- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the `INVOKE` operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns a *hpx::future<std::ranges::iterator_t<Rng>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::ranges::iterator_t<Rng>* otherwise. It returns *last*.

hpx::ranges::uninitialized_move, hpx::ranges::uninitialized_move_n

Defined in header `hpx/algorithm.hpp`⁶²³.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
    namespace ranges
```

Functions

```
template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_move(InIter first1, Sent1 last1,
                                                                    FwdIter first2, Sent2 last2)
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move* algorithm returns an *in_out_result<InIter, FwdIter>*. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

⁶²³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move* algorithm returns a *hpx::future<in_out_result<InIter, FwdIter>>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result<InIter, FwdIter>* otherwise. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

template<typename **Rng1**, typename **Rng2**>

hpx::parallel::util::in_out_result<typename *hpx::traits::range_traits*<*Rng1*>::iterator_type, typename *hpx::traits::range_traits*<*Rng2*>::iterator_type>

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

Returns

The *uninitialized_move* algorithm returns an *in_out_result*<typename *hpx::traits::range_traits*<*Rng1*>::iterator_type, typename *hpx::traits::range_traits*<*Rng2*>::iterator_type>. The *uninitialized_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type,
typename hpx::traits::range_traits<Rng2>::iterator_type>>
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

Returns

The *uninitialized_move* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `in_out_result< typename hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The *uninitialized_move* algorithm returns the input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename InIter, typename Size, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> uninitialized_move_n(InIter first1, Size count,
                                                                    FwdIter first2, Sent2 last2)
```

Moves the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1`, to another range beginning at `dest`. If an exception is thrown during the initialization, some objects in `[first, first + count)` are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move_n* algorithm returns `in_out_result<InIter, FwdIter>`. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
```

`parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type uninitialized`

Moves the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1`, to another range beginning at `dest`. If an exception is thrown during the initialization, some objects in `[first, first + count)` are left in a valid but unspecified state.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_move_n* algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_move_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

hpx::ranges::remove, hpx::ranges::remove_if

Defined in header `hpx/algorithm.hpp`⁶²⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename Iter, typename Sent, typename Pred, typename Proj = hpx::identity>  
subrange_t<Iter, Sent> remove_if(Iter first, Sent sent, Pred &&pred, Proj &&proj = Proj())
```

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred* and the projection *proj*.

Template Parameters

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*..
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a *subrange_t*<*FwdIter*, *Sent*>. The *remove_if* algorithm

⁶²⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
subrange_t<std::ranges::iterator_t<Rng>> remove_if(Rng &&rng, Pred &&pred, Proj &&proj =
    Proj())
```

Removes all elements that are equal to *value* from the range *rng* and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator==() and the projection *proj*.
-

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a *subrange_t<std::ranges::iterator_t<Rng>>*. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =
    hpx::identity>
```

```

parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type remove_if(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
sent,
Pred
&&pred,
Proj
&&proj
=
Proj())

```

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred* and the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a `hpx::future<subrange_t<FwdIter, Sent>>`. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>>> remove_if(ExPolicy
                                                                                                     &&pol-
                                                                                                     icy,
                                                                                                     Rng
                                                                                                     &&rng,
                                                                                                     Pred
                                                                                                     &&pred,
                                                                                                     Proj
                                                                                                     &&proj
                                                                                                     =
                                                                                                     Proj())
```

Removes all elements that are equal to *value* from the range *rng* and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than `util::end(rng)`

- `util::begin(rng)` assignments, exactly `util::end(rng) - util::begin(rng)` applications of the operator `==()` and the projection *proj*.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the ob-

jects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove_if* algorithm returns a *hpx::future<subrange_t<std::ranges::iterator_t<Rng>>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename Iter, typename Sent, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<Iter, Proj>::value_type>
```

```
subrange_t<Iter, Sent> remove(Iter first, Sent last, T const &value, Proj &&proj = Proj())
```

Removes all elements that are equal to *value* from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator==() and the projection *proj*.

Template Parameters

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a *subrange_t<FwdIter, Sent>*. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
```

```
subrange_t<std::ranges::iterator_t<Rng>> remove(Rng &&rng, T const &value, Proj &&proj = Proj())
```

Removes all elements that are equal to *value* from the range *rng* and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator *==()* and the projection *proj*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a *subrange_t<std::ranges::iterator_t<Rng>>*. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Proj = hpx::identity,
typename T = typename hpx::parallel::traits::projected<FwdIter, Proj>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type remove(ExPolicy
&&policy,
FwdIter
first, Sent
last, T
const
&value,
Proj
&&proj =
Proj())
```

Removes all elements that are equal to *value* from the range [first, last) and and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator *==()* and the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a *hpx::future<subrange_t<FwdIter, Sent>>*. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename T = typename  
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>  
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> remove(ExPolicy  
                                                    &&pol-  
                                                    icy,  
                                                    Rng  
                                                    &&rng,  
                                                    T  
                                                    const  
                                                    &value,  
                                                    Proj  
                                                    &&proj  
                                                    =  
                                                    Proj())
```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng)* - *util::begin(rng)* applications of the operator==() and the projection *proj*.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *remove* algorithm returns a `hpx::future< subrange_t<std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove* algorithm returns the iterator to the new end of the range.

hpx::ranges::is_heap, hpx::ranges::is_heap_until

Defined in header `hpx/algorithm.hpp`⁶²⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename ExPolicy, typename Rng, typename Comp = hpx::parallel::detail::less, typename
Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> is_heap(ExPolicy &&policy, Rng
&&rng, Comp &&comp =
Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

⁶²⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp =  
hpx::parallel::detail::less, typename Proj = hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> is_heap(ExPolicy &&policy, Iter first,  
Sent last, Comp &&comp =  
Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
bool is_heap(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

Note: Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap* algorithm returns *bool*. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool is_heap(Iter first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

Note: Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap* algorithm returns *bool*. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename ExPolicy, typename Rng, typename Comp = hpx::parallel::detail::less, typename  
Proj = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> is_heap_until(ExPolicy  
                                                    &&pol-  
                                                    icy,  
                                                    Rng  
                                                    &&rng,  
                                                    Comp  
                                                    &&comp  
                                                    =  
                                                    Comp(),  
                                                    Proj  
                                                    &&proj  
                                                    =  
                                                    Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [*first*, *it*) is a max heap.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp =
    hpx::parallel::detail::less, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> is_heap_until(ExPolicy &&policy, Iter
    first, Sent last, Comp
    &&comp = Comp(), Proj
    &&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [*first*, *it*) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> is_heap_until(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

comp has to induce a strict weak ordering on the values.

Note: Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap_until* algorithm returns *RandIter*. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
Iter is_heap_until(Iter first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

comp has to induce a strict weak ordering on the values.

Note: Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter1`.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate `is` is invoked.

Returns

The `is_heap_until` algorithm returns `RandIter`. The `is_heap_until` algorithm returns the upper bound of the largest range beginning at `first` which is a max heap. That is, the last iterator `it` for which range `[first, it)` is a max heap.

`hpx::ranges::copy`, `hpx::ranges::copy_n`, `hpx::ranges::copy_if`

Defined in header `hpx/algorithm.hpp`⁶²⁶.

parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_result<FwdIter1, FwdIter>>::type copy(ExPolicy
&&pol-
icy,
FwdIter1
iter,
Sent1
sent,
FwdIter
dest)
```

Copies the elements in the range, defined by `[first, last)`, to another range beginning at `dest`.

The assignments in the parallel `copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

⁶²⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a `hpx::future<ranges::copy_result<FwdIter1, FwdIter> >` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::copy_result<FwdIter1, FwdIter>` otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter>
parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_result<typename hpx::traits::range_traits<Rng>::iterator_type
```

Copies the elements in the range *rng* to another range beginning at *dest*.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a *hpx::future<ranges::copy_result<iterator_t<Rng>, FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::copy_result<iterator_t<Rng>, FwdIter2>* otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter>
ranges::copy_result<FwdIter1, FwdIter> copy(FwdIter1 iter, Sent1 sent, FwdIter dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter>
ranges::copy_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter> copy(Rng
                                                                                               &&rng,
                                                                                               FwdIter
                                                                                               dest)
```

Copies the elements in the range *rng* to another range beginning at *dest*.

Note: Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_n_result<FwdIter1, FwdIter2>>::type copy_n(ExPolicy
&&pol-
icy,
FwdIter
first,
Size
count,
FwdIter
dest)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy_n* algorithm returns a *hpx::future<ranges::copy_n_result<FwdIter1, FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::copy_n_result<FwdIter1, FwdIter2>* otherwise. The *copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Size, typename FwdIter2>
ranges::copy_n_result<FwdIter1, FwdIter2> copy_n(FwdIter1 first, Size count, FwdIter2 dest)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count

- 1., to another range beginning at *dest*.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter, typename
Pred, typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_if_result<FwdIter1, FwdIter>>::type copy_if(ExPolicy
&&pol
icy,
FwdIter
iter,
Sent1
sent,
FwdIter
dest,
Pred
&&pre
Proj
&&pro
=
Proj())
```

Copies the elements in the range, defined by [*first*, *last*) to another range beginning at *dest*. The order of the elements that are not removed is preserved.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `FwdIter1`.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns `true` if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types `Type1` must be such that objects of type `FwdIter` can be dereferenced and then implicitly converted to `Type1`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The `copy_if` algorithm returns a `hpx::future<ranges::copy_if_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::copy_if_result<iterator_t<Rng>, FwdIter2>` otherwise. The `copy_if` algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename Pred, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_if_result<typename hpx::traits::range_traits<Rng>::iter
```

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

The assignments in the parallel `copy_if` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `copy_if` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns `true` if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types `Type1` must be such that objects of type `FwdIter` can be dereferenced and then implicitly converted to `Type1`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate is invoked.

Returns

The `copy_if` algorithm returns a `hpx::future<ranges::copy_if_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::copy_if_result<iterator_t<Rng>, FwdIter2>` otherwise. The `copy_if` algorithm returns the pair of the input iterator `last` and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter, typename Pred, typename Proj =
hpx::identity>
ranges::copy_if_result<FwdIter1, FwdIter> copy_if(FwdIter1 iter, Sent1 sent, FwdIter dest, Pred
&&pred, Proj &&proj = Proj())
```

Copies the elements in the range, defined by `[first, last)` to another range beginning at `dest`. The order of the elements that are not removed is preserved.

