template Parameters

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `FwdIter`.

<sup>789</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *remove* algorithm returns a *subrange\_t<FwdIter, Sent>*. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::remove(Rng &&rng, T const &value, Proj &&proj =
Proj())
```

Removes all elements that are equal to *value* from the range *rng* and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the *operator==()* and the projection *proj*.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *remove* algorithm returns a *subrange\_t*<*std::ranges::iterator\_t*<*Rng*>>. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Proj = hpx::identity, typename T =  
typename hpx::parallel::traits::projected<FwdIter, Proj>::value_type>  
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::remove(ExPolicy  
                                                    &&pol-  
                                                    icy,  
                                                    FwdIter  
                                                    first,  
                                                    Sent  
                                                    last, T  
                                                    const  
                                                    &value,  
                                                    Proj  
                                                    &&proj  
                                                    =  
                                                    Proj())
```

Removes all elements that are equal to *value* from the range [first, last) and and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator==() and the projection *proj*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *remove* algorithm returns a `hpx::future<subrange_t<FwdIter, Sent>>`. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::remove(ExPolicy
&&pol-
icy,
Rng
&&rng,
T
const
&value,
Proj
&&proj
=
Proj())
```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator==() and the projection *proj*.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *remove* algorithm returns a `hpx::future<subrange_t<std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *remove* algorithm returns the iterator to the new end of the range.

## `hpx::ranges::remove_if`

Defined in header `hpx/algorithm.hpp`<sup>790</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::remove`

`template<typename Iter, typename Sent, typename Pred, typename Proj = hpx::identity>`

`subrange_t<Iter, Sent> hpx::ranges::remove_if(Iter first, Sent sent, Pred &&pred, Proj &&proj = Proj())`

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove\_if* algorithm execute in sequential order in the calling thread.

---

<sup>790</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred* and the projection *proj*.

**Template Parameters**

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `remove_if` requires *Pred* to meet the requirements of *CopyConstructible*..
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The `remove_if` algorithm returns a `subrange_t<FwdIter, Sent>`. The `remove_if` algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::remove_if(Rng &&rng, Pred &&pred, Proj &&proj = Proj())
```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel `remove_if` algorithm execute in sequential order in the calling thread.

**Note**

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator==() and the projection *proj*.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *remove\_if* algorithm returns a *subrange\_t<std::ranges::iterator\_t<Rng>>*. The *remove\_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =  
hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::remove_if(ExPolicy  
                                                         &&pol-  
                                                         icy,  
                                                         FwdIter  
                                                         first,  
                                                         Sent  
                                                         sent,  
                                                         Pred  
                                                         &&pred,  
                                                         Proj  
                                                         &&proj  
                                                         =  
                                                         Proj())
```

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred* and the projection *proj*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *remove\_if* algorithm returns a `hpx::future<subrange_t<FwdIter, Sent>>`. The *remove\_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::remove_if(ExPolicy
&&pol-
icy,
Rng
&&rng,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(*rng*)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator==() and the projection *proj*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *remove\_if* algorithm returns a `hpx::future<subrange_t<std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *remove\_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

## hpx::ranges::reverse

Defined in header `hpx/algorithm.hpp`<sup>791</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::reverse_copy`

```
template<typename Iter, typename Sent>
```

```
Iter hpx::ranges::reverse(Iter first, Sent sent)
```

Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Linear in the distance between *first* and *last*.

## Template Parameters

<sup>791</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

#### Returns

The *reverse* algorithm returns a *Iter*. It returns *last*.

```
template<typename Rng>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::reverse(Rng &&rng)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Reverses the order of the elements in the range [first, last). Behaves as if applying *std::iter\_swap* to every pair of iterators *first+i*, *(last-i) - 1* for each non-negative  $i < (last-first)/2$ .

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Linear in the distance between *first* and *last*.

#### Template Parameters

**Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

#### Parameters

**rng** – Refers to the sequence of elements the algorithm will be applied to.

#### Returns

The *reverse* algorithm returns a *hpx::traits::range\_iterator<Rng>::type*. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::reverse(ExPolicy &&policy, Iter first, Sent sent)
```

Reverses the order of the elements in the range [first, last). Behaves as if applying *std::iter\_swap* to every pair of iterators *first+i*, *(last-i) - 1* for each non-negative  $i < (last-first)/2$ .

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in the distance between *first* and *last*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

### Returns

The *reverse* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

template<typename **ExPolicy**, typename **Rng**>

*parallel::util::detail::algorithm\_result<ExPolicy, std::ranges::iterator\_t<Rng>>* *hpx::ranges::reverse*(*ExPolicy* &&pol-  
icy, *Rng* &&rng)

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Reverses the order of the elements in the range [first, last). Behaves as if applying *std::iter\_swap* to every pair of iterators *first+i*, (*last-i*) - 1 for each non-negative *i* < (*last-first*)/2.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear in the distance between *first* and *last*.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

**Returns**

The *reverse* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `hpx::future<std::ranges::iterator_t<Rng>>` otherwise. It returns *last*.

**hpx::ranges::reverse\_copy**

Defined in header `hpx/algorithm.hpp`<sup>792</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::reverse`

`template<typename Iter, typename Sent, typename OutIter>`

`reverse_copy_result<Iter, OutIter> hpx::ranges::reverse_copy(Iter first, Sent last, OutIter result)`

Copies the elements from the range `[first, last)` to another range beginning at `result` in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment `*(result + (last - first) - 1 - i) = *(first + i)` once for each non-negative `i < (last - first)`. If the source and destination ranges (that is, `[first, last)` and `[result, result+(last-first))` respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse\_copy* algorithm execute in sequential order in the calling thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

---

<sup>792</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

## Returns

The *reverse\_copy* algorithm returns a *reverse\_copy\_result<Iter, OutIter>*. The *reverse\_copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename OutIter>
```

```
reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::reverse_copy(Rng &&rng, OutIter  
result)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last) to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment  $*(result + (last - first) - 1 - i) = *(first + i)$  once for each non-negative  $i < (last - first)$ . If the source and destination ranges (that is, [first, last) and [result, result+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse\_copy* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

### Returns

The `reverse_copy` algorithm returns a `ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>`. The `reverse_copy` algorithm returns an object equal to `{last, result + N}` where `N = last - first`

```
template<typename ExPolicy, typename Iter, typename Sent, typename FwdIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, reverse_copy_result<Iter, FwdIter>>::type hpx::ranges::reverse_copy(ExPolicy
&&pol-
icy,
Iter
first,
Sent
last,
FwdIter
re-
sult)
```

Copies the elements from the range `[first, last)` to another range beginning at `result` in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment `*(result + (last - first) - 1 - i) = *(first + i)` once for each non-negative `i < (last - first)`. If the source and destination ranges (that is, `[first, last)` and `[result, result+(last-first))` respectively) overlap, the behavior is undefined.

The assignments in the parallel `reverse_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `reverse_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly `last - first` assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `Iter`.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

## Returns

The *reverse\_copy* algorithm returns a `hpx::future<reverse_copy_result<Iter, FwdIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *reverse\_copy\_result<Iter, FwdIter>* otherwise. The *reverse\_copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename OutIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>>::type hpx::ranges::revers
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range  $[first, last)$  to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment  $*(result + (last - first) - 1 - i) = *(first + i)$  once for each non-negative  $i < (last - first)$ . If the source and destination ranges (that is,  $[first, last)$  and  $[result, result + (last - first))$  respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* assignments.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

#### Returns

The *reverse\_copy* algorithm returns a `hpx::future<ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>` otherwise. The *reverse\_copy* algorithm returns an object equal to `{last, result + N}` where `N = last - first`

### hpx::ranges::replace

Defined in header `hpx/algorithm.hpp`<sup>793</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace_if`
- `hpx::ranges::replace_copy`
- `hpx::ranges::replace_copy_if`

```
template<typename Iter, typename Sent, typename Proj = hpx::identity, typename T1 = typename  
hpx::parallel::traits::projected<Iter, Proj>::value_type, typename T2 = T1>
```

```
Iter hpx::ranges::replace(Iter first, Sent sent, T1 const &old_value, T2 const &new_value, Proj &&proj =  
Proj())
```

Replaces all elements satisfying specific criteria with *new\_value* in the range `[first, last)`.

Effects: Substitutes elements referred by the iterator *it* in the range `[first,last)` with *new\_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

---

<sup>793</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *replace* algorithm returns an *Iter*.

```
template<typename Rng, typename Proj = hpx::identity, typename T1 = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
std::ranges::iterator_t<Rng> hpx::ranges::replace(Rng &&rng, T1 const &old_value, T2 const &new_value,
Proj &&proj = Proj())
```

Replaces all elements satisfying specific criteria with *new\_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new\_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

**Note**

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* assignments.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *replace* algorithm returns an *hpx::traits::range\_iterator<Rng>::type*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Proj = hpx::identity, typename T1 =  
typename hpx::parallel::traits::projected<Iter, Proj>::value_type, typename T2 = T1>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::replace(ExPolicy &&policy, Iter  
first, Sent sent, T1 const  
old_value, T2 const  
new_value, Proj &&proj  
= Proj())
```

Replaces all elements satisfying specific criteria with *new\_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator it in the range [first,last) with *new\_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *replace* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename T1 = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::replace(ExPolicy
&&pol-
icy, Rng
&&rng,
T1 const
&old_value,
T2 const
&new_value,
Proj
&&proj =
Proj())
```

Replaces all elements satisfying specific criteria with *new\_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator it in the range *rng* with *new\_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

### Returns

The *replace* algorithm returns an `hpx::future<hpx::traits::range_iterator<Rng>::type>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `hpx::traits::range_iterator<Rng>::type` otherwise.

### `hpx::ranges::replace_if`

Defined in header `hpx/algorithm.hpp`<sup>794</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace`
- `hpx::ranges::replace_copy`
- `hpx::ranges::replace_copy_if`

---

<sup>794</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename Iter, typename Sent, typename Pred, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<Iter, Proj>::value_type>
```

```
Iter hpx::ranges::replace_if(Iter first, Sent sent, Pred &&pred, T const &new_value, Proj &&proj = Proj())
```

Replaces all elements satisfying specific criteria (for which predicate *f* returns true) with *new\_value* in the range [first, sent).

Effects: Substitutes elements referred by the iterator *it* in the range [first, sent) with *new\_value*, when the following corresponding conditions hold: INVOKE(*f*, INVOKE(*proj*, \**it*)) != false

The assignments in the parallel *replace\_if* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *sent - first* applications of the predicate.

### Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *replace\_if* algorithm returns *Iter*. It returns *last*.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
std::ranges::iterator_t<Rng> hpx::ranges::replace_if(Rng &&rng, Pred &&pred, T const &new_value, Proj
&&proj = Proj())
```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new\_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new\_value*, when the following corresponding conditions hold: INVOKE(f, INVOKE(proj, \*it)) != false

#### Note

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by *rng*. This is a unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The `replace_if` algorithm returns an `hpx::traits::range_iterator<Rng>::type`. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Pred, typename Proj = hpx::identity,
typename T = typename hpx::parallel::traits::projected<Iter, Proj>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::replace_if(ExPolicy &&policy,
                                                                                   Iter first, Sent sent,
                                                                                   Pred &&pred, T const
                                                                                   &new_value, Proj
                                                                                   &&proj = Proj())
```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new\_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new\_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

The assignments in the parallel *replace\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` applications of the predicate.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *replace\_if* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity, typename T =  
typename hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>  
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::replace_if(ExPolicy  
                                                                &&pol-  
                                                                icy,  
                                                                Rng  
                                                                &&rng,  
                                                                Pred  
                                                                &&pred,  
                                                                T  
                                                                const  
                                                                &new_value,  
                                                                Proj  
                                                                &&proj  
                                                                =  
                                                                Proj())
```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new\_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new\_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an

unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly  $util::end(rng) - util::begin(rng)$  applications of the predicate.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by *rng*. This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *replace\_if* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy*. It returns *last*.

## hpx::ranges::replace\_copy

Defined in header `hpx/algorithm.hpp`<sup>795</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace`
- `hpx::ranges::replace_if`
- `hpx::ranges::replace_copy_if`

```
template<typename InIter, typename Sent, typename OutIter, typename Proj = hpx::identity, typename T1 =  
typename hpx::parallel::traits::projected<InIter, Proj>::value_type, typename T2 = T1>  
replace_copy_result<InIter, OutIter> hpx::ranges::replace_copy(InIter first, Sent sent, OutIter dest, T1 const  
                                &old_value, T2 const &new_value, Proj  
                                &&proj = Proj())
```

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either *new\_value* or *\*(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(proj, *(first + (i - result))) == old_value`

The assignments in the parallel *replace\_copy* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *sent - first* applications of the predicate.

## Template Parameters

- **InIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

---

<sup>795</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *replace\_copy* algorithm returns an *in\_out\_result<InIter, OutIter>*. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename OutIter, typename Proj = hpx::identity, typename T1 = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
replace_copy_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::replace_copy(Rng &&rng, OutIter
dest, T1 const
&old_value, T2 const
&new_value, Proj
&&proj = Proj())
```

Copies the all elements from the range *rbg* to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*.

Effects: Assigns to every iterator *it* in the range  $[result, result + (util::end(rng) - util::begin(rng)))$  either *new\_value* or  $*(first + (it - result))$  depending on whether the following corresponding condition holds:  $INVOKE(proj, *(first + (i - result))) == old\_value$

The assignments in the parallel *replace\_copy* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly  $util::end(rng) - util::begin(rng)$  applications of the predicate.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *replace\_copy* algorithm returns an *in\_out\_result*<*std::ranges::iterator\_t*<*Rng*>, *OutIter*>. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Proj =  
hpx::identity, typename T1 = typename hpx::parallel::traits::projected<FwdIter1, Proj>::value_type, typename T2 =  
T1>
```

```
parallel::util::detail::algorithm_result<ExPolicy, replace_copy_result<FwdIter1, FwdIter2>>::type hpx::ranges::replace_copy(ExPolicy,  
    &&pol-  
    icy,  
    FwdIter  
    first,  
    Sent  
    sent,  
    FwdIter  
    dest,  
    T1  
    const  
    &old_v  
    T2  
    const  
    &new_v  
    Proj  
    &&proj  
    =  
    Proj())
```

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either *new\_value* or *\*(first + (it - result))* depending on whether the following corresponding condition holds: *INVOKE*(*proj*, *\*(first + (i - result))*) == *old\_value*

The assignments in the parallel *replace\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *sent - first* applications of the predicate.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *replace\_copy* algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `in_out_result<FwdIter1, FwdIter2>` otherwise. The *copy* algorithm returns the pair of the forward iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename Proj = hpx::identity, typename T1 =  
typename hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
```

`parallel::util::detail::algorithm_result<ExPolicy, replace_copy_result<std::ranges::iterator_t<Rng>, FwdIter>>>::type hpx::ranges::repla`

Copies the all elements from the range `rbg` to another range beginning at `dest` replacing all elements satisfying a specific criteria with `new_value`.

Effects: Assigns to every iterator `it` in the range `[result, result + (util::end(rng) - util::begin(rng))]` either `new_value` or `*(first + (it - result))` depending on whether the following corresponding condition holds: `INVOKE(proj, *(first + (i - result))) == old_value`

The assignments in the parallel `replace_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `replace_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` applications of the predicate.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old\_value** – Refers to the old value of the elements to replace.
- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *replace\_copy* algorithm returns a `hpx::future<in_out_result<std::ranges::iterator_t<Rng>, FwdIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *in\_out\_result<std::ranges::iterator\_t<Rng>, FwdIter>>* The *copy* algorithm returns the pair of the input iterator *last* and the forward iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::replace\_copy\_if

Defined in header `hpx/algorithm.hpp`<sup>796</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::replace*
- *hpx::ranges::replace\_if*
- *hpx::ranges::replace\_copy*

template<typename **InIter**, typename **Sent**, typename **OutIter**, typename **Pred**, typename **T** = typename *std::iterator\_traits<OutIter>::value\_type*, typename **Proj** = *hpx::identity*>

*replace\_copy\_if\_result<InIter, OutIter>* **hpx::ranges::replace\_copy\_if**(*InIter* first, *Sent* sent, *OutIter* dest, *Pred* &&pred, *T* const &new\_value, *Proj* &&proj = *Proj*())

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either *new\_value* or *\*(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false`

The assignments in the parallel *replace\_copy\_if* algorithm execute in sequential order in the calling thread.

<sup>796</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *sent - first* applications of the predicate.

**Template Parameters**

- **InIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *replace\_copy\_if* algorithm returns a *in\_out\_result<InIter, OutIter>*. The *replace\_copy\_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename OutIter, typename Pred, typename T = typename  
std::iterator_traits<OutIter>::value_type, typename Proj = hpx::identity>
```

```
replace_copy_if_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::replace_copy_if(Rng &&rng,
                                                                                          OutIter dest,
                                                                                          Pred &&pred,
                                                                                          T const
                                                                                          &new_value,
                                                                                          Proj &&proj =
                                                                                          Proj())
```

Copies the all elements from the range *rng* to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*.

Effects: Assigns to every iterator it in the range  $[\text{result}, \text{result} + (\text{util::end}(\text{rng}) - \text{util::begin}(\text{rng}))]$  either *new\_value* or  $*(\text{first} + (\text{it} - \text{result}))$  depending on whether the following corresponding condition holds:  $\text{INVOKE}(\text{f}, \text{INVOKE}(\text{proj}, *(\text{first} + (\text{i} - \text{result})))) \neq \text{false}$

The assignments in the parallel *replace\_copy\_if* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly  $\text{util::end}(\text{rng}) - \text{util::begin}(\text{rng})$  applications of the predicate.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by  $[\text{first}, \text{last})$ . This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *replace\_copy\_if* algorithm returns an *in\_out\_result*<*std::ranges::iterator\_t*<*Rng*>, *OutIter*>. The *replace\_copy\_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Pred,  
typename T = typename std::iterator_traits<FwdIter2>::value_type, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, replace_copy_if_result<FwdIter1, FwdIter2>>::type hpx::ranges::replace_copy_if(E
```

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new\_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either *new\_value* or *\*(first + (it - result))* depending on whether the following corresponding condition holds: *INVOKE*(*f*, *INVOKE*(*proj*, *\*(first + (i - result))*)) != false

The assignments in the parallel *replace\_copy\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace\_copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *sent - first* applications of the predicate.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *replace\_copy\_if* algorithm returns an *hpx::future<FwdIter1, FwdIter2>*. The *replace\_copy\_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename Pred, typename T = typename
std::iterator_traits<FwdIter>::value_type, typename Proj = hpx::identity>
```

`parallel::util::detail::algorithm_result<ExPolicy, replace_copy_if_result<std::ranges::iterator_t<Rng>, FwdIter>>::type hpx::ranges::rep`

Copies the all elements from the range `rng` to another range beginning at `dest` replacing all elements satisfying a specific criteria with `new_value`.

Effects: Assigns to every iterator `it` in the range `[result, result + (util::end(rng) - util::begin(rng))]` either `new_value` or `*(first + (it - result))` depending on whether the following corresponding condition holds: `INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false`

The assignments in the parallel `replace_copy_if` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `replace_copy_if` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` applications of the predicate.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `equal` requires `Pred` to meet the requirements of `CopyConstructible`. (deduced).
- **T** – The type of the new values to replace (deduced).

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new\_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *replace\_copy\_if* algorithm returns an `hpx::future<in_out_result<std::ranges::iterator_t<Rng>, OutIter>>`. The *replace\_copy\_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::sort

Defined in header `hpx/algorithm.hpp`<sup>797</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
RandomIt hpx::ranges::sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

*comp* has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

<sup>797</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity:  $O(N \log(N))$ , where  $N = \text{detail::distance}(\text{first}, \text{last})$  comparisons.

**Template Parameters**

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The *sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename
Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type hpx::ranges::sort(ExPolicy &&policy,
                                                                    RandomIt first, Sent last,
                                                                    Comp &&comp = Comp(),
                                                                    Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, \*(i + n)), INVOKE(proj, \*i)) == false.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{detail::distance}(\text{first}, \text{last})$  comparisons.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp, typename Proj>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

*comp* has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$  comparisons.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the `INVOKE` operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *sort* algorithm returns `std::ranges::iterator_t<Rng>`. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::sort(ExPolicy  
                                                    &&policy,  
                                                    Rng &&rng,  
                                                    Comp  
                                                    &&comp =  
                                                    Comp(), Proj  
                                                    &&proj =  
                                                    Proj())
```

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$  comparisons.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to *bool*, yields *true* if the first argument of the call is less than the second, and *false* otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

## Returns

The *sort* algorithm returns a *hpx::future<std::ranges::iterator\_t<Rng>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *std::ranges::iterator\_t<Rng>* otherwise. It returns *last*.

## hpx::ranges::partition

Defined in header *hpx/algorithm.hpp*<sup>798</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::stable\_partition*

<sup>798</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- `hpx::ranges::partition_copy`

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::partition(Rng &&rng, Pred &&pred, Proj &&proj =  
Proj())
```

Reorders the elements in the range *rng* in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Performs at most  $2 * N$  swaps, exactly  $N$  applications of the predicate and projection, where  $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *partition* algorithm returns `subrange_t<std::ranges::iterator_t<Rng>>` The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
```

```

parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::partition(ExPolicy
&&pol-
icy,
Rng
&&rng,
Pred
&&pred,
Proj
&&proj
=
Proj())

```

Reorders the elements in the range *rng* in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs at most  $2 * N$  swaps, exactly  $N$  applications of the predicate and projection, where  $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$ .

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *partition* algorithm returns a `hpx::future<subrange_t<std::ranges::iterator_t<Rng>>>` if the execution policy is of type *parallel\_task\_policy* and returns `subrange_t<std::ranges::iterator_t<Rng>>` The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

```
template<typename FwdIter, typename Sent, typename Pred, typename Proj = hpx::identity>
```

```
subrange_t<FwdIter> hpx::ranges::partition(FwdIter first, Sent last, Pred &&pred, Proj &&proj = Proj())
```

Reorders the elements in the range `[first, last)` in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: At most  $2 * (\text{last} - \text{first})$  swaps. Exactly *last - first* applications of the predicate and projection.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *partition* algorithm returns *subrange\_t<FwdIter>*. The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =  
hpx::identity>  
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter>>::type hpx::ranges::partition(ExPolicy  
                                                    &&pol-  
                                                    icy,  
                                                    FwdIter  
                                                    first,  
                                                    Sent  
                                                    last,  
                                                    Pred  
                                                    &&pred,  
                                                    Proj  
                                                    &&proj  
                                                    =  
                                                    Proj())
```

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most 2 \* (last - first) swaps. Exactly *last - first* applications of the predicate and projection.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

`bool pred(const Type &a);`

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *partition* algorithm returns a `hpx::future<subrange_t<FwdIter>>` if the execution policy is of type *parallel\_task\_policy* and returns *subrange\_t<FwdIter>* otherwise. The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

### `hpx::ranges::stable_partition`

Defined in header `hpx/algorithm.hpp`<sup>799</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::partition`
- `hpx::ranges::partition_copy`

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
```

---

<sup>799</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

```
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::stable_partition(Rng &&rng, Pred &&pred, Proj
&&proj = Proj())
```

Permutes the elements in the range `[first, last)` such that there exists an iterator `i` such that for every iterator `j` in the range `[first, i)` `INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator `k` in the range `[i, last)`, `INVOKE(f, INVOKE(proj, *k)) == false`

The invocations of `f` in the parallel *stable\_partition* algorithm invoked without an execution policy object executes in sequential order in the calling thread.

#### Note

Complexity: At most  $(last - first) * \log(last - first)$  swaps, but only linear number of swaps if there is enough extra memory Exactly *last - first* applications of the predicate and projection.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an bidirectional iterator
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

### Returns

The *stable\_partition* algorithm returns an iterator `i` such that for every iterator `j` in the range `[first, i)`, `f(*j) != false` `INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator `k` in the range `[i, last)`, `f(*k) == false` `INVOKE(f, INVOKE(proj, *k)) == false`. The relative order of the elements in both groups is preserved.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::stable_partition(ExPolicy
&&pol-
icy,
Rng
&&rng,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Permutes the elements in the range `[first, last)` such that there exists an iterator `i` such that for every iterator `j` in the range `[first, i)` `INVOKE(f, INVOKE (proj, *j)) != false`, and for every iterator `k` in the range `[i, last)`, `INVOKE(f, INVOKE (proj, *k)) == false`

The invocations of `f` in the parallel *stable\_partition* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The invocations of `f` in the parallel *stable\_partition* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $(last - first) * \log(last - first)$  swaps, but only linear number of swaps if there is enough extra memory. Exactly *last - first* applications of the predicate and projection.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of `f`.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an bidirectional iterator
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

### Returns

The *stable\_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range `[first, i)`, `f(*j) != false INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator *k* in the range `[i, last)`, `f(*k) == false INVOKE(f, INVOKE(proj, *k)) == false`. The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel\_task\_policy* the algorithm returns a `future<>` referring to this iterator.

```
template<typename BidirIter, typename Sent, typename Pred, typename Proj = hpx::identity>
```

```
subrange_t<BidirIter> hpx::ranges::stable_partition(BidirIter first, Sent last, Pred &&pred, Proj &&proj = Proj())
```

Permutes the elements in the range `[first, last)` such that there exists an iterator *i* such that for every iterator *j* in the range `[first, i)` `INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator *k* in the range `[i, last)`, `INVOKE(f, INVOKE(proj, *k)) == false`.

The invocations of *f* in the parallel *stable\_partition* algorithm invoked without an execution policy object executes in sequential order in the calling thread.

### Note

Complexity: At most  $(last - first) * \log(last - first)$  swaps, but only linear number of swaps if there is enough extra memory. Exactly *last - first* applications of the predicate and projection.

### Template Parameters

- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *BidirIter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

### Returns

The *stable\_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range [first, *i*),  $f(*j) \neq \text{false}$  INVOKE(*f*, INVOKE(*proj*, *\*j*))  $\neq \text{false}$ , and for every iterator *k* in the range [*i*, last),  $f(*k) == \text{false}$  INVOKE(*f*, INVOKE(*proj*, *\*k*))  $== \text{false}$ . The relative order of the elements in both groups is preserved.

```
template<typename ExPolicy, typename BidirIter, typename Sent, typename Pred, typename Proj =  
hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<BidirIter>>::type hpx::ranges::stable_partition(ExPolicy  
                                                                                                     &&pol-  
                                                                                                     icy,  
                                                                                                     BidirIter  
                                                                                                     first,  
                                                                                                     Sent  
                                                                                                     last,  
                                                                                                     Pred  
                                                                                                     &&pred,  
                                                                                                     Proj  
                                                                                                     &&proj  
                                                                                                     =  
                                                                                                     Proj())
```

Permutes the elements in the range [first, last) such that there exists an iterator *i* such that for every iterator *j* in the range [first, *i*) INVOKE(*f*, INVOKE(*proj*, *\*j*))  $\neq \text{false}$ , and for every iterator *k* in the range [*i*, last), INVOKE(*f*, INVOKE(*proj*, *\*k*))  $== \text{false}$

The invocations of *f* in the parallel *stable\_partition* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The invocations of *f* in the parallel *stable\_partition* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: At most  $(\text{last} - \text{first}) * \log(\text{last} - \text{first})$  swaps, but only linear number of swaps if there is enough extra memory Exactly *last* - *first* applications of the predicate and projection.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *BidirIter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

## Returns

The *stable\_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range [first, *i*), *f*(\*j) != false INVOKE(*f*, INVOKE(*proj*, \*j)) != false, and for every iterator *k* in the range [*i*, last), *f*(\*k) == false INVOKE(*f*, INVOKE(*proj*, \*k)) == false. The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel\_task\_policy* the algorithm returns a `future<>` referring to this iterator.