Template Parameters

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `FwdIter1`.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns `true` if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *copy_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter, typename Pred, typename Proj = hpx::identity>
ranges::copy_if_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter> copy_if(Rng
                                                                                               &&rng,
                                                                                               FwdIter
                                                                                               dest,
                                                                                               Pred
                                                                                               &&pred,
                                                                                               Proj
                                                                                               &&proj
                                                                                               =
                                                                                               Proj())
```

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *copy_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::shift_right

Defined in header `hpx/algorithm.hpp`⁶²⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**, typename **Size**>

FwdIter **shift_right**(*FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns *FwdIter*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**, typename **Size**>

hpx::parallel::util::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **shift_right**(*ExPolicy* &&policy, *FwdIter* first, *Sent* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

⁶²⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename Rng, typename Size>  
std::ranges::iterator_t<Rng> shift_right(Rng &&rng, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *std::ranges::iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns *std::ranges::iterator_t<Rng>*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename Rng, typename Size>
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> shift_right(ExPolicy
                                                    &&pol-
                                                    icy, Rng
                                                    &&rng,
                                                    Size n)
```

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *std::ranges::iterator_t<Rng>* must meet the requirements of *Move-Assignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns a *hpx::future<std::ranges::iterator_t<Rng>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::ranges::iterator_t<Rng>* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

hpx::ranges::move

Defined in header `hpx/algorithm.hpp`⁶²⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
    namespace ranges
```

Functions

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, move_result<Iter1, Iter2>>::type move(ExPolicy  
                                                    &&policy,  
                                                    Iter1 first,  
                                                    Sent1 last,  
                                                    Iter2 dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a `hpx::future<ranges::move_result<iterator_t<Rng>,`

⁶²⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

`FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::move_result<iterator_t<Rng>, FwdIter2>* otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename Rng, typename Iter2>
hpx::parallel::util::detail::algorithm_result<ExPolicy, move_result<std::ranges::iterator_t<Rng>, Iter2>>>::type move(ExPol
&&pc
icy,
Rng
&&rn
Iter2
dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a *hpx::future<ranges::move_result<iterator_t<Rng>, FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::move_result<iterator_t<Rng>, FwdIter2>* otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Iter1, typename Sent1, typename Iter2>
move_result<Iter1, Iter2> move(Iter1 first, Sent1 last, Iter2 dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

Note: Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns `ranges::move_result<iterator_t<Rng>, FwdIter2>`. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Rng, typename Iter2>
move_result<std::ranges::iterator_t<Rng>, Iter2> move(Rng &&rng, Iter2 dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

Note: Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a `ranges::move_result<iterator_t<Rng>, FwdIter2>`. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

hpx::ranges::transform_reduce

Defined in header `hpx/algorithm.hpp`⁶²⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁶²⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename **T**, typename **Reduce**, typename **Convert**>

hpx::parallel::util::detail::algorithm_result_t<*ExPolicy*, *T*> **transform_reduce**(*ExPolicy* &&policy, *Iter* first, *Sent* last, *T* init, *Reduce* &&red_op, *Convert* &&conv_op)

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename T, typename Reduce, typename Convert>  
T transform_reduce(Iter first, Sent last, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter
                                                                    first, Sent last, Iter2 first2, T
                                                                    init)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
 - *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [*first*, *last*).

```
template<typename Iter, typename Sent, typename Iter2, typename T>
T transform_reduce(Iter first, Sent last, Iter2 first2, T init)
```

Returns GENERALIZED_SUM(*red_op*, *init*, *conv_op*(**first*), ..., *conv_op*((**first* + (*last* - *first*) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
 - *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [*first*, *last*).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T, typename
Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Iter
                                                                    first, Sent last, Iter2 first2, T
                                                                    init, Reduce &&red_op,
                                                                    Convert &&conv_op)
```

Returns GENERALIZED_SUM(*red_op*, *init*, *conv_op*(**first*), ..., *conv_op*((**first* + (*last* - *first*) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
 - *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
```

```
T transform_reduce(Iter first, Sent last, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.

- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng
                                                                    &&rng, T init, Reduce
                                                                    &&red_op, Convert
                                                                    &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
 - *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Rng, typename T, typename Reduce, typename Convert>
T transform_reduce(Rng &&rng, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng
&&rng, Iter2 first2, T init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename Rng, typename Iter2, typename T>
```

T **transform_reduce**(*Rng* &&rng, *Iter2* first2, *T* init)

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns *T*.

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T, typename Reduce, typename  
Convert>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, Rng  
                                     &&rng, Iter2 first2, T init,  
                                     Reduce &&red_op, Convert  
                                     &&conv_op)
```

Returns the result of accumulating init with the inner products of the pairs formed by the elements of two ranges starting at first1 and first2.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
T transform_reduce(Rng &&rng, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns

The *transform_reduce* algorithm returns *T*.

`hpx::ranges::uninitialized_fill`, `hpx::ranges::uninitialized_fill_n`

Defined in header `hpx/algorithm.hpp`⁶³⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

⁶³⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename FwdIter, typename Sent, typename T>
FwdIter uninitialized_fill(FwdIter first, Sent last, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the ranges *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_fill(ExPolicy
                                                                                      &&policy,
                                                                                      FwdIter first,
                                                                                      Sent last, T
                                                                                      const
                                                                                      &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

executes the assignments.

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename Rng, typename T>
```

```
hpx::traits::range_traits<Rng>::iterator_type uninitialized_fill(Rng &&rng, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a returns *hpx::traits::range_traits<Rng>::iterator_type*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename T>
```

```
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type uninitia
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a *hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename hpx::traits::range_traits<Rng>::iterator_type* otherwise. The *uninitialized_fill* algorithm returns the iterator to one past the last element filled in the range.

template<typename **FwdIter**, typename **Size**, typename **T**>

FwdIter **uninitialized_fill_n**(*FwdIter* first, *Size* count, *T* const &value)

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill_n* algorithm returns a *FwdIter*. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_fill_n(ExPolicy
                                                                                          &&policy,
                                                                                          FwdIter
                                                                                          first, Size
                                                                                          count, T
                                                                                          const
                                                                                          &value)
```

Copies the given *value* value to the first *count* elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill_n* algorithm returns a *hpx::future<FwdIter>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

hpx::ranges::rotate, hpx::ranges::rotate_copy

Defined in header [hpx/algorithm.hpp](#)⁶³¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

⁶³¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent>
subrange_t<FwdIter, Sent> rotate(FwdIter first, FwdIter middle, Sent last)
```

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element middle becomes the first element of the new range and middle - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a *subrange_t<FwdIter, Sent>*. The *rotate* algorithm returns the iterator equal to pair(first + (last - middle), last).

```
template<typename ExPolicy, typename FwdIter, typename Sent>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type rotate(ExPolicy
&&policy,
FwdIter
first,
FwdIter
middle,
Sent last)
```

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element middle becomes the first element of the new range and middle - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified

threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a *hpx::future<subrange_t<FwdIter, Sent>>* if the execution policy is of type *parallel_task_policy* and returns a *subrange_t<FwdIter, Sent>* otherwise. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

```
template<typename Rng>
subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>> rotate(Rng &&rng,
                                                                    std::ranges::iterator_t<Rng>
                                                                    middle)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range `[first, last)` in such a way that the element *middle* becomes the first element of the new range and *middle - 1* becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

Returns

The *rotate* algorithm returns a *subrange_t*<*std::ranges::iterator_t*<*Rng*>, *std::ranges::iterator_t*<*Rng*>>. The *rotate* algorithm returns the iterator equal to *pair*(*first* + (*last* - *middle*), *last*).

```
template<typename ExPolicy, typename Rng>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> r
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [*first*, *last*) in such a way that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

Returns

The *rotate* algorithm returns a *hpx::future* <*subrange_t*<*std::ranges::iterator_t*<*Rng*>, *std::ranges::iterator_t*<*Rng*>>> if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *subrange_t*<*std::ranges::iterator_t*<*Rng*>, *std::ranges::iterator_t*<*Rng*>>. otherwise. The *rotate* algorithm returns the iterator equal to *pair*(*first* + (*last* - *middle*), *last*).

```
template<typename FwdIter, typename Sent, typename OutIter>
rotate_copy_result<FwdIter, OutIter> rotate_copy(FwdIter first, FwdIter middle, Sent last, OutIter
dest_first)
```

Copies the elements from the range `[first, last)`, to another range beginning at `dest_first` in such a way, that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel `rotate_copy` algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly `last - first` assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range `[first,last)`.

Returns

The `rotate_copy` algorithm returns a `rotate_copy_result<FwdIter, OutIter>`. The `rotate_copy` algorithm returns the output iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2>
parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<FwdIter1, FwdIter2>>::type rotate_copy(ExPolicy
&&pol-
icy,
FwdIter1
first,
FwdIter1
mid-
dle,
Sent
last,
FwdIter2
dest_first)
```

Copies the elements from the range `[first, last)`, to another range beginning at `dest_first` in such a way, that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel `rotate_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `rotate_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns

The *rotate_copy* algorithm returns `hpx::future< rotate_copy_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *rotate_copy_result<FwdIter1, FwdIter2>* otherwise. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename Rng, typename OutIter>
rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter> rotate_copy(Rng &&rng,
                                                                    std::ranges::iterator_t<Rng>
                                                                    middle, OutIter dest_first)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle - 1* becomes the last element.

The assignments in the parallel *rotate_copy* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns

The *rotate* algorithm returns a *rotate_copy_result*<std::ranges::iterator_t<Rng>, OutIter>. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename ExPolicy, typename Rng, typename OutIter>  
parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>> rotate_copy
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *new_first* becomes the first element of the new range and *new_first* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range [first,last).

Returns

The *rotate_copy* algorithm returns a *hpx::future*<*otate_copy_result*<std::ranges::iterator_t<Rng>, OutIter>> if the execution policy is of type *parallel_task_policy* and returns *rotate_copy_result*<std::ranges::iterator_t<Rng>, OutIter> otherwise. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

hpx::ranges::transform_inclusive_scan

Defined in header `hpx/algorithm.hpp`⁶³².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp>
transform_inclusive_scan_result<InIter, OutIter> transform_inclusive_scan(InIter first, Sent last,
                                                                           OutIter dest, BinOp
                                                                           &&binary_op, UnOp
                                                                           &&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
 - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where $1 < K+1 = M \leq N$).
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

⁶³² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_inclusive_scan* algorithm returns *transform_inclusive_scan_result<InIter, OutIter>*. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename  
BinOp, typename UnOp>  
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type transform_incl
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
 - `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_result<FwdIter1,`

`FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_result<FwdIter1, FwdIter2>* otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp>
transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O> transform_inclusive_scan(Rng
                                                                                          &&rng,
                                                                                          O
                                                                                          dest,
                                                                                          BinOp
                                                                                          &&bi-
                                                                                          nary_op,
                                                                                          UnOp
                                                                                          &&unary_op)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- *a1* when *N* is 1
 - `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.
-

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects

passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_inclusive_scan* algorithm returns a *transform_inclusive_scan_result*< std::ranges::iterator_t<Rng>, O>. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1

- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where  $1 < K+1 = M \leq N$ .`

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_inclusive_scan* algorithm returns a `hpx::future<transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>* otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp,
typename T = typename std::iterator_traits<InIter>::value_type>
transform_inclusive_scan_result<InIter, OutIter> transform_inclusive_scan(InIter first, Sent last,
                                                                    OutIter dest, BinOp
                                                                    &&binary_op, UnOp
                                                                    &&unary_op, T init)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
 - *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aK*), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *aM*, ..., *aN*)) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns *transform_inclusive_scan_result<InIter, OutIter>*. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename
BinOp, typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type transform_inc
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
 - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where $1 < K+1 = M \leq N$).
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **FwdIter**.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns a *hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *transform_inclusive_result<FwdIter1, FwdIter2>* otherwise. The *transform_inclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

```
transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O> transform_inclusive_scan(Rng
                                                                                          &&rng,
                                                                                          O
                                                                                          dest,
                                                                                          BinOp
                                                                                          &&bi-
                                                                                          nary_op,
                                                                                          UnOp
                                                                                          &&unary_op,
                                                                                          T
                                                                                          init)
```

Assigns through each iterator i in $[result, result + (last - first))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges $[first, last)$ or $[result, result + (last - first))$.

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of the predicates `op` and `conv`.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$ when N is 1
 - `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.
-

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types `Type1` and `Ret` must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by $[first, last)$. This is a unary predicate. The

signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns a *transform_inclusive_scan_result*< std::ranges::iterator_t<Rng>, O>. The *transform_inclusive_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename
T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type>
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform_inclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *op* and *conv*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1

- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN) where  $1 < K+1 = M \leq N$ .`

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

Returns

The `transform_inclusive_scan` algorithm returns a `hpx::future<transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>` otherwise. The `transform_inclusive_scan` algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::is_partitioned

Defined in header `hpx/algorithm.hpp`⁶³³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent, typename Pred, typename Proj = hpx::identity>
bool is_partitioned(FwdIter first, Sent last, Pred &&pred, Proj &&proj = Proj())
```

Determines if the range [first, last) is partitioned.

Note: Complexity: at most (N) predicate evaluations where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns *bool*. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range [first, last) contains less than two elements, the function is always true.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj = hpx::identity>
```

⁶³³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> is_partitioned(ExPolicy &&policy,
                                                                    FwdIter first, Sent last,
                                                                    Pred &&pred, Proj
                                                                    &&proj = Proj())
```

Determines if the range [first, last) is partitioned.

The predicate operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (N) predicate evaluations where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *Copy-Constructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range [first, last) contains less than two elements, the function is always true.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
bool is_partitioned(Rng &&rng, Pred &&pred, Proj &&proj = Proj())
```

Determines if the range *rng* is partitioned.

Note: Complexity: at most (N) predicate evaluations where $N = \text{std::size}(\text{rng})$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns *bool*. The *is_partitioned* algorithm returns true if each element in the sequence for which `pred` returns true precedes those for which `pred` returns false. Otherwise *is_partitioned* returns false. If the range `rng` contains less than two elements, the function is always true.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> is_partitioned(ExPolicy &&policy,
                                                                              Rng &&rng, Pred
                                                                              &&pred, Proj &&proj
                                                                              = Proj())
```

Determines if the range [first, last) is partitioned.

The predicate operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (N) predicate evaluations where $N = \text{std::size}(\text{rng})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *Copy-Constructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

`bool pred(const Type &a);`

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns a `hpx::future<bool>` if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range *rng* contains less than two elements, the function is always true.

`hpx::ranges::remove_copy, hpx::ranges::remove_copy_if`

namespace **hpx**

namespace **ranges**

`hpx::ranges::unique, hpx::ranges::unique_copy`

Defined in header `hpx/algorithm.hpp`⁶³⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

⁶³⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

⁶³⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename Proj =
hpx::identity>
subrange_t<FwdIter, Sent> unique(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj =
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **FwdIter**.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns `subrange_t<FwdIter, Sent>`. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = ranges::equal_to,
typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type unique(ExPolicy
&&policy,
FwdIter
first, Sent
last, Pred
&&pred =
Pred(),
Proj
&&proj =
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns *subrange_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>> unique(Rng &&rng, Pred
&&pred = Pred(), Proj
&&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where N = *std::distance(begin(rng), end(rng))*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to *std::equal_to<>*
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns *subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename Rng, typename Pred = ranges::equal_to, typename Proj =
hpx::identity>
```

parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> u

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where N = `std::distance(begin(rng), end(rng))`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique* algorithm returns a *hpx::future* `<subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>* otherwise. The *unique* algorithm returns an object `{ret, last}`, where *ret* is a past-the-end iterator for a new subrange.

```
template<typename InIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename
Proj = hpx::identity>
unique_copy_result<InIter, O> unique_copy(InIter first, Sent last, O dest, Pred &&pred = Pred(), Proj
&&proj = Proj())
```

Copies the elements from the range `[first, last)`, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns a `unique_copy_result<InIter, O>`. The *unique_copy* algorithm returns an `in_out_result` with the source iterator to one past the

last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename O, typename Pred =  
    ranges::equal_to, typename Proj = hpx::identity>  
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<FwdIter, O>>::type unique_copy(ExPolicy  
    &&pol-  
    icy,  
    FwdIter  
    first,  
    Sent  
    last,  
    O  
    dest,  
    Pred  
    &&pred  
    =  
    Pred(),  
    Proj  
    &&proj  
    =  
    Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns a `hpx::future< unique_copy_result<FwdIter, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `unique_copy_result<FwdIter, O>` otherwise. The *unique_copy* algorithm returns an `in_out_result` with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj =
hpx::identity>
unique_copy_result<std::ranges::iterator_t<Rng>, O> unique_copy(Rng &&rng, O dest, Pred &&pred
= Pred(), Proj &&proj = Proj())
```

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *N* assignments, exactly *N* - 1 applications of the predicate *pred*, where *N* = `std::distance(begin(rng), end(rng))`.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns *unique_copy_result*< `std::ranges::iterator_t<Rng>`, `O`>. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename Rng, typename O, typename Pred = ranges::equal_to,
typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<std::ranges::iterator_t<Rng>, O>> unique_copy(Ex
```

```
&&
icy
Rng
&&
O
des
Pre
&&
=
Pre
Pro
&&
=
Pro
```

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *N* assignments, exactly *N* - 1 applications of the predicate *pred*, where *N* = `std::distance(begin(rng), end(rng))`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of

CopyConstructible. This defaults to `std::equal_to<>`

- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *unique_copy* algorithm returns a `hpx::future<unique_copy_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `unique_copy_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

hpx::ranges::adjacent_difference

Defined in header `hpx/algorithm.hpp`⁶³⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter1, typename FwdIter2, typename Sent>
FwdIter2 adjacent_difference(FwdIter1 first, Sent last, FwdIter2 dest)
```

Searches the range [first, last) for two consecutive identical elements.

Note: Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.

⁶³⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename Rng, typename FwdIter2>
FwdIter2 adjacent_difference(Rng &&rng, FwdIter2 dest)
    Searches the rng for two consecutive identical elements.
```

Note: Complexity: Exactly the smaller of $(\text{result} - \text{first}) + 1$ and $(\text{last} - \text{first}) - 1$ application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> adjacent_difference(ExPolicy
                                                                                          &&policy,
                                                                                          FwdIter1
                                                                                          first, Sent
                                                                                          last,
                                                                                          FwdIter2
                                                                                          dest)
```

Searches the range $[\text{first}, \text{last})$ for two consecutive identical elements.

Note: Complexity: Exactly the smaller of $(\text{result} - \text{first}) + 1$ and $(\text{last} - \text{first}) - 1$ application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename Rng, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> adjacent_difference(ExPolicy
                                                                                      &&policy,
                                                                                      Rng
                                                                                      &&rng,
                                                                                      FwdIter2
                                                                                      dest)
```

Searches the *rng* for two consecutive identical elements.

Note: Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename FwdIter1, typename Sent, typename FwdIter2, typename Op>
FwdIter2 adjacent_difference(FwdIter1 first, Sent last, FwdIter2 dest, Op &&op)
```

Searches the range [first, last) for two consecutive identical elements.

Note: Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type `iterator_traits<InputIt>::value_type` can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename Rng, typename FwdIter2, typename Op>
FwdIter2 adjacent_difference(Rng &&rng, FwdIter2 dest, Op &&op)
```

Searches the *rng* for two consecutive identical elements.

Template Parameters

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type `iterator_traits<InputIt>::value_type` can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Op>
```

```

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> adjacent_difference(ExPolicy
                                                                                       &&policy,
                                                                                       FwdIter1
                                                                                       first, Sent
                                                                                       last,
                                                                                       FwdIter2
                                                                                       dest, Op
                                                                                       &&op)

```

Searches the range [first, last) for two consecutive identical elements.

Note: Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type `iterator_traits<InputIt>::value_type` can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```

template<typename ExPolicy, typename Rng, typename FwdIter2, typename Op>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> adjacent_difference(ExPolicy
                                                                                       &&policy,
                                                                                       Rng
                                                                                       &&rng,
                                                                                       FwdIter2
                                                                                       dest, Op
                                                                                       &&op)

```

Searches the *rng* for two consecutive identical elements.

Note: Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type *iterator_traits<InputIt>::value_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *adjacent_difference* algorithm returns an iterator to the first of the identical elements.

hpx::ranges::all_of, hpx::ranges::any_of, hpx::ranges::none_of

Defined in header `hpx/algorithm.hpp`⁶³⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

⁶³⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> none_of(ExPolicy &&policy, Rng
                                                                    &&rng, F &&f, Proj &&proj =
                                                                    Proj())
```

Checks if unary predicate *f* returns true for no elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> none_of(ExPolicy &&policy, Iter first,
                                                                    Sent last, F &&f, Proj &&proj =
                                                                    Proj())
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
bool none_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range *rng*.

Note: Complexity: At most *std::distance(begin(rng), end(rng))* applications of the predicate *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
bool none_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

Note: Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> any_of(ExPolicy &&policy, Rng &&rng,
                                                                    F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> any_of(ExPolicy &&policy, Iter first,
                                                                    Sent last, F &&f, Proj &&proj =
                                                                    Proj())
```

Checks if unary predicate f returns true for at least one element in the range rng .

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate f

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `Iter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires F to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *any_of* algorithm returns true if the unary predicate f returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
bool any_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate f returns true for at least one element in the range rng .

Note: Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate f

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>  
bool any_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

Note: Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> all_of(ExPolicy &&policy, Rng &&rng,
                                                                    F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> all_of(ExPolicy &&policy, Iter first,
                                                                    Sent last, F &&f, Proj &&proj =
                                                                    Proj())
```

Checks if unary predicate f returns true for all elements in the range rng .