## hpx::ranges::partition\_copy

Defined in header `hpx/algorithm.hpp`<sup>800</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Rng, typename OutIter2, typename OutIter3, typename Pred, typename Proj =  
hpx::identity>  
partition_copy_result<std::ranges::iterator_t<Rng>, OutIter2, OutIter3> hpx::ranges::partition_copy(Rng  
                                                                                               &&rng,  
                                                                                               Out-  
                                                                                               Iter2  
                                                                                               dest_true,  
                                                                                               Out-  
                                                                                               Iter3  
                                                                                               dest_false,  
                                                                                               Pred  
                                                                                               &&pred,  
                                                                                               Proj  
                                                                                               &&proj  
                                                                                               =  
                                                                                               Proj())
```

Copies the elements in the range *rng*, to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest\_true*. The rest of the elements are copied to the range beginning at *dest\_false*. The order of the elements is preserved.

The assignments in the parallel *partition\_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Performs not more than N assignments, exactly N applications of the predicate *pred*, where N = `std::distance(begin(rng), end(rng))`.

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.

---

<sup>800</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *partition\_copy* algorithm returns a `partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>>`. The *partition\_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

```
template<typename ExPolicy, typename Rng, typename FwdIter2, typename FwdIter3, typename Pred,
typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>>>::type hpx::rang
```

Copies the elements in the range *rng*, to two different ranges depending on the value

returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest\_true*. The rest of the elements are copied to the range beginning at *dest\_false*. The order of the elements is preserved.

The assignments in the parallel *partition\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs not more than N assignments, exactly N applications of the predicate *pred*, where  $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *partition\_copy* algorithm returns a `hpx::future<partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>>` if the execution policy is of type *parallel\_task\_policy* and returns `partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>` otherwise. The *partition\_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

```
template<typename InIter, typename Sent, typename OutIter2, typename OutIter3, typename Pred, typename Proj = hpx::identity>
```

```
partition_copy_result<InIter, OutIter2, OutIter3> hpx::ranges::partition_copy(InIter first, Sent last, OutIter2
                                                                    dest_true, OutIter3 dest_false,
                                                                    Pred &&pred, Proj &&proj =
                                                                    Proj())
```

Copies the elements in the range, defined by `[first, last)`, to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest\_true*. The rest of the elements are copied to the range beginning at *dest\_false*. The order of the elements is preserved.

The assignments in the parallel *partition\_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *partition\_copy* algorithm returns a *partition\_copy\_result*<*FwdIter*, *OutIter2*, *OutIter3*>. The *partition\_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename OutIter2, typename OutIter3,  
typename Pred, typename Proj = hpx::identity>
```

`parallel::util::detail::algorithm_result<ExPolicy, partition_copy_result<FwdIter, OutIter2, OutIter3>>::type` `hpx::ranges::partition_co`

Copies the elements in the range, defined by `[first, last)`, to two different ranges depending on the value returned by the predicate `pred`. The elements, that satisfy the predicate `pred` are copied to the range beginning at `dest_true`. The rest of the elements are copied to the range beginning at `dest_false`. The order of the elements is preserved.

The assignments in the parallel `partition_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `partition_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate `pred` (deduced). This iterator type must meet the requirements of an forward iterator.

- **OutIter3** – The type of the iterator representing the destination range for the elements that don’t satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don’t satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *partition\_copy* algorithm returns a `hpx::future<partition_copy_result<FwdIter, OutIter2, OutIter3>>` if the execution policy is of type *parallel\_task\_policy* and returns `partition_copy_result<FwdIter, OutIter2, OutIter3>` otherwise. The *partition\_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

#### `hpx::ranges::transform_reduce`

Defined in header `hpx/algorithm.hpp`<sup>801</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

#### Warning

doxygenfunction: Cannot find function “`hpx::ranges::transform_reduce`” in doxygen xml output for project “hpx” from directory: `../hpx_autodoc`

---

<sup>801</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## hpx::ranges::is\_heap

Defined in header `hpx/algorithm.hpp`<sup>802</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::is_heap_until`

```
template<typename ExPolicy, typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_heap(ExPolicy &&policy, Rng
&&rng, Comp &&comp =
Comp(), Proj &&proj =
Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 \* N applications of the projection *proj*, where N = last - first.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

<sup>802</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

### Returns

The *is\_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *is\_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less,
typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_heap(ExPolicy &&policy, Iter
                                                                                   first, Sent last, Comp
                                                                                   &&comp = Comp(), Proj
                                                                                   &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 \* N applications of the projection *proj*, where N = last - first.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

## Returns

The *is\_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *is\_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_heap(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

### Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 \* N applications of the projection *proj*, where N = last - first.

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

#### Returns

The *is\_heap* algorithm returns *bool*. The *is\_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_heap(Iter first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

#### Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 \* N applications of the projection *proj*, where N = last - first.

#### Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

#### Returns

The *is\_heap* algorithm returns *bool*. The *is\_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

## hpx::ranges::is\_heap\_until

Defined in header `hpx/algorithm.hpp`<sup>803</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::is_heap`

```
template<typename ExPolicy, typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::is_heap_until(ExPolicy
&&pol-
icy,
Rng
&&rng,
Comp
&&comp
=
Comp(),
Proj
&&proj
=
Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 \* N applications of the projection *proj*, where N = last - first.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

<sup>803</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

### Returns

The *is\_heap\_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandIter* otherwise. The *is\_heap\_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less,
typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::is_heap_until(ExPolicy
                                                                                      &&policy, Iter
                                                                                      first, Sent last,
                                                                                      Comp &&comp =
                                                                                      Comp(), Proj
                                                                                      &&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 \* N applications of the projection *proj*, where N = last - first.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

#### Returns

The *is\_heap\_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandIter* otherwise. The *is\_heap\_until* algorithm returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [*first*, *it*) is a max heap.

```
template<typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::is_heap_until(Rng &&rng, Comp &&comp = Comp(), Proj
&&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [*first*, *it*) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

#### Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 \* N applications of the projection *proj*, where N = last - first.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

### Returns

The *is\_heap\_until* algorithm returns *RandIter*. The *is\_heap\_until* algorithm returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [*first*, *it*) is a max heap.

```
template<typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
Iter hpx::ranges::is_heap_until(Iter first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [*first*, *it*) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

*comp* has to induce a strict weak ordering on the values.

#### Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 \* N applications of the projection *proj*, where N = last - first.

### Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

### Returns

The *is\_heap\_until* algorithm returns *RandIter*. The *is\_heap\_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

## hpx::ranges::experimental::for\_loop

Defined in header [hpx/algorithm.hpp](#)<sup>804</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::experimental::for\\_loop\\_strided](#)
- [hpx::ranges::experimental::for\\_loop\\_n](#)
- [hpx::ranges::experimental::for\\_loop\\_n\\_strided](#)

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename ...**Args**>

[hpx::parallel::util::detail::algorithm\\_result<ExPolicy>::type](#) [hpx::ranges::experimental::for\\_loop](#)(*ExPolicy* &&pol-  
icy, *Iter* first,  
*Sent* last,  
*Args*&&... args)

The *for\_loop* implements loop functionality over a range specified by iterator bounds. These algorithms resemble *for\_each* from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Iter* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of MoveConstructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the

<sup>804</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

induction value for that induction object corresponding to the position of the application of  $f$  in the input sequence.

Complexity: Applies  $f$  exactly once for each element of the input sequence.

Remarks: If  $f$  returns a result, the result is ignored.

**Note**

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

**Note**

The order of the elements of the input sequence is important for determining ordinal position of an application of  $f$ , even though the applications themselves may be unordered.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the iteration variable (forward iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Iter const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

## Returns

The *for\_loop* algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Iter, typename Sent, typename ...Args>
```

```
void hpx::ranges::experimental::for_loop(Iter first, Sent last, Args&&... args)
```

The `for_loop` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Iter* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using `advance` and `distance`.

#### Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

## Template Parameters

- **Iter** – The type of the iteration variable (input iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *Iter*.

- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

`<ignored> pred(Iter const& a, ...);`

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename R, typename ...Args>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy>::type hpx::ranges::experimental::for_loop(ExPolicy  
                                                                                               &&pol-  
                                                                                               icy, R  
                                                                                               &&rng,  
                                                                                               Args&&...  
                                                                                               args)
```

The `for_loop` implements loop functionality over a range specified by a range. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Rng::iterator* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of Move-Constructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the

induction value for that induction object corresponding to the position of the application of  $f$  in the input sequence.

Complexity: Applies  $f$  exactly once for each element of the input sequence.

Remarks: If  $f$  returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

#### Note

The order of the elements of the input sequence is important for determining ordinal position of an application of  $f$ , even though the applications themselves may be unordered.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **R** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

## Returns

The *for\_loop* algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Rng, typename ...Args>
```

```
void hpx::ranges::experimental::for_loop(Rng &&rng, Args&&... args)
```

The `for_loop` implements loop functionality over a range specified by a range. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Rng::iterator* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using `advance` and `distance`.

#### Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

### `hpx::ranges::experimental::for_loop_strided`

Defined in header `hpx/algorithm.hpp`<sup>805</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::experimental::for_loop`
- `hpx::ranges::experimental::for_loop_n`
- `hpx::ranges::experimental::for_loop_n_strided`

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **S**, typename ...**Args**>

`hpx::parallel::util::detail::algorithm_result_t<ExPolicy> hpx::ranges::experimental::for_loop_strided(ExPolicy  
&&policy,  
Iter  
first,  
Sent  
last,  
S  
stride,  
Args&&...  
args)`

The `for_loop_strided` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Iter* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

<sup>805</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Effects: Applies  $f$  to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding  $f$ , an additional argument is passed to each application of  $f$  as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of  $f$  in the input sequence.

Complexity: Applies  $f$  exactly once for each element of the input sequence.

Remarks: If  $f$  returns a result, the result is ignored.

**Note**

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

**Note**

The order of the elements of the input sequence is important for determining ordinal position of an application of  $f$ , even though the applications themselves may be unordered.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the iteration variable (forward iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if *Iter* meets the requirements a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Iter const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

### Returns

The `for_loop_strided` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Iter, typename Sent, typename S, typename ...Args>
```

```
void hpx::ranges::experimental::for_loop_strided(Iter first, Sent last, S stride, Args&&... args)
```

The `for_loop_strided` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop_strided` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Iter* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

**Note**

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

**Note**

The order of the elements of the input sequence is important for determining ordinal position of an application of  $f$ , even though the applications themselves may be unordered.

**Template Parameters**

- **Iter** – The type of the iteration variable (input iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if Iter meets the requirements a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Iter const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename Rng, typename S, typename ...Args>
```

`hpx::parallel::util::detail::algorithm_result_t<ExPolicy> hpx::ranges::experimental::for_loop_strided(ExPolicy  
&&policy,  
Rng  
&&rng,  
S  
stride,  
Args&&...  
args)`

The `for_loop_strided` implements loop functionality over a range specified by a range. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: `Rng::iterator` shall meet the requirements of a forward iterator type. The `args` parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of Move-Constructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the `args` parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the `args` parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using `advance` and `distance`.

#### Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **S** – The type of the stride variable. This should be an integral type.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if `Rng::iterator` meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

`<ignored> pred(Rng::iterator const& a, ...);`

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

### Returns

The `for_loop_strided` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Rng, typename S, typename ...Args>
```

```
void hpx::ranges::experimental::for_loop_strided(Rng &&rng, S stride, Args&&... args)
```

The `for_loop_strided` implements loop functionality over a range specified by a range. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop_strided` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: `Rng::iterator` shall meet the requirements of an input iterator type. The `args` parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of `MoveConstructible`.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the `args` parameter pack. The length

of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

#### Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

#### Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, its last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if `Rng::iterator` meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

<sup>808</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<Iter1, Iter2, Iter3>>::type hpx::ranges::set_symmetric_difference`

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::abs(m-n)` times. If *m*>*n*, then the last *m-n* of those elements are copied from *[first1,last1)*, otherwise the last *n-m* elements are copied from *[first2,last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The `set_symmetric_difference` algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges `[first1, last1)` and `[first2, last2)`, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in `[first1, last1)` and *n* times in `[first2, last2)`, it will be copied to *dest* exactly `std::abs(m-n)` times. If *m*>*n*, then the last *m-n* of those elements are copied from `[first1,last1)`, otherwise the last *n-m* elements are copied from `[first2,last2)`. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (`sequenced_policy`) or in a single new thread spawned from the current thread (for `sequenced_task_policy`).

The application of function objects in parallel algorithm invoked with an execution pol-

icy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The `set_symmetric_difference` algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise, where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>`. The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred
= hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
set_symmetric_difference_result<Iter1, Iter2, Iter3> hpx::ranges::set_symmetric_difference(Iter1 first1,
                                                                                      Sent1 last1,
                                                                                      Iter2 first2,
                                                                                      Sent2 last2,
                                                                                      Iter3 dest,
                                                                                      Pred &&op =
                                                                                      Pred(), Proj1
                                                                                      &&proj1 =
                                                                                      Proj1(), Proj2
                                                                                      &&proj2 =
                                                                                      Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges `[first1, last1)` and `[first2, last2)`, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in `[first1, last1)` and *n* times in `[first2, last2)`, it will be copied to *dest* exactly `std::abs(m-n)` times. If *m*>*n*, then the last *m-n* of those elements are copied from `[first1,last1)`, otherwise the last *n-m* elements are copied from `[first2,last2)`. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

### Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter1`.

- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_symmetric\_difference* algorithm returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>`. The *set\_symmetric\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```
set_symmetric_difference_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::set_symmetric_diff
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges  $[first1, last1)$  and  $[first2, last2)$ , but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in  $[first1, last1)$  and *n* times in  $[first2, last2)$ , it will be copied to *dest* exactly  $\text{std::abs}(m-n)$  times. If  $m > n$ , then the last  $m-n$  of those elements are copied from  $[first1, last1)$ , otherwise the last  $n-m$  elements are copied from  $[first2, last2)$ . The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`

- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

`bool pred(const Type1 &a, const Type1 &b);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_symmetric\_difference* algorithm returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>`. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set\_symmetric\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

### `hpx::ranges::for_each`

Defined in header `hpx/algorithm.hpp`<sup>809</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::for_each_n`

`template<typename InIter, typename Sent, typename F, typename Proj = hpx::identity>`

`for_each_result<InIter, F> hpx::ranges::for_each(InIter first, Sent last, F &&f, Proj &&proj = Proj())`

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

---

<sup>809</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Applies  $f$  exactly *last - first* times.

**Template Parameters**

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for\_each* requires  $F$  to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

{last, HPX\_MOVE(f)} where last is the iterator corresponding to the input sentinel last.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```
for_each_result<std::ranges::iterator_t<Rng>, F> hpx::ranges::for_each(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Applies  $f$  to the result of dereferencing every iterator in the given range *rng*.

If  $f$  returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator,  $f$  may apply non-constant functions through the dereferenced iterator.

**Note**

Complexity: Applies  $f$  exactly *size(rng)* times.

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for\_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

```
{std::end(rng), HPX_MOVE(f)}
```

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::for_each(ExPolicy &&policy,  
                                                                                   FwdIter first, Sent  
                                                                                   last, F &&f, Proj  
                                                                                   &&proj = Proj())
```

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for\_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Applies  $f$  exactly *last - first* times.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for\_each* requires  $F$  to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *for\_each* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
```

```

hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::for_each(ExPolicy
&&pol-
icy,
Rng
&&rng,
F
&&f,
Proj
&&proj
=
Proj())

```

Applies *f* to the result of dereferencing every iterator in the given range *rng*.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for\_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Applies *f* exactly *size(rng)* times.

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for\_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *for\_each* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. It returns *last*.

### hpx::ranges::for\_each\_n

Defined in header [hpx/algorithm.hpp](#)<sup>810</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::for\\_each](#)

```
template<typename InIter, typename Size, typename F, typename Proj = hpx::identity>
```

```
for_each_n_result<InIter, F> hpx::ranges::for_each_n(InIter first, Size count, F &&f, Proj &&proj = Proj())
```

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for\_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

#### Note

Complexity: Applies *f* exactly *count* times.

### Template Parameters

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

<sup>810</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for\_each* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

`<ignored> pred(const Type &a);`

The signature does not need to have `const&`. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

It returns *last*.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::for_each_n(ExPolicy  
                                                                                      &&policy,  
                                                                                      FwdIter first,  
                                                                                      Size count, F  
                                                                                      &&f, Proj  
                                                                                      &&proj =  
                                                                                      Proj())
```

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for\_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Applies  $f$  exactly *count* times.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply  $f$  to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for\_each* requires  $F$  to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *for\_each* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. It returns *last*.

## hpx::ranges::all\_of

Defined in header `hpx/algorithm.hpp`<sup>811</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::any_of`
- `hpx::ranges::none_of`

template<typename **ExPolicy**, typename **Rng**, typename **F**, typename **Proj** = `hpx::identity`>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::all_of(ExPolicy &&policy, Rng
&&rng, F &&f, Proj
&&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

<sup>811</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *all\_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *all\_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::all_of(ExPolicy &&policy, Iter  
first, Sent last, F &&f, Proj  
&&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *all\_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *all\_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::all_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

### Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

## Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *all\_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::all_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

#### Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

### Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *all\_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

## hpx::ranges::any\_of

Defined in header `hpx/algorithm.hpp`<sup>812</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::all_of`
- `hpx::ranges::none_of`

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::any_of(ExPolicy &&policy, Rng  
                                     &&rng, F &&f, Proj  
                                     &&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

<sup>812</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *any\_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *any\_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::any_of(ExPolicy &&policy, Iter  
first, Sent last, F &&f, Proj  
&&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *any\_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *any\_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::any_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

#### Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *any\_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::any_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

#### Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

#### Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *any\_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

### hpx::ranges::none\_of

Defined in header `hpx/algorithm.hpp`<sup>813</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::all_of`
- `hpx::ranges::any_of`

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::none_of(ExPolicy &&policy, Rng
&&rng, F &&f, Proj
&&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

<sup>813</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

## Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

## Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

## Returns

The *none\_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *none\_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::none_of(ExPolicy &&policy, Iter
                                                                    first, Sent last, F &&f,
                                                                    Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most *last - first* applications of the predicate *f*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *none\_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *none\_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::none_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range *rng*.

**Note**

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *none\_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

```
bool hpx::ranges::none_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

**Note**

Complexity: At most *last - first* applications of the predicate *f*

**Template Parameters**

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none\_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

`bool pred(const Type &a);`

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *none\_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

### hpx::ranges::transform

Defined in header [hpx/algorithm.hpp](#)<sup>814</sup>.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

template<typename **ExPolicy**, typename **FwdIter1**, typename **Sent1**, typename **FwdIter2**, typename **F**, typename **Proj** = *hpx::identity*>

*parallel::util::detail::algorithm\_result*<*ExPolicy*, *ranges::unary\_transform\_result*<*FwdIter1*, *FwdIter2*>>::type *hpx::ranges::transform*(

---

<sup>814</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/algorithm.hpp>

Applies the given function  $f$  to the given range  $rng$  and stores the result in another range, beginning at  $dest$ .

The invocations of  $f$  in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The invocations of  $f$  in the parallel *transform* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly  $\text{size}(rng)$  applications of  $f$

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of  $f$ .
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires  $F$  to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type

*Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

### Returns

The *transform* algorithm returns a `hpx::future<ranges::unary_transform_result<FwdIter1, FwdIter2>>` if the execution policy is of type *parallel\_task\_policy* and returns `ranges::unary_transform_result<FwdIter1, FwdIter2>` otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<std::ranges::iterator_t<Rng>, FwdIter>> hpx::ranges::t
```

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at *dest*.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly `size(rng)` applications of *f*

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *range\_iterator<Rng>::type* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

#### Returns

The *transform* algorithm returns a `hpx::future<ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>>` if the execution policy is of type *parallel\_task\_policy* and returns *ranges::unary\_transform\_result<range\_iterator<Rng>::type, FwdIter>* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename FwdIter3, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

`parallel::util::detail::algorithm_result<ExPolicy, ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>::type hpx::ranges::tr`

Applies the given function  $f$  to pairs of elements from two ranges: one defined by  $rng$  and the other beginning at  $first2$ , and stores the result in another range, beginning at  $dest$ .

The invocations of  $f$  in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The invocations of  $f$  in the parallel *transform* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Exactly  $\text{size}(rng)$  applications of  $f$

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of  $f$ .
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for `FwdIter2`.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types `FwdIter1` and `FwdIter2` can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type `FwdIter3` can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

### Returns

The *transform* algorithm returns `A hpx::future<ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>` if the execution policy is of type *parallel\_task\_policy* and returns `ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>` otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename F, typename Proj = hpx::identity>
ranges::unary_transform_result<FwdIter1, FwdIter2> hpx::ranges::transform(FwdIter1 first, Sent1 last,
                                                                    FwdIter2 dest, F &&f, Proj
                                                                    &&proj = Proj())
```

Applies the given function  $f$  to the given range  $rng$  and stores the result in another range, beginning at  $dest$ .

#### Note

Complexity: Exactly  $\text{size}(rng)$  applications of  $f$

### Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires  $F$  to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate  $f$  is invoked.

### Returns

The *transform* algorithm returns *ranges::unary\_transform\_result<FwdIter1, FwdIter2>*. The *transform* algorithm returns a tuple holding an iterator referring

to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
```

```
ranges::unary_transform_result<std::ranges::iterator_t<Rng>, FwdIter> hpx::ranges::transform(Rng &&rng,  
                                                                 FwdIter dest,  
                                                                 F &&f, Proj  
                                                                 &&proj =  
                                                                 Proj())
```

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at *dest*.

#### Note

Complexity: Exactly `size(rng)` applications of *f*

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *range\_iterator<Rng>::type* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

### Returns

The *transform* algorithm returns *ranges::unary\_transform\_result<range\_iterator<Rng>::type, FwdIter>*. The *transform* algorithm returns a tuple holding an iterator referring to

the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename FwdIter3,
typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3> hpx::ranges::transform(FwdIter1 first1,
                                                                                   Sent1 last1,
                                                                                   FwdIter2 first2,
                                                                                   Sent2 last2,
                                                                                   FwdIter3 dest, F
                                                                                   &&f, Proj1
                                                                                   &&proj1 = Proj1(),
                                                                                   Proj2 &&proj2 =
                                                                                   Proj2())
```

Applies the given function *f* to pairs of elements from two ranges: one defined by *rng* and the other beginning at *first2*, and stores the result in another range, beginning at *dest*.

**Note**

Complexity: Exactly `size(rng)` applications of *f*

### Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for **FwdIter1**.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for **FwdIter2**.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

### Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.

- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

### Returns

The *transform* algorithm returns *ranges::binary\_transform\_result<FwdIter1, FwdIter2, FwdIter3>*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename FwdIter, typename F, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
```

```
ranges::binary_transform_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, FwdIter> hpx::ranges::transform(Rng1
&&rn
Rng2
&&rn
FwdIt
dest,
F
&&f,
Proj1
&&pr
=
Proj1
Proj2
&&pr
=
Proj2
```

Applies the given function *f* to pairs of elements from two ranges: one defined by

[first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest.

**Note**

Complexity: Exactly  $\min(\text{last2}-\text{first2}, \text{last1}-\text{first1})$  applications of  $f$

**Note**

The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

### Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires  $F$  to meet the requirements of *Copy-Constructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

### Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types `range_iterator<Rng1>::type` and `range_iterator<Rng2>::type` can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate  $f$  is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

### Returns

The *transform* algorithm returns *ranges::binary\_transform\_result*<std::ranges::iterator\_t<Rng1>, std::ranges::iterator\_t<Rng2>, FwdIter>. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

### asio

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/asio/asio\_util.hpp

Defined in header `hpx/asio/asio_util.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

### Functions

bool **get\_endpoint**(*std::string* const &addr, *std::uint16\_t* port, ::asio::ip::tcp::endpoint &ep, bool force\_ipv4 = false)

*std::string* **get\_endpoint\_name**(::asio::ip::tcp::endpoint const &ep)

::asio::ip::tcp::endpoint **resolve\_hostname**(*std::string* const &hostname, *std::uint16\_t* port, ::asio::io\_context &io\_service, bool force\_ipv4 = false)

detail::endpoint\_iterator\_type **connect\_begin**(*std::string* const &address, *std::uint16\_t* port, ::asio::io\_context &io\_service)

template<typename **Locality**>

detail::endpoint\_iterator\_type **connect\_begin**(*Locality* const &loc, ::asio::io\_context &io\_service)

Returns an iterator which when dereferenced will give an endpoint suitable for a call to `connect()` related to this locality.

inline detail::endpoint\_iterator\_type **connect\_end**()

detail::endpoint\_iterator\_type **accept\_begin**(*std::string* const &address, *std::uint16\_t* port, ::asio::io\_context &io\_service)

template<typename **Locality**>

detail::endpoint\_iterator\_type **accept\_begin**(*Locality* const &loc, ::asio::io\_context &io\_service)

Returns an iterator which when dereferenced will give an endpoint suitable for a call to `accept()` related to this locality.

inline detail::endpoint\_iterator\_type **accept\_end**()

## **assertion**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### **hpx/assertion/evaluate\_assert.hpp**

Defined in header `hpx/assertion/evaluate_assert.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **assertion**

### **hpx/assertion/api.hpp**

Defined in header `hpx/assertion/api.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **assertion**

## Typedefs

using **assertion\_handler** = void (\*)(*hpx::source\_location* const &loc, char const \*expr, *std::string* const &msg)

The signature for an assertion handler.

## Functions

*assertion\_handler* **set\_assertion\_handler**(*assertion\_handler* handler)

Set the assertion handler to be used within a program. If the handler has been set already once, the call to this function will be ignored.

### Note

This function is not thread safe

## HPX\_ASSERT

Defined in header `hpx/assert.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [HPX\\_ASSERT\\_MSG](#)

### Warning

doxygenfunction: Cannot find function “HPX\_ASSERT” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

## HPX\_ASSERT\_MSG

Defined in header `hpx/assert.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

## hpx::sync

Defined in header `hpx/future.hpp`<sup>817</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

### See also

*hpx::sync (distributed)*

```
template<typename Action, typename F, typename ...Ts>
```

```
auto hpx::sync(F &&f, Ts&&... ts) -> decltype(detail::sync_action_dispatch<Action,  
std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *sync* runs the function *f* synchronously and returns a `hpx::future` that will eventually hold the result of that function call.

```
template<typename Action, typename F, typename ...Ts>
```

```
auto hpx::sync(F &&f, Ts&&... ts) -> decltype(detail::sync_action_dispatch<Action,  
std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *sync* runs the function *f* synchronously and returns a `hpx::future` that will eventually hold the result of that function call.

### Warning

doxygenfunction: Unable to resolve function “hpx::sync” with arguments (Action&&, Target&&, Ts&&...) in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc. Potential matches:

```
- template<typename  
→ Action, typename F, typename ...Ts> auto sync(F &&f, Ts&&...  
→ ts) -> decltype(detail::sync_action_dispatch<Action, std::decay_  
→ t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))  
- template<typename  
→ Action, typename Target, typename ...Ts> decltype(auto)  
→ sync(Action &&action, Target &&target, Ts&&... ts)  
- template<typename  
→ F, typename ...Ts> decltype(auto) sync(F &&f, Ts&&... ts)
```

<sup>817</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

## hpx::launch

Defined in header `hpx/future.hpp`<sup>818</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
struct launch : public hpx::detail::policy_holder<>
```

Launch policies for *hpx::async* etc.

## hpx::post

Defined in header `hpx/future.hpp`<sup>819</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

### See also

*hpx::post (distributed)*

```
template<typename F, typename ...Ts>
```

```
bool hpx::post(F &&f, Ts&&... ts)
```

Runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool). This is done in a fire-and-forget manner, meaning there is no return value or way to synchronize with the function execution (it does not return an *hpx::future* that would hold the result of that function call).

*hpx::post* is particularly useful when synchronization mechanisms as heavyweight as futures are not desired, and instead, more lightweight mechanisms like latches or atomic variables are preferred. Essentially, the post function enables the launch of a new thread without the overhead of creating a future.

### Note

*hpx::post* is similar to *hpx::async* but does not return a future. This is why there is no way of finding out the result/failure of the execution of this function.

```
template<typename Action, typename ...Ts>
```

```
bool hpx::post(hpx::id_type const &id, Ts&&... vs)
```

```
template<typename Action, typename Client, typename Stub, typename Data, typename ...Ts>
```

```
bool hpx::post(components::client_base<Client, Stub, Data> const &c, Ts&&... vs)
```

---

<sup>818</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

<sup>819</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

```
template<typename Action, typename DistPolicy, typename ...Ts>
```

```
bool hpx::post(DistPolicy const &policy, Ts&&... vs)
```

```
template<typename Action, typename Continuation, typename ...Ts>
```

```
bool hpx::post(Continuation &&c, hpx::id_type const &gid, Ts&&... vs)
```

```
template<typename Action, typename Continuation, typename Client, typename Stub, typename Data,  
typename ...Ts>
```

```
bool hpx::post(Continuation &&cont, components::client_base<Client, Stub, Data> const &c, Ts&&... vs)
```

```
template<typename Action, typename Continuation, typename DistPolicy, typename ...Ts>
```

```
bool hpx::post(Continuation &&c, DistPolicy const &policy, Ts&&... vs)
```

```
template<typename Action, typename Target, typename ...Ts>
```

```
bool hpx::post(Action &&action, Target &&target, Ts&&... ts)
```

The distributed implementation of *hpx::post* can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID.

### Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

### Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

### Returns

true if the action was successfully posted, false otherwise.

**hpx::dataflow**

Defined in header `hpx/future.hpp`<sup>820</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**See also**

*hpx::dataflow (distributed)*

**Warning**

```

**hpx::async**

Defined in header `hpx/future.hpp`<sup>821</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**See also**

*hpx::async (distributed)*

`template<typename Action, typename F, typename ...Ts>`

<sup>820</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

<sup>821</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

```
auto hpx::async(F &&f, Ts&&... ts) -> decltype(detail::async_action_dispatch<Action,
std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a *hpx::future* that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being *hpx::launch::async* | *hpx::launch::deferred*. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the *async* flag is set (i.e. (policy & *hpx::launch::async*) != 0), then *async* executes the callable object *f* on a new thread of execution (with all thread-locals initialized) as if spawned by *hpx::thread*(std::forward<*F*>(f), std::forward<*Ts*>(ts)...), except that if the function *f* returns a value or throws an exception, it is stored in the shared state accessible through the *hpx::future* that *async* returns to the caller.
- If the *deferred* flag is set (i.e. (policy & *hpx::launch::deferred*) != 0), then *async* converts *f* and *ts...* the same way as by *hpx::thread* constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the *hpx::future* that *async* returned to the caller will cause the copy of *f* to be invoked (as a rvalue) with the copies of *ts...* (also passed as rvalues) in the current thread (which does not have to be the thread that originally called *hpx::async*). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same *hpx::future* will return the result immediately.
- If neither *hpx::launch::async* nor *hpx::launch::deferred*, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the *hpx::launch::async* and *hpx::launch::deferred* flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to *hpx::async* synchronizes-with (as defined in std::memory\_order) the call to *f*, and the completion of *f* is sequenced-before making the shared state ready. If the *async* policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If std::decay<Function>::type or each type in std::decay<*Ts*>::type is not constructible from its corresponding argument, the program is ill-formed.

## Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to *f*

## Returns

*hpx::future* referring to the shared state created by this call to *hpx::async*.

```
template<typename Action, typename F, typename ...Ts>
```

```
auto hpx::async(F &&f, Ts&&... ts) -> decltype(detail::async_action_dispatch<Action,
std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a *hpx::future* that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being *hpx::launch::async* | *hpx::launch::deferred*. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the `async` flag is set (i.e. `(policy & hpx::launch::async) != 0`), then `async` executes the callable object `f` on a new thread of execution (with all thread-locals initialized) as if spawned by `hpx::thread(std::forward<F>(f), std::forward<Ts>(ts)...) ,` except that if the function `f` returns a value or throws an exception, it is stored in the shared state accessible through the `hpx::future` that `async` returns to the caller.
- If the `deferred` flag is set (i.e. `(policy & hpx::launch::deferred) != 0`), then `async` converts `f` and `ts...` the same way as by `hpx::thread` constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the `hpx::future` that `async` returned to the caller will cause the copy of `f` to be invoked (as a rvalue) with the copies of `ts...` (also passed as rvalues) in the current thread (which does not have to be the thread that originally called `hpx::async`). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same `hpx::future` will return the result immediately.
- If neither `hpx::launch::async` nor `hpx::launch::deferred`, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the `hpx::launch::async` and `hpx::launch::deferred` flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to `hpx::async` synchronizes-with (as defined in `std::memory_order`) the call to `f`, and the completion of `f` is sequenced-before making the shared state ready. If the `async` policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If `std::decay<Function>::type` or each type in `std::decay<Ts>::type` is not constructible from its corresponding argument, the program is ill-formed.

## Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to `f`

## Returns

`hpx::future` referring to the shared state created by this call to `hpx::async`.

### Warning

doxygenfunction: Unable to resolve function “hpx::async” with arguments (Executor&&, hpx::sycl::experimental::sycl\_executor::queue\_function\_ptr\_t<Ts...>&&, Ts&&...) in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc. Potential matches:

```
- template<typename Action,
→ typename F, typename ...Ts> auto async(F &&f, Ts&&... ts)
→-> decltype(detail::async_action_dispatch<Action, std::decay_
→t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...)
- template<typename Action, typename Target, typename
→...Ts> auto async(Action &&action, Target &&target, Ts&&... ts)
- template<typename Executor, typename ...Ts> decltype(auto)
→async(Executor &&exec, hpx::sycl::experimental::sycl_
→executor::queue_function_ptr_t<Ts...> &&f, Ts&&... ts)
- template<typename
→F, typename ...Ts> decltype(auto) async(F &&f, Ts&&... ts)
```

```
template<typename Action, typename Target, typename ...Ts>
```

```
auto hpx::async(Action &&action, Target &&target, Ts&&... ts)
```

The distributed implementation of `hpx::async` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID. The action executes asynchronously.

### Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

### Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

### Returns

*hpx::future* referring to the shared state created by this call to `hpx::async`

### *async*\_combinators

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### *hpx::wait\_some*

Defined in header `hpx/future.hpp`<sup>822</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait\_some\_nothrow*
- *hpx::wait\_some\_n*
- *hpx::wait\_some\_n\_nothrow*

```
template<typename InputIter>
```

```
void hpx::wait_some(std::size_t n, InputIter first, InputIter last)
```

The function *wait\_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

<sup>822</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

**Note**

The function `wait_some` returns after *n* futures have become ready. All input futures are still valid after `wait_some` returns.

**Note**

The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

**Parameters**

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the function to return.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *when\_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *when\_all* should wait.

```
template<typename R>
```

```
void hpx::wait_some(std::size_t n, std::vector<future<R>> &&futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

**Note**

The function `wait_some` returns after *n* futures have become ready. All input futures are still valid after `wait_some` returns.

**Note**

The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

**Parameters**

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A vector holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_some` should wait.

```
template<typename R, std::size_t N>
```

```
void hpx::wait_some(std::size_t n, std::array<future<R>, N> &&futures)
```

The function *wait\_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

#### Note

The function *wait\_some* returns after *n* futures have become ready. All input futures are still valid after *wait\_some* returns.

#### Note

The function *wait\_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait\_some\_nothrow* instead.

### Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_some* should wait.

```
template<typename ...T>
```

```
void hpx::wait_some(std::size_t n, T&&... futures)
```

The function *wait\_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

#### Note

The function *wait\_all* returns after *n* futures have become ready. All input futures are still valid after *wait\_some* returns.

#### Note

The function *wait\_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait\_some\_nothrow* instead.

### Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_some* should wait.

### `hpx::wait_some_nothrow`

Defined in header `hpx/future.hpp`<sup>823</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_some`
- `hpx::wait_some_n`
- `hpx::wait_some_n_nothrow`

#### Warning

doxygenfunction: Cannot find function “`hpx::wait_some_nothrow`” in doxygen xml output for project “hpx” from directory: `../hpx_autodoc`

### `hpx::wait_some_n`

Defined in header `hpx/future.hpp`<sup>824</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_some`
- `hpx::wait_some_nothrow`
- `hpx::wait_some_n_nothrow`

`template<typename InputIter>`

`void hpx::wait_some_n(std::size_t n, InputIter first, std::size_t count)`

The function `wait_some_n` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after `n` of them finished executing.

#### Note

The function `wait_some_n` returns after `n` futures have become ready. All input futures are still valid after `wait_some_n` returns.

#### Note

The function `wait_some_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_n_nothrow` instead.

- *hpx::wait\_all\_n*
- *hpx::wait\_all\_n\_nothrow*

template<typename **InputIter**>

void **hpx::wait\_all**(*InputIter* first, *InputIter* last)

The function *wait\_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

<sup>825</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

<sup>826</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

**Note**

The function *wait\_all* returns after all futures have become ready. All input futures are still valid after *wait\_all* returns.

**Note**

The function *wait\_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait\_all\_nothrow* instead.

**Note**

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait\_all* returns and all inspection of the futures is complete.

**Parameters**

- **first** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_all* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or *shared\_future* objects for which *wait\_all* should wait.

```
template<typename R>
```

```
void hpx::wait_all(std::vector<future<R>> &&futures)
```

The function *wait\_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function *wait\_all* returns after all futures have become ready. All input futures are still valid after *wait\_all* returns.

**Note**

The function *wait\_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait\_all\_nothrow* instead.

**Note**

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait\_all* returns and all inspection of the futures is complete.

**Parameters**

**futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_all* should wait.

```
template<typename R, std::size_t N>
```

```
void hpx::wait_all(std::array<future<R>, N> &&futures)
```

The function *wait\_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function *wait\_all* returns after all futures have become ready. All input futures are still valid after *wait\_all* returns.

**Note**

The function *wait\_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait\_all\_nothrow* instead.

**Note**

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait\_all* returns and all inspection of the futures is complete.

**Parameters**

**futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_all* should wait.

```
template<typename T>
```

```
void hpx::wait_all(hpx::future<T> const &f)
```

The function *wait\_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function *wait\_all* returns after the future has become ready. The input future is still valid after *wait\_all* returns.

**Note**

The function *wait\_all* will rethrow any exceptions captured by the future while becoming ready. If this behavior is undesirable, use *wait\_all\_nothrow* instead.

**Parameters**

**f** – A *future* or *shared\_future* for which *wait\_all* should wait.

```
template<typename ...T>
```

```
void hpx::wait_all(T&&... futures)
```

The function *wait\_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function *wait\_all* returns after all futures have become ready. All input futures are still valid after *wait\_all* returns.

**Note**

The function *wait\_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait\_all\_nothrow* instead.

**Parameters**

**futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_all* should wait.

***hpx::wait\_all\_nothrow***

Defined in header *hpx/future.hpp*<sup>827</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait\_all*
- *hpx::wait\_all\_n*
- *hpx::wait\_all\_n\_nothrow*

```
template<typename InputIter>
```

```
bool hpx::wait_all_nothrow(InputIter first, InputIter last)
```

The function *wait\_all\_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait\_all*. It differs from *wait\_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

**Note**

The function *wait\_all\_nothrow* returns after all futures have become ready. All input futures are still valid after *wait\_all\_nothrow* returns.

---

<sup>827</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

**Note**

Unlike *wait\_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

**Note**

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait\_all* returns and all inspection of the futures is complete.

**Parameters**

- **first** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_all\_nothrow* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or *shared\_future* objects for which *wait\_all\_nothrow* should wait.

**Returns**

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

template<typename R>

bool *hpx::wait\_all\_nothrow*(std::vector<future<R>> &&futures)

The function *wait\_all\_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait\_all*. It differs from *wait\_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

**Note**

The function *wait\_all\_nothrow* returns after all futures have become ready. All input futures are still valid after *wait\_all\_nothrow* returns.

**Note**

Unlike *wait\_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

**Parameters**

**futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_all\_nothrow* should wait.

**Returns**

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

```
template<typename R, std::size_t N>
```

```
bool hpx::wait_all_nothrow(std::array<future<R>, N> &&futures)
```

The function *wait\_all\_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait\_all*. It differs from *wait\_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

**Note**

The function *wait\_all\_nothrow* returns after all futures have become ready. All input futures are still valid after *wait\_all\_nothrow* returns.

**Note**

Unlike *wait\_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

**Parameters**

**futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_all\_nothrow* should wait.

**Returns**

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

```
template<typename T>
```

```
bool hpx::wait_all_nothrow(hpx::future<T> const &f)
```

The function *wait\_all\_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait\_all*. It differs from *wait\_all* in that it will not rethrow any exceptions captured by the given future while it became ready.

**Note**

The function *wait\_all\_nothrow* returns after the future has become ready. The input future is still valid after *wait\_all\_nothrow* returns.

**Note**

Unlike *wait\_all*, this function will not rethrow any exception captured by the future while becoming ready. Any such exception is silently discarded; the caller can use the returned *bool* to detect its presence.

**Parameters**

**f** – A *future* or *shared\_future* for which *wait\_all\_nothrow* should wait.

**Returns**

Returns *true* if the given future held an exception once it became ready, and *false* otherwise.

```
template<typename ...T>
```

```
bool hpx::wait_all_nothrow(T&&... futures)
```

The function *wait\_all\_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait\_all*. It differs from *wait\_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

**Note**

The function *wait\_all\_nothrow* returns after all futures have become ready. All input futures are still valid after *wait\_all\_nothrow* returns.

**Note**

Unlike *wait\_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

**Parameters**

**futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_all\_nothrow* should wait.

**Returns**

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

***hpx::wait\_all\_n***

<sup>828</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

```
void hpx::wait_all_n(InputIter begin, std::size_t count)
```

The function *wait\_all\_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function *wait\_all\_n* returns after all futures have become ready. All input futures are still valid after *wait\_all\_n* returns.

**Note**

The function *wait\_all\_n* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait\_all\_n\_nothrow* instead.

**Note**

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait\_all* returns and all inspection of the futures is complete.

**Parameters**

- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_all\_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

**Returns**

The function *wait\_all\_n* will return an iterator referring to the first element in the input sequence after the last processed element.

***hpx::wait\_all\_n\_nothrow***

Defined in header *hpx/future.hpp*<sup>829</sup>.

The function *wait\_all\_n\_nothrow* is an operator allowing to join on the result of all

---

<sup>829</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

given futures. It AND-composes all future objects given and returns after they finished executing, similar to `wait_all_n`. It differs from `wait_all_n` in that it will not rethrow any exceptions captured by the given futures while they became ready.

#### Note

The function `wait_all_n_nothrow` returns after all futures have become ready. All input futures are still valid after `wait_all_n_nothrow` returns.

#### Note

Unlike `wait_all_n`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned `bool` to detect their presence.

#### Note

The caller is responsible for keeping the `futures` container alive, unmoved, and unmodified until `wait_all` returns and all inspection of the futures is complete.

## Parameters

- **begin** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all_n_nothrow` should wait.
- **count** – The number of elements in the sequence starting at *first*.

## Returns

The function `wait_all_n_nothrow` returns a pair consisting of an iterator referring to the first element in the input sequence after the last processed element, and a `bool` that is `true` if any of the given futures held an exception once it became ready, and `false` otherwise.

## hpx::when\_any

Defined in header `hpx/future.hpp`<sup>830</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>>
future<when_any_result<Container>> hpx::when_any(InputIter first, InputIter last)
```

function `when_any` creates a future object that becomes when at least one element in a set of `future` and `shared_future` objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

<sup>830</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

### Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *when\_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *when\_any* should wait.

### Returns

Returns a *when\_any\_result* holding the same list of futures as has been passed to *when\_any* and an index pointing to a ready future.

- `future<when_any_result<Container<future<R>>>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
```

```
future<when_any_result<Range>> hpx::when_any(Range &values)
```

function *when\_any* creates a future object that becomes when at least one element in a set of *future* and *shared\_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

### Parameters

**values** – [in] A range holding an arbitrary amount of *futures* or *shared\_future* objects for which *when\_any* should wait.

### Returns

Returns a *when\_any\_result* holding the same list of futures as has been passed to *when\_any* and an index pointing to a ready future.

- `future<when_any_result<Container<future<R>>>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename ...T>
```

```
future<when_any_result<tuple<future<T>...>>> hpx::when_any(T&&... futures)
```

function *when\_any* creates a future object that becomes when at least one element in a set of *future* and *shared\_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

### Parameters

**futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *when\_any* should wait.

### Returns

Returns a *when\_any\_result* holding the same list of futures as has been passed to *when\_any* and an index pointing to a ready future.

- `future<when_any_result<tuple<future<T0>, future<T1>...>>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.

- `future<when_any_result<tuple<>>>` if *when\_any* is called with zero arguments. The returned future will be initially ready.

### hpx/async\_combinators/split\_future.hpp

Defined in header `hpx/async_combinators/split_future.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

### Functions

template<typename ...Ts>

inline *tuple<future<Ts>...>* **split\_future**(*future<tuple<Ts...>>* &&f)

The function *split\_future* is an operator allowing to split a given future of a sequence of values (any tuple, `std::pair`, or `std::array`) into an equivalent container of futures where each future represents one of the values from the original future. In some sense this function provides the inverse operation of *when\_all*.

#### Note

The following cases are special:

```
tuple<future<void> > split_future(future<tuple<> > && f);
array<future<void>, 1> split_future(future<array<T, 0> > && f);
```

here the returned futures are directly representing the futures which were passed to the function.

#### Parameters

**f** – [in] A future holding an arbitrary sequence of values stored in a tuple-like container. This facility supports *hpx::tuple<>*, *std::pair<T1, T2>*, and *std::array<T, N>*

#### Returns

Returns an equivalent container (same container type as passed as the argument) of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

template<typename T>

inline *std::vector<future<T>>* **split\_future**(*future<std::vector<T>>* &&f, *std::size\_t* size)

The function *split\_future* is an operator allowing to split a given future of a sequence of values (any `std::vector`) into a `std::vector` of futures where each future represents one of the values from the original `std::vector`. In some sense this function provides the inverse operation of *when\_all*.

## Parameters

- **f** – [in] A future holding an arbitrary sequence of values stored in a `std::vector`.
- **size** – [in] The number of elements the vector will hold once the input future has become ready

## Returns

Returns a `std::vector` of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

## `hpx::when_all`

Defined in header `hpx/future.hpp`<sup>831</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>  
hpx::future<Container> hpx::when_all(InputIter first, InputIter last)
```

function `when_all` creates a future object that becomes ready when all elements in a set of `future` and `shared_future` objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

### Note

Calling this version of `when_all` where `first == last`, returns a future with an empty container that is immediately ready. Each future and `shared_future` is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_all` will not throw an exception, but the futures held in the output collection may.

## Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.

## Returns

Returns a future holding the same list of futures as has been passed to `when_all`.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

---

<sup>831</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

```
template<typename Range>
```

```
hpx::future<Range> hpx::when_all(Range &&values)
```

function *when\_all* creates a future object that becomes ready when all elements in a set of *future* and *shared\_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

#### Note

Calling this version of *when\_all* where the input container is empty, returns a future with an empty container that is immediately ready. Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_all* will not throw an exception, but the futures held in the output collection may.

#### Parameters

**values** – [in] A range holding an arbitrary amount of *future* or *shared\_future* objects for which *when\_all* should wait.

#### Returns

Returns a future holding the same list of futures as has been passed to *when\_all*.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type.

```
template<typename ...T>
```

```
hpx::future<hpx::tuple<hpx::future<T>...>> hpx::when_all(T&&... futures)
```

function *when\_all* creates a future object that becomes ready when all elements in a set of *future* and *shared\_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

#### Note

Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_all* will not throw an exception, but the futures held in the output collection may.

#### Parameters

**futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *when\_all* should wait.

#### Returns

Returns a future holding the same list of futures as has been passed to *when\_all*.

- `future<tuple<future<T0>, future<T1>, future<T2>...>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.

- `future<tuple<>>>` if `when_all` is called with zero arguments. The returned future will be initially ready.

### `hpx::when_some`

Defined in header `hpx/future.hpp`<sup>832</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>  
future<when_some_result<Container>> hpx::when_some(std::size_t n, Iterator first, Iterator last)
```

The function `when_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after `n` of them finished executing.

#### Note

The future returned by the function `when_some` becomes ready when at least `n` argument futures have become ready.

#### Note

Calling this version of `when_some` where `first == last`, returns a future with an empty container that is immediately ready. Each future and `shared_future` is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_some` will not throw an exception, but the futures held in the output collection may.

### Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of `future` or `shared_future` objects for which `when_all` should wait.

### Returns

Returns a `when_some_result` holding the same list of futures as has been passed to `when_some` and indices pointing to ready futures.

- `future<when_some_result<Container<future<R>>>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
```

---

<sup>832</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

*future*<when\_some\_result<*Range*>> *hpx* : **when\_some**(*std::size\_t* n, *Range* &&futures)

The function *when\_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

#### Note

The future returned by the function *when\_some* becomes ready when at least *n* argument futures have become ready.

#### Note

Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_some* will not throw an exception, but the futures held in the output collection may.

### Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A container holding an arbitrary amount of *future* or *shared\_future* objects for which *when\_some* should wait.

### Returns

Returns a *when\_some\_result* holding the same list of futures as has been passed to *when\_some* and indices pointing to ready futures.

- *future*<when\_some\_result<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename ...**Ts**>

*future*<when\_some\_result<*tuple*<*future*<T>...>>> *hpx* : **when\_some**(*std::size\_t* n, *Ts*&&... futures)

The function *when\_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

#### Note

The future returned by the function *when\_some* becomes ready when at least *n* argument futures have become ready.

#### Note

Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_some* will not throw an exception, but the futures held in the output collection may.

### Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *when\_some* should wait.

### Returns

Returns a *when\_some\_result* holding the same list of futures as has been passed to *when\_some* and an index pointing to a ready future..

- `future<when_some_result<tuple<future<T0>, future<T1>...>>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- `future<when_some_result<tuple<>>>` if *when\_some* is called with zero arguments. The returned future will be initially ready.

### *hpx::when\_each*

Defined in header `hpx/future.hpp`<sup>833</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

`template<typename F, typename Future>`

`future<void> hpx::when_each(F &&f, std::vector<Future> &&futures)`

The function *when\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

#### Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

### Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.

---

<sup>833</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

- **futures** – A vector holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_each* should wait.

### Returns

Returns a future representing the event of all input futures being ready.

```
template<typename F, typename Iterator>
```

```
future<Iterator> hpx::when_each(F &&f, Iterator begin, Iterator end)
```

The function *when\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

#### Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

### Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *wait\_each* should wait.

### Returns

Returns a future representing the event of all input futures being ready.

```
template<typename F, typename ...Ts>
```

```
future<void> hpx::when_each(F &&f, Ts&&... futures)
```

The function *when\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

#### Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

## Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_each* should wait.

## Returns

Returns a future representing the event of all input futures being ready.

### `hpx::wait_all_for`

Defined in header `hpx/future.hpp`<sup>834</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_all_for_nothrow`
- `hpx::wait_all_for_n`
- `hpx::wait_all_for_n_nothrow`

```
template<typename InputIter>
```

```
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, InputIter first, InputIter last)
```

The function *wait\_all\_for* is an operator allowing to join on the result of all given futures, similar to *wait\_all*. It differs from *wait\_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function *wait\_all\_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

#### Note

The function *wait\_all\_for* will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait\_all\_for\_nothrow* instead.

## Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.

---

<sup>834</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

- **first** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_all\_for* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or *shared\_future* objects for which *wait\_all\_for* should wait.

### Returns

Returns *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise.

template<typename R>

*hpx::future\_status* **hpx::wait\_all\_for**(*hpx::chrono::steady\_duration* const &timeout, *std::vector*<*future*<R>> const &futures)

The function *wait\_all\_for* is an operator allowing to join on the result of all given futures, similar to *wait\_all*. It differs from *wait\_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function *wait\_all\_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

#### Note

The function *wait\_all\_for* will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait\_all\_for\_nothrow* instead.

#### Note

The function *wait\_all\_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

#### Note

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, *wait\_all\_for* may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

### Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_all\_for* should wait.

### Returns

Returns *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise.

```
template<typename R, std::size_t N>
```

```
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, std::array<future<R>, N>
                                     const &futures)
```

The function *wait\_all\_for* is an operator allowing to join on the result of all given futures, similar to *wait\_all*. It differs from *wait\_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function *wait\_all\_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

#### Note

The function *wait\_all\_for* will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait\_all\_for\_nothrow* instead.

#### Note

The function *wait\_all\_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

**Note**

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, *wait\_all\_for* may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

**Parameters**

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_all\_for* should wait.

**Returns**

Returns *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise.

```
template<typename T>
```

```
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, hpx::future<T> const &f)
```

The function *wait\_all\_for* is an operator allowing to join on the result of the given future, similar to *wait\_all*. It differs from *wait\_all* in that it will not suspend indefinitely if the given future never becomes ready; instead it returns as soon as either the future has become ready, or the given timeout has elapsed, whichever happens first.

**Note**

The function *wait\_all\_for* returns after the future has become ready, or after the given timeout has expired, whichever comes first. The input future is still valid after *wait\_all\_for* returns, independently of the returned status.

**Note**

The function *wait\_all\_for* will rethrow any exceptions captured by the future while becoming ready, as long as the given future became ready before the timeout elapsed. If this behavior is undesirable, use *wait\_all\_for\_nothrow* instead.

**Parameters**

- **timeout** – The maximum duration to wait for the given future to become ready.
- **f** – A *future* or *shared\_future* for which *wait\_all\_for* should wait.

**Returns**

Returns *hpx::future\_status::ready* if the given future has become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise.

template<typename ...T>

*hpx::future\_status* *hpx::wait\_all\_for*(*hpx::chrono::steady\_duration* const &timeout, *T* const&... futures)

The function *wait\_all\_for* is an operator allowing to join on the result of all given futures, similar to *wait\_all*. It differs from *wait\_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function *wait\_all\_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

#### Note

The function *wait\_all\_for* will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait\_all\_for\_nothrow* instead.

### Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_all\_for* should wait.

### Returns

Returns *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise.

### *hpx::wait\_all\_for\_nothrow*

Defined in header *hpx/future.hpp*<sup>835</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait\_all\_for*

- *hpx::wait\_all\_for\_n\_nothrow*

template<typename **InputIter**>

---

<sup>835</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

*hpx::wait\_all\_for\_nothrow\_result* **hpx::wait\_all\_for\_nothrow**(*hpx::chrono::steady\_duration* const &timeout, *InputIter* first, *InputIter* last)

The function *wait\_all\_for\_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait\_all\_for*. It differs from *wait\_all\_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function *wait\_all\_for\_nothrow* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for\_nothrow* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

#### Note

Unlike *wait\_all\_for\_nothrow*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

### Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **first** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_all\_for\_nothrow* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or *shared\_future* objects for which *wait\_all\_for\_nothrow* should wait.

### Returns

Returns a *wait\_all\_for\_nothrow\_result* object whose *status* member is *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise; and whose *has\_exceptional\_results* member indicates whether any of the futures that became ready had captured an exception.

template<typename R>

*hpx::wait\_all\_for\_nothrow\_result* **hpx::wait\_all\_for\_nothrow**(*hpx::chrono::steady\_duration* const &timeout, *std::vector<future<R>>* const &futures)

The function *wait\_all\_for\_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait\_all\_for*. It differs from *wait\_all\_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function *wait\_all\_for\_nothrow* returns after all futures have become ready, or after

the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

#### Note

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

#### Note

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

#### Note

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, `wait_all_for` may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

## Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_all_for_nothrow` should wait.

## Returns

Returns a `wait_all_for_nothrow_result` object whose `status` member is `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise; and whose `has_exceptional_results` member indicates whether any of the futures that became ready had captured an exception.

template<typename **R**, *std::size\_t* **N**>

*hpx::wait\_all\_for\_nothrow\_result* **hpx::wait\_all\_for\_nothrow**(*hpx::chrono::steady\_duration* const &timeout, *std::array<future<R>, N>* const &futures)

The function `wait_all_for_nothrow` is an operator allowing to join on the result of all given futures, similar to `wait_all_for`. It differs from `wait_all_for` in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

**Note**

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

**Note**

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, `wait_all_for` may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

**Parameters**

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_all_for_nothrow` should wait.

**Returns**

Returns a `wait_all_for_nothrow_result` object whose `status` member is `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise; and whose `has_exceptional_results` member indicates whether any of the futures that became ready had captured an exception.

template<typename T>

`hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout, hpx::future<T> const &f)`

The function `wait_all_for_nothrow` is an operator allowing to join on the result of the given future, similar to `wait_all_for`. It differs from `wait_all_for` in that it will not

rethrow any exceptions captured by the given future while it became ready; instead it returns as soon as either the future has become ready, or the given timeout has elapsed, whichever happens first.

**Note**

The function `wait_all_for_nothrow` returns after the future has become ready, or after the given timeout has expired, whichever comes first. The input future is still valid after `wait_all_for_nothrow` returns, independently of the returned status.

**Note**

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the future while becoming ready. Any such exception is silently discarded.

**Parameters**

- **timeout** – The maximum duration to wait for the given future to become ready.
- **f** – A *future* or *shared\_future* for which `wait_all_for_nothrow` should wait.

**Returns**

Returns a `wait_all_for_nothrow_result` object whose `status` member is `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise; and whose `has_exceptional_results` member indicates whether any of the futures that became ready had captured an exception.

```
template<typename ...T>
```

```
hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout, T  
                                                         const&... futures)
```

The function `wait_all_for_nothrow` is an operator allowing to join on the result of all given futures, similar to `wait_all_for`. It differs from `wait_all_for` in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

**Note**

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

## Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_all\_for\_nothrow* should wait.

## Returns

Returns a *wait\_all\_for\_nothrow\_result* object whose *status* member is *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise; and whose *has\_exceptional\_results* member indicates whether any of the futures that became ready had captured an exception.

## `hpx::wait_all_for_n`

Defined in header `hpx/future.hpp`<sup>836</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::wait\_all\_for*
- *hpx::wait\_all\_for\_nothrow*
- *hpx::wait\_all\_for\_n\_nothrow*

```
template<typename InputIter>
```

```
hpx::future_status hpx::wait_all_for_n(hpx::chrono::steady_duration const &timeout, InputIter begin,
                                         std::size_t count)
```

The function *wait\_all\_for\_n* is an operator allowing to join on the result of all given futures, similar to *wait\_all\_n*. It differs from *wait\_all\_n* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

### Note

The function *wait\_all\_for\_n* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for\_n* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

### Note

The function *wait\_all\_for\_n* will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait\_all\_for\_n\_nothrow* instead.

<sup>836</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

## Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_all\_for\_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

## Returns

Returns *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise.

## **hpx::wait\_all\_for\_n\_nothrow**

Defined in header [hpx/future.hpp](#)<sup>837</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

- [hpx::wait\\_all\\_for\\_n](#)

template<typename **InputIter**>

*hpx::wait\_all\_for\_nothrow\_result* **hpx::wait\_all\_for\_n\_nothrow**(*hpx::chrono::steady\_duration* const &timeout, *InputIter* begin, *std::size\_t* count)

The function *wait\_all\_for\_n\_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait\_all\_n*. It differs from *wait\_all\_for\_n* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

### Note

The function *wait\_all\_for\_n\_nothrow* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for\_n\_nothrow* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

### Note

Unlike *wait\_all\_for\_n*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

## Parameters

---

<sup>837</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_all\_for\_n\_nothrow* should wait.
- **count** – The number of elements in the sequence starting at *first*.