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate f

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `Iter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires F to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate f returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
bool all_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate f returns true for all elements in the range rng .

Note: Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate f

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
bool all_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

Note: Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

hpx::ranges::reverse, hpx::ranges::reverse_copy

Defined in header `hpx/algorithm.hpp`⁶³⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **Iter**, typename **Sent**>

Iter **reverse**(*Iter* first, *Sent* sent)

Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a *Iter*. It returns *last*.

template<typename **Rng**>

`std::ranges::iterator_t<Rng>` **reverse**(*Rng* &&rng)

Uses *rng* as the source range, as if using `util::begin(rng)` as *first* and `ranges::end(rng)` as *last*. Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*.

⁶³⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

Parameters

rng – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a *hpx::traits::range_iterator<Rng>::type*. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> reverse(ExPolicy &&policy, Iter first,
                                                                    Sent sent)
```

Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng>
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> reverse(ExPolicy
                                                                    &&policy, Rng
                                                                    &&rng)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type

parallel_policy or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `hpx::future< std::ranges::iterator_t<Rng>>` otherwise. It returns *last*.

```
template<typename Iter, typename Sent, typename OutIter>
reverse_copy_result<Iter, OutIter> reverse_copy(Iter first, Sent last, OutIter result)
```

Copies the elements from the range [first, last) to another range beginning at result in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment $*(result + (last - first) - 1 - i) = *(first + i)$ once for each non-negative $i < (last - first)$. If the source and destination ranges (that is, [first, last) and [result, result+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a `reverse_copy_result<Iter, OutIter>`. The *reverse_copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename OutIter>
reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter> reverse_copy(Rng &&rng, OutIter result)
```

Uses *rng* as the source range, as if using `util::begin(rng)` as *first* and `ranges::end(rng)` as *last*. Copies

the elements from the range $[first, last)$ to another range beginning at $result$ in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment $*(result + (last - first) - 1 - i) = *(first + i)$ once for each non-negative $i < (last - first)$. If the source and destination ranges (that is, $[first, last)$ and $[result, result + (last - first))$ respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a `ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>`. The *reverse_copy* algorithm returns an object equal to $\{last, result + N\}$ where $N = last - first$.

```
template<typename ExPolicy, typename Iter, typename Sent, typename FwdIter>
parallel::util::detail::algorithm_result<ExPolicy, reverse_copy_result<Iter, FwdIter>>::type reverse_copy(ExPolicy
&&pol-
icy,
Iter
first,
Sent
last,
FwdIter
re-
sult)
```

Copies the elements from the range $[first, last)$ to another range beginning at $result$ in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment $*(result + (last - first) - 1 - i) = *(first + i)$ once for each non-negative $i < (last - first)$. If the source and destination ranges (that is, $[first, last)$ and $[result, result + (last - first))$ respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for **Iter**.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a `hpx::future<reverse_copy_result<Iter, FwdIter> >` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *reverse_copy_result<Iter, FwdIter>* otherwise. The *reverse_copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename OutIter>  
parallel::util::detail::algorithm_result<ExPolicy, reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>>::type revers
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last) to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment $*(result + (last - first) - 1 - i) = *(first + i)$ once for each non-negative $i < (last - first)$. If the source and destination ranges (that is, [first, last) and [result, result+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a *hpx::future<ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>* otherwise. The *reverse_copy* algorithm returns an object equal to {last, result + N} where N = last - first

hpx::ranges::set_union

Defined in header [hpx/algorithm.hpp](#)⁶³⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2,
        typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename
        Proj2 = hpx::identity>
```

⁶³⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<Iter1, Iter2, Iter3>>::type set_union(ExPolicy
&&pol-
icy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, then all *m* elements will be copied from *[first1, last1)* to *dest*, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from *[first2, last2)* to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.

- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter1`.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for `Iter2`.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_union` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type `Type1` must be such that objects of type `InIter` can be dereferenced and then implicitly converted to `Type1`

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate `op` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate `op` is invoked.

Returns

The `set_union` algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. The `set_union` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, then all *m* elements will be copied from *[first1, last1)* to *dest*, preserving order, and then exactly *std::max(n-m, 0)* elements will be copied from *[first2, last2)* to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter1* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_union* algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
set_union_result<Iter1, Iter2, Iter3> tag_fallback_invoke(set_union_t, Iter1 first1, Sent1 last1, Iter2
first2, Sent2 last2, Iter3 dest, Pred &&op
= Pred(), Proj1 &&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), then all *m* elements will be copied from [*first1*, *last1*) to *dest*, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from [*first2*, *last2*) to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence

and $N2$ is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_union* algorithm returns `ranges::set_union_result<Iter1, Iter2, Iter3>`. The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```

set_union_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> set_union(Rng1
&&rng1,
Rng2
&&rng2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())

```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, then all *m* elements will be copied from *[first1, last1)* to *dest*, preserving order, and then exactly *std::max(n-m, 0)* elements will be copied from *[first2, last2)* to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_union* algorithm returns *ranges::set_union_result<Iter1, Iter2, Iter3>*. where *Iter1* is *range_iterator_t<Rng1>* and *Iter2* is *range_iterator_t<Rng2>* The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::swap_ranges

Defined in header [hpx/algorithm.hpp](#)⁶⁴⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename InIter1, typename Sent1, typename InIter2, typename Sent2>  
swap_ranges_result<InIter1, InIter2> swap_ranges(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2)
```

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **InIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for *InIter1*.
- **InIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

Parameters

- **first1** – Refers to the beginning of the sequence of elements for the first range.

⁶⁴⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns

The *swap_ranges* algorithm returns *swap_ranges_result<InIter1, InIter2>*. The *swap_ranges* algorithm returns *in_in_result* with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

```
parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<FwdIter1, FwdIter2>>::type swap_ranges(ExPolicy
&&pol-
icy,
FwdIter1
first1,
Sent1
last1,
FwdIter2
first2,
Sent2
last2)
```

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for *FwdIter1*.
- **FwdIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.

- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

Returns

The *swap_ranges* algorithm returns a *hpx::future<swap_ranges_result<FwdIter1, FwdIter2>>* if the execution policy is of type *parallel_task_policy* and returns *FwdIter2* otherwise. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename Rng1, typename Rng2>
swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>> swap_ranges(Rng1
                                                                                               &&rng1,
                                                                                               Rng2
                                                                                               &&rng2)
```

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns

The *swap_ranges* algorithm returns *swap_ranges_result< std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>*. The *swap_ranges* algorithm returns in_in_result with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<
```

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in

unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first1* and *last1*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

Returns

The `swap_ranges` algorithm returns a `hpx::future<swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>>` if the execution policy is of type `parallel_task_policy` and returns `swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>` otherwise. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

hpx::ranges::uninitialized_value_construct, hpx::ranges::uninitialized_value_construct_n

Defined in header `hpx/algorithm.hpp`⁶⁴¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

template<typename **FwdIter**, typename **Sent**>
FwdIter uninitialized_value_construct(*FwdIter* first, *Sent* last)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel `uninitialized_value_construct` algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

⁶⁴¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_value_construct* algorithm returns a *FwdIter*. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Sent>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_value_construct(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               FwdIter
                                                                                               first,
                                                                                               Sent
                                                                                               last)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

Returns

The *uninitialized_value_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter*

otherwise. The *uninitialized_value_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename Rng>
hpx::traits::range_traits<Rng>::iterator_type uninitialized_value_construct(Rng &&rng)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the range to which will be value constructed.

Returns

The *uninitialized_value_construct* algorithm returns a returns `hpx::traits::range_traits<Rng>::iterator_type`. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename Rng>
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type uninitial
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be value constructed

Returns

The *uninitialized_value_construct* algorithm returns a *hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename hpx::traits::range_traits<Rng>::iterator_type* otherwise. The *uninitialized_value_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename FwdIter, typename Size>  
FwdIter uninitialized_value_construct_n(FwdIter first, Size count)
```

Constructs objects of type *typename iterator_traits<ForwardIt>::value_type* in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_value_construct_n* algorithm returns a *returns FwdIter*. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Size>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_value_construct_n(ExPolicy  
                                                                                               &&pol-  
                                                                                               icy,  
                                                                                               FwdIter  
                                                                                               first,  
                                                                                               Size  
                                                                                               count)
```

Constructs objects of type *typename iterator_traits<ForwardIt>::value_type* in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered

fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_value_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::ranges::exclusive_scan

Defined in header [hpx/algorithm.hpp](#)⁶⁴².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename InIter, typename Sent, typename OutIter, typename T = typename
std::iterator_traits<InIter>::value_type, typename Op = std::plus<T>>
exclusive_scan_result<InIter, OutIter> exclusive_scan(InIter first, Sent last, OutIter dest, T init, Op
&&op = Op())
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, ..., *(first + (i - result) - 1)).

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

⁶⁴² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
 - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

Ret fun(const Type1 &a, const Type1 &b);

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename T
= typename std::iterator_traits<FwdIter1>::value_type, typename Op = std::plus<T>>
parallel::util::detail::algorithm_result<ExPolicy, exclusive_scan_result<FwdIter1, FwdIter2>>::type exclusive_scan(Ex
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERAL-

IZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, ..., *(first + (i - result) - 1)).

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
 - *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aK*), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *aM*, ..., *aN*)) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter1*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns a *hpx::future<util::in_out_result<FwdIter1, FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *util::in_out_result<FwdIter1, FwdIter2>* otherwise. The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type, typename Op = std::plus<T>>
exclusive_scan_result<std::ranges::iterator_t<Rng>, O> exclusive_scan(Rng &&rng, O dest, T init,
                                                                    Op &&op = Op())
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, ..., *(first + (i - result) - 1))

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *std::plus<T>*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
 - GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)
 - GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type, typename Op = std::plus<T>>
```

parallel::util::detail::algorithm_result<ExPolicy, exclusive_scan_result<std::ranges::iterator_t<Rng>, O>> exclusive_sca

Assigns through each iterator i in $[result, result + (last - first))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, ..., *(first + (i - result) - 1))

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the i th input element in the i th sum.

Note: Complexity: $O(last - first)$ applications of the predicate *std::plus<T>*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
 - GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)
 - GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate

should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::search, hpx::ranges::search_n

Defined in header `hpx/algorithm.hpp`⁶⁴³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent, typename FwdIter2, typename Sent2, typename Pred =  
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
FwdIter search(FwdIter first, Sent last, FwdIter2 s_first, Sent2 s_last, Pred &&op = Pred(), Proj1  
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most $(S \cdot N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

⁶⁴³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename FwdIter2, typename
Sent2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type search(ExPolicy &&policy, FwdIter
first, Sent last, FwdIter2 s_first,
Sent2 s_last, Pred &&op =
Pred(), Proj1 &&proj1 =
Proj1(), Proj2 &&proj2 =
Proj2())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [*s_first*, *s_last*) in range [*first*, *last*). If the length of the subsequence [*s_first*, *s_last*) is greater than the length of the range [*first*, *last*), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity>
std::ranges::iterator_t<Rng1> search(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [*first*, *last*) for any elements in the range [*s_first*, *s_last*). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most (*S***N*) comparisons where *S* = distance(*s_first*, *s_last*) and *N* = distance(*first*, *last*).

Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to<>*
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an

iterator to the beginning of the first subsequence [s_first, s_last) in range [first, last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred =  
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng1>> search(ExPolicy  
                                                    &&policy,  
                                                    Rng1  
                                                    &&rng1,  
                                                    Rng2  
                                                    &&rng2,  
                                                    Pred  
                                                    &&op =  
                                                    Pred(),  
                                                    Proj1  
                                                    &&proj1  
                                                    = Proj1(),  
                                                    Proj2  
                                                    &&proj2  
                                                    = Proj2())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most ($S \cdot N$) comparisons where S = distance(s_first, s_last) and N = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.

- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [*s_first*, *s_last*) in range [*first*, *last*). If the length of the subsequence [*s_first*, *s_last*) is greater than the length of the range [*first*, *last*), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename FwdIter, typename FwdIter2, typename Sent2, typename Pred =
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
FwdIter search_n(FwdIter first, std::size_t count, FwdIter2 s_first, Sent s_last, Pred &&op = Pred(),
Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [*first*, *last*) for any elements in the range [*s_first*, *s_last*). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search_n* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most (*S***N*) comparisons where *S* = distance(*s_first*, *s_last*) and *N* = count.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate is invoked.

Returns

The *search_n* algorithm returns *FwdIter*. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [*s_first*, *s_last*) in range [*first*, *first*+*count*). If the length of the subsequence [*s_first*, *s_last*) is greater than the length of the range [*first*, *first*+*count*), *first* is returned. Additionally, if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename ExPolicy, typename FwdIter, typename FwdIter2, typename Sent2, typename
Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type search_n(ExPolicy &&policy,
FwdIter first,
std::size_t count,
FwdIter2 s_first, Sent2
s_last, Pred &&op =
Pred(), Proj1 &&proj1
= Proj1(), Proj2
&&proj2 = Proj2())
```

Searches the range [*first*, *last*) for any elements in the range [*s_first*, *s_last*). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (*S***N*) comparisons where *S* = distance(*s_first*, *s_last*) and *N* = count.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it

executes the assignments.

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search_n* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [*s_first*, *s_last*) in range [*first*, *first*+*count*). If the length of the subsequence [*s_first*, *s_last*) is greater than the length of the range [*first*, *first*+*count*), *first* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity>
std::ranges::iterator_t<Rng1> search_n(Rng1 &&rng1, std::size_t count, Rng2 &&rng2, Pred &&op =
Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [*first*, *last*) for any elements in the range [*s_first*, *s_last*). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng2*.

Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence $[s_first, s_last)$ in range $[first, last)$. If the length of the subsequence $[s_first, s_last)$ is greater than the length of the range $[first, last)$, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred =
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```

hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng1>>> search_n(ExPolicy
                                                                 &&pol-
                                                                 icy,
                                                                 Rng1
                                                                 &&rng1,
                                                                 std::size_t
                                                                 count,
                                                                 Rng2
                                                                 &&rng2,
                                                                 Pred
                                                                 &&op
                                                                 =
                                                                 Pred(),
                                                                 Proj1
                                                                 &&proj1
                                                                 =
                                                                 Proj1(),
                                                                 Proj2
                                                                 &&proj2
                                                                 =
                                                                 Proj2())

```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most ($S \cdot N$) comparisons where S = distance(s_first, s_last) and N = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.

- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [*s_first*, *s_last*) in range [*first*, *last*). If the length of the subsequence [*s_first*, *s_last*) is greater than the length of the range [*first*, *last*), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

hpx::ranges::set_symmetric_difference

Defined in header `hpx/algorithm.hpp`⁶⁴⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **ranges**

⁶⁴⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2,
typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename
Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<Iter1, Iter2, Iter3>>::type set_symm
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly $\text{std::abs}(m-n)$ times. If $m > n$, then the last $m-n$ of those elements are copied from *[first1, last1)*, otherwise the last $n-m$ elements are copied from *[first2, last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence

and N_2 is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<std::ranges::iterator_t<Rng1>, std::
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly $\text{std::abs}(m-n)$ times. If $m > n$, then the last $m-n$ of those elements are copied from *[first1, last1)*, otherwise the last $n-m$ elements are copied from *[first2, last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>`. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
set_symmetric_difference_result<Iter1, Iter2, Iter3> set_symmetric_difference(Iter1 first1, Sent1
                                                                    last1, Iter2 first2,
                                                                    Sent2 last2, Iter3
                                                                    dest, Pred &&op =
                                                                    Pred(), Proj1
                                                                    &&proj1 = Proj1(),
                                                                    Proj2 &&proj2 =
                                                                    Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges `[first1, last1)` and `[first2, last2)`, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found m times in $[first1, last1)$ and n times in $[first2, last2)$, it will be copied to *dest* exactly $\text{std::abs}(m-n)$ times. If $m > n$, then the last $m-n$ of those elements are copied from $[first1, last1)$, otherwise the last $n-m$ elements are copied from $[first2, last2)$. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns `ranges::set_symmetric_difference_result<Iter1,`

Iter2, Iter3>. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_symmetric_difference_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> set_symmetric_di
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly *std::abs(m-n)* times. If *m>n*, then the last *m-n* of those elements are copied from *[first1,last1)*, otherwise the last *n-m* elements are copied from *[first2,last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::less<>*
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_symmetric_difference* algorithm returns *ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>*. where *Iter1* is *range_iterator_t<Rng1>* and *Iter2* is *range_iterator_t<Rng2>*
The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::transform_exclusive_scan

Defined in header `hpx/algorithm.hpp`⁶⁴⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename InIter, typename OutIter, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<InIter>::value_type>
OutIter transform_exclusive_scan(InIter first, InIter last, OutIter dest, T init, BinOp &&binary_op,
                                UnOp &&unary_op)
```

Transforms each element in the range `[first, last)` with *unary_op*, then computes an exclusive prefix sum operation using *binary_op* over the resulting range, with *init* as the initial value, and writes the results to the range beginning at *dest*. “exclusive” means that the *i*-th input element is not included in the *i*-th sum. Formally, assigns through each iterator *i* in `[dest, d_first + (last - first))` the value of the generalized noncommutative sum of *init*, *unary_op*(**j*)... for every *j* in `[first, first + (i - d_first))` over *binary_op*, where generalized noncommutative sum *GNSUM*(*op*, *a1*, ..., *aN*) is defined as follows:

- if *N*=1, *a1*
- if *N* > 1, *op*(*GNSUM*(*op*, *a1*, ..., *aK*), *GNSUM*(*op*, *aM*, ..., *aN*)) for any *K* where *1* < *K*+1 = *M* <= *N* In other words, the summation operations may be performed in arbitrary order, and the behavior is nondeterministic if *binary_op* is not associative.

⁶⁴⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *unary_op* nor *binary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges $[first, last)$ or $[result, result + (last - first))$.

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of each of *binary_op* and *unary_op*.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- a_1 when N is 1
 - $op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a_1, \dots, a_K), GENERALIZED_NONCOMMUTATIVE_SUM(op, a_{K+1}, \dots, a_N))$ where $1 < K+1 = M \leq N$.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Binary *FunctionObject* that will be applied to the result of *unary_op*, the results of other *binary_op*, and *init*.
- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.

Returns

The *transform_exclusive_scan* algorithm returns a returns *OutIter*. The *transform_exclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename BinOp, typename UnOp,  
typename T = typename std::iterator_traits<FwdIter1>::value_type>
```

```

parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type transform_exclusive_scan(ExPolicy
                                                                 &&policy,
                                                                 FwdIter1
                                                                 first,
                                                                 FwdIter1
                                                                 last,
                                                                 FwdIter2
                                                                 dest, T init,
                                                                 BinOp
                                                                 &&bi-
                                                                 nary_op,
                                                                 UnOp
                                                                 &&unary_op)

```

Assigns through each iterator i in $[result, result + (last - first))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))`). Executed according to the policy.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *unary_op* nor *binary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges $[first, last)$ or $[result, result + (last - first))$.

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note: Complexity: $O(last - first)$ applications of each of *binary_op* and *unary_op*.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$ when N is 1
 - $op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, \dots, aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, \dots, aN))$ where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.

- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Binary *FunctionObject* that will be applied in to the result of *unary_op*, the results of other *binary_op*, and *init*.
- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.

Returns

The *transform_exclusive_scan* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *transform_exclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::experimental::reduction_bit_and

Defined in header [hpx/algorithm.hpp](#)⁶⁴⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

template<typename T>

constexpr *hpx::parallel::detail::reduction_helper<T, std::bit_and<T>>* **reduction_bit_and**(T &var)

The function template *reduction_bit_and* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::bit_and{ }` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_bit_and* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

⁶⁴⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_and{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note: In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_and<T>> reduction_bit_and(T &var, T
                                                                    const
                                                                    &iden-
                                                                    tity)
```

hpx/parallel/algorithms/iota.hpp

Defined in header `hpx/parallel/algorithms/iota.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename FwdIter, typename Sent, typename T>
void iota(FwdIter first, Sent last, T value)
```

Fills the range `[first, last)` with sequentially increasing values, starting with *value* and repetitively evaluating `++value`.

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Exactly `std::distance(first, last)` assignments and increments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input or output iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced). This type must be weakly incrementable.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns *void*.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> iota(ExPolicy &&policy, FwdIter first, Sent last, T
                                                                value)
```

Fills the range [first, last) with sequentially increasing values, starting with *value* and repetitively evaluating ++*value*.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly *std::distance(first, last)* assignments and increments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to be assigned (deduced). This type must be weakly incrementable.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a `hpx::future<void>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

hpx::equal

Defined in header `hpx/algorithm.hpp`⁶⁴⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
util::detail::algorithm_result_t<ExPolicy, bool> equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,
                                                    FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise. Executed according to the policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$ applications of the predicate *op*.

Note: The two ranges are considered equal if, for every iterator *i* in the range [first1, last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses `operator==` to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

⁶⁴⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range `[first1, last1)` does not equal the length of the range `[first2, last2)`, it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
util::detail::algorithm_result_t<ExPolicy, bool> equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,
                                                       FwdIter2 first2, FwdIter2 last2)
```

Returns true if the range `[first1, last1)` is equal to the range `[first2, last2)`, and false otherwise. Executed according to policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(\min(\textit{last1} - \textit{first1}, \textit{last2} - \textit{first2}))$ applications of the predicate *std::equal_to*.