### Returns

Returns a *wait\_all\_for\_nothrow\_result* object whose *status* member is *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise; and whose *has\_exceptional\_results* member indicates whether any of the futures that became ready had captured an exception.

### `hpx::wait_each`

Defined in header `hpx/future.hpp`<sup>838</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::wait\_each\_nothrow*
- *hpx::wait\_each\_n*
- *hpx::wait\_each\_n\_nothrow*

```
template<typename F, typename Future>
```

```
void hpx::wait_each(F &&f, std::vector<Future> &&futures)
```

The function *wait\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait\_each* returns after all futures have been become ready.

#### Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

### Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_each* should wait.

```
template<typename F, typename Iterator>
```

<sup>838</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

```
void hpx::wait_each(F &&f, Iterator begin, Iterator end)
```

The function *wait\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait\_each* returns after all futures have been become ready.

**Note**

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

**Parameters**

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *wait\_each* should wait.

```
template<typename F, typename ...T>
```

```
void hpx::wait_each(F &&f, T&&... futures)
```

The function *wait\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait\_each* returns after all futures have been become ready.

**Note**

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

**Parameters**

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_each* should wait.

## hpx::wait\_each\_nothrow

Defined in header `hpx/future.hpp`<sup>839</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_each`
- `hpx::wait_each_n`
- `hpx::wait_each_n_nothrow`

### Warning

doxygenfunction: Cannot find function “hpx::wait\_each\_nothrow” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

## hpx::wait\_each\_n

Defined in header `hpx/future.hpp`<sup>840</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_each`
- `hpx::wait_each_nothrow`
- `hpx::wait_each_n_nothrow`

template<typename **F**, typename **Iterator**>

void `hpx::wait_each_n`(*F* &&*f*, *Iterator* begin, *std::size\_t* count)

The function `wait_each` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready.

### Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

## Parameters

<sup>839</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

<sup>840</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_each\_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

### **hpx::wait\_each\_n\_nothrow**

Defined in header `hpx/future.hpp`<sup>841</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::wait\_each*
- *hpx::wait\_each\_nothrow*
- *hpx::wait\_each\_n*

#### **Warning**

doxygenfunction: Cannot find function “hpx::wait\_each\_n\_nothrow” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

### **hpx::wait\_any**

Defined in header `hpx/future.hpp`<sup>842</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::wait\_any\_nothrow*
- *hpx::wait\_any\_n*
- *hpx::wait\_any\_n\_nothrow*

template<typename **InputIter**>

void **hpx::wait\_any**(*InputIter* first, *InputIter* last)

The function *wait\_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

#### **Note**

The function *wait\_any* returns after at least one future has become ready. All input futures are still valid after *wait\_any* returns.

---

<sup>841</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

<sup>842</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

**Note**

The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

**Parameters**

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which `wait_any` should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which `wait_any` should wait.

```
template<typename R>
```

```
void hpx::wait_any(std::vector<future<R>> &futures)
```

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

**Note**

The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

**Note**

The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

**Parameters**

**futures** – [in] A vector holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_any` should wait.

```
template<typename R, std::size_t N>
```

```
void hpx::wait_any(std::array<future<R>, N> &futures)
```

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

**Note**

The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

**Note**

The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

**Parameters**

**futures** – [in] An array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_any` should wait.

template<typename ...T>

void `hpx::wait_any`(T&&... futures)

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

**Note**

The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

**Note**

The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

**Parameters**

**futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which `wait_any` should wait.

**`hpx::wait_any_nothrow`**

Defined in header `hpx/future.hpp`<sup>843</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_any`
- `hpx::wait_any_n`
- `hpx::wait_any_n_nothrow`

**Warning**

doxygenfunction: Cannot find function “`hpx::wait_any_nothrow`” in doxygen xml output for project “hpx” from directory: `../hpx_autodoc`

---

<sup>843</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

## hpx::wait\_any\_n

Defined in header `hpx/future.hpp`<sup>844</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_any_n_nothrow`

```
template<typename InputIter>
```

```
void hpx::wait_any_n(InputIter first, std::size_t count)
```

The function `wait_any_n` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

### Note

The function `wait_any_n` returns after at least one future has become ready. All input futures are still valid after `wait_any_n` returns.

### Note

The function `wait_any_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_n_nothrow` instead.

## Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which `wait_any_n` should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

## hpx::wait\_any\_n\_nothrow

Defined in header `hpx/future.hpp`<sup>845</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

## Functions

template<typename **Executor**, typename ...**Ts**>

decltype(auto) **async**(*Executor* &&exec, *hpx::sycl::experimental::sycl\_executor::queue\_function\_ptr\_t*<*Ts*...>  
&&f, *Ts*&&... ts)

`hpx::async` overload for launching `sycl` queue member functions with an `sycl` executor

template<typename **Executor**, typename ...**Ts**>

bool **apply**(*Executor* &&exec, *hpx::sycl::experimental::sycl\_executor::queue\_function\_ptr\_t*<*Ts*...> &&f,  
*Ts*&&... ts)

`hpx::apply` overload for launching `sycl` queue member functions with an `sycl` executor

namespace **execution**

namespace **experimental**

namespace **sycl**

namespace **experimental**

struct **sycl\_executor**

## Public Types

using **future\_type** = *hpx::future*<void>

template<typename ...**Params**>

using **queue\_function\_ptr\_t** = ::sycl::event  
 (::sycl::queue::\*)(*std::conditional\_t*<*std::is\_trivial\_v*<*std::remove\_reference\_t*<*Params*>>,  
*std::decay\_t*<*Params*>, *Params*>...)

Default Implementation without the extra intel code\_location parameter. Removes the reference for trivial types to make the function matching easier (see *sycl\_stream.cpp* test)

## Public Functions

template<typename **sycl\_device\_selector**>

inline explicit **sycl\_executor**(*sycl\_device\_selector* const &selector)

Create a SYCL executor (based on a sycl queue)

**~sycl\_executor**() = default

inline *future\_type* **get\_future**()

Get future for this command\_queue (NOTE will be more efficient if an event is provided  
 &#8212; otherwise a dummy kernel must be submitted to get an event)

```
inline future_type get_future(::sycl::event event)
```

Get future for that becomes ready when the given event completes.

```
template<typename ...Params>
```

```
inline void post(queue_function_ptr_t<Params...> &&queue_member_function, Params&&...  
                args)
```

Invoke queue member function given queue and parameters &#8212; do not use event to return a `hpx::future` (One way)

```
template<typename ...Params>
```

```
inline hpx::future<void> async_execute(queue_function_ptr_t<Params...>  
                                       &&queue_member_function, Params&&... args)
```

Invoke queue member function given queue and parameters &#8212; `hpx::future` tied to the `sycl` event / (two way)

```
inline ::sycl::device get_device() const
```

Return the device used by the underlying SYCL queue.

```
inline ::sycl::context get_context() const
```

Return the context used by the underlying SYCL queue.

```
inline ::sycl::queue &get_queue()
```

Return the underlying queue for direct access.

## Protected Attributes

```
::sycl::queue command_queue
```

## cache

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## hpx/cache/local\_cache.hpp

Defined in header `hpx/cache/local_cache.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

namespace **cache**

```
template<typename Key, typename Entry, typename UpdatePolicy = std::less<Entry>, typename
InsertPolicy = policies::always<Entry>, typename CacheStorage = std::map<Key, Entry>,
typename Statistics = statistics::no_statistics>
```

class **local\_cache**

*#include <hpx/cache/local\_cache.hpp>* The **local\_cache** implements the basic functionality needed for a local (non-distributed) cache.

#### Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache, must model the *CacheEntry* concept
- **UpdatePolicy** – A (optional) type specifying a (binary) function object used to sort the cache entries based on their ‘age’. The ‘oldest’ entries (according to this sorting criteria) will be discarded first if the maximum capacity of the cache is reached. The default is *std::less<Entry>*. The function object will be invoked using 2 entry instances of the type *Entry*. This type must model the *UpdatePolicy* model.
- **InsertPolicy** – A (optional) type specifying a (unary) function object used to allow global decisions whether a particular entry should be added to the cache or not. The default is *policies::always*, imposing no global insert related criteria on the cache. The function object will be invoked using the entry instance to be inserted into the cache. This type must model the *InsertPolicy* model.
- **CacheStorage** – A (optional) container type used to store the cache items. The container must be an associative and STL compatible container. The default is a *std::map<Key, Entry>*.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the *CacheStatistics* concept. The default value is the type *statistics::no\_statistics* which does not collect any numbers, but provides empty stubs allowing the code to compile.

#### Public Types

using **key\_type** = *Key*

using **entry\_type** = *Entry*

using **update\_policy\_type** = *UpdatePolicy*

using **insert\_policy\_type** = *InsertPolicy*

using **storage\_type** = *CacheStorage*

```
using statistics_type = Statistics
```

```
using value_type = typename entry_type::value_type
```

```
using size_type = typename storage_type::size_type
```

```
using storage_value_type = typename storage_type::value_type
```

## Public Functions

```
inline explicit local_cache(size_type max_size = 0, update_policy_type const &up =  
    update_policy_type(), insert_policy_type const &ip =  
    insert_policy_type())
```

Construct an instance of a *local\_cache*.

### Parameters

- **max\_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get\_size* function.
- **up** – [in] An instance of the *UpdatePolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *UpdatePolicy* template parameter.
- **ip** – [in] An instance of the *InsertPolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *InsertPolicy* template parameter.

```
local_cache(local_cache const &other) = default
```

```
local_cache(local_cache &&other) = default
```

```
local_cache &operator=(local_cache const &other) = default
```

```
local_cache &operator=(local_cache &&other) = default
```

```
~local_cache() = default
```

```
inline constexpr size_type size() const noexcept
```

Return current size of the cache.

#### Returns

The current size of this cache instance.

```
inline constexpr size_type capacity() const noexcept
```

Access the maximum size the cache is allowed to grow to.

#### Note

The unit of this value is usually determined by the unit of the return values of the entry's function `entry::get_size`.

#### Returns

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

```
inline bool reserve(size_type max_size)
```

Change the maximum size this cache can grow to.

#### Parameters

**max\_size** – [in] The new maximum size this cache will be allowed to grow to.

#### Returns

This function returns *true* if successful. It returns *false* if the new *max\_size* is smaller than the current limit and the cache could not be shrunk to the new maximum size.

```
inline bool holds_key(key_type const &k) const
```

Check whether the cache currently holds an entry identified by the given key.

#### Note

This function does not call the entry's function `entry::touch`. It just checks if the cache contains an entry corresponding to the given key.

#### Parameters

**k** – [in] The key for the entry which should be looked up in the cache.

#### Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &k, key_type &realkey, entry_type &val)
```

Get a specific entry identified by the given key.

#### Note

The function will call the entry's `entry::touch` function if the value corresponding to the provided key is found in the cache.

#### Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &k, entry_type &val)
```

Get a specific entry identified by the given key.

**Note**

The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

**Parameters**

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &k, value_type &val)
```

Get a specific entry identified by the given key.

**Note**

The function will call the entry's *entry::touch* function if the value corresponding to the provided is found in the cache.

**Parameters**

- **k** – [in] The key for the entry which should be retrieved from the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding value.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool insert(key_type const &k, value_type const &val)
```

Insert a new element into this cache.

**Note**

This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the newly constructed entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value

pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

### Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **val** – [in] The value which should be added to the cache.

### Returns

This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```
inline bool insert(key_type const &k, value_type &&val)
```

```
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>,
entry_type>, int> = 0>
```

```
inline bool insert(key_type const &k, Entry_ &&e)
```

Insert a new entry into this cache.

### Note

This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the provided entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

### Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **e** – [in] The entry which should be added to the cache.

### Returns

This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```
template<typename Value, std::enable_if_t<std::is_convertible_v<std::decay_t<Value>,
value_type>, int> = 0>
```

```
inline bool update(key_type const &k, Value &&val)
```

Update an existing element in this cache.

### Note

The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

### Note

The difference to the other overload of the *insert* function is that this overload replaces

the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

### Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

### Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename F, typename Value, typename =
std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>>>
inline bool update_if(key_type const &k, Value &&val, F &&f)
```

Update an existing element in this cache.

#### Note

The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

#### Note

The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

### Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

### Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>,
entry_type>, int> = 0>
inline bool update(key_type const &k, Entry_ &&e)
```

Update an existing entry in this cache.

#### Note

The function will call the entry's *entry::touch* function if the indexed value is found in

the cache.

#### Note

The difference to the other overload of the *insert* function is that this overload replaces the whole cache entry, while the other overload replaces the cached value only, leaving the cache entry properties untouched.

#### Parameters

- **k** – [in] The key for the entry which should be updated in the cache.
- **e** – [in] The entry which should be used as a replacement for the existing entry in the cache. Any existing entry is first removed and then this entry is added.

#### Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func = policies::always<storage_value_type>>
```

```
inline size_type erase(Func &&ep = Func())
```

Remove stored entries from the cache for which the supplied function object returns true.

#### Parameters

**ep** – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*. Even then the entry might not be removed from the cache as its *entry::remove* function might return false.

#### Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get\_size* functions of the removed entries).

```
inline size_type erase()
```

Remove all stored entries from the cache.

#### Note

All entries are considered for removal, but in the end an entry might not be removed from the cache as its *entry::remove* function might return false. This function is very useful for instance in conjunction with an entry's *entry::remove* function enforcing additional criteria like entry expiration, etc.

#### Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get\_size* functions of the removed entries).

```
inline void clear()
```

Clear the cache.

Unconditionally removes all stored entries from the cache.

```
inline constexpr statistics_type const &get_statistics() const noexcept
```

Allow to access the embedded statistics instance.

**Returns**

This function returns a reference to the statistics instance embedded inside this cache

```
inline statistics_type &get_statistics() noexcept
```

**Protected Functions**

```
inline bool free_space(long num_free)
```

**Private Types**

## hpx/cache/lru\_cache.hpp

Defined in header `hpx/cache/lru_cache.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
template<typename Key, typename Entry, typename Statistics = statistics::no_statistics>
```

```
class lru_cache
```

*#include <hpx/cache/lru\_cache.hpp>* The `lru_cache` implements the basic functionality needed for a local (non-distributed) LRU cache.

### Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the `CacheStatistics` concept. The default value is the type `statistics::no_statistics` which does not collect any numbers, but provides empty stubs allowing the code to compile.

### Public Types

```
using key_type = Key
```

```
using entry_type = Entry
```

```
using statistics_type = Statistics
```

```
using entry_pair = std::pair<key_type, entry_type>
```

```
using storage_type = std::list<entry_pair>
```

```
using map_type = std::map<Key, typename storage_type::iterator>
```

```
using size_type = std::size_t
```

## Public Functions

```
inline explicit lru_cache(size_type max_size = 0)
```

Construct an instance of a *lru\_cache*.

### Parameters

**max\_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get\_size* function.

```
lru_cache(lru_cache const &other) = default
```

```
lru_cache(lru_cache &&other) = default
```

```
lru_cache &operator=(lru_cache const &other) = default
```

```
lru_cache &operator=(lru_cache &&other) = default
```

```
~lru_cache() = default
```

```
inline constexpr size_type size() const noexcept
```

Return current size of the cache.

### Returns

The current size of this cache instance.

```
inline constexpr size_type capacity() const noexcept
```

Access the maximum size the cache is allowed to grow to.

### Note

The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get\_size*.

**Returns**

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

```
inline void reserve(size_type max_size)
```

Change the maximum size this cache can grow to.

**Parameters**

**max\_size** – [in] The new maximum size this cache will be allowed to grow to.

```
inline bool holds_key(key_type const &key) const
```

Check whether the cache currently holds an entry identified by the given key.

**Note**

This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

**Parameters**

**key** – [in] The key for the entry which should be looked up in the cache.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &key, key_type &realkey, entry_type &entry)
```

Get a specific entry identified by the given key.

**Note**

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

**Parameters**

- **key** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &key, entry_type const &entry)
```

Get a specific entry identified by the given key.

**Note**

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

**Parameters**

- **key** – [in] The key for the entry which should be retrieved from the cache.

- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
template<typename Entry_, typename =
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>
inline bool insert(key_type const &key, Entry_ &&entry)
```

Insert a new entry into this cache.

**Note**

This function assumes that the entry is not in the cache already. Inserting an already existing entry is considered undefined behavior

**Parameters**

- **key** – [in] The key for the entry which should be added to the cache.
- **entry** – [in] The entry which should be added to the cache.

```
template<typename Entry_, typename =
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>
inline void update(key_type const &key, Entry_ &&entry)
```

Update an existing element in this cache.

**Note**

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

**Note**

The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

**Parameters**

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The entry which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

```
template<typename F, typename Entry_,
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
inline bool update_if(key_type const &key, Entry_ &&entry, F &&f)
```

Update an existing element in this cache.

**Note**

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

**Note**

The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

**Parameters**

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

**Returns**

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func>
```

```
inline size_type erase(Func const &ep)
```

Remove stored entries from the cache for which the supplied function object returns true.

**Parameters**

**ep** – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*.

**Returns**

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get\_size* functions of the removed entries).

```
inline size_type erase()
```

Remove all stored entries from the cache.

**Returns**

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get\_size* functions of the removed entries).

```
inline size_type clear()
```

Clear the cache.

Unconditionally removes all stored entries from the cache.

```
inline constexpr statistics_type const &get_statistics() const noexcept
```

Allow to access the embedded statistics instance.

## Returns

This function returns a reference to the statistics instance embedded inside this cache

```
inline statistics_type &get_statistics() noexcept
```

## Private Types

```
using update_on_exit = typename statistics_type::update_on_exit
```

## hpx/cache/entries/size\_entry.hpp

Defined in header `hpx/cache/entries/size_entry.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
namespace entries
```

```
template<typename Value>
```

```
class size_entry : public hpx::util::cache::entries::entry<Value>
```

*#include <hpx/cache/entries/size\_entry.hpp>* The `size_entry` type can be used to store values in a cache which have a size associated (such as files, etc.). Using this type as the cache's entry type makes sure that the entries with the biggest size are discarded from the cache first.

### Note

The `size_entry` conforms to the `CacheEntry` concept.

### Note

This type can be used to model a 'discard smallest first' cache policy if it is used with a `std::greater` as the caches' `UpdatePolicy` (instead of the default `std::less`).

### Template Parameters

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

## Public Functions

**size\_entry()** = default

Any cache entry has to be default constructible.

```
inline explicit size_entry(Value const &val, std::size_t size = 0)
    noexcept(std::is_nothrow_constructible_v<base_type, Value
    const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit size_entry(Value &&val, std::size_t size = 0) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline constexpr std::size_t get_size() const noexcept
```

Return the ‘size’ of this entry.

## Private Types

```
using base_type = entry<Value>
```

## Private Members

```
std::size_t size_ = 0
```

## Friends

```
inline friend auto operator<(size_entry const &lhs, size_entry const &rhs) noexcept
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has a bigger size.

```
inline friend auto operator>(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator<=(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator>=(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator==(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator!=(size_entry const &lhs, size_entry const &rhs) noexcept
```

### **hpx/cache/entries/lru\_entry.hpp**

Defined in header `hpx/cache/entries/lru_entry.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
namespace entries
```

```
template<typename Value>
```

```
class lru_entry : public hpx::util::cache::entries::entry<Value>
```

*#include* <*hpx/cache/entries/lru\_entry.hpp*> The `lru_entry` type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently used entries are discarded from the cache first.

#### **Note**

The `lru_entry` conforms to the `CacheEntry` concept.

#### **Note**

This type can be used to model a 'most recently used' cache policy if it is used with a `std::greater` as the caches' `UpdatePolicy` (instead of the default `std::less`).

### **Template Parameters**

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

## Public Functions

inline **lru\_entry**()

Any cache entry has to be default constructible.

inline explicit **lru\_entry**(*Value* const &val)  
noexcept(*std::is\_nothrow\_constructible\_v<base\_type, Value*  
const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **lru\_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline bool **touch**()

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LRU entry we store the time of the last access which will be used to compare the age of an entry during the invocation of the *operator<()*.

### Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

inline constexpr *time\_point* const &**get\_access\_time**() const noexcept

Returns the last access time of the entry.

## Private Types

using **base\_type** = *entry*<*Value*>

using **time\_point** = *std::chrono::steady\_clock::time\_point*

## Private Members

*time\_point* **access\_time\_**

## Friends

```
inline friend auto operator<(lru_entry const &lhs, lru_entry const &rhs)
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been accessed less recently (LRU).

```
inline friend auto operator>(lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator<=(lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator>=(lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator==(lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator!=(lru_entry const &lhs, lru_entry const &rhs)
```

## hpx/cache/entries/fifo\_entry.hpp

Defined in header `hpx/cache/entries/fifo_entry.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
namespace entries
```

```
template<typename Value>
```

```
class fifo_entry : public hpx::util::cache::entries::entry<Value>
```

*#include* `<hpx/cache/entries/fifo_entry.hpp>` The `fifo_entry` type can be used to store arbitrary values in a cache. Using this type as the cache’s entry type makes sure that the least recently inserted entries are discarded from the cache first.

**Note**

The `fifo_entry` conforms to the `CacheEntry` concept.

**Note**

This type can be used to model a ‘last in first out’ cache policy if it is used with a `std::greater` as the caches’ `UpdatePolicy` (instead of the default `std::less`).

**Template Parameters**

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

**Public Functions**

**fifo\_entry()** = default

Any cache entry has to be default constructible.

```
inline explicit fifo_entry(Value const &val)
    noexcept(std::is_nothrow_constructible_v<base_type, Value
    const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit fifo_entry(Value &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline constexpr bool insert()
```

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

**Note**

This function is part of the `CacheEntry` concept

**Returns**

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

```
inline constexpr time_point const &get_creation_time() const noexcept
```

## Private Types

```
using base_type = entry<Value>
```

```
using time_point = std::chrono::steady_clock::time_point
```

## Private Members

```
time_point insertion_time_
```

## Friends

```
inline friend auto operator<(fifo_entry const &lhs, fifo_entry const &rhs)
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been created earlier (FIFO).

```
inline friend auto operator>(fifo_entry const &lhs, fifo_entry const &rhs)
```

```
inline friend auto operator<=(fifo_entry const &lhs, fifo_entry const &rhs)
```

```
inline friend auto operator>=(fifo_entry const &lhs, fifo_entry const &rhs)
```

```
inline friend auto operator==(fifo_entry const &lhs, fifo_entry const &rhs)
```

```
inline friend auto operator!=(fifo_entry const &lhs, fifo_entry const &rhs)
```

## **hpx/cache/entries/lfu\_entry.hpp**

Defined in header `hpx/cache/entries/lfu_entry.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **lfu\_entry** : public *hpx::util::cache::entries::entry<Value>*

*#include <hpx/cache/entries/lfu\_entry.hpp>* The *lfu\_entry* type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least frequently used entries are discarded from the cache first.

#### Note

The *lfu\_entry* conforms to the CacheEntry concept.

#### Note

This type can be used to model a 'most frequently used' cache policy if it is used with a `std::greater` as the caches' UpdatePolicy (instead of the default `std::less`).

### Template Parameters

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

### Public Functions

**lfu\_entry**() = default

Any cache entry has to be default constructible.

```
inline explicit lfu_entry(Value const &val)
    noexcept(std::is_nothrow_constructible_v<base_type, Value>
    const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit lfu_entry(Value &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline bool touch() noexcept
```

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LFU entry we store the reference count tracking the number of times this entry has been requested. This which will be used to compare the age of an entry during the invocation of the *operator<()*.

### Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

```
inline constexpr unsigned long const &get_access_count() const noexcept
```

## Private Types

```
using base_type = entry<Value>
```

## Private Members

```
unsigned long ref_count_ = 0
```

## Friends

```
inline friend auto operator<(lfu_entry const &lhs, lfu_entry const &rhs)
```

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been accessed less frequently (LFU).

```
inline friend auto operator>(lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator<=(lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator>=(lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator==(lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator!=(lfu_entry const &lhs, lfu_entry const &rhs)
```

**hpx/cache/entries/entry.hpp**

Defined in header `hpx/cache/entries/entry.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
namespace entries
```

```
template<typename Value>
```

```
class entry
```

```
    #include <hpx/cache/entries/entry.hpp>
```

**Template Parameters**

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less\_than\_comparable.

Subclassed by `hpx::util::cache::entries::fifo_entry< Value >`,  
`hpx::util::cache::entries::lfu_entry< Value >`, `hpx::util::cache::entries::lru_entry< Value >`, `hpx::util::cache::entries::size_entry< Value >`

**Public Types**

```
using value_type = Value
```

**Public Functions**

```
entry() = default
```

Any cache entry has to be default constructible.

```
inline explicit entry(value_type const &val)  
    noexcept(std::is_nothrow_copy_constructible_v<value_type>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit entry(value_type &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

inline *value\_type* &get() noexcept

Get a reference to the stored data value.

**Note**

This function is part of the CacheEntry concept

inline constexpr *value\_type* const &get() const noexcept

## Public Static Functions

static inline constexpr bool touch() noexcept

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

**Note**

It is possible to change the entry in a way influencing the sort criteria mandated by the UpdatePolicy. In this case the function should return *true* to indicate this to the cache, forcing to reorder the cache entries.

**Note**

This function is part of the CacheEntry concept

## Returns

This function should return *true* if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

static inline constexpr bool insert() noexcept

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

**Note**

This function is part of the CacheEntry concept

## Returns

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

static inline constexpr bool remove() noexcept

The function *remove* is called by a cache holding this instance whenever it is about to be removed from the cache.

#### Note

This function is part of the CacheEntry concept

### Returns

The return value can be used to avoid removing this instance from the cache. If the value is *true* it is ok to remove the entry, otherwise it will stay in the cache.

static inline constexpr *std::size\_t* **get\_size()** noexcept

Return the ‘size’ of this entry. By default, the size of each entry is just one (1), which is sensible if the cache has a limit (capacity) measured in number of entries.

### Private Members

*value\_type* **value\_**

### Friends

friend auto **operator<=>**(*entry* const&, *entry* const&) = default

Forwarding operator<=> allowing to compare entries instead of the values.

### hpx/cache/statistics/no\_statistics.hpp

Defined in header `hpx/cache/statistics/no_statistics.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **statistics**

## Enums

enum class **method**

*Values:*

enumerator **get\_entry**

enumerator **insert\_entry**

enumerator **update\_entry**

enumerator **erase\_entry**

class **no\_statistics**

Subclassed by *hpx::util::cache::statistics::local\_statistics*

## Public Static Functions

static inline constexpr void **got\_hit**() noexcept

The function *got\_hit* will be called by a cache instance whenever an entry got touched.

static inline constexpr void **got\_miss**() noexcept

The function *got\_miss* will be called by a cache instance whenever a requested entry has not been found in the cache.

static inline constexpr void **got\_insertion**() noexcept

The function *got\_insertion* will be called by a cache instance whenever a new entry has been inserted.

static inline constexpr void **got\_eviction**() noexcept

The function *got\_eviction* will be called by a cache instance whenever an entry has been removed from the cache because a new inserted entry let the cache grow beyond its capacity.

static inline constexpr void **clear**() noexcept

Reset all statistics.

static inline constexpr *std::int64\_t* **get\_get\_entry\_count**(bool) noexcept

The function *get\_get\_entry\_count* returns the number of invocations of the *get\_entry*() API function of the cache.

```
static inline constexpr std::int64_t get_insert_entry_count(bool) noexcept
```

The function *get\_insert\_entry\_count* returns the number of invocations of the *insert\_entry()* API function of the cache.

```
static inline constexpr std::int64_t get_update_entry_count(bool) noexcept
```

The function *get\_update\_entry\_count* returns the number of invocations of the *update\_entry()* API function of the cache.

```
static inline constexpr std::int64_t get_erase_entry_count(bool) noexcept
```

The function *get\_erase\_entry\_count* returns the number of invocations of the *erase()* API function of the cache.

```
static inline constexpr std::int64_t get_get_entry_time(bool) noexcept
```

The function *get\_get\_entry\_time* returns the overall time spent executing of the *get\_entry()* API function of the cache.

```
static inline constexpr std::int64_t get_insert_entry_time(bool) noexcept
```

The function *get\_insert\_entry\_time* returns the overall time spent executing of the *insert\_entry()* API function of the cache.

```
static inline constexpr std::int64_t get_update_entry_time(bool) noexcept
```

The function *get\_update\_entry\_time* returns the overall time spent executing of the *update\_entry()* API function of the cache.

```
static inline constexpr std::int64_t get_erase_entry_time(bool) noexcept
```

The function *get\_erase\_entry\_time* returns the overall time spent executing of the *erase()* API function of the cache.

```
struct update_on_exit
```

*#include <no\_statistics.hpp>* Helper class to update timings and counts on function exit.

### Public Functions

```

```
inline std::size_t insertions(bool const reset) noexcept
```

```
inline std::size_t evictions(bool const reset) noexcept
```

```
inline void got_hit() noexcept
```

The function *got\_hit* will be called by a cache instance whenever an entry got touched.

```
inline void got_miss() noexcept
```

The function *got\_miss* will be called by a cache instance whenever a requested entry has not been found in the cache.

```
inline void got_insertion() noexcept
```

The function *got\_insertion* will be called by a cache instance whenever a new entry has been inserted.