Note: The two ranges are considered equal if, for every iterator *i* in the range `[first1, last1)`, **i* equals **(first2 + (i - first1))*. This overload of *equal* uses operator`==` to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
util::detail::algorithm_result_t<ExPolicy, bool> equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,
                                                    FwdIter2 first2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise. Executed according to policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$ applications of the predicate *op*.

Note: The two ranges are considered equal if, for every iterator *i* in the range [first1, last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses operator== to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
util::detail::algorithm_result_t<ExPolicy, bool> equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,
                                                       FwdIter2 first2)
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise. Executed according to policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most *last1 - first1* applications of the predicate *op*.

Note: The two ranges are considered equal if, for every iterator i in the range $[first1, last1)$, $*i$ equals $*(first2 + (i - first1))$. This overload of `equal` uses `operator==` to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range $[first1, last1)$ does not equal the length of the range $[first2, last2)$, it returns false.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
bool equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
    Returns true if the range  $[first1, last1)$  is equal to the range  $[first2, last2)$ , and false otherwise.
```

Note: Complexity: At most $\min(last1 - first1, last2 - first2)$ applications of the predicate *op*.

Note: The two ranges are considered equal if, for every iterator i in the range $[first1, last1)$, $*i$ equals $*(first2 + (i - first1))$. This overload of `equal` uses `operator==` to determine if two elements are equal.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *bool*. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename FwdIter1, typename FwdIter2>  
bool equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

Note: Complexity: At most $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the predicate *std::equal_to*.

Note: The two ranges are considered equal if, for every iterator *i* in the range [first1, last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *equal* algorithm returns a *bool*. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
bool equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range [first2, first2 + (last1 - first1)), and false otherwise.

Note: Complexity: At most *last1 - first1* applications of the predicate *op*.

Note: The two ranges are considered equal if, for every iterator *i* in the range [first1, last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses operator== to determine if two elements are equal.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *bool*. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

                                                                                               FwdIter1
                                                                                               last1,
                                                                                               FwdIter2
                                                                                               first2,
                                                                                               FwdIter2
                                                                                               last2,
                                                                                               Pred
                                                                                               &&op)
```

Returns the first mismatching pair of elements from two ranges: one defined by `[first1, last1)` and another defined by `[first2, last2)`. If `last2` is not provided, it denotes `first2 + (last1 - first1)`. Executed according to the policy.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the predicate *op* or *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$ then no applications of the predicate *op* or *operator==* are made.

Note: The two ranges are considered mismatch if, for every iterator *i* in the range `[first1, last1)`, **i* mismatches **(first2 + (i - first1))*. This overload of *mismatch* uses *operator==* to determine if two elements are

⁶⁴⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

mismatch.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1,FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::pair<FwdIter1,FwdIter2>` otherwise. If no mismatches are found when the comparison reaches *last1* or *last2*, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::pair<FwdIter1, FwdIter2>> mismatch(ExPolicy
&&pol-
icy,
FwdIter1
first1,
FwdIter1
last1,
FwdIter2
first2,
FwdIter2
last2)
```

Returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2,last2). If last2 is not provided, it denotes first2 + (last1 - first1). Executed according to the policy.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$ then no applications of *operator==* are made.

Note: The two ranges are considered mismatch if, for every iterator *i* in the range [first1,last1), *i mismatches *(first2 + (i - first1)). This overload of mismatch uses operator== to determine if two elements are mismatch.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1,FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::pair<FwdIter1,FwdIter2>` otherwise. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::pair<FwdIter1, FwdIter2>> mismatch(ExPolicy
                                                    &&pol-
                                                    icy,
                                                    FwdIter1
                                                    first1,
                                                    FwdIter1
                                                    last1,
                                                    FwdIter2
                                                    first2,
                                                    Pred
                                                    &&op)
```

Returns the first mismatching pair of elements from two ranges: one defined by `[first1, last1)` and another defined by `[first2,last2)`. If `last2` is not provided, it denotes `first2 + (last1 - first1)`. Executed according to the policy.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most `last1 - first1` applications of the predicate *op* or *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and `(last1 - first1) != (last2 - first2)` then no applications of the predicate *op* or *operator==* are made.

Note: The two ranges are considered mismatch if, for every iterator *i* in the range `[first1,last1)`, **i* mismatches **(first2 + (i - first1))*. This overload of *mismatch* uses *operator==* to determine if two elements are mismatch.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1,FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::pair<FwdIter1,FwdIter2>` otherwise. If no mismatches are found when the comparison reaches *last1* or *last2*, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::pair<FwdIter1, FwdIter2>> mismatch(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               FwdIter1
                                                                                               first1,
                                                                                               FwdIter1
                                                                                               last1,
                                                                                               FwdIter2
                                                                                               first2)
```

Returns the first mismatching pair of elements from two ranges: one defined by [*first1*, *last1*) and another defined by [*first2*,*last2*). If *last2* is not provided, it denotes *first2* + (*last1* - *first1*). Executed according to the policy.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most *last1* - *first1* applications of *operator==*. If *FwdIter1* and *FwdIter2* meet

the requirements of *RandomAccessIterator* and $(last1 - first1) \neq (last2 - first2)$ then no applications of *operator==* are made.

Note: The two ranges are considered mismatch if, for every iterator *i* in the range $[first1, last1)$, **i* mismatches $*(first2 + (i - first1))$. This overload of *mismatch* uses *operator==* to determine if two elements are mismatch.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::pair<FwdIter1, FwdIter2>` otherwise. If no mismatches are found when the comparison reaches *last1* or *last2*, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename FwdIter1, typename FwdIter2, typename Pred>
std::pair<FwdIter1, FwdIter2> mismatch(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2,
                                     Pred &&op)
```

Returns the first mismatching pair of elements from two ranges: one defined by $[first1, last1)$ and another defined by $[first2, last2)$. If *last2* is not provided, it denotes $first2 + (last1 - first1)$.

Note: Complexity: At most $\min(last1 - first1, last2 - first2)$ applications of the predicate *op* or *operator==*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and $(last1 - first1) \neq (last2 - first2)$ then no applications of the predicate *op* or *operator==* are made.

Note: The two ranges are considered mismatch if, for every iterator *i* in the range `[first1,last1)`, **i* mismatches `*(first2 + (i - first1))`. This overload of `mismatch` uses `operator==` to determine if two elements are mismatch.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *mismatch* algorithm returns a `std::pair<FwdIter1,FwdIter2>`. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename FwdIter1, typename FwdIter2>
std::pair<FwdIter1, FwdIter2> mismatch(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns the first mismatching pair of elements from two ranges: one defined by `[first1, last1)` and another defined by `[first2,last2)`. If `last2` is not provided, it denotes `first2 + (last1 - first1)`.

Note: Complexity: At most `min(last1 - first1, last2 - first2)` applications of `operator==`. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and `(last1 - first1) != (last2 - first2)` then no applications of `operator==` are made.

Note: The two ranges are considered mismatch if, for every iterator *i* in the range `[first1,last1)`, **i* mismatches **(first2 + (i - first1))*. This overload of `mismatch` uses `operator==` to determine if two elements are mismatch.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *mismatch* algorithm returns a `std::pair<FwdIter1,FwdIter2>`. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename FwdIter1, typename FwdIter2, typename Pred>
std::pair<FwdIter1, FwdIter2> mismatch(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, Pred &&op)
```

Returns the first mismatching pair of elements from two ranges: one defined by `[first1, last1)` and another defined by `[first2,last2)`. If `last2` is not provided, it denotes `first2 + (last1 - first1)`.

Note: Complexity: At most `last1 - first1` applications of the predicate *op* or `operator==`. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and `(last1 - first1) != (last2 - first2)` then no applications of the predicate *op* or `operator==` are made.

Note: The two ranges are considered mismatch if, for every iterator *i* in the range `[first1,last1)`, **i* mismatches **(first2 + (i - first1))*. This overload of `mismatch` uses `operator==` to determine if two elements are mismatch.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *mismatch* algorithm returns a `std::pair<FwdIter1,FwdIter2>`. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

```
template<typename FwdIter1, typename FwdIter2>
```

```
std::pair<FwdIter1, FwdIter2> mismatch(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2)
```

Returns the first mismatching pair of elements from two ranges: one defined by `[first1, last1)` and another defined by `[first2,last2)`. If `last2` is not provided, it denotes `first2 + (last1 - first1)`.

Note: Complexity: At most `last1 - first1` applications of `operator==`. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and `(last1 - first1) != (last2 - first2)` then no applications of `operator==` are made.

Note: The two ranges are considered mismatch if, for every iterator *i* in the range `[first1,last1)`, `*i` mismatches `*(first2 + (i - first1))`. This overload of *mismatch* uses `operator==` to determine if two elements are mismatch.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *mismatch* algorithm returns a `std::pair<FwdIter1,FwdIter2>`. If no mismatches are found when the comparison reaches `last1` or `last2`, whichever happens first, the pair holds the end iterator and the corresponding iterator from the other range.

hpx::is_sorted, hpx::is_sorted_until

Defined in header `hpx/algorithm.hpp`⁶⁴⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename FwdIter, typename Pred = hpx::parallel::detail::less>
bool is_sorted(FwdIter first, FwdIter last, Pred &&pred = Pred())
```

Determines if the range `[first, last)` is sorted. Uses `pred` to compare elements.

The comparison operations in the parallel *is_sorted* algorithm executes in sequential order in the calling thread.

Note: Complexity: at most $(N+S-1)$ comparisons where N = `distance(first, last)`. S = number of partitions

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use.

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

⁶⁴⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *is_sorted* algorithm returns a *bool*. The *is_sorted* algorithm returns true if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

```
template<typename ExPolicy, typename FwdIter, typename Pred = hpx::parallel::detail::less>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> is_sorted(ExPolicy &&policy, FwdIter first,  
                                                                    FwdIter last, Pred &&pred =  
                                                                    Pred())
```

Determines if the range [first, last) is sorted. Uses *pred* to compare elements. Executed according to the policy.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $(N+S-1)$ comparisons where N = distance(first, last). S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *is_sorted* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_sorted* algorithm returns a *bool* if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

```
template<typename FwdIter, typename Pred = hpx::parallel::detail::less>
FwdIter is_sorted_until(FwdIter first, FwdIter last, Pred &&pred = Pred())
```

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most (N+S-1) comparisons where *N* = distance(first, last). *S* = number of partitions

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use.