```
inline void got_eviction() noexcept
```

The function *got\_eviction* will be called by a cache instance whenever an entry has been removed from the cache because a new inserted entry let the cache grow beyond its capacity.

```
inline void clear() noexcept
```

Reset all statistics.

## Private Members

```

```
std::size_t misses_ = 0
```

```
std::size_t insertions_ = 0
```

```
std::size_t evictions_ = 0
```

### Private Static Functions

```
static inline std::size_t get_and_reset(std::size_t &value, bool const reset) noexcept
```

### checkpoint\_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/checkpoint\_base/checkpoint\_data.hpp

Defined in header `hpx/checkpoint_base/checkpoint_data.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

### Functions

```
template<typename Container, typename ...Ts>
```

```
void save_checkpoint_data(Container &data, Ts&&... ts)
```

```
save_checkpoint_data
```

`Save_checkpoint_data` takes any number of objects which a user may wish to store in the given container.

#### Template Parameters

- **Container** – Container used to store the check-pointed data.
- **Ts** – Types of variables to checkpoint

#### Parameters

- **data** – Container instance used to store the checkpoint data
- **ts** – Variable instances to be inserted into the checkpoint.

```
template<typename ...Ts>
```

```
std::size_t prepare_checkpoint_data(Ts const&... ts)
```

```
prepare_checkpoint_data
```

`prepare_checkpoint_data` takes any number of objects which a user may wish to store in a subsequent `save_checkpoint_data` operation. The function will return the number of bytes necessary to store the data that will be produced.

#### Template Parameters

**Ts** – Types of variables to checkpoint

#### Parameters

**ts** – Variable instances to be inserted into the checkpoint.

```
template<typename Container, typename ...Ts>
```

```
void restore_checkpoint_data(Container const &cont, Ts&... ts)
```

```
restore_checkpoint_data
```

`restore_checkpoint_data` takes any number of objects which a user may wish to restore from the given container. The sequence of objects has to correspond to the sequence of objects for the corresponding call to `save_checkpoint_data` that had used the given container instance.

#### Template Parameters

- **Container** – Container used to restore the check-pointed data.
- **Ts** – Types of variables to restore

#### Parameters

- **cont** – Container instance used to restore the checkpoint data
- **ts** – Variable instances to be restored from the container

```
struct checkpointing_tag
```

```
template<>
```

```
struct extra_data_helper<checkpointing_tag>
```

```

```
inline void assign(InIter first, InIter last)
```

```
inline void assign(std::initializer_list<T> ilist)
```

inline *allocator\_type* **get\_allocator**() const noexcept

Returns the allocator associated with the container.

inline *reference* **at**(*size\_type* pos)

inline *const\_reference* **at**(*size\_type* pos) const

inline *reference* **operator[]**(*size\_type* pos)

inline *const\_reference* **operator[]**(*size\_type* pos) const

inline *reference* **front**()

Returns a reference to the first element in the container. Calling front on an empty container is undefined.

inline *const\_reference* **front**() const

Returns a reference to the first element in the container. Calling front on an empty container is undefined.

inline *reference* **back**()

Returns a reference to the last element in the container. Calling back on an empty container is undefined.

inline *const\_reference* **back**() const

Returns a reference to the last element in the container. Calling back on an empty container is undefined.

inline *pointer* **data**() noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data*(); *data*() + *size*()) is always a valid range, even if the container is empty (*data*() is not dereference-able in that case).

inline *const\_pointer* **data**() const noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data*(); *data*() + *size*()) is always a valid range, even if the container is empty (*data*() is not dereference-able in that case).

inline *T* \***device\_data**() const noexcept

Returns a raw pointer corresponding to the address of the data allocated on the device.

inline *std::size\_t* **size**() const noexcept

inline *std::size\_t* **capacity**() const noexcept

inline bool **empty**() const noexcept

Returns: `size() == 0`.

inline void **resize**(*size\_type*)

Effects: If `size <= size()`, equivalent to calling `pop_back()` `size()`

- `size` times. If `size() < size`, appends `size - size()` default-inserted elements to the sequence.

Requires: T shall be MoveInsertable and DefaultInsertable into \*this.

Remarks: If an exception is thrown other than by the move constructor of a non-CopyInsertable T there are no effects.

inline void **resize**(*size\_type*, T const&)

Effects: If `size <= size()`, equivalent to calling `pop_back()` `size() - size` times. If `size() < size`, appends `size - size()` copies of `val` to the sequence.

Requires: T shall be CopyInsertable into \*this.

Remarks: If an exception is thrown there are no effects.

inline *iterator* **begin**() noexcept

inline *iterator* **end**() noexcept

inline *const\_iterator* **cbegin**() const noexcept

inline *const\_iterator* **cend**() const noexcept

inline *const\_iterator* **begin**() const noexcept

inline *const\_iterator* **end**() const noexcept

inline *reverse\_iterator* **rbegin**() noexcept

inline *reverse\_iterator* **rend**() noexcept

inline *const\_reverse\_iterator* **crbegin**() const noexcept

inline *const\_reverse\_iterator* **crend**() const noexcept

inline *const\_reverse\_iterator* **rbegin**() const noexcept

inline *const\_reverse\_iterator* **rend**() const noexcept

inline void **swap**(*vector* &other) noexcept

Effects: Exchanges the contents and capacity() of \*this with that of x.

Complexity: Constant time.

inline void **clear**() noexcept

Effects: Erases all elements in the range [begin(),end()). Destroys all elements in 'a'. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.

Post: a.empty() returns true.

Complexity: Linear.

### **hpx/compute\_local/host/block\_fork\_join\_executor.hpp**

Defined in header `hpx/compute_local/host/block_fork_join_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

class **block\_fork\_join\_executor**

*#include <block\_fork\_join\_executor.hpp>* An executor with fork-join (blocking) semantics.

The *block\_fork\_join\_executor* creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a *fork\_join\_executor* hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of `bulk_(a)sync_execute`.

This behaviour is similar to the plain *fork\_join\_executor* except that the *block\_fork\_join\_executor* creates a hierarchy of *fork\_join\_executors*, one for each target used to initialize it.

## Public Functions

```
inline explicit block_fork_join_executor(threads::thread_priority const priority =
                                         threads::thread_priority::bound,
                                         threads::thread_stacksize const stacksize =
                                         threads::thread_stacksize::small_,
                                         fork_join_executor::loop_schedule const
                                         schedule =
                                         fork_join_executor::loop_schedule::static_,
                                         std::chrono::nanoseconds const yield_delay =
                                         std::chrono::milliseconds(1))
```

Construct a *block\_fork\_join\_executor*.

### Note

This constructor will create one *fork\_join\_executor* for each numa domain

## Parameters

- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be *nostack*.
- **schedule** – The loop schedule of the parallel regions.
- **yield\_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

```
inline explicit block_fork_join_executor(std::vector<compute::host::target> const
                                         &targets, threads::thread_priority const priority =
                                         threads::thread_priority::bound,
                                         threads::thread_stacksize const stacksize =
                                         threads::thread_stacksize::small_,
                                         fork_join_executor::loop_schedule const
                                         schedule =
                                         fork_join_executor::loop_schedule::static_,
                                         std::chrono::nanoseconds const yield_delay =
                                         std::chrono::milliseconds(1))
```

Construct a *block\_fork\_join\_executor*.

### Note

This constructor will create one *fork\_join\_executor* for each given target

## Parameters

- **targets** – The list of targets to use for thread placement
- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be *nostack*.
- **schedule** – The loop schedule of the parallel regions.
- **yield\_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

```

```
template<class U>
```

```
inline void destroy(U *const p)
```

```
inline void initialize_pages(pointer p, size_t n) const
```

Touches every page of the allocation starting at *p* so that each page is physically bound to the NUMA domain assigned to it by *binding\_helper\_*. One first-touch task per NUMA domain is dispatched and the call blocks until all of them complete.

#### Parameters

- **p** – pointer to the start of the allocation to initialize.
- **n** – number of elements to initialize.

#### Pre

Must be called from an HPX thread. `init_mutex` serializes concurrent calls to this function and is intentionally held across `hpx::wait_all()` below, which is a suspension point that may resume the calling HPX thread on a different OS worker thread. `hpx::mutex` (unlike `std::mutex`) supports this safely, and `ignore_while_checking` silences the HPX lock-checking layer's warning about a lock spanning a suspension point.

```
inline std::string display_binding(pointer p, numa_binding_helper_ptr helper)
```

Builds a human-readable, page-by-page description of how the allocation starting at *p*

is bound across NUMA domains, suitable for debug output. `init_mutex` is held only for the duration of this synchronous call; unlike `initialize_pages()`, no suspension point is crossed while it is held.

**Parameters**

- **p** – pointer to the start of the allocation to describe.
- **helper** – binding helper describing the array layout used to compute per-page offsets.

**Returns**

a formatted string describing the domain binding of each page in the allocation.

## config

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## hpx/config.hpp

Defined in header `hpx/config.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## Defines

### HPX\_INITIAL\_IP\_PORT

This is the default ip/port number used by the parcel subsystem.

### HPX\_CONNECTING\_IP\_PORT

### HPX\_INITIAL\_IP\_ADDRESS

### HPX\_RUNTIME\_INSTANCE\_LIMIT

This defines the maximum number of possible runtime instances in one executable

### HPX\_PARCEL\_BOOTSTRAP

This defines the type of the parcelport to be used during application bootstrap. This value can be changed at runtime by the configuration parameter:

`hpx.parcels.bootstrap = ...`

(or by setting the corresponding environment variable `HPX_PARCEL_BOOTSTRAP`).

### HPX\_PARCEL\_MAX\_CONNECTIONS

This defines the number of outgoing (parcel-) connections kept alive (to all other localities). This value can be changed at runtime by setting the configuration parameter:

`hpx.parcels.max_connections = ...`

(or by setting the corresponding environment variable `HPX_PARCEL_MAX_CONNECTIONS`).

**HPX\_PARCEL\_IPC\_DATA\_BUFFER\_CACHE\_SIZE**

This defines the number of outgoing ipc (parcel-) connections kept alive (to each of the other localities on the same node). This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.ipc.data_buffer_cache_size = ...
```

(or by setting the corresponding environment variable HPX\_PARCEL\_IPC\_DATA\_BUFFER\_CACHE\_SIZE).

**HPX\_PARCEL\_MPI\_MAX\_REQUESTS**

This defines the number of MPI requests in flight This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.mpi.max_requests = ...
```

(or by setting the corresponding environment variable HPX\_PARCEL\_MPI\_MAX\_REQUESTS).

**HPX\_HAVE\_PARCELPOR MPI\_BACKGROUND\_THREADS**

This defines the number of cores that perform background work for the MPI parcelport This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.mpi.background_threads = ...
```

(or by setting the corresponding environment variable HPX\_HAVE\_PARCELPOR MPI\_BACKGROUND\_THREADS).

**HPX\_PARCEL\_MAX\_CONNECTIONS\_PER\_LOCALITY**

This defines the number of outgoing (parcel-) connections kept alive (to each of the other localities). This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.max_connections_per_locality = ...
```

(or by setting the corresponding environment variable HPX\_PARCEL\_MAX\_CONNECTIONS\_PER\_LOCALITY).

**HPX\_PARCEL\_MAX\_MESSAGE\_SIZE**

This defines the maximally allowed message size for messages transferred between localities. This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.max_message_size = ...
```

(or by setting the corresponding environment variable HPX\_PARCEL\_MAX\_MESSAGE\_SIZE).

**HPX\_PARCEL\_MAX\_OUTBOUND\_MESSAGE\_SIZE**

This defines the maximally allowed outbound message size for coalescing messages transferred between localities. This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.max_outbound_message_size = ...
```

(or by setting the corresponding environment variable `HPX_PARCEL_MAX_OUTBOUND_MESSAGE_SIZE`).

#### **HPX\_PARCEL\_SERIALIZATION\_OVERHEAD**

#### **HPX\_AGAS\_LOCAL\_CACHE\_SIZE**

This defines the number of AGAS address translations kept in the local cache. This is just the initial size which may be adjusted depending on the load of the system (not implemented yet), etc. It must be a minimum of 3 for AGAS v3 bootstrapping.

This value can be changes at runtime by setting the configuration parameter:

```
hpx.agas.local_cache_size = ...
```

(or by setting the corresponding environment variable `HPX_AGAS_LOCAL_CACHE_SIZE`)

#### **HPX\_AGAS\_RPC\_TIMEOUT**

This defines the default AGAS RPC timeout in milliseconds.

This value can be changed at runtime by setting the configuration parameter:

```
hpx.agas.rpc_timeout = val
```

(or by setting the corresponding environment variable `HPX_AGAS_RPC_TIMEOUT`)

#### **HPX\_INITIAL\_AGAS\_MAX\_PENDING\_REFCNT\_REQUESTS**

#### **HPX\_GLOBALCREDIT\_INITIAL**

This defines the initial global reference count associated with any created object.

#### **HPX\_NUM\_IO\_POOL\_SIZE**

This defines the default number of OS-threads created for the different internal thread pools

#### **HPX\_NUM\_PARCEL\_POOL\_SIZE**

#### **HPX\_NUM\_TIMER\_POOL\_SIZE**

#### **HPX\_SPINLOCK\_DEADLOCK\_DETECTION\_LIMIT**

By default, enable minimal thread deadlock detection in debug builds only.

#### **HPX\_HAVE\_THREAD\_BACKTRACE\_DEPTH**

By default we capture only 20 levels of stack back trace on suspension.

By default we do not maintain stack back-traces on suspension. This is a pure debugging aid to be able to see in the debugger where a suspended thread got stuck.

**HPX\_MAX\_NETWORK\_RETRIES**

**HPX\_NETWORK\_RETRIES\_SLEEP**

**HPX\_INI\_PATH\_DELIMITER**

**HPX\_PATH\_DELIMITERS**

**HPX\_SHARED\_LIB\_EXTENSION**

**HPX\_EXECUTABLE\_EXTENSION**

**HPX\_DEBUG\_POSTFIX\_STR**

**HPX\_MAKE\_DLL\_STRING(*n*)**

**HPX\_MANGLE\_NAME(*n*)**

**HPX\_MANGLE\_STRING(*n*)**

namespace **hpx**

namespace **threads**

### Enums

enum class **thread\_schedule\_state** : *std::int8\_t*

The *thread\_schedule\_state* enumerator encodes the current state of a *thread* instance

**Task Lifecycle State Transitions:**

```

stateDiagram-v2
    %% Creation Phase
    [*] --> Staged : task_staged
    [*] --> Pending : task_created
    [*] --> Suspended : task_created
    Staged --> Pending : task_created

    %% Execution Loop
    Pending --> Active : task_executing
    Active --> Pending : task_yielded

    %% Sleep / Wake Cycle
    Active --> Suspended : task_suspended
    Suspended --> Pending : task_resumed

    %% Termination Paths
    Active --> Terminated : task_completed
    Active --> Deleted : task_completed (Inline fast-path)
    Pending --> Terminated : task_completed (Aborted)
    Suspended --> Terminated : task_completed (Aborted)

    %% Cleanup (Destruction / Recycling)
    Terminated --> Deleted : task_deleted
    Deleted --> [*]

```

*Values:*

enumerator **unknown**

enumerator **active**

thread is currently active (running, has resources)

enumerator **pending**

thread is pending (ready to run, but no hardware resource available)

enumerator **suspended**

thread has been suspended (waiting for synchronization event, but still known and under control of the thread-manager)

enumerator **depleted**

thread has been depleted (deeply suspended, it is not known to the thread-manager)

enumerator **terminated**

thread has been stopped and may be garbage collected

enumerator **staged**

this is not a real thread state, but allows to reference staged task descriptions, which eventually will be converted into thread objects

enumerator **pending\_do\_not\_schedule**

this is not a real thread state, but allows to create a thread in pending state without scheduling it (internal, do not use)

enumerator **pending\_boost**

this is not a real thread state, but allows to suspend a thread in pending state without high priority rescheduling

enumerator **deleted**

thread has been stopped and was deleted

enum class **thread\_priority** : *std::int8\_t*

This enumeration lists all possible thread-priorities for HPX threads.

*Values:*

enumerator **unknown**

enumerator **default\_**

Will assign the priority of the task to the default (normal) priority.

enumerator **low**

Task goes onto a special low priority queue and will not be executed until all high/normal priority tasks are done, even if they are added after the low priority task.

enumerator **normal**

Task will be executed when it is taken from the normal priority queue, this is usually a first in-first-out ordering of tasks (depending on scheduler choice). This is the default priority.

enumerator **high\_recursive**

The task is a high priority task and any child tasks spawned by this task will be made high priority as well - unless they are specifically flagged as non default priority.

enumerator **boost**

Same as *thread\_priority\_high* except that the thread will fall back to *thread\_priority\_normal* if resumed after being suspended.

enumerator **high**

Task goes onto a special high priority queue and will be executed before normal/low priority tasks are taken (some schedulers modify the behavior slightly and the documentation for those should be consulted).

**enumerator `bound`**

Task goes onto a special high priority queue and will never be stolen by another thread after initial assignment. This should be used for thread placement tasks such as OpenMP type for loops.

**enumerator `initially_bound`**

Task initially goes onto a special high priority queue and will never be stolen by another thread after initial assignment. If the thread is rescheduled later, it will use normal priority.

enum class **`thread_restart_state`** : *std::int8\_t*

The *thread\_restart\_state* enumerator encodes the reason why a thread is being restarted

*Values:*

**enumerator `unknown`****enumerator `signaled`**

The thread has been signaled.

**enumerator `timeout`**

The thread has been reactivated after a timeout.

**enumerator `terminate`**

The thread needs to be terminated.

**enumerator `abort`**

The thread needs to be aborted.

enum class **`thread_stacksize`** : *std::int8\_t*

A *thread\_stacksize* references any of the possible stack-sizes for HPX threads.

*Values:*

**enumerator `unknown`****enumerator `small_`**

use small stack size (the underscore is to work around ‘small’ being defined to char on Windows)

**enumerator `medium`**

use medium sized stack size

enumerator **large**

use large stack size

enumerator **huge**

use very large stack size

enumerator **nostack**

this thread does not suspend (does not need a stack)

enumerator **current**

use size of current thread's stack

enumerator **default\_**

use default stack size

enumerator **minimal**

use minimally stack size

enumerator **maximal**

use maximally stack size

enum class **thread\_schedule\_hint\_mode** : *std::int8\_t*

The type of hint given when creating new tasks.

*Values:*

enumerator **none**

A hint that leaves the choice of scheduling entirely up to the scheduler.

enumerator **thread**

A hint that tells the scheduler to prefer scheduling a task on the local thread number associated with this hint. Local thread numbers are indexed from zero. It is up to the scheduler to decide how to interpret thread numbers that are larger than the number of threads available to the scheduler. Typically, thread numbers will wrap around when too large.

enumerator **numa**

A hint that tells the scheduler to prefer scheduling a task on the NUMA domain associated with this hint. NUMA domains are indexed from zero. It is up to the scheduler to decide how to interpret NUMA domain indices that are larger than the number of available NUMA domains to the scheduler. Typically, indices will wrap around when too large.

enum class **thread\_placement\_hint** : *std::int8\_t*

The type of hint given to the scheduler related to thread placement

The type of hint given to the scheduler related running a thread as a child directly in the context of the parent thread

*Values:*

enumerator **none**

No hint is specified. The implementation is free to chose what placement methods to use.

enumerator **depth\_first**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core).

enumerator **breadth\_first**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores).

enumerator **depth\_first\_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core). Threads are being scheduled in reverse order.

enumerator **breadth\_first\_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores). Threads are being scheduled in reverse order.

enum class **thread\_sharing\_hint** : *std::int8\_t*

The type of hint given to the scheduler related to whether it is ok to share the invoked function object between threads

*Values:*

enumerator **none**

No hint is specified. The implementation is free to chose what sharing methods to use.

enumerator **do\_not\_share\_function**

A hint that tells the scheduler to avoid sharing the given function (object) between threads.

enumerator **do\_not\_combine\_tasks**

A hint that tells the scheduler to avoid combining tasks on the same thread. This is important for tasks that may synchronize between each other, which could lead to deadlocks if those tasks are combined running by the same thread.

enum class **thread\_execution\_hint** : *std::int8\_t*

*Values:*

enumerator **none**

No hint is specified. Always run the thread in its own execution environment.

enumerator **run\_as\_child**

Attempt to run the thread in the execution context of the parent thread.

## Functions

*std::ostream* &**operator**<<(*std::ostream* &os, *thread\_schedule\_state* t)

char const \***get\_thread\_state\_name**(*thread\_schedule\_state* state) noexcept

Returns the name of the given state.

Get the readable string representing the name of the given thread\_state constant.

### Parameters

**state** – this represents the thread state.

*std::ostream* &**operator**<<(*std::ostream* &os, *thread\_priority* t)

char const \***get\_thread\_priority\_name**(*thread\_priority* priority) noexcept

Return the thread priority name.

Get the readable string representing the name of the given thread\_priority constant.

### Parameters

**priority** – this represents the thread priority.

*std::ostream* &**operator**<<(*std::ostream* &os, *thread\_restart\_state* t)

char const \***get\_thread\_state\_ex\_name**(*thread\_restart\_state* state) noexcept

Get the readable string representing the name of the given thread\_restart\_state constant.

char const \***get\_thread\_state\_name**(thread\_state state) noexcept

Get the readable string representing the name of the given thread\_state constant.

*std::ostream* &**operator**<<(*std::ostream* &os, *thread\_stacksize* t)

char const \***get\_stack\_size\_enum\_name**(*thread\_stacksize* size) noexcept

Returns the stack size name.

Get the readable string representing the given stack size constant.

### Parameters

**size** – this represents the stack size

constexpr bool **do\_not\_share\_function**(*thread\_sharing\_hint* hint) noexcept

constexpr bool **do\_not\_combine\_tasks**(*thread\_sharing\_hint* hint) noexcept

constexpr *thread\_sharing\_hint* **operator|**(*thread\_sharing\_hint* lhs, *thread\_sharing\_hint* rhs) noexcept

constexpr bool **run\_as\_child**(*thread\_execution\_hint* hint) noexcept

## Variables

constexpr *thread\_execution\_hint* **default\_runs\_as\_child\_hint** = *thread\_execution\_hint::none*

Default value to use for runs-as-child mode (if *true*, then futures will attempt to execute associated threads directly if they have not started running).

struct **thread\_schedule\_hint**

*#include <thread\_enums.hpp>* A hint given to a scheduler to guide where a task should be scheduled.

A scheduler is free to ignore the hint, or modify the hint to suit the resources available to the scheduler.

## Public Functions

inline constexpr **thread\_schedule\_hint**() noexcept

Construct a default hint with mode *thread\_schedule\_hint\_mode::none*.

```
inline explicit constexpr thread_schedule_hint(std::int16_t const thread_hint,
        thread_placement_hint placement =
        thread_placement_hint::none,
        thread_execution_hint runs_as_child =
        default_runs_as_child_hint,
        thread_sharing_hint sharing =
        thread_sharing_hint::none) noexcept
```

Construct a hint with mode *thread\_schedule\_hint\_mode::thread* and the given hint as the local thread number.

```
inline constexpr thread_schedule_hint(thread_schedule_hint_mode const mode, std::int16_t
        const hint, thread_placement_hint placement =
        thread_placement_hint::none, thread_execution_hint
        runs_as_child = default_runs_as_child_hint,
        thread_sharing_hint sharing =
        thread_sharing_hint::none) noexcept
```

Construct a hint with the given mode and hint. The numerical hint is unused when the mode is *thread\_schedule\_hint\_mode::none*.

```
inline explicit constexpr thread_schedule_hint(thread_placement_hint placement) noexcept
```

Construct a hint with the given placement hint.

```
inline explicit constexpr thread_schedule_hint(thread_execution_hint runs_as_child) noexcept
```

Construct a hint with the given execution hint.

```
inline explicit constexpr thread_schedule_hint(thread_sharing_hint sharing) noexcept
```

Construct a hint with the given sharing hint.

```
inline constexpr thread_placement_hint placement_mode() const noexcept
```

```
inline constexpr void placement_mode(thread_placement_hint bits) noexcept
```

```
inline constexpr thread_sharing_hint sharing_mode() const noexcept
```

```
inline constexpr void sharing_mode(thread_sharing_hint bits) noexcept
```

```
inline constexpr thread_execution_hint runs_as_child_mode() const noexcept
```

```
inline constexpr void runs_as_child_mode(thread_execution_hint bits) noexcept
```

```
inline constexpr void schedule_hint(std::int16_t core) noexcept
```

## Public Members

```
std::int16_t hint = -1
```

The hint associated with the mode. The interpretation of this hint depends on the given mode.

```
thread_schedule_hint_mode mode = thread_schedule_hint_mode::none
```

The mode of the scheduling hint.

`std::uint8_t placement_mode_bits`

The mode of the desired thread placement.

`std::uint8_t sharing_mode_bits`

The mode of the desired sharing hint.

`std::uint8_t runs_as_child_mode_bits`

The thread will run as a child directly in the context of the current thread

## datastructures

See *Public API* for a list of names and headers that are part of the public HPX API.

## hpx::ignore

Defined in header `hpx/tuple.hpp`<sup>846</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::tuple`
- `hpx::tuple_size`
- `hpx::tuple_element`
- `hpx::make_tuple`
- `hpx::tie`
- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

constexpr `hpx::detail::ignore_type hpx::ignore` = { }

An object of unspecified type such that any value can be assigned to it with no effect. Intended for use with `hpx::tie` when unpacking a `hpx::tuple`, as a placeholder for the arguments that are not used. While the behavior of `hpx::ignore` outside of `hpx::tie` is not formally specified, some code guides recommend using `hpx::ignore` to avoid warnings from unused return values of `[[nodiscard]]` functions.

<sup>846</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/tuple.hpp)

## hpx::tuple

Defined in header `hpx/tuple.hpp`<sup>847</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ignore`
- `hpx::tuple_size`
- `hpx::tuple_element`
- `hpx::make_tuple`
- `hpx::tie`
- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

`template<typename ...Ts>`

class **tuple**

Class template `hpx::tuple` is a fixed-size collection of heterogeneous values. It is a generalization of `hpx::pair`. If `std::is_trivially_destructible<Ti>::value` is true for every `Ti` in `Ts`, the destructor of tuple is trivial.

**Param Ts...**

the types of the elements that the tuple stores.

## hpx::tuple\_size

Defined in header `hpx/tuple.hpp`<sup>848</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

`template<typename T, typename Enable = void>`

---

<sup>847</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/tuple.hpp)

<sup>848</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/tuple.hpp)

**struct `tuple_size`**

Provides access to the number of elements in a tuple-like type as a compile-time constant expression.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like. The `Enable` parameter allows constraining partial specializations via SFINAE (mirroring `hpx::tuple_element`).

**`hpx::tuple_element`**

Defined in header `hpx/tuple.hpp`<sup>849</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ignore`
- `hpx::tuple`
- `hpx::tuple_size`
- `hpx::make_tuple`
- `hpx::tie`
- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

```
template<std::size_t I, typename T, typename Enable = void>
```

**struct `tuple_element`**

Provides compile-time indexed access to the types of the elements of a tuple-like type.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

**`hpx::make_tuple`**

Defined in header `hpx/tuple.hpp`<sup>850</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ignore`
- `hpx::tuple`
- `hpx::tuple_size`

- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

template<typename ...Ts>

constexpr `tuple<util::decay_unwrap_t<Ts>...>` `hpx::make_tuple`(Ts&&... ts)

Provides compile-time indexed access to the types of the elements of the tuple.

## `hpx::tie`

Defined in header `hpx/tuple.hpp`<sup>851</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ignore`
- `hpx::tuple`
- `hpx::tuple_size`
- `hpx::tuple_element`
- `hpx::make_tuple`
- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

template<typename ...Ts>

constexpr `tuple<Ts&...>` `hpx::tie`(Ts&... ts)

Creates a tuple of lvalue references to its arguments or instances of `hpx::ignore`.

### Parameters

**ts** – zero or more lvalue arguments to construct the tuple from.

### Returns

`hpx::tuple` object containing lvalue references.

## `hpx::forward_as_tuple`

Defined in header `hpx/tuple.hpp`<sup>852</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ignore`
- `hpx::tuple`

---

<sup>851</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/tuple.hpp)

<sup>852</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/tuple.hpp)

- `hpx::tuple_size`
- `hpx::tuple_element`
- `hpx::make_tuple`
- `hpx::tie`
- `hpx::tuple_cat`
- `hpx::get`

template<typename ...**Ts**>

constexpr `tuple`<`Ts`&&...> `hpx::forward_as_tuple`(`Ts`&&... ts)

Constructs a tuple of references to the arguments in args suitable for forwarding as an argument to a function. The tuple has rvalue reference data members when rvalues are used as arguments, and otherwise has lvalue reference data members.

#### Parameters

**ts** – zero or more arguments to construct the tuple from

#### Returns

`hpx::tuple` object created as if by

```
hpx::tuple<Ts&&...>(HPX_FORWARD(Ts, ts)...)

```

### `hpx::tuple_cat`

Defined in header `hpx/tuple.hpp`<sup>853</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ignore`
- `hpx::tuple`
- `hpx::tuple_size`
- `hpx::tuple_element`
- `hpx::make_tuple`
- `hpx::tie`
- `hpx::forward_as_tuple`
- `hpx::get`

template<typename ...**Tuples**>

constexpr auto `hpx::tuple_cat`(`Tuples`&&... tuples)

Constructs a tuple that is a concatenation of all tuples in `tuples`. The behavior is undefined if any type in `std::decay_t<Tuples>...` is not a specialization of `hpx::tuple`. However, an implementation may choose to support types (such as `std::array` and `std::pair`) that follow the tuple-like protocol.

<sup>853</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/tuple.hpp)

**Parameters**

**tuples** -- zero or more tuples to concatenate

**Returns**

*hpx::tuple* object composed of all elements of all argument tuples constructed from *hpx::get<Is>*(HPX\_FORWARD(UTuple,t) for each individual element.

**hpx::get**

Defined in header [hpx/tuple.hpp](#)<sup>854</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ignore*
- *hpx::tuple*

## errors

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx::error\_code

Defined in header `hpx/system_error.hpp`<sup>862</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

class **error\_code** : public `std::error_code`

A `hpx::error_code` represents an arbitrary error condition.

The class `hpx::error_code` describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.

#### Note

Class `hpx::error_code` is an adjunct to error reporting by exception

### hpx::exception

Defined in header `hpx/exception.hpp`<sup>863</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

class **exception** : public `std::system_error`

A `hpx::exception` is the main exception type used by HPX to report errors.

The `hpx::exception` type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by `hpx::bad_alloc_exception`, `hpx::cuda::experimental::cuda_exception`, `hpx::exception_list`, `hpx::experimental::task_canceled_exception`, `hpx::mpi::experimental::mpi_exception`

<sup>862</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/system\\_error.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/system_error.hpp)

### hpx/errors/define\_error\_info.hpp

Defined in header `hpx/errors/define_error_info.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/errors/macros.hpp

Defined in header `hpx/errors/macros.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## Defines

### HPX\_THROW\_EXCEPTION(errcode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX\_THROW\_EXCEPTION* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter *errcode* holds the *hpx::error* code the new exception should encapsulate. The parameter *f* is expected to hold the name of the function exception is thrown from and the parameter *msg* holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    ↪ // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_EXCEPTION(hpx::error::no_success, "raise_exception",
        "simulated error");
}
```

### Example:

### HPX\_THROW\_EXCEPTION\_MODE(errcode, mode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX\_THROW\_EXCEPTION\_MODE* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the `hpx::error` code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate. The `throwmode` parameter allows to specify the type of the thrown exception.

```
void raise_exception() {
    ↪ // Throw a hpx::exception initialized from the given parameters.
    HPX_THROW_EXCEPTION_MODE(hpx::error::no_success,
        hpx::throwmode::lighweight, "raise_exception",
        "simulated error");
}
```

**Example:**

#### **HPX\_THROW\_BAD\_ALLOC(f)**

Throw a `hpx::bad_alloc_exception` initialized from the given parameters.

The macro `HPX_THROW_BAD_ALLOC` can be used to throw a `hpx::exception`. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the `hpx::error` code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    ↪ // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_BAD_ALLOC("raise_exception", "simulated error");
}
```

**Example:**

#### **HPX\_THROWS\_IF(ec, errcode, f, ...)**

Either throw a `hpx::exception` or initialize `hpx::error_code` from the given parameters.

The macro `HPX_THROWS_IF` can be used to either throw a `hpx::exception` or to initialize a `hpx::error_code` from the given parameters. If `&ec == &hpx::throws`, the semantics of this macro are equivalent to `HPX_THROW_EXCEPTION`. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

The parameter `errcode` holds the `hpx::error` code from which the new exception should be initialized. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

**HPX\_THROWS\_BAD\_ALLOC\_IF**(`ec`, `f`)

Either throw a `hpx::bad_alloc_exception` or `hpx::error_code` to `out_of_memory`.

The macro `HPX_THROWS_BAD_ALLOC_IF` can be used to either throw a `hpx::bad_alloc_exception` or to initialize a `hpx::error_code` to `hpx::error::out_of_memory`. If `&ec == &hpx::throws`, the semantics of this macro are equivalent to `HPX_THROW_BAD_ALLOC`. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

**HPX\_DEFINE\_ERROR\_INFO**(`NAME`, `TYPE`)

### `hpx/errors/try_catch_exception_ptr.hpp`

## Public Types

using **iterator** = exception\_list\_type::const\_iterator  
bidirectional iterator

## Public Functions

inline *std*::size\_t **size**() const noexcept

The number of exception\_ptr objects contained within the *exception\_list*.

### Note

Complexity: Constant time.

inline exception\_list\_type::const\_iterator **begin**() const noexcept

An iterator referring to the first exception\_ptr object contained within the *exception\_list*.

inline exception\_list\_type::const\_iterator **end**() const noexcept

An iterator which is the past-the-end value for the *exception\_list*.

## hpx/errors/error.hpp

Defined in header hpx/errors/error.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

## Defines

**HPX\_ERROR\_UNSCOPED\_ENUM\_DEPRECATION\_MSG**

namespace **hpx**

## Enums

enum class **error** : *std*::int16\_t

Possible error conditions.

This enumeration lists all possible error conditions which can be reported from any of the API functions.

*Values:*

enumerator **success**

The operation was successful.

enumerator **no\_success**

The operation did failed, but not in an unexpected manner.

enumerator **not\_implemented**

The operation is not implemented.

enumerator **out\_of\_memory**

The operation caused an out of memory condition.

enumerator **bad\_action\_code**

enumerator **bad\_component\_type**

The specified component type is not known or otherwise invalid.

enumerator **network\_error**

A generic network error occurred.

enumerator **version\_too\_new**

The version of the network representation for this object is too new.

enumerator **version\_too\_old**

The version of the network representation for this object is too old.

enumerator **version\_unknown**

The version of the network representation for this object is unknown.

enumerator **unknown\_component\_address**

enumerator **duplicate\_component\_address**

The given global id has already been registered.

enumerator **invalid\_status**

The operation was executed in an invalid status.

enumerator **bad\_parameter**

One of the supplied parameters is invalid.

enumerator **internal\_server\_error**

enumerator **service\_unavailable**

enumerator **bad\_request**

enumerator **repeated\_request**

enumerator **lock\_error**

enumerator **duplicate\_console**

There is more than one console locality.

enumerator **no\_registered\_console**

There is no registered console locality available.

enumerator **startup\_timed\_out**

enumerator **uninitialized\_value**

enumerator **bad\_response\_type**

enumerator **deadlock**

enumerator **assertion\_failure**

enumerator **null\_thread\_id**

Attempt to invoke an API function from a non-HPX thread.

enumerator **invalid\_data**

enumerator **yield\_aborted**

The yield operation was aborted.

enumerator **dynamic\_link\_failure**

enumerator **commandline\_option\_error**

One of the options given on the command line is erroneous.

enumerator **serialization\_error**

There was an error during serialization of this object.

enumerator **unhandled\_exception**

An unhandled exception has been caught.

enumerator **kernel\_error**

The OS kernel reported an error.

enumerator **broken\_task**

The task associated with this future object is not available anymore.

enumerator **task\_moved**

The task associated with this future object has been moved.

enumerator **task\_already\_started**

The task associated with this future object has already been started.

enumerator **future\_already\_retrieved**

The future object has already been retrieved.

enumerator **promise\_already\_satisfied**

The value for this future object has already been set.

enumerator **future\_does\_not\_support\_cancellation**

The future object does not support cancellation.

enumerator **future\_can\_not\_be\_cancelled**

The future can't be canceled at this time.

enumerator **no\_state**

The future object has no valid shared state.

enumerator **broken\_promise**

The promise has been deleted.

enumerator **thread\_resource\_error**

enumerator **future\_cancelled**

enumerator **thread\_cancelled**

enumerator **thread\_not\_interruptable**

enumerator **duplicate\_component\_id**

The component type has already been registered.

enumerator **unknown\_error**

An unknown error occurred.

enumerator **bad\_plugin\_type**

The specified plugin type is not known or otherwise invalid.

enumerator **filesystem\_error**

The specified file does not exist or other filesystem related error.

enumerator **bad\_function\_call**

equivalent of `std::bad_function_call`

enumerator **task\_canceled\_exception**

`parallel::task_canceled_exception`

enumerator **task\_block\_not\_active**

`task_region` is not active

enumerator **out\_of\_range**

Equivalent to `std::out_of_range`.

enumerator **length\_error**

Equivalent to `std::length_error`.

enumerator **migration\_needs\_retry**

migration failed because of global race, retry

enumerator **stale\_state**

The queried state may be stale, e.g. because no state has been recorded yet or a preceding notification has not yet been delivered

enumerator **target\_fenced**

A dispatch was deliberately and correctly refused because the target had already latched a terminal lifecycle event; this is a final rejection, not a staleness signal, and should not be retried

enumerator **future\_wait\_timed\_out**

future wait timed out

enumerator **locality\_was\_disconnected**

the requested target locality was disconnected

enumerator **future\_uncompleted**

future was resumed while being empty

## Functions

constexpr bool **operator==(int lhs, *error* rhs)** noexcept

constexpr bool **operator==(error lhs, int rhs)** noexcept

constexpr bool **operator!=(int lhs, *error* rhs)** noexcept

constexpr bool **operator!=(error lhs, int rhs)** noexcept

```

### **hpx/errors/exception\_fwd.hpp**

Defined in header `hpx/errors/exception_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

### **Enums**

```
enum class throwmode : std::uint8_t
```

Encode error category for new *error\_code*.

*Values:*

enumerator **plain**

enumerator **rethrow**

enumerator **lightweight**

## Functions

constexpr bool **operator&**(*throwmode* lhs, *throwmode* rhs) noexcept

## Variables

*error\_code* **throws**

Predefined *error\_code* object used as “throw on error” tag.

The predefined *hpx::error\_code* object *hpx::throws* is supplied for use as a “throw on error” tag.

Functions that specify an argument in the form ‘*error\_code*& ec=throws’ (with appropriate namespace qualifiers), have the following error handling semantics:

If &ec != &throws and an error occurred: ec.value() returns the implementation specific error number for the particular error that occurred and ec.category() returns the error\_category for ec.value().

If &ec != &throws and an error did not occur, ec.clear().

If an error occurs and &ec == &throws, the function throws an exception of type *hpx::exception* or of a type derived from it. The exception’s *get\_errorcode()* member function returns a reference to a *hpx::error\_code* object with the behavior as specified above.

## execution

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx/execution/algorithms/future\_sender.hpp

Defined in header *hpx/execution/algorithms/future\_sender.hpp*.

See *Public API* for a list of names and headers that are part of the public HPX API.

Implementation details for adapting HPX futures as P2300 senders.

Usage:

```
hpx::future<int> f = hpx::async([]{ return 42; });
auto
↳ result = hpx::execution::experimental::as_sender(std::move(f))
↳
↳ | hpx::execution::experimental::then([](int x){ return x * 2; })
  | hpx::execution::experimental::sync_wait();
```

namespace **hpx**

namespace **execution**

namespace **experimental**

### hpx/execution/algorithms/sender\_future.hpp

Defined in header `hpx/execution/algorithms/sender_future.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Converts any P2300 stdexec sender into an `hpx::future<T>`.

Usage:

```
// Explicit T:
auto sender_
    = stdexec::just(42) | stdexec::then([](int x){ return x; });
hpx::future<int> f =
    hpx::execution::experimental::as_future<int>(std::move(sender));
int val = f.get();    // == 42
```

namespace **hpx**

namespace **execution**

namespace **experimental**

### Variables

template<typename T>

constexpr *as\_future\_t*<T> **as\_future** = {}

template<typename T>

struct **as\_future\_t**

## Public Functions

```
template<typename Sender, typename =
std::enable_if_t<hpx::execution::experimental::is_sender_v<std::decay_t<Sender>>>>
inline constexpr hpx::future<T> operator()(Sender &&sender) const
```

### hpx/execution/traits/policy\_traits.hpp

Defined in header `hpx/execution/traits/policy_traits.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

### hpx/execution/traits/is\_execution\_policy.hpp

Defined in header `hpx/execution/traits/is_execution_policy.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

```

```
#include <is_execution_policy.hpp> Extension: Detect whether given execution policy
makes algorithms asynchronous
```

- i. The type *is\_async\_execution\_policy* can be used to detect asynchronous execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.
- ii. If *T* is the type of the standard or implementation-defined execution policy, *is\_async\_execution\_policy*<*T*> shall be publicly derived from *integral\_constant*<*bool*, *true*>, otherwise from *integral\_constant*<*bool*, *false*>.
- iii. The behavior of a program that adds specializations for *is\_async\_execution\_policy* is undefined.

### **hpx::execution::experimental::static\_chunk\_size**

Defined in header *hpx/execution.hpp*<sup>867</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
struct static_chunk_size
```

Loop iterations are divided into pieces of size *chunk\_size* and then assigned to threads. If *chunk\_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

#### Note

This executor parameters type is equivalent to OpenMP's *STATIC* scheduling directive.

### **hpx/execution/executors/adaptive\_static\_chunk\_size.hpp**

Defined in header *hpx/execution/executors/adaptive\_static\_chunk\_size.hpp*.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace execution
```

<sup>867</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/execution.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/execution.hpp)

```
namespace experimental
```

```
struct adaptive_static_chunk_size
```

*#include <adaptive\_static\_chunk\_size.hpp>* Loop iterations are divided into pieces of size *chunk\_size* and then assigned to threads. If *chunk\_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

**Note**

This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

**Public Functions**

```
adaptive_static_chunk_size() = default
```

Construct a `adaptive_static_chunk_size` executor parameters object

**Note**

By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

```
inline explicit constexpr adaptive_static_chunk_size(std::size_t const chunk_size)  
noexcept
```

Construct a `adaptive_static_chunk_size` executor parameters object

**Parameters**

**chunk\_size** – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

**hpx/execution/executors/execution\_information.hpp**

Defined in header `hpx/execution/executors/execution_information.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace execution
```

```
namespace experimental
```

## Variables

constexpr struct *hpx::execution::experimental::get\_pu\_mask\_t* **get\_pu\_mask**

constexpr struct *hpx::execution::experimental::set\_scheduler\_mode\_t* **set\_scheduler\_mode**

struct **has\_pending\_closures\_t**

*#include <execution\_information.hpp>* Retrieve whether this executor has operations pending or not.

### Note

If the executor does not expose this information, this call will always return *false*

### Param exec

[in] The executor object to use to extract the requested information for.

## Public Functions

template<typename **Executor**>

inline decltype(auto) **operator()** (*Executor* &&exec) const

template<typename **Executor**>

inline decltype(auto) **operator()** (*Executor*&&) const

struct **get\_pu\_mask\_t**

*#include <execution\_information.hpp>* Retrieve the bitmask describing the processing units the given thread is allowed to run on

All threads::executors invoke sched.get\_pu\_mask().

### Note

If the executor does not support this operation, this call will always invoke *hpx::threads::get\_pu\_mask()*

### Param exec

[in] The executor object to use for querying the number of pending tasks.

**Param topo**

[in] The topology object to use to extract the requested information.

**Param thread\_num**

[in] The sequence number of the thread to retrieve information for.

**Public Functions**

```
template<typename Executor>
```

```
inline decltype(auto) operator() (Executor &&exec, threads::topology &topo, std::size_t  
                                thread_num) const
```

```
template<typename Executor>
```

```
inline decltype(auto) operator() (Executor&&, threads::topology &topo, std::size_t  
                                thread_num) const
```

```
struct set_scheduler_mode_t
```

*#include <execution\_information.hpp>* Set various modes of operation on the scheduler underneath the given executor.

**Note**

This calls `exec.set_scheduler_mode(mode)` if it exists; otherwise it does nothing.

**Param exec**

[in] The executor object to use.

**Param mode**

[in] The new mode for the scheduler to pick up

**Public Functions**

```
template<typename Executor, typename Mode>
```

```
inline void operator() (Executor &&exec, Mode const &mode) const
```

```
template<typename Executor, typename Mode>
```

```
inline void operator() (Executor&&, Mode const&) const
```

**hpx::execution::experimental::guided\_chunk\_size**

Defined in header [hpx/execution.hpp](#)<sup>868</sup>.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

**struct guided\_chunk\_size**

Iterations are dynamically assigned to threads in blocks as threads request those until no blocks remain to be assigned. Similar to [dynamic\\_chunk\\_size](#) except that the block size decreases each time a number of loop iterations is given to a thread. The size of the initial block is proportional to  $number\_of\_iterations / number\_of\_cores$ . Subsequent blocks are proportional to  $number\_of\_iterations\_remaining / number\_of\_cores$ . The optional chunk size parameter defines the minimum block size. The default chunk size is 1.

**Note**

This executor parameters type is equivalent to OpenMP's GUIDED scheduling directive.

**hpx::execution::experimental::auto\_chunk\_size**

Defined in header [hpx/execution.hpp](#)<sup>869</sup>.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

**struct auto\_chunk\_size**

Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

**hpx/execution/executors/execution\_parameters.hpp**

Defined in header [hpx/execution/executors/execution\\_parameters.hpp](#).

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

## **hpx::execution::experimental::max\_num\_chunks**

Defined in header [hpx/execution.hpp](#)<sup>870</sup>.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

struct **max\_num\_chunks**

Loop iterations are divided into not more than *num\_chunks* partitions that are assigned to threads. If *num\_chunks* is not specified, the number of chunks is determined based on the number of available cores.

## **hpx::execution::experimental::persistent\_auto\_chunk\_size**

Defined in header [hpx/execution.hpp](#)<sup>871</sup>.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

struct **persistent\_auto\_chunk\_size**

Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

## hpx/execution/executors/default\_parameters.hpp

Defined in header `hpx/execution/executors/default_parameters.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **default\_parameters**

*#include <default\_parameters.hpp>* Loop iterations are divided into pieces of size *chunk\_size* and then assigned to threads. If *chunk\_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

### Note

This executor parameters type is equivalent to OpenMP's `STATIC` scheduling directive.

## Public Functions

**default\_parameters()** = default

Construct a `default_parameters` executor parameters object

### Note

By default, the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

## hpx/execution/executors/polymorphic\_executor.hpp

```
struct null_parameters_t
```

```
struct get_chunk_size_t
```

*#include <execution\_parameters\_fwd.hpp>* Return the number of invocations of the given function *f* which should be combined into a single task

**Param params**

[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num\_tasks*.

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Param iteration\_duration**

[in] The time one of the tasks require to be executed.

**Param cores**

[in] The number of cores the number of chunks should be determined for.

**Param num\_tasks**

[in] The number of tasks the chunk size should be determined for

**Return**

The size of the chunks (number of iterations per chunk) that should be used for parallel execution.

## Public Functions

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec,  
                                   hpx::chrono::steady_duration const &iteration_duration,  
                                   std::size_t cores, std::size_t num_tasks) const
```

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec, std::size_t cores,  
                                   std::size_t num_tasks) const
```

```
struct measure_iteration_t
```

*#include <execution\_parameters\_fwd.hpp>* Return the measured execution time for one iteration based on running the given function.

### Note

The parameter *f* is expected to be a nullary function returning a *std::size\_t* representing the number of iteration the function has already executed (i.e. which don't have to be scheduled anymore).

**Param params**

[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num\_tasks*.

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Param f**

[in] The function which will be optionally scheduled using the given executor.

**Param num\_tasks**

[in] The number of tasks the chunk size should be determined for

**Return**

The execution time for one of the tasks.

**Public Functions**

```
template<typename Parameters, typename Executor, typename F>
```

```
inline decltype(auto) operator()(Parameters &&params, Executor &&exec, F &&f,  
                                std::size_t num_tasks) const
```

```
struct maximal_number_of_chunks_t
```

*#include <execution\_parameters\_fwd.hpp>* Return the largest reasonable number of chunks to create for a single algorithm invocation.

**Param params**

[in] The executor parameters object to use for determining the number of chunks for the given number of *cores*.

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Param cores**

[in] The number of cores the number of chunks should be determined for.

**Param num\_tasks**

[in] The number of tasks the chunk size should be determined for

**Public Functions**

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator()(Parameters &&params, Executor &&exec, std::size_t cores,  
                                std::size_t num_tasks) const
```

```
struct reset_thread_distribution_t
```

*#include <execution\_parameters\_fwd.hpp>* Reset the internal round robin thread distribution scheme for the given executor.

**Note**

This calls `params.reset_thread_distribution(exec)` if it exists; otherwise it does nothing.

**Param params**

[in] The executor parameters object to use for resetting the thread distribution scheme.

**Param exec**

[in] The executor object to use.

**Public Functions**

```
template<typename Parameters, typename Executor>
```

```
inline decltype(auto) operator() (Parameters &&params, Executor &&exec) const
```

```
struct processing_units_count_t
```

*#include <execution\_parameters\_fwd.hpp>* Retrieve the number of (kernel-)threads used by the associated executor.

**Note**

This calls `params.processing_units_count(Executor&&)` if it exists; otherwise it forwards the request to the executor parameters object.

**Param params**

[in] The executor parameters object to use as a fallback if the executor does not expose

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Param iteration\_duration**

[in] The time one of the tasks require to be executed.

**Param num\_tasks**

[in] The number of tasks the number of cores should be determined for

**Return**

The number of cores to use

**hpx/execution/executors/rebind\_policy.hpp**

Defined in header [hpx/execution/executors/rebind\\_policy.hpp](#).

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Orthogonal customization points for rebinding an execution policy's executor and executor parameters independently of one another.

`hpx::execution::detail::execution_policy` is the CRTP base class that CRTP-based built-in execution policies derive from; not every built-in policy uses it (`thrust_task_policy` is one example that does not). It exposes a single, combined rebind operation: given a new Executor and a new Parameters type, it produces `Derived<Executor, Parameters>`, where `Derived` is the template `<typename, typename>` class the concrete policy is written as. `hpx::execution::experimental::rebind_executor_t` builds on top of that combined operation and is what `hpx::execution::detail::execution_policy` itself uses internally for `on()`, `with()`, and `query()`.

That combined operation requires every execution policy to be shaped exactly as `Derived<Executor, Parameters>`, which is awkward for a policy that needs to carry additional state, expose additional template parameters, or simply is not naturally expressed as a two-parameter class template. This header adds two smaller, independently specializable customization points, one per axis, so a policy can opt in to rebinding along either axis without being forced into that shape at all. This is purely additive: nothing

<sup>872</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/execution.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/execution.hpp)

here replaces or is called by the existing combined `rebind_executor_t`, `on()`, `with()`, or `query()` machinery.

namespace **hpx**

namespace **execution**

### **hpx::execution::experimental::collect\_chunking\_parameters**

Defined in header [hpx/execution.hpp](#)<sup>873</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **collect\_chunking\_parameters**

Collect various parameters used for running a parallel algorithm.

### **hpx::execution::experimental::dynamic\_chunk\_size**

Defined in header [hpx/execution.hpp](#)<sup>874</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **dynamic\_chunk\_size**

Loop iterations are divided into pieces of size *chunk\_size* and then dynamically scheduled among the threads; when a thread finishes one chunk, it is dynamically assigned another. If *chunk\_size* is not specified, the default chunk size is 1.

#### **Note**

This executor parameters type is equivalent to OpenMP's DYNAMIC scheduling directive.

### **execution\_base**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

---

<sup>874</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/execution.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/execution.hpp)

## hpx/execution\_base/execution.hpp

Defined in header `hpx/execution_base/execution.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

struct **sequenced\_execution\_tag**

*#include <execution.hpp>* Function invocations executed by a group of sequential execution agents execute in sequential order.

struct **parallel\_execution\_tag**

*#include <execution.hpp>* Function invocations executed by a group of parallel execution agents execute in unordered fashion. Any such invocations executing in the same thread are indeterminately sequenced with respect to each other.

### Note

`parallel_execution_tag` is weaker than `sequenced_execution_tag`.

struct **unsequenced\_execution\_tag**

*#include <execution.hpp>* Function invocations executed by a group of vector execution agents are permitted to execute in unordered fashion when executed in different threads, and un-sequenced with respect to one another when executed in the same thread.

### Note

`unsequenced_execution_tag` is weaker than `parallel_execution_tag`.

namespace **parallel**

namespace **execution**

## Variables

constexpr struct *hpx::parallel::execution::sync\_execute\_t* **sync\_execute**

constexpr struct *hpx::parallel::execution::async\_execute\_t* **async\_execute**

constexpr struct *hpx::parallel::execution::then\_execute\_t* **then\_execute**

constexpr struct *hpx::parallel::execution::post\_t* **post**

constexpr struct *hpx::parallel::execution::bulk\_sync\_execute\_t* **bulk\_sync\_execute**

constexpr struct *hpx::parallel::execution::bulk\_async\_execute\_t* **bulk\_async\_execute**

constexpr struct *hpx::parallel::execution::bulk\_then\_execute\_t* **bulk\_then\_execute**

constexpr struct *hpx::parallel::execution::async\_invoke\_t* **async\_invoke**

constexpr struct *hpx::parallel::execution::sync\_invoke\_t* **sync\_invoke**

struct **sync\_execute\_t**

*#include <execution.hpp>* Customization point for synchronous execution agent creation.

This synchronously creates a single function invocation *f()* using the associated executor. The execution of the supplied function synchronizes with the caller

### Note

It will call `exec.sync_execute(f, ts...)` if the executor exposes a corresponding member function. For two-way executors it will invoke `async_execute` and wait for the task's completion before returning.

### Param *exec*

[in] The executor object to use for scheduling of the function *f*.

### Param *f*

[in] The function which will be scheduled using the given executor.

**Params**

[in] Additional arguments to use to invoke *f*.

**Return**

*f*(*ts...*)'s result

**Public Functions**

```
template<typename Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<typename Executor, typename F, typename...  
Ts> HPX_DEPRECATED_V(2, 0,  
"tag_invoke overloads for sync_execute are deprecated. " "Define a .  
sync_execute() member function instead.  
") decltype(auto) operator()(Executor &&exec
```

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

**Public Members**

*F* &&*f*

```
F Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(sync_execute_t{},  
std::forward< Executor >( exec ), std::forward< F >( f ),  
std::forward< Ts >( ts )...)
```

```
struct async_execute_t
```

*#include <execution.hpp>* Customization point for asynchronous execution agent creation.

This asynchronously creates a single function invocation *f*() using the associated executor.

**Note**

Executors have to implement only `async_execute()`. All other functions will be emulated by this or other customization points in terms of this single basic primitive. However, some executors will naturally specialize all operations for maximum efficiency.

**Note**

This is valid for one way executors (calls `make_ready_future(exec.sync_execute(f, ts...))` if it exists) and for two-way executors (calls `exec.async_execute(f, ts...)` if it exists).

**Param exec**

[in] The executor object to use for scheduling of the function *f*.

**Param f**

[in] The function which will be scheduled using the given executor.

**Param ts**

[in] Additional arguments to use to invoke *f*.

**Return**

*f*(*ts...*)'s result through a future

**Public Functions**

```
template<typename Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<typename Executor, typename F, typename...  
Ts> HPX_DEPRECATED_V (2, 0,  
"tag_invoke overloads for async_execute are deprecated. " "Define an .  
async_execute() member function instead.  
") decltype(auto) operator()(Executor &&exec
```

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

**Public Members**

```
F &&f
```

```
F Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(async_execute_t{},  
std::forward< Executor >( exec ), std::forward< F >( f ),  
std::forward< Ts >( ts )...)
```

```
struct then_execute_t
```

```
#include <execution.hpp> Customization point for execution agent creation depending  
on a given future.
```

This creates a single function invocation `f()` using the associated executor after the given future object has become ready.

#### Note

This is valid for two-way executors (calls `exec.then_execute(f, predecessor, ts...)` if it exists) and for one way executors (calls `predecessor.then(bind(f, ts...))`).

#### Param `exec`

[in] The executor object to use for scheduling of the function `f`.

#### Param `f`

[in] The function which will be scheduled using the given executor.

#### Param `predecessor`

[in] The future object the execution of the given function depends on.

#### Param `ts`

[in] Additional arguments to use to invoke `f`.

#### Return

`f(ts...)`'s result through a future

### Public Functions

```
template<typename Executor, typename F, typename Future, typename ...Ts>
```

```
inline decltype(auto) operator()(Executor &&exec, F &&f, Future &&predecessor, Ts&&...  
                                ts) const
```

```
template<typename Executor, typename F, typename Future, typename...  
Ts> HPX_DEPRECATED_V(2, 0,  
"tag_invoke overloads for then_execute are deprecated. " "Define a .  
then_execute() member function instead.  
") decltype(auto) operator()(Executor &&exec
```

```
template<executor_any Executor, typename F, typename Future, typename ...Ts>
```

```
inline decltype(auto) operator()(Executor &&exec, F &&f, Future &&predecessor, Ts&&...  
                                ts) const
```

### Public Members

`F &&f`

`F Future && predecessor`

```
F Future Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(then_execute_t{}  
std::forward< Executor >( exec ), std::forward< F >( f ),  
std::forward< Future >( predecessor ), std::forward< Ts >( ts )..  
.)
```

struct **post\_t**

*#include <execution.hpp>* Customization point for asynchronous fire & forget execution agent creation.