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *is_sorted_until* algorithm returns a *FwdIter*. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename ExPolicy, typename FwdIter, typename Pred = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type is_sorted_until(ExPolicy &&policy,
                                                                                      FwdIter first,
                                                                                      FwdIter last, Pred
                                                                                      &&pred = Pred())
```

Returns the first element in the range `[first, last)` that is not sorted. Uses a predicate to compare elements or the less than operator. Executed according to the policy.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $(N+S-1)$ comparisons where N = distance(first, last). S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *is_sorted_until* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

hpx::experimental::for_each_index

Defined in header `hpx/algorithm.hpp`⁶⁵⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

```
template<typename Mapping, typename Fun>
constexpr void for_each_index(Mapping const &mapping, Fun fun)
```

Calls *fun* with every multidimensional index in the domain of *mapping* (i.e., its extents), in sequential order.

If *fun* returns a result, the result is ignored.

The layout mapping is a hint; implementations are encouraged to choose an iteration order that performs well for the given mapping.

Note: Complexity: Applies *fun* exactly the product of all extents of *mapping* times.

Template Parameters

- **Mapping** – A type meeting the layout mapping requirements. Must expose *index_type*, *extents_type*, *static rank()*, and *extents()*.
- **Fun** – The type of the function/function object to use (deduced). *Fun* must meet *Copy-Constructible* and be invocable with exactly *Mapping::rank()* arguments of type *Mapping::index_type*.

Parameters

- **mapping** – The layout mapping whose extents define the iteration domain.
- **fun** – Callable invoked as *fun*(*i0*, *i1*, ...) for every multidimensional index in the domain.

```
template<typename ExPolicy, typename Mapping, typename Fun>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> for_each_index(ExPolicy &&policy,
                                                                    Mapping const &mapping,
                                                                    Fun fun)
```

Calls *fun* with every multidimensional index in the domain of *mapping* (i.e., its extents), executed according to *policy*.

If *fun* returns a result, the result is ignored.

Note: Complexity: Applies *fun* exactly the product of all extents of *mapping* times.

⁶⁵⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced).
- **Mapping** – A type meeting the layout mapping requirements. Must meet *CopyConstructible*.
- **Fun** – The type of the function/function object to use (deduced). Must meet *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for scheduling.
- **mapping** – The layout mapping whose extents define the iteration domain.
- **fun** – Callable invoked as `fun(i0, i1, ...)` for every multidimensional index in the domain.

Returns

hpx::future<void> if the execution policy is *sequenced_task_policy* or *parallel_task_policy*, *void* otherwise.

hpx::uninitialized_copy, hpx::uninitialized_copy_n

Defined in header [hpx/algorithm.hpp](#)⁶⁵¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

template<typename **InIter**, typename **FwdIter**>

FwdIter **uninitialized_copy**(*InIter* first, *InIter* last, *FwdIter* dest)

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

⁶⁵¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Returns

The *uninitialized_copy* algorithm returns *FwdIter*. The *uninitialized_copy* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> uninitialized_copy(ExPolicy
                                                                                      &&policy,
                                                                                      FwdIter1 first,
                                                                                      FwdIter1 last,
                                                                                      FwdIter2 dest)
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects. Executed according to the policy.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_copy* algorithm returns a *hpx::future<FwdIter2>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_copy* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename Size, typename FwdIter>
```

FwdIter uninitialized_copy_n(InIter first, Size count, FwdIter dest)

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_copy_n* algorithm returns a returns *FwdIter*. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> uninitialized_copy_n(ExPolicy  
                                                                                          &&policy,  
                                                                                          FwdIter1 first,  
                                                                                          Size count,  
                                                                                          FwdIter2 dest)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_copy_n* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::starts_with

Defined in header `hpx/algorithm.hpp`⁶⁵².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename InIter1, typename InIter2, typename Pred = hpx::parallel::detail::equal_to>
bool starts_with(InIter1 first1, InIter1 last1, InIter2 first2, InIter2 last2, Pred &&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate.

Template Parameters

⁶⁵² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **InIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The binary predicate that compares the elements. This defaults to *hpx::parallel::detail::equal_to*.

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

Returns

The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename InIter1, typename InIter2, typename Pred = ranges::equal_to>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> starts_with(ExPolicy &&policy, InIter1
                                                                    first1, InIter1 last1, InIter2
                                                                    first2, InIter2 last2, Pred
                                                                    &&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2). Executed according to the policy.

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The binary predicate that compares the elements. This defaults to *ranges::equal_to*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.

- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

Returns

The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

hpx::set_difference

Defined in header [hpx/algorithm.hpp](#)⁶⁵³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename
Pred = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter3> set_difference(ExPolicy &&policy,
                                          FwdIter1 first1,
                                          FwdIter1 last1,
                                          FwdIter2 first2,
                                          FwdIter2 last2,
                                          FwdIter3 dest, Pred
                                          &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range $[first1, last1)$ and not present in the range $[first2, last2)$. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

Equivalent elements are treated individually, that is, if some element is found *m* times in $[first1, last1)$ and *n* times in $[first2, last2)$, it will be copied to *dest* exactly $\text{std::max}(m-n, 0)$ times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

⁶⁵³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_difference* algorithm returns a `hpx::future<FwdIter3>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter3* otherwise. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =  
hpx::parallel::detail::less>
```

```
FwdIter3 set_difference(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, FwdIter3 dest,
                        Pred &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range *[first1, last1)* and not present in the range *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*.

Equivalent elements are treated individually, that is, if some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_difference* algorithm returns a *FwdIter3*. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::for_each, hpx::for_each_n

Defined in header [hpx/algorithm.hpp](#)⁶⁵⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename InIter, typename F>  
F for_each(InIter first, InIter last, F &&f)
```

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Note: Complexity: Applies *f* exactly *last - first* times.

Template Parameters

- **InIter** – The type of the source begin and end iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). *F* must meet requirements of *MoveConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

f.

```
template<typename ExPolicy, typename FwdIter, typename F>
```

⁶⁵⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
util::detail::algorithm_result_t<ExPolicy, void> for_each(ExPolicy &&policy, FwdIter first, FwdIter last, F
&&f)
```

Applies *f* to the result of dereferencing every iterator in the range [first, last). Executed according to the policy.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Applies *f* exactly *last - first* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin and end iterator used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *for_each* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns void otherwise.

```
template<typename InIter, typename Size, typename F>  
InIter for_each_n(InIter first, Size count, F &&f)
```

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Note: Complexity: Applies *f* exactly *count* times.

Template Parameters

- **InIter** – The type of the source begin and end iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). *F* must meet requirements of *MoveConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

first + *count* for non-negative values of *count* and *first* for negative values.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F>  
util::detail::algorithm_result_t<ExPolicy, FwdIter> for_each_n(ExPolicy &&policy, FwdIter first, Size  
count, F &&f)
```

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1. Executed according to the policy.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each_n* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Applies *f* exactly *count* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each_n* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *for_each_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *first* + *count* for non-negative values of *count* and *first* for negative values.

hpx::includes

Defined in header `hpx/algorithm.hpp`⁶⁵⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

⁶⁵⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred =  
hpx::parallel::detail::less>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool>::type includes(ExPolicy &&policy, FwdIter1  
first1, FwdIter1 last1,  
FwdIter2 first2, FwdIter2  
last2, Pred &&op = Pred())
```

Returns true if every element from the sorted range $[first2, last2)$ is found within the sorted range $[first1, last1)$. Also returns true if $[first2, last2)$ is empty. The version expects both ranges to be sorted with the user supplied binary predicate f . Executed according to the policy.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1 = \text{std::distance}(first1, last1)$ and $N2 = \text{std::distance}(first2, last2)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *includes* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range $[first2, last2)$ is found within the sorted range $[first1, last1)$. Also returns true if $[first2, last2)$ is empty.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = hpx::parallel::detail::less>
bool includes(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns true if every element from the sorted range $[first2, last2)$ is found within the sorted range $[first1, last1)$. Also returns true if $[first2, last2)$ is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

Note: At most $2*(N1+N2-1)$ comparisons, where $N1 = \text{std::distance}(first1, last1)$ and $N2 = \text{std::distance}(first2, last2)$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::less<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *includes* algorithm returns a *bool*. The *includes* algorithm returns true every element from the sorted range $[first2, last2)$ is found within the sorted range $[first1, last1)$. Also returns true if $[first2, last2)$ is empty.

hpx::shift_left

Defined in header [hpx/algorithm.hpp](#)⁶⁵⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename FwdIter, typename Size>
FwdIter shift_left(FwdIter first, FwdIter last, Size n)
```

Shifts the elements in the range $[first, last)$ by n positions towards the beginning of the range. For every integer i in $[0, last - first$

- $n)$, moves the element originally at position $first + n + i$ to position $first + i$.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most $(last - first) - n$ assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns *FwdIter*. The *shift_left* algorithm returns an iterator to the end of the resulting range. Specifically: If n is 0 or $n \geq (last - first)$, does nothing and returns *last* and *first* respectively. Otherwise returns $first + ((last - first) - n)$.

⁶⁵⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename FwdIter, typename Size>
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter> shift_left(ExPolicy &&policy, FwdIter
                                                                    first, FwdIter last, Size n)
```

Shifts the elements in the range [first, last) by *n* positions towards the beginning of the range. For every integer *i* in [0, last - first)

- *n*), moves the element originally at position first + *n* + *i* to position first + *i*. Executed according to the policy.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - *n* assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range. Specifically: If *n* is 0, does nothing and returns *last*. If *n* >= (last - first), does nothing and returns *first*. Otherwise returns *first* + ((last - first) - *n*).

hpx::experimental::reduction_plus

Defined in header `hpx/algorithm.hpp`⁶⁵⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

template<typename **T**>

constexpr *hpx::parallel::detail::reduction_helper*<*T*, *std::plus*<*T*>> **reduction_plus**(*T* &var)

The function template *reduction_plus* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::plus{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_plus* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::plus{}` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note: In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

template<typename **T**>

⁶⁵⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
constexpr hpx::parallel::detail::reduction_helper<T, std::plus<T>> reduction_plus(T &var, T const
&identity)
```

hpx::partial_sort

Defined in header [hpx/algorithm.hpp](#)⁶⁵⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename RandIter, typename Comp = hpx::parallel::detail::less>
RandIter partial_sort(RandIter first, RandIter middle, RandIter last, Comp &&comp = Comp())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

Note: Complexity: Approximately (last - first) * log(middle - first) comparisons.

Template Parameters

- **RandIter** – The type of the source begin, middle, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. It defaults to detail::less.

Returns

The *partial_sort* algorithm returns a *RandIter* that refers to *last*.