This asynchronously (fire & forget) creates a single function invocation *f()* using the associated executor.

#### Note

This is valid for two-way executors (calls `exec.post(f, ts...)`, if available, otherwise it calls `exec.async_execute(f, ts...)` while discarding the returned future), and for non-blocking two-way executors (calls `exec.post(f, ts...)` if it exists).

#### Param *exec*

[in] The executor object to use for scheduling of the function *f*.

#### Param *f*

[in] The function which will be scheduled using the given executor.

#### Param *ts*

[in] Additional arguments to use to invoke *f*.

### Public Functions

```
template<typename Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<typename Executor, typename F, typename...  
Ts> HPX_DEPRECATED_V(2, 0,  
"tag_invoke overloads for post are deprecated. " "Define a .  
post() member function instead.  
") decltype(auto) operator()(Executor &&exec
```

```
template<executor_any Executor, typename F, typename ...Ts>
```

```
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

## Public Members

F &&f

```
F Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(post_t{},
std::forward< Executor >( exec ), std::forward< F >( f ),
std::forward< Ts >( ts )...)}
```

struct **bulk\_sync\_execute\_t**

*#include <execution.hpp>* Bulk form of synchronous execution agent creation.

This synchronously creates a group of function invocations  $f(i)$  whose ordering is given by the `execution_category` associated with the executor. The function synchronizes the execution of all scheduled functions with the caller.

Here  $i$  takes on all values in the index space implied by `shape`. All exceptions thrown by invocations of  $f(i)$  are reported in a manner consistent with parallel algorithm execution through the returned future.

### Note

This is deliberately different from the `bulk_sync_execute` customization points specified in P0443. The `bulk_sync_execute` customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

### Note

This calls `exec.bulk_sync_execute(f, shape, ts...)` if it exists; otherwise it executes `sync_execute(f, shape, ts...)` as often as needed.

### Param `exec`

[in] The executor object to use for scheduling of the function  $f$ .

### Param `f`

[in] The function which will be scheduled using the given executor.

### Param `shape`

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to  $f$ .

### Param `ts`

[in] Additional arguments to use to invoke  $f$ .

### Return

The return type of `executor_type::bulk_sync_execute` if defined by `executor_type`. Otherwise, a vector holding the returned values of each invocation of  $f$  except when  $f$  returns void, which case void is returned.

## Public Functions

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
    const
```

```
template<typename Executor, typename F, typename Shape, typename...
Ts> HPX_DEPRECATED_V (2, 0,
"tag_invoke overloads for bulk_sync_execute are deprecated. " "Define a .
bulk_sync_execute() member function instead.
") decltype(auto) operator()(Executor &&exec
```

```
template<executor_any Executor, typename F, typename Shape, typename ...Ts>

```
F Shape const Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(bulk_sync_execute_t{}),
std::forward< Executor >( exec ),std::forward< F >( f ), shape,
std::forward< Ts >( ts )...}
```

struct **bulk\_async\_execute\_t**

*#include <execution.hpp>* Bulk form of asynchronous execution agent creation.

This asynchronously creates a group of function invocations *f*(*i*) whose ordering is given by the *execution\_category* associated with the executor.

Here  $i$  takes on all values in the index space implied by `shape`. All exceptions thrown by invocations of `f(i)` are reported in a manner consistent with parallel algorithm execution through the returned future.

#### Note

This is deliberately different from the `bulk_async_execute` customization points specified in P0443. The `bulk_async_execute` customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

#### Note

This calls `exec.bulk_async_execute(f, shape, ts...)` if it exists; otherwise it executes `async_execute(f, shape, ts...)` as often as needed.

#### Param `exec`

[in] The executor object to use for scheduling of the function  $f$ .

#### Param `f`

[in] The function which will be scheduled using the given executor.

#### Param `shape`

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to  $f$ .

#### Param `ts`

[in] Additional arguments to use to invoke  $f$ .

#### Return

The return type of `executor_type::bulk_async_execute` if defined by `executor_type`. Otherwise, a vector of futures holding the returned values of each invocation of  $f$ .

## Public Functions

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
```

```

```

## Public Members

**F &&f**

**F Shape const & shape**

```
F Shape const Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(bulk_async_execute_t{},
std::forward< Executor >( exec ),std::forward< F >( f ), shape,
std::forward< Ts >( ts )...)}
```

struct **bulk\_then\_execute\_t**

*#include <execution.hpp>* Bulk form of execution agent creation depending on a given future.

This creates a group of function invocations  $f(i)$  whose ordering is given by the execution\_category associated with the executor.

Here  $i$  takes on all values in the index space implied by shape. All exceptions thrown by invocations of  $f(i)$  are reported in a manner consistent with parallel algorithm execution through the returned future.

### Note

This is deliberately different from the then\_sync\_execute customization points specified in P0443. The bulk\_then\_execute customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

### Note

This calls exec.bulk\_then\_execute(f, shape, pred, ts...) if it exists; otherwise it executes sync\_execute(f, shape, pred.share(), ts...) (if this executor is also an OneWayExecutor),

or `async_execute(f, shape, pred.share(), ts...)` (if this executor is also a `TwoWayExecutor`) - as often as needed.

**Param exec**

[in] The executor object to use for scheduling of the function *f*.

**Param f**

[in] The function which will be scheduled using the given executor.

**Param shape**

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to *f*.

**Param predecessor**

[in] The future object the execution of the given function depends on.

**Param ts**

[in] Additional arguments to use to invoke *f*.

**Return**

The return type of `executor_type::bulk_then_execute` if defined by `executor_type`. Otherwise, a vector holding the returned values of each invocation of *f*.

**Public Functions**

```
template<typename Executor, typename F, typename Shape, typename Future, typename
...Ts>
```

```
struct scheduler_executor
```

### hpx/executors/thread\_pool\_continues\_on\_sender.hpp

Defined in header `hpx/executors/thread_pool_continues_on_sender.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Domain-optimized `continues_on` sender for HPX thread pool schedulers.

When `stdexec::continues_on` is applied with an HPX `thread_pool_scheduler`, the generic `stdexec` implementation creates two operation states: one for the source sender and one for the scheduler hop (`schedule_from`). This double-state overhead adds ~1 us per task in microbenchmarks.

This header provides a custom sender that replaces the generic path by:

1. Connecting the source sender to a lightweight receiver that captures the downstream receiver and the scheduler.
2. On `set_value`: if we are already on the same HPX thread pool, forwarding inline; otherwise, posting a single HPX task to forward the values.

This eliminates the intermediate `__storage_for_t`, the second operation state, and the `run_loop` overhead.

namespace **hpx**

namespace **execution**

namespace **experimental**

### hpx/executors/annotating\_executor.hpp

Defined in header `hpx/executors/annotating_executor.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

template<executor\_any **BaseExecutor**>

struct **annotating\_executor**

- `hpx::execution::sequenced_policy`
- `hpx::execution::parallel_policy`
- `hpx::execution::sequenced_task_policy`
- `hpx::execution::parallel_task_policy`

```
using hpx::execution::parallel_unsequenced_policy =  
detail::parallel_unsequenced_policy_shim<parallel_executor,  
hpx::traits::executor_parameters_type_t<parallel_executor>>
```

<sup>880</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/execution.](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/execution.)

hpp

<sup>881</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/execution.](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/execution.)

hpp

The class `parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

### `hpx::execution::sequenced_task_policy`

Defined in header `hpx/execution.hpp`<sup>882</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::execution::seq`
- `hpx::execution::par`
- `hpx::execution::par_unseq`
- `hpx::execution::task`
- `hpx::execution::sequenced_policy`
- `hpx::execution::parallel_policy`
- `hpx::execution::parallel_unsequenced_policy`
- `hpx::execution::parallel_task_policy`

```
using hpx::execution::sequenced_task_policy = detail::sequenced_task_policy_shim<sequenced_executor,
hpx::traits::executor_parameters_type_t<sequenced_executor>>
```

Extension: The class `sequenced_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may not be parallelized (has to run sequentially).

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the `sequenced_policy`.

### `hpx::execution::parallel_task_policy`

Defined in header `hpx/execution.hpp`<sup>883</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::execution::seq`
- `hpx::execution::par`
- `hpx::execution::par_unseq`
- `hpx::execution::task`
- `hpx::execution::sequenced_policy`
- `hpx::execution::parallel_policy`

<sup>882</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/execution.](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/execution.)

hpp

<sup>883</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/execution.](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/execution.)  
hpp

- `hpx::execution::parallel_unsequenced_policy`
- `hpx::execution::sequenced_task_policy`

using `hpx::execution::parallel_task_policy` = detail::parallel\_task\_policy\_shim<*parallel\_executor*,  
*hpx::traits::executor\_parameters\_type\_t*<*parallel\_executor*>>

Extension: The class `parallel_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the `parallel_policy`.

### `hpx/executors/execution_policy_parameters.hpp`

Defined in header `hpx/executors/execution_policy_parameters.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### `hpx/executors/execution_policy_mappings.hpp`

Defined in header `hpx/executors/execution_policy_mappings.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **execution**

### **Typedefs**

typedef *hpx::execution::parallel\_executor* **instead**

namespace **this\_thread**

### **Functions**

*hpx::execution::parallel\_executor* **get\_executor**(*error\_code* &ec = *throws*)

Returns a reference to the executor that was used to create the current thread.

#### **Throws**

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw a *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

namespace **threads**

## Functions

*hpx::execution::parallel\_executor* **get\_executor**(thread\_id\_type const &id, error\_code &ec = *throws*)

Returns a reference to the executor that was used to create the given thread.

### Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw a *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

### Warning

doxygenfunction: Unable to resolve function “hpx::bind\_back” with arguments (F&&, Ts&&...) in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc. Potential matches:

- `template`  
   → `<typename F, typename ...Ts> constexpr hpx::detail::bound_`  
   → `back<std::decay_t<F>, util::make_index_pack_t<sizeof...`  
   → `(Ts)>, util::decay_unwrap_t<Ts>...> bind_back(F &&f, Ts&&... vs)`
- `template<typename F> constexpr std::decay_t<F> bind_back(F &&f)`

template<typename F>

<sup>887</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/functional.hpp)

<sup>888</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/functional.hpp)

```
constexpr std::decay_t<F> hpx::bind_back(F &&f)
```

### ***hpx::invoke\_fused***

Defined in header `hpx/functional.hpp`<sup>889</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::invoke\_fused\_r*

```
template<typename F, typename Tuple>
```

```
constexpr detail::invoke_fused_result_t<F, Tuple> hpx::invoke_fused(F &&f, Tuple &&t) noexcept(  
    cept(noexcept(detail::invoke_fused_impl(detail::fused_index_pack  
        std::forward<F>(f),  
        std::forward<Tuple>(t))))
```

Invokes the given callable object *f* with the content of the sequenced type *t* (tuples, pairs).

#### **Note**

This function is similar to `std::apply` (C++17). The difference between *hpx::invoke* and *hpx::invoke\_fused* is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes *hpx::invoke\_fused* rather useful.

### **Parameters**

- **f** – Must be a callable object. If *f* is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to *hpx::get*.

### **Throws**

*std::exception* – like objects thrown by call to object *f* with the arguments contained in the sequenceable type *t*.

### **Returns**

The result of the callable object when it's called with the content of the given sequenced type.

---

<sup>889</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/functional.hpp)

## hpx::invoke\_fused\_r

Defined in header `hpx/functional.hpp`<sup>890</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::invoke_fused`

template<typename **R**, typename **F**, typename **Tuple**>

```
constexpr R hpx::invoke_fused_r(F &&f, Tuple &&t) noexcept(
    noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{ },
        std::forward<F>(f), std::forward<Tuple>(t))))
```

Invokes the given callable object `f` with the content of the sequenced type `t` (tuples, pairs).

### Note

This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

### Note

The difference between `hpx::invoke_fused` and `hpx::invoke_fused_r` is that the later allows to specify the return type as well.

## Parameters

- **f** – Must be a callable object. If `f` is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to `hpx::get`.

## Throws

`std::exception` – like objects thrown by call to object `f` with the arguments contained in the sequenceable type `t`.

## Template Parameters

**R** – The result type of the function when it's called with the content of the given sequenced type.

## Returns

The result of the callable object when it's called with the content of the given sequenced type.

<sup>890</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/functional.hpp)

## hpx::move\_only\_function

Defined in header `hpx/functionality.hpp`<sup>891</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Sig, bool Serializable = false>
```

```
class move_only_function
```

Class template `hpx::move_only_function` is a general-purpose polymorphic function wrapper. `hpx::move_only_function` objects can store and invoke any constructible (not required to be move constructible) Callable target `&#8212`; functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to member objects.

The stored callable object is called the target of `hpx::move_only_function`. If an `hpx::move_only_function` contains no target, it is called empty. Unlike `hpx::function`, invoking an empty `hpx::move_only_function` results in undefined behavior.

`hpx::move_only_function` supports every possible combination of cv-qualifiers, ref-qualifiers, and noexcept-specifiers not including volatile provided in its template parameter. These qualifiers and specifier (if any) are added to its operator(). `hpx::move_only_function` satisfies the requirements of MoveConstructible and MoveAssignable, but does not satisfy CopyConstructible or CopyAssignable.

## hpx::bind

Defined in header `hpx/functionality.hpp`<sup>892</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

## `hpx::function_ref`

Defined in header `hpx/functional.hpp`<sup>897</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **Sig**>

class **function\_ref**

`function_ref` class is a vocabulary type with reference semantics for passing entities to call.

An example use case that benefits from higher-order functions is `retry(n, f)` which attempts to call `f` up to `n` times synchronously until success. This example might model the real-world scenario of repeatedly querying a flaky web service.

```
using payload = std::optional< /* ... */ >;
// Repeatedly invokes `action` up to `times` repetitions.
// Immediately returns if `action` returns a valid `payload`.
// Returns `std::nullopt` otherwise.
payload retry(size_t times, /* ????? */ action);
```

<sup>896</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/functional.](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/functional.hpp)

hpp

<sup>897</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/functional.](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/functional.hpp)

hpp

The passed-in action should be a callable entity that takes no arguments and returns a payload. This can be done with function pointers, `hpx::function` or a template but it is much simpler with `function_ref` as seen below:

```
payload retry(size_t times, function_ref<payload()> action);
```

## hpx::function

Defined in header `hpx/functional.hpp`<sup>898</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Sig, bool Serializable = false>
```

```
class function
```

Class template `hpx::function` is a general-purpose polymorphic function wrapper. Instances of `hpx::function` can store, copy, and invoke any CopyConstructible Callable target `&#8212`; functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to data members. The stored callable object is called the target of `hpx::function`. If an `hpx::function` contains no target, it is called empty. Invoking the target of an empty `hpx::function` results in `hpx::error::bad_function_call` exception being thrown. `hpx::function` satisfies the requirements of CopyConstructible and CopyAssignable.

## hpx::bind\_front

Defined in header `hpx/functional.hpp`<sup>899</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

### Warning

doxygenfunction: Unable to resolve function “hpx::bind\_front” with arguments (F&&, Ts&&...) in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc. Potential matches:

```
- template<typename F, typename ...Ts> constexpr detail::bound_
  → front<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>
  → , util::decay_unwrap_t<Ts>...> bind_front(F &&f, Ts&&... vs)
- template<typename F> constexpr std::decay_t<F> bind_front(F &&f)
```

```
template<typename F>
```

```
constexpr std::decay_t<F> hpx::bind_front(F &&f)
```

<sup>898</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/functional.hpp)

<sup>899</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/functional.hpp)

### hpx::experimental::scope\_success

Defined in header `hpx/experimental/scope.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
template<typename F>
```

```
auto hpx::experimental::scope_success(F &&f)
```

The class template `scope_success` is a general-purpose scope guard intended to call its exit function when a scope is normally exited.

#### Template Parameters

**F** – type of stored exit function

#### Parameters

**f** – stored exit function

### hpx::experimental::scope\_fail

Defined in header `hpx/experimental/scope.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
template<typename F>
```

```
auto hpx::experimental::scope_fail(F &&f)
```

The class template `scope_fail` is a general-purpose scope guard intended to call its exit function when a scope is exited via an exception.

#### Template Parameters

**F** – type of stored exit function

#### Parameters

**f** – stored exit function

### hpx::experimental::scope\_exit

Defined in header `hpx/experimental/scope.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
template<typename F>
```

```
auto hpx::experimental::scope_exit(F &&f)
```

The class template `scope_exit` is a general-purpose scope guard intended to call its exit function when a scope is exited.

#### Template Parameters

**F** – type of stored exit function

#### Parameters

**f** – stored exit function

## hpx::is\_bind\_expression

Defined in header [hpx/functional.hpp](#)<sup>900</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename T>
```

```
struct is_bind_expression : public std::is\_bind\_expression<T>
```

If T is the type produced by a call to `hpx::bind`, this template is derived from `std::true_type`. For any other type, this template is derived from `std::false_type`.

This template may be specialized for a user-defined type T to implement *UnaryTypeTrait* with base characteristic of `std::true_type` to indicate that T should be treated by `hpx::bind` as if it were the type of a bind subexpression: when a bind-generated function object is invoked, a bound argument of this type will be invoked as a function object and will be given all the unbound arguments passed to the bind-generated object.

Subclassed by `hpx::is_bind_expression< T const >`

## hpx::is\_placeholder

Defined in header [hpx/functional.hpp](#)<sup>901</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename T>
```

```
struct is_placeholder
```

If T is a standard, Boost, or HPX placeholder (`_1`, `_2`, `_3`, ...) then this template is derived from `std::integral_constant<int,1>`, `std::integral_constant<int,2>`, `std::integral_constant<int,3>`, respectively. Otherwise, it is derived from `std::integral_constant<int,0>`.

The template may be specialized for any user-defined T type: the specialization must satisfy *UnaryTypeTrait* with base characteristic of `std::integral_constant<int,N>` with N>0 to indicate that T should be treated as N'th placeholder type. `hpx::bind` uses [hpx::is\\_placeholder](#) to detect placeholders for unbound arguments.

Defined in header `hpx/future.hpp`<sup>902</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Sig>
```

```
class packaged_task
```

The class template `hpx::packaged_task` wraps any Callable` target (function, lambda expression, bind expression, or another function object) so that it can be invoked asynchronously. Its return value or exception thrown is stored in a shared state which can be accessed through `hpx::future` objects. Just like `hpx::function`, `hpx::packaged_task` is a polymorphic, allocator-aware container: the stored callable target may be allocated on heap or with a provided allocator.

### hpx::promise

Defined in header `hpx/future.hpp`<sup>903</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename R>
```

```
class promise : public hpx::detail::promise_base<R>
```

The class template `hpx::promise` provides a facility to store a value or an exception that is later acquired asynchronously via a `hpx::future` object created by the `hpx::promise` object. Note that the `hpx::promise` object is meant to be used only once. Each promise is associated with a shared state, which contains some state information and a result which may be not yet evaluated, evaluated to a value (possibly void) or evaluated to an exception. A promise may do three things with the shared state:

- make ready: the promise stores the result or the exception in the shared state. Marks the state ready and unblocks any thread waiting on a future associated with the shared state.
- release: the promise gives up its reference to the shared state. If this was the last such reference, the shared state is destroyed. Unless this was a shared state created by `hpx::async` which is not yet ready, this operation does not block.
- abandon: the promise stores the exception of type `hpx::future_error` with error code `hpx::error::broken_promise`, makes the shared state ready, and then releases it. The promise is the “push” end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in `hpx::memory_order`) the successful return from any function that is waiting on the shared state (such as `hpx::future::get`). Concurrent access to the same shared state may conflict otherwise: for example multiple callers of `hpx::shared_future::get` must either all be read-only or provide external synchronization.

<sup>902</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

<sup>903</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

## hpx::future

Defined in header `hpx/future.hpp`<sup>904</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::shared_future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`
- `hpx::make_exceptional_future`

template<typename R>

class **future** : public `hpx::lcos::detail::future_base<future<R>, R>`

The class template `hpx::future` provides a mechanism to access the result of asynchronous operations:

- An asynchronous operation (created via `hpx::async`, `hpx::packaged_task`, or `hpx::promise`) can provide a `hpx::future` object to the creator of that asynchronous operation.
- The creator of the asynchronous operation can then use a variety of methods to query, wait for, or extract a value from the `hpx::future`. These methods may block if the asynchronous operation has not yet provided a value.
- When the asynchronous operation is ready to send a result to the creator, it can do so by modifying shared state (e.g. `hpx::promise::set_value`) that is linked to the creator's `hpx::future`. Note that `hpx::future` references shared state that is not shared with any other asynchronous return objects (as opposed to `hpx::shared_future`).

## hpx::shared\_future

Defined in header `hpx/future.hpp`<sup>905</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`

---

<sup>904</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

<sup>905</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`
- `hpx::make_exceptional_future`

template<typename **R**>

class **shared\_future** : public `hpx::lcos::detail::future_base<shared_future<R>, R>`

The class template `hpx::shared_future` provides a mechanism to access the result of asynchronous operations, similar to `hpx::future`, except that multiple threads are allowed to wait for the same shared state. Unlike `hpx::future`, which is only moveable (so only one instance can refer to any particular asynchronous result), `hpx::shared_future` is copyable and multiple shared future objects may refer to the same shared state. Access to the same shared state from multiple threads is safe if each thread does it through its own copy of a `shared_future` object.

### **hpx::make\_future**

Defined in header `hpx/future.hpp`<sup>906</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::future`
- `hpx::shared_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`
- `hpx::make_exceptional_future`

template<typename **R**, typename **U**>

`hpx::future<R> hpx::make_future(hpx::future<U> &&f)`

Converts any future of type **U** to any other future of type **R** based on an existing conversion path from **U** to **R**.

template<typename **R**, typename **U**, typename **Conv**>

`hpx::future<R> hpx::make_future(hpx::future<U> &&f, Conv &&conv)`

Converts any future of type **U** to any other future of type **R** based on a given conversion function: `R conv(U)`.

template<typename **R**, typename **U**>

<sup>906</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

*hpx::future<R>* **hpx::make\_future**(*hpx::shared\_future<U>* f)

Converts any *shared\_future* of type U to any other future of type R based on an existing conversion path from U to R.

template<typename R, typename U, typename Conv>

*hpx::future<R>* **hpx::make\_future**(*hpx::shared\_future<U>* f, Conv &&conv)

Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

### **hpx::make\_shared\_future**

Defined in header *hpx/future.hpp*<sup>907</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::future*
- *hpx::shared\_future*
- *hpx::make\_future*
- *hpx::make\_ready\_future*
- *hpx::make\_ready\_future\_alloc*
- *hpx::make\_ready\_future\_at*
- *hpx::make\_ready\_future\_after*
- *hpx::make\_exceptional\_future*

template<typename R>

*hpx::shared\_future<R>* **hpx::make\_shared\_future**(*hpx::future<R>* &&f) noexcept

Converts any future or *shared\_future* of type T to a corresponding *shared\_future* of type T.

template<typename R>

*hpx::shared\_future<R>* &**hpx::make\_shared\_future**(*hpx::shared\_future<R>* &f) noexcept

Converts any future or *shared\_future* of type T to a corresponding *shared\_future* of type T.

template<typename R>

*hpx::shared\_future<R>* &&**hpx::make\_shared\_future**(*hpx::shared\_future<R>* &&f) noexcept

Converts any future or *shared\_future* of type T to a corresponding *shared\_future* of type T.

---

<sup>907</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

template<typename R>

*hpx::shared\_future*<R> const &*hpx::make\_shared\_future*(*hpx::shared\_future*<R> const &f) noexcept

Converts any future or *shared\_future* of type T to a corresponding *shared\_future* of type T.

### ***hpx::make\_ready\_future***

Defined in header *hpx/future.hpp*<sup>908</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::future*
- *hpx::shared\_future*
- *hpx::make\_future*
- *hpx::make\_shared\_future*
- *hpx::make\_ready\_future\_alloc*
- *hpx::make\_ready\_future\_at*
- *hpx::make\_ready\_future\_after*
- *hpx::make\_exceptional\_future*

template<typename T, typename ...Ts>

*std::enable\_if\_t<std::is\_constructible\_v<T, Ts&&...> || std::is\_void\_v<T>, future<T>>* *hpx::make\_ready\_future*(Ts&&...  
ts)

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, *valid()* == true and *is\_ready()* == true.

template<int DeductionGuard = 0, typename T>

*future<hpx::util::decay\_unwrap\_t<T>>* *hpx::make\_ready\_future*(T &&init)

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, *valid()* == true and *is\_ready()* == true.

*future<void>* *hpx::make\_ready\_future*()

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, *valid()* == true and *is\_ready()* == true.

<sup>908</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

### hpx::make\_ready\_future\_alloc

Defined in header `hpx/future.hpp`<sup>909</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::future`
- `hpx::shared_future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`
- `hpx::make_exceptional_future`

template<typename **T**, typename **Allocator**, typename ...**Ts**>

```
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> hpx::make_ready_future_alloc(Allocator const &a, Ts&&... ts)
```

Creates a pre-initialized future object with allocator (extension)

template<int **DeductionGuard** = 0, typename **Allocator**, typename **T**>

```
future<hpx::util::decay_unwrap_t<T>> hpx::make_ready_future_alloc(Allocator const &a, T &&init)
```

template<typename **Allocator**>

```
inline future<void> hpx::make_ready_future_alloc(Allocator const &a)
```

### hpx::make\_ready\_future\_at

Defined in header `hpx/future.hpp`<sup>910</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::future`
- `hpx::shared_future`
- `hpx::make_future`

---

<sup>909</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

<sup>910</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`

template<typename **T**>

`future<T> hpx::make_exceptional_future(std::exception_ptr const &e)`

Creates a pre-initialized future object which holds the given error (extension)

template<typename **T**, typename **E**>

`future<T> hpx::make_exceptional_future(E e)`

Creates a pre-initialized future object which holds the given error (extension)

## **hpx/futures/future\_fwd.hpp**

Defined in header `hpx/futures/future_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **lcos**

namespace **lcos**

---

<sup>912</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/future.hpp>

## io\_service

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx/io\_service/io\_service\_pool.hpp

Defined in header `hpx/io_service/io_service_pool.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

class **io\_service\_pool**

*#include <io\_service\_pool.hpp>* A pool of io\_service objects.

### Public Functions

explicit **io\_service\_pool**(*std::size\_t* pool\_size = 2, *threads::policies::callback\_notifier* const &notifier = *threads::policies::callback\_notifier*(), char const \*pool\_name = "", char const \*name\_postfix = "")

Construct the io\_service pool.

#### Parameters

- **pool\_size** – [in] The number of threads to run to serve incoming requests
- **notifier** – [in]
- **pool\_name** – [in]
- **name\_postfix** – [in]

explicit **io\_service\_pool**(*threads::policies::callback\_notifier* const &notifier, char const \*pool\_name = "", char const \*name\_postfix = "")

Construct the io\_service pool.

#### Parameters

- **notifier** – [in]
- **pool\_name** – [in]
- **name\_postfix** – [in]

**io\_service\_pool**(*io\_service\_pool* const&) = delete

**io\_service\_pool**(*io\_service\_pool*&&) = delete

*io\_service\_pool* &operator=(*io\_service\_pool* const&) = delete

*io\_service\_pool* &operator=(*io\_service\_pool*&&) = delete

**~io\_service\_pool()**

bool **run**(bool join\_threads = true, *std::shared\_ptr<barrier>* startup = {}) const

Run all *io\_service* objects in the pool. If *join\_threads* is true this will also wait for all threads to complete.

#### Parameters

- **join\_threads** – [in] If true, wait for all pool threads to join before returning.
- **startup** – [in] Optional startup barrier used to synchronize pool worker thread startup with the caller. Its participant count must equal the number of pool worker threads plus one for the caller. The caller must call *startup->wait()* after invoking *run()*.

bool **run**(*std::size\_t* num\_threads, bool join\_threads = true, *std::shared\_ptr<barrier>* startup = {}) const

Run *num\_threads* *io\_service* objects in the pool. If *join\_threads* is true this will also wait for all threads to complete.

#### Parameters

- **num\_threads** – [in] The number of worker threads to start.
- **join\_threads** – [in] If true, wait for all pool threads to join before returning.
- **startup** – [in] Optional startup barrier used to synchronize pool worker thread startup with the caller. Its participant count must equal *num\_threads* plus one for the caller. The caller must call *startup->wait()* after invoking *run()*.

void **stop**() const

Stop all *io\_service* objects in the pool.

void **join**() const

Join all *io\_service* threads in the pool.

void **clear**() const

Clear all internal data structures.

void **wait**() const

Wait for all work to be done.

bool **stopped**() const

```
::asio::io_context &get_io_service(int index = -1) const
```

Get an io\_service to use.

```
std::thread &get_os_thread_handle(std::size_t thread_num) const
```

access underlying thread handle

```
std::size_t size() const noexcept
```

Get number of threads associated with this I/O service.

```
void thread_run(std::size_t index, std::shared_ptr<barrier> startup = {}) const
```

Activate the thread *index* for this thread pool.

```
char const *get_name() const noexcept
```

Return name of this pool.

```
void init(std::size_t pool_size) const
```

## Private Members

## **hpx::lcos::local::and\_gate**

Defined in header `hpx/modules/lcos_local.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

struct **and\_gate** : public *hpx::lcos::local::base\_and\_gate*<*hpx::no\_mutex*>

An AND-gate synchronization primitive that fires once all of its expected inputs have been received.

### Note

This type is not thread-safe. It has to be protected from concurrent access by different threads by the code using instances of this type.

## pack\_traversal

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/pack\_traversal/pack\_traversal.hpp

Defined in header `hpx/pack_traversal/pack_traversal.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

## Functions

```
template<typename Mapper, typename...  
T> < unspecified > map_pack (Mapper &&mapper, T &&... pack)
```

Maps the pack with the given mapper.

This function tries to visit all plain elements which may be wrapped in:

- homogeneous containers (`std::vector`, `std::list`)
- heterogeneous containers (`hpx::tuple`, `std::pair`, `std::array`) and re-assembles the pack with the result of the mapper. Mapping from one type to a different one is supported.

Elements that aren't accepted by the mapper are routed through and preserved through the hierarchy.

```
// Maps all integers to floats  
map_pack([](int value) {  
    return float(value);  
},  
1, hpx::make_tuple(2, std::vector<int>{3, 4}), 5);
```

### Throws

`std::exception` – like objects which are thrown by an invocation to the mapper.

### Parameters

- **mapper** – A callable object, which accept an arbitrary type and maps it to another type or the same one.
- **pack** – An arbitrary variadic pack which may contain any type.

### Returns

The mapped element or in case the pack contains multiple elements, the pack is wrapped into a `hpx::tuple`.

## hpx::functional::unwrap

Defined in header `hpx/unwrap.hpp`<sup>913</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::functional::unwrap\\_n](#)
- [hpx::unwrap](#)
- [hpx::unwrap\\_n](#)
- [hpx::unwrap\\_all](#)
- [hpx::unwrapping](#)
- [hpx::unwrapping\\_n](#)
- [hpx::unwrapping\\_all](#)

struct **unwrap\_all**

A helper function object for functionally invoking [hpx::unwrap\\_all](#). For more information please refer to its documentation.

## hpx::unwrap

Defined in header [hpx/unwrap.hpp](#)<sup>916</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::functional::unwrap](#)
- [hpx::functional::unwrap\\_n](#)
- [hpx::functional::unwrap\\_all](#)
- [hpx::unwrap\\_n](#)
- [hpx::unwrap\\_all](#)
- [hpx::unwrapping](#)
- [hpx::unwrapping\\_n](#)
- [hpx::unwrapping\\_all](#)

template<typename ...**Args**>

auto [hpx::unwrap](#)(*Args*&&... args) ->

```
    decltype(util::detail::unwrap_depth_impl<1U>(std::forward<Args>(args)...))  
    915 http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\_local/include/hpx/unwrap.  
hpp  
916 http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/unwrap.  
hpp
```

A helper function for retrieving the actual result of any `hpx::future` like type which is wrapped in an arbitrary way.

Unwraps the given pack of arguments, so that any `hpx::future` object is replaced by its future result type in the argument pack:

- `hpx::future<int> -> int`
- `hpx::future<std::vector<float>> -> std::vector<float>`
- `std::vector<future<float>> -> std::vector<float>`

The function is capable of unwrapping `hpx::future` like objects that are wrapped inside any container or tuple like type, see `hpx::util::map_pack()` for a detailed description about which surrounding types are supported. Non `hpx::future` like types are permitted as arguments and passed through.

```
hpx::unwrap(hpx::make_ready_future(0));

// Multiple arguments hpx::tuple<int, int> i2 =
    hpx::unwrap(hpx::make_ready_future(1),
                hpx::make_ready_future(2));
```

#### Note

This function unwraps the given arguments until the first traversed nested `hpx::future` which corresponds to an unwrapping depth of one. See `hpx::unwrap_n()` for a function which unwraps the given arguments to a particular depth or `hpx::unwrap_all()` that unwraps all future like objects recursively which are contained in the arguments.

#### Parameters

**args** – the arguments that are unwrapped which may contain any arbitrary future or non-future type.

#### Throws

`std::exception` – like objects in case any of the given wrapped `hpx::future` objects were resolved through an exception. See `hpx::future::get()` for details.

#### Returns

Depending on the count of arguments this function returns a `hpx::tuple` containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

### `hpx::unwrap_n`

Defined in header `hpx/unwrap.hpp`<sup>917</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`

<sup>917</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/unwrap.hpp)

- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_n`
- `hpx::unwrapping_all`

template<std::size\_t **Depth**, typename ...**Args**>

```
auto hpx::unwrap_n(Args&&... args) ->
    decltype(util::detail::unwrap_depth_impl<Depth>(std::forward<Args>(args)...))
```

An alternative version of `hpx::unwrap()`, which unwraps the given arguments to a certain depth of `hpx::future` like objects.

See `unwrap` for a detailed description.

### Template Parameters

**Depth** – The count of `hpx::future` like objects which are unwrapped maximally.

### `hpx::unwrap_all`

Defined in header `hpx/unwrap.hpp`<sup>918</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_n`
- `hpx::unwrapping`
- `hpx::unwrapping_n`
- `hpx::unwrapping_all`

template<typename ...**Args**>

```
auto hpx::unwrap_all(Args&&... args) ->
    decltype(util::detail::unwrap_depth_impl<0U>(std::forward<Args>(args)...))
```

An alternative version of `hpx::unwrap()`, which unwraps the given arguments recursively so that all contained `hpx::future` like objects are replaced by their actual value.

See `hpx::unwrap()` for a detailed description.

---

<sup>918</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/unwrap.hpp)

## hpx::unwrapping

Defined in header `hpx/unwrap.hpp`<sup>919</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping_n`
- `hpx::unwrapping_all`

template<typename **T**>

```
auto hpx::unwrapping(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<1U>(std::forward<T>(callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap()` function and then passes the result to the given callable object.

```
    return left + right;
};

int i1 = callable(hpx::make_ready_future(1),
                  hpx::make_ready_future(2));
```

See `hpx::unwrap()` for a detailed description.

### Parameters

**callable** – the callable object which is called with the result of the corresponding unwrap function.

## hpx::unwrapping\_n

Defined in header `hpx/unwrap.hpp`<sup>920</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`

<sup>919</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/unwrap.hpp)

<sup>920</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/unwrap.hpp)

- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_all`

template<std::size\_t **Depth**, typename **T**>

auto `hpx::unwrapping_n`(*T* &&callable) -> decltype(`util::detail::functional_unwrap_depth_impl`<*Depth*>(`std::forward`<*T*>(*callable*)))

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_n()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

### `hpx::unwrapping_all`

Defined in header `hpx/unwrap.hpp`<sup>921</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_n`

template<typename **T**>

auto `hpx::unwrapping_all`(*T* &&callable) -> decltype(`util::detail::functional_unwrap_depth_impl`<0U>(`std::forward`<*T*>(*callable*)))

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_all()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

---

<sup>921</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/core/include_local/include/hpx/unwrap.hpp)

## hpx/pack\_traversal/pack\_traversal\_async.hpp

Defined in header `hpx/pack_traversal/pack_traversal_async.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

### Functions

template<typename **Visitor**, typename ...**T**>

auto **traverse\_pack\_async**(*Visitor* &&visitor, *T* &&... pack) -> decltype(detail::apply\_pack\_transform\_async(std::forward<*Visitor*>(visitor), std::forward<*T*>(pack)...))

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus, we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```

struct my_async_visitor {
    // The synchronous overload is called for each object. It may
    ↪ // return false to suspend the current control. In that case the
    // overload below is called.
    template <typename T>
    bool operator()(async_traverse_visit_tag, T&& element)
    {
        return true;
    }

    // The asynchronous overload is called when the synchronous
    // overload returned false. In addition to the current visited
    ↪ // element, the overload is called with a continuation callable
    // object which resumes the traversal when called later.
    template <typename T, typename N>
    void
    ↪ operator()(async_traverse_detach_tag, T&& element, N&& next)
    {
    }

    // The overload is called when the traversal was finished. The
    // whole pack which was traversed asynchronously is passed.
    template <typename T>
    void operator()(async_traverse_complete_tag, T&& pack)

```

(continues on next page)

(continued from previous page)

```
{
}
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

### Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally, the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.

### Returns

A `hpx::intrusive_ptr` that references an instance of the given visitor object.

```
template<typename Allocator, typename Visitor, typename ...T>
```

```
auto traverse_pack_async_allocator(Allocator const &alloc, Visitor &&visitor, T&&... pack) ->
    de-
    ctype(detail::apply_pack_transform_async_allocator(alloc,
        std::forward<Visitor>(visitor), std::forward<T>(pack)...))
```

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus, we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
struct my_async_visitor {
    // The synchronous overload is called for each object. It may
    ↪ // return false to suspend the current control. In that case the
    // overload below is called.
    template <typename T>
    bool operator()(async_traverse_visit_tag, T&& element)
    {
        return true;
    }

    // The asynchronous overload is called when the synchronous
    // overload returned false. In addition to the current visited
    //
    ↪ / element, this overload receives a continuation callable object
    //
    ↪ which resumes the traversal when called later. The continuation
    ↪
    ↪ // may be stored and called later or dropped completely to abort
    // the traversal early.
    template <typename T, typename N>
    void_
    ↪ operator()(async_traverse_detach_tag, T&& element, N&& next)
```

(continues on next page)

(continued from previous page)

```

{
}

// This overload is called when the traversal is finished. The
// complete pack that was traversed asynchronously is passed.
template <typename T>
void operator()(async_traverse_complete_tag, T&& pack)
{
}
};

```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

### Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally, the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.
- **alloc** – Allocator instance to use to create the traversal frame.

### Returns

A `hpx::intrusive_ptr` that references an instance of the given visitor object.

## preprocessor

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/preprocessor/strip\_parens.hpp

Defined in header `hpx/preprocessor/strip_parens.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## Defines

### HPX\_PP\_STRIP\_PARENS(X)

For any symbol `X`, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to `X` itself without error.

The original implementation of this macro is from Steven Watanbe as shown in <http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-td2591973.html#a2591976>

```

HPX_PP_STRIP_PARENS(no_parens)
HPX_PP_STRIP_PARENS((with_parens))

```

**Example Usage:**

This produces the following output

```
no_parens  
with_parens
```

**Parameters**

- **X** – Symbol to strip parens from

**[hpx/preprocessor/cat.hpp](#)**

Defined in header `hpx/preprocessor/cat.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

**Defines****HPX\_PP\_CAT(A, B)**

Concatenates the tokens **A** and **B** into a single token. Evaluates to **AB**

**Parameters**

- **A** – First token
- **B** – Second token

**[hpx/preprocessor/nargs.hpp](#)**

Defined in header `hpx/preprocessor/nargs.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

**Defines****HPX\_PP\_NARGS(...)**

Expands to the number of arguments passed in

Example Usage:

```
HPX_PP_NARGS(hpx, pp, nargs)  
HPX_PP_NARGS(hpx, pp)  
HPX_PP_NARGS(hpx)
```

Expands to:

```
3
2
1
```

## Parameters

- ... – The variadic number of arguments

### hpx/preprocessor/stringize.hpp

Defined in header `hpx/preprocessor/stringize.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

## Defines

### HPX\_PP\_STRINGIZE(X)

The *HPX\_PP\_STRINGIZE* macro stringizes its argument after it has been expanded.

The passed argument *X* will expand to "*X*". Note that the stringizing operator (#) prevents arguments from expanding. This macro circumvents this shortcoming.

## Parameters

- *X* – The text to be converted to a string literal

### hpx/preprocessor/expand.hpp

Defined in header `hpx/preprocessor/expand.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

## Defines

### HPX\_PP\_EXPAND(X)

The *HPX\_PP\_EXPAND* macro performs a double macro-expansion on its argument.

This macro can be used to produce a delayed preprocessor expansion.

Example:

```
#define MACRO(a, b, c) (a)(b)(c)
#define ARGS() (1, 2, 3)

HPX_PP_EXPAND(MACRO ARGS()) // expands to (1)(2)(3)
```

## Parameters

- **X** – Token to be expanded twice

### resiliency

See *Public API* for a list of names and headers that are part of the public *HPX* API.

#### hpx/resiliency/replay\_executor.hpp

Defined in header `hpx/resiliency/replay_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

template<typename **BaseExecutor**, typename **Validator**>

struct **is\_two\_way\_executor**<*hpx::resiliency::experimental::replay\_executor*<*BaseExecutor*,  
*Validator*>> : public *std::true\_type*

template<typename **BaseExecutor**, typename **Validator**>

struct  
**is\_bulk\_two\_way\_executor**<*hpx::resiliency::experimental::replay\_executor*<*BaseExecutor*,  
*Validator*>> : public *std::true\_type*

namespace **resiliency**

namespace **experimental**

## Functions

```
template<executor_any BaseExecutor, typename Validate>

replay_executor<BaseExecutor, std::decay_t<Validate>> make_replay_executor(BaseExecutor
                                                                    &exec,
                                                                    std::size_t n,
                                                                    Validate
                                                                    &&validate)

template<executor_any BaseExecutor>

replay_executor<BaseExecutor, detail::replay_validator> make_replay_executor(BaseExecutor
                                                                    &exec,
                                                                    std::size_t n)

template<typename BaseExecutor, typename Validate>

class replay_executor

## hpx/resiliency/async\_replicate\_executor.hpp

Defined in header `hpx/resiliency/async_replicate_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resiliency**

namespace **experimental**

## Functions

template<typename **Executor**, typename **Vote**, typename **Pred**, typename **F**, typename ...**Ts**>

decltype(auto) **hpx\_invoke**(*async\_replicate\_vote\_validate\_t*, *Executor* &&exec, *std::size\_t* n, *Vote* &&vote, *Pred* &&pred, *F* &&f, *Ts*&&... ts)

ADL hook for `async_replicate_vote_validate` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, validates results with *pred*, then runs valid results through *vote*.

### Parameters

- **tag** – CPO tag (*async\_replicate\_vote\_validate\_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the voted-upon result.

```
template<typename Executor, typename Vote, typename F, typename ...Ts>
```

```
decltype(auto) hpx_invoke(async_replicate_vote_t, Executor &&exec, std::size_t n, Vote &&vote,  
                          F &&f, Ts&&... ts)
```

ADL hook for `async_replicate_vote` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, runs valid results through *vote*. Validation uses the default exception check.

#### Parameters

- **tag** – CPO tag (*async\_replicate\_vote\_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

#### Returns

future with the voted-upon result.

```
template<typename Executor, typename Pred, typename F, typename ...Ts>
```

```
decltype(auto) hpx_invoke(async_replicate_validate_t, Executor &&exec, std::size_t n, Pred  
                          &&pred, F &&f, Ts&&... ts)
```

ADL hook for `async_replicate_validate` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, validates results with *pred*. Returns the first valid result.

#### Parameters

- **tag** – CPO tag (*async\_replicate\_validate\_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

#### Returns

future with the first valid result.

```
template<typename Executor, typename F, typename ...Ts>
```

```
decltype(auto) hpx_invoke(async_replicate_t, Executor &&exec, std::size_t n, F &&f, Ts&&... ts)
```

ADL hook for `async_replicate` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*. Validates by checking for exceptions. Returns the first valid result.

#### Parameters

- **tag** – CPO tag (*async\_replicate\_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

#### Returns

future with the first non-throwing result.

## hpx/resiliency/async\_replicate.hpp

Defined in header hpx/resiliency/async\_replicate.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **resiliency**

namespace **experimental**

### Functions

template<typename **Vote**, typename **Pred**, typename **F**, typename ...**Ts**>

*hpx::future<hpx::util::detail::invoke\_deferred\_result\_t<F, Ts...>>* **hpx\_invoke**(*async\_replicate\_vote\_validate\_t*,  
std::size\_t n, *Vote*  
&&vote, *Pred*  
&&pred, *F* &&f,  
*Ts*&&... ts)

ADL hook for `async_replicate_vote_validate` CPO.

Asynchronously launches *f* exactly *n* times, validates results with *pred*, then runs valid results through *vote*.

#### Parameters

- **tag** – CPO tag (*async\_replicate\_vote\_validate\_t*).
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

#### Returns

future with the voted-upon result.

template<typename **Vote**, typename **F**, typename ...**Ts**>

*hpx::future<hpx::util::detail::invoke\_deferred\_result\_t<F, Ts...>>* **hpx\_invoke**(*async\_replicate\_vote\_t*,  
std::size\_t n, *Vote*  
&&vote, *F* &&f,  
*Ts*&&... ts)

ADL hook for `async_replicate_vote` CPO.

Asynchronously launches *f* exactly *n* times, runs valid results through *vote*. Validation uses the default exception check.

#### Parameters

- **tag** – CPO tag (*async\_replicate\_vote\_t*).
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

**Returns**

future with the voted-upon result.

```
template<typename Pred, typename F, typename ...Ts>
```

```
hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> hpx_invoke(async_replicate_validate_t,  
                                                                    std::size_t n, Pred  
                                                                    &&pred, F &&f,  
                                                                    Ts&&... ts)
```

ADL hook for *async\_replicate\_validate* CPO.

Asynchronously launches *f* exactly *n* times, validates results with *pred*. Returns the first valid result.

**Parameters**

- **tag** – CPO tag (*async\_replicate\_validate\_t*).
- **n** – Number of replicated invocations.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

**Returns**

future with the first valid result.

```
template<typename F, typename ...Ts>
```

```
hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> hpx_invoke(async_replicate_t,  
                                                                    std::size_t n, F  
                                                                    &&f, Ts&&... ts)
```

ADL hook for *async\_replicate* CPO.

Asynchronously launches *f* exactly *n* times. Validates by checking for exceptions. Returns the first valid result.

**Parameters**

- **tag** – CPO tag (*async\_replicate\_t*).
- **n** – Number of replicated invocations.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

**Returns**

future with the first non-throwing result.

**hpx/resiliency/replicate\_executor.hpp**

```

## Functions

```
template<typename Executor, typename Pred, typename F, typename ...Ts>
decltype(auto) hpx_invoke(async_replay_validate_t, Executor &&exec, std::size_t n, Pred
&&pred, F &&f, Ts&&... ts)
```

ADL hook for `async_replay_validate` CPO with executor.

Asynchronously launches *f* on *exec*, validating results with *pred*. Repeats on error up to *n* times (aborts on `abort_replay_exception`).

### Parameters

- **tag** – CPO tag (*async\_replay\_validate\_t*).
- **exec** – Executor to run *f* on.
- **n** – Maximum number of retry attempts.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the first valid result of *f*.

```
template<typename Executor, typename F, typename ...Ts>
decltype(auto) hpx_invoke(async_replay_t, Executor &&exec, std::size_t n, F &&f, Ts&&... ts)
```

ADL hook for `async_replay` CPO with executor.

Asynchronously launches *f* on *exec*, repeating on error up to *n* times (aborts on `abort_replay_exception`).

### Parameters

- **tag** – CPO tag (*async\_replay\_t*).
- **exec** – Executor to run *f* on.
- **n** – Maximum number of retry attempts.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the first successful result of *f*.

## hpx/resiliency/async\_replay.hpp

Defined in header `hpx/resiliency/async_replay.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resiliency**

namespace **experimental**

## Functions

template<typename **Pred**, typename **F**, typename ...**Ts**>

*hpx::future<hpx::util::detail::invoke\_deferred\_result\_t<F, Ts...>>* **hpx\_invoke**(*async\_replay\_validate\_t*,  
*std::size\_t n*, *Pred*  
&&pred, *F* &&f,  
*Ts*&&... ts)

ADL hook for `async_replay_validate` CPO.

Asynchronously launches *f*, validating results with *pred*. Repeats on error up to *n* times (aborts on `abort_replay_exception`).

### Parameters

- **tag** – CPO tag (*async\_replay\_validate\_t*).
- **n** – Maximum number of retry attempts.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the first valid result of *f*.

template<typename **F**, typename ...**Ts**>

*hpx::future<hpx::util::detail::invoke\_deferred\_result\_t<F, Ts...>>* **hpx\_invoke**(*async\_replay\_t*,  
*std::size\_t n*, *F*  
&&f, *Ts*&&... ts)

ADL hook for `async_replay` CPO.

Asynchronously launches *f*, repeating on error up to *n* times (aborts on `abort_replay_exception`).

### Parameters

- **tag** – CPO tag (*async\_replay\_t*).
- **n** – Maximum number of retry attempts.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the first successful result of *f*.

## hpx/resiliency/resiliency\_cpos.hpp

Defined in header `hpx/resiliency/resiliency_cpos.hpp`.

`bool tolerate_node_faults()`

Check whether fault tolerance for node/locality faults is enabled via the “enable\_fault\_tolerance” configuration entry in the “hpx” section.

**Returns**

true if fault tolerance is enabled, false otherwise.

inline void **tolerate\_node\_faults**(bool const value) const

Set whether this runtime instance should tolerate node faults.

This controls whether the runtime is configured to continue operating in the presence of locality failures (e.g. forced or unexpected disconnection of remote localities) rather than treating such failures as fatal errors.

#### Parameters

**value** – Set to **true** to enable fault tolerance for node failures, or **false** to require all localities to remain connected for normal operation.

## **hpx::runtime\_mode**

Defined in header [hpx/init.hpp](#)<sup>922</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

enum class **hpx::runtime\_mode** : *std::int8\_t*

A HPX runtime can be executed in two different modes: console mode and worker mode.

*Values:*

enumerator **invalid**

enumerator **console**

The runtime is the console locality.

enumerator **worker**

The runtime is a worker locality.

enumerator **connect**

The runtime is a worker locality connecting late

enumerator **local**

The runtime is fully local.

enumerator **default\_**

The runtime mode will be determined based on the command line arguments

enumerator **last**

<sup>922</sup> [http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/init\\_runtime/include/hpx/init.hpp](http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/init_runtime/include/hpx/init.hpp)

## hpx::components::component\_commandline\_base

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

struct **component\_commandline\_base**

The `component_commandline_base` has to be used as a base class for all component command-line line handling registries.

Subclassed by `hpx::components::component_commandline`

## HPX\_REGISTER\_COMPONENT\_MODULE

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### Warning

doxygenfunction: Cannot find function “HPX\_REGISTER\_COMPONENT\_MODULE” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

## hpx/runtime\_configuration/plugin\_registry\_base.hpp

Defined in header `hpx/runtime_configuration/plugin_registry_base.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **plugins**

struct **plugin\_registry\_base**

`#include <plugin_registry_base.hpp>` The `plugin_registry_base` has to be used as a base class for all plugin registries.

### Public Functions

virtual **~plugin\_registry\_base()** = default

virtual bool **get\_plugin\_info**(`std::vector<std::string> &fillini`) = 0

Return the configuration information for any plugin implemented by this module

**Parameters**

**fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all plugins implemented in this module.

**Returns**

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

```
inline virtual void init(int*, char***, util::runtime_configuration&)
```

**hpx/runtime\_configuration/component\_registry\_base.hpp**

Defined in header `hpx/runtime_configuration/component_registry_base.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace components
```

```
struct component_registry_base
```

*#include <component\_registry\_base.hpp>* The `component_registry_base` has to be used as a base class for all component registries.

**Public Functions**

```
virtual ~component_registry_base() = default
```

```
virtual bool get_component_info(std::vector<std::string> &fillini, std::string const &filepath,  
                                bool is_static = false) = 0
```

Return the ini-information for all contained components.

**Parameters**

- **fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** – [in]
- **is\_static** – [in]

**Returns**

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

```
virtual void register_component_type() = 0
```

Register the component type represented by this component.

## runtime\_local

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx::get\_locality\_id

Defined in header `hpx/runtime.hpp`<sup>923</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

`std::uint32_t hpx::get_locality_id(error_code &ec = throws)`

Return the number of the locality this function is being called from.

This function returns the id of the current locality.

#### Note

The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by `get_num_localities()`).

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

#### Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

## Parameters

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

### hpx/runtime\_local/get\_os\_thread\_count.hpp

Defined in header `hpx/runtime_local/get_os_thread_count.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

---

<sup>923</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/runtime.hpp>

## Functions

`std::size_t get_os_thread_count()`

Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

`std::size_t get_os_thread_count(threads::executor const &exec)`

Return the number of worker OS- threads used by the given executor to execute HPX threads.

This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

### Parameters

**exec** – [in] The executor to be used.

namespace **threads**

## hpx::get\_locality\_name

Defined in header `hpx/runtime.hpp`<sup>924</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

`std::string hpx::get_locality_name()`

Return the name of the locality this function is called on.

This function returns the name for the locality on which this function is called.

### See also

`future<std::string> get_locality_name(hpx::id_type const& id)`

### Returns

This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcellports.

`future<std::string> hpx::get_locality_name(hpx::id_type const &id)`

Return the name of the referenced locality.

This function returns a future referring to the name for the locality of the given id.

<sup>924</sup> <http://github.com/TheHPXProject/hpx/blob/3e6647ea3911f99d32186445d067a08558cdadcd/libs/full/include/include/hpx/runtime.hpp>

**See also**`std::string get_locality_name()`**Parameters**

**id** – [in] The global id of the locality for which the name should be retrieved

**Returns**

This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

**hpx/runtime\_local/thread\_mapper.hpp**

Defined in header `hpx/runtime_local/thread_mapper.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

class **thread\_mapper**

## **hpx/runtime\_local/custom\_exception\_info.hpp**

Defined in header `hpx/runtime_local/custom_exception_info.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

## Functions

`std::string diagnostic_information(exception_info const &xi)`

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function `hpx::diagnostic_information` can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

### Parameters

**xi** – The parameter `e` will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

### Throws

`std::bad_alloc` – (if any of the required allocation operations fail)

### Returns

The formatted string holding all the available diagnostic information stored in the given exception instance.

`std::string default_diagnostic_information(std::exception_ptr const &e)`

`std::uint32_t get_error_locality_id(hpx::exception_info const &xi) noexcept`

Return the locality id where the exception was thrown.

The function `hpx::get_error_locality_id` can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

### See also

```

hpx::diagnostic_information(),          hpx::get_error_host_name(),
hpx::get_error_process_id(),           hpx::get_error_function_name(),
hpx::get_error_file_name(),            hpx::get_error_line_number(),
hpx::get_error_os_thread(),             hpx::get_error_thread_id(),
hpx::get_error_thread_description(),    hpx::get_error(), hpx::get_error_backtrace(),
hpx::get_error_env(),                  hpx::get_error_what(), hpx::get_error_config(),
hpx::get_error_state()

```

**Parameters**

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

**Throws**

nothing –

**Returns**

The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return *hpx::naming::invalid\_locality\_id*.

*std::string* **get\_error\_host\_name**(*hpx::exception\_info* const &xi)

Return the hostname of the locality where the exception was thrown.

The function *hpx::get\_error\_host\_name* can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

**See also**

```

hpx::diagnostic_information()          hpx::get_error_process_id(),
hpx::get_error_function_name(),        hpx::get_error_file_name(),
hpx::get_error_line_number(),          hpx::get_error_os_thread(),
hpx::get_error_thread_id(), hpx::get_error_thread_description(), hpx::get_error()
hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(),
hpx::get_error_config(), hpx::get_error_state()

```

**Parameters**

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

**Throws**

*std::bad\_alloc* – (if one of the required allocations fails)

**Returns**

The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::int64_t get_error_process_id(hpx::exception_info const &xi) noexcept`

Return the (operating system) process id of the locality where the exception was thrown.

The function `hpx::get_error_process_id` can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.

#### Parameters

**xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

#### Throws

nothing –

#### Returns

The process id of the OS-process which threw the exception. If the exception instance does not hold this information, the function will return 0.

`std::string get_error_env(hpx::exception_info const &xi)`

Return the environment of the OS-process at the point the exception was thrown.

The function `hpx::get_error_env` can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

| <code>hpx::get_error_what(),</code>               | <code>hpx::get_error_state(),</code>         |

#### Parameters

**xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This

parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

### Throws

*std::bad\_alloc* – (if one of the required allocations fails)

### Returns

The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

*std::string* **get\_error\_backtrace**(*hpx::exception\_info* const &xi)

Return the stack backtrace from the point the exception was thrown.

The function *hpx::get\_error\_backtrace* can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

| <i>hpx::get_error_config()</i> ,             | <i>hpx::get_error_state()</i>           |

### Parameters

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

### Throws

*std::bad\_alloc* – (if one of the required allocations fails)

### Returns

The stack back trace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

*std::size\_t* **get\_error\_os\_thread**(*hpx::exception\_info* const &xi) noexcept

Return the sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

The function *hpx::get\_error\_os\_thread* can be used to extract the diagnostic information element representing the sequence number of the OS-thread as stored in the given exception instance.

hpx::get_error_thread_id(), hpx::get_error_thread_description(), hpx::get_error(),
hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(),
hpx::get_error_config(), hpx::get_error_state()

```

**Parameters**

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

**Throws**

nothing –

**Returns**

The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size(-1)`.

*std::size\_t* **get\_error\_thread\_id**(*hpx::exception\_info* const &xi) noexcept

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function *hpx::get\_error\_thread\_id* can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

**See also**

```

hpx::get_error_config(), hpx::get_error_state()

```

**Parameters**

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

**Throws**

nothing –

**Returns**

The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size_t(0)`.

*std::string* **get\_error\_thread\_description**(*hpx::exception\_info* const &xi)

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_description` can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.