```
template<typename ExPolicy, typename RandIter, typename Comp = hpx::parallel::detail::less>
parallel::util::detail::algorithm_result_t<ExPolicy, RandIter> partial_sort(ExPolicy &&policy, RandIter
first, RandIter middle, RandIter
last, Comp &&comp =
Comp())
```

⁶⁵⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

Note: Complexity: Approximately $(last - first) * \log(middle - first)$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **RandIter** – The type of the source begin, middle, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. It defaults to `detail::less`.

Returns

The *partial_sort* algorithm returns a `hpx::future<RandIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The iterator returned refers to *last*.

hpx::min_element, hpx::max_element, hpx::minmax_element

Defined in header `hpx/algorithm.hpp`⁶⁵⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁶⁵⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename FwdIter, typename F = hpx::parallel::detail::less>
FwdIter min_element(FwdIter first, FwdIter last, F &&f)
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min_element* algorithm execute in sequential order in the calling thread.

Note: Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *min_element* algorithm returns *FwdIter*. The *min_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename F = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> min_element(ExPolicy &&policy, FwdIter
first, FwdIter last, F &&f)
```

Finds the smallest element in the range [first, last) using the given comparison function *f*. Executed according to the policy.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *min_element* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *min_element* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *min_element* algorithm returns the iterator to the smallest element in the range `[first, last)`. If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename FwdIter, typename F = hpx::parallel::detail::less>  
FwdIter max_element(FwdIter first, FwdIter last, F &&f)
```

Finds the largest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *min_element* algorithm execute in sequential order in the calling thread.

Note: Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if left argument is less than the right element. This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *max_element* algorithm returns *FwdIter*. The *max_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename F = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type max_element(ExPolicy &&policy,
                                                                                   FwdIter first, FwdIter
                                                                                   last, F &&f)
```

Removes all elements satisfying specific criteria from the range Finds the largest element in the range [first, last) using the given comparison function *f*. Executed according to the policy.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly $\max(N-1, 0)$ comparisons, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max_element* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **f** – The binary predicate which returns true if left argument is less than the right element. This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *max_element* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *max_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename FwdIter, typename F = hpx::parallel::detail::less>
minmax_element_result<FwdIter> minmax_element(FwdIter first, FwdIter last, F &&f)
```

Finds the largest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *minmax_element* algorithm execute in sequential order in the calling thread.

Note: Complexity: At most $\max(\text{floor}(3/2 * (N-1)), 0)$ applications of the predicate, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *minmax_element* algorithm returns a *minmax_element_result<FwdIter>* The *min-max_element* algorithm returns a pair consisting of an iterator to the smallest element as

the min element and an iterator to the largest element as the max element. Returns *minmax_element_result*<*FwdIter*>{*first*,*first*} if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename ExPolicy, typename FwdIter, typename F = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, minmax_element_result<FwdIter>> minmax_element(ExPolicy
&&pol-
icy,
FwdIter
first,
FwdIter
last,
F
&&f)
```

Finds the largest element in the range [*first*, *last*) using the given comparison function *f*.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $\max(\text{floor}(3/2*(N-1)), 0)$ applications of the predicate, where $N = \text{std::distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax_element* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *minmax_element* algorithm returns a `hpx::future<minmax_element_result<FwdIter>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *minmax_element_result<FwdIter>* otherwise. The *minmax_element* algorithm returns a pair consisting of an iterator to the smallest element as the min element and an iterator to the largest element as the max element. Returns `std::make_pair(first,first)` if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

hpx::ends_with

Defined in header `hpx/algorithm.hpp`⁶⁶⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename InIter1, typename InIter2, typename Pred = hpx::parallel::detail::equal_to>  
bool ends_with(InIter1 first1, InIter1 last1, InIter2 first2, InIter2 last2, Pred &&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate.

Template Parameters

- **InIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the begin destination iterators used (deduced). This iterator type must meet the requirements of a input iterator.
- **Pred** – The binary predicate that compares the elements. This defaults to `hpx::parallel::detail::equal_to`.

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Refers to the end of the source range.
- **first2** – Refers to the beginning of the destination range.

⁶⁶⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **last2** – Refers to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

Returns

The *ends_with* algorithm returns *bool*. The *ends_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred =
    ranges::equal_to>
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type ends_with(ExPolicy &&policy, FwdIter1
    first1, FwdIter1 last1, FwdIter2
    first2, FwdIter2 last2, Pred
    &&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2). Executed according to the policy.

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *ends_with* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear: at most min(N1, N2) applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the begin destination iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The binary predicate that compares the elements. This defaults to *ranges::equal_to*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Refers to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

Returns

The *ends_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *ends_with* algorithm returns a boolean with the value *true* if the second range matches the suffix of the first range, *false* otherwise.

hpx::adjacent_find

Defined in header [hpx/algorithm.hpp](#)⁶⁶¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename InIter, typename Pred = hpx::parallel::detail::equal_to>  
InIter adjacent_find(InIter first, InIter last, Pred &&pred = Pred())
```

Searches the range [first, last) for two consecutive identical elements.

Note: Complexity: Exactly the smaller of $(result - first) + 1$ and $(last - first) - 1$ application of the predicate where *result* is the value returned

Template Parameters

- **InIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Pred = hpx::parallel::detail::equal_to>
```

⁶⁶¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> adjacent_find(ExPolicy &&policy,
                                                                              FwdIter first, FwdIter
                                                                              last, Pred &&pred =
                                                                              Pred())
```

Searches the range [first, last) for two consecutive identical elements. This version uses the given binary predicate *pred*

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent_find* invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

Note: Complexity: Exactly the smaller of $(result - first) + 1$ and $(last - first) - 1$ application of the predicate where *result* is the value returned

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *adjacent_find* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of

type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *adjacent_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

hpx::sort

Defined in header [hpx/algorithm.hpp](#)⁶⁶².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename RandomIt, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>  
void sort(RandomIt first, RandomIt last, Comp &&comp, Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.

⁶⁶² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns *void*.

```
template<typename ExPolicy, typename RandomIt, typename Comp = hpx::parallel::detail::less, typename
Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> sort(ExPolicy &&policy, RandomIt first, RandomIt
last, Comp &&comp, Proj &&proj)
```

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using `operator<()`). Executed according to the policy.

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the `INVOKE` operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *sort* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

hpx::experimental::reduction_bit_xor

Defined in header [hpx/algorithm.hpp](#)⁶⁶³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

template<typename T>

constexpr *hpx::parallel::detail::reduction_helper<T, std::bit_xor<T>>* **reduction_bit_xor**(T &var)

The function template *reduction_bit_xor* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses *std::bit_xor{ }* as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_bit_xor* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the *std::bit_xor{ }* operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note: In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The live-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

⁶⁶³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_xor<T>> reduction_bit_xor(T &var, T
                                                                    const
                                                                    &identity)
```

hpx::transform

Defined in header `hpx/algorithm.hpp`⁶⁶⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename FwdIter1, typename FwdIter2, typename F>
FwdIter2 transform(FwdIter1 first, FwdIter1 last, FwdIter2 dest, F &&f)
```

Applies the given function *f* to the range [first, last) and stores the result in another range, beginning at dest.

Note: Complexity: Exactly *last - first* applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

Ret fun(const Type &a);

⁶⁶⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

Returns

The *transform* algorithm returns a *FwdIter2*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename F>
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> transform(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 dest, F
                                                                    &&f)
```

Applies the given function *f* to the range [first, last) and stores the result in another range, beginning at dest. Executed according to the policy.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly *last - first* applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

Returns

The *transform* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *parallel_task_policy* and returns *FwdIter2* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename F>
FwdIter3 transform(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter3 dest, F &&f)
```

Applies the given function *f* to pairs of elements from two ranges: one defined by `[first1, last1)` and the other beginning at `first2`, and stores the result in another range, beginning at `dest`.

Note: Complexity: Exactly *last - first* applications of *f*

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators for the second range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

Returns

The *transform* algorithm returns a *FwdIter3*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename F>
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter3> transform(ExPolicy &&policy, FwdIter1
                                                                    first1, FwdIter1 last1, FwdIter2
                                                                    first2, FwdIter3 dest, F &&f)
```

Applies the given function *f* to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest. Executed according to the policy.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly *last - first* applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators for the second range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

Returns

The *transform* algorithm returns a *hpx::future<FwdIter3>* if the execution policy is of type *parallel_task_policy* and returns *FwdIter3* otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

hpx::inclusive_scan

Defined in header [hpx/algorithm.hpp](#)⁶⁶⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename InIter, typename OutIter>
OutIter inclusive_scan(InIter first, InIter last, OutIter dest)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(+, *first, ..., *(first + (i - result))).

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*, here `std::plus<>()`.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
 - GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)
 - GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where $1 < K+1 = M \leq N$.
-

⁶⁶⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *inclusive_scan* algorithm returns *OutIter*. The *inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> inclusive_scan(ExPolicy &&policy,  
                                           FwdIter1 first,  
                                           FwdIter1 last, FwdIter2  
                                           dest)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(+, *first, ..., *(first + (i - result))). Executed according to the policy.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*, here `std::plus<>()`.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(+, *a*1, ..., *a*N) is defined as:

- *a*1 when N is 1
 - GENERALIZED_NONCOMMUTATIVE_SUM(+, *a*1, ..., *a*K)
– GENERALIZED_NONCOMMUTATIVE_SUM(+, *a*M, ..., *a*N) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *inclusive_scan* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename OutIter, typename Op>
OutIter inclusive_scan(InIter first, InIter last, OutIter dest, Op &&op)
```

Assigns through each iterator *i* in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- `a1` when *N* is 1
 - `GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)`
 - `GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN)` where $1 < K+1 = M \leq N$.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *inclusive_scan* algorithm returns *OutIter*. The *inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Op>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> inclusive_scan(ExPolicy &&policy,
                                                                                   FwdIter1 first,
                                                                                   FwdIter1 last, FwdIter2
                                                                                   dest, Op &&op)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result)))`. Executed according to the policy.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- `a1` when *N* is 1
 - `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK)`
 - `GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN)` where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *inclusive_scan* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename OutIter, typename Op, typename T>
OutIter inclusive_scan(InIter first, InIter last, OutIter dest, Op &&op, T init)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- a_1 when N is 1
 - $op(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(op, a_1, \dots, a_K), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(op, a_M, \dots, a_N))$ where $1 < K+1 = M \leq N$.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *inclusive_scan* algorithm returns *OutIter*. The *inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Op, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> inclusive_scan(ExPolicy &&policy,
                                                                                   FwdIter1 first,
                                                                                   FwdIter1 last, FwdIter2
                                                                                   dest, Op &&op, T init)
```

Assigns through each iterator i in $[\text{result}, \text{result} + (\text{last} - \text{first}))$ the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`. Executed according to the policy.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_N) is defined as:

- *a*₁ when *N* is 1
 - *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_K), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*_M, ..., *a*_N)) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *inclusive_scan* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::merge, hpx::inplace_merge

Defined in header [hpx/algorithm.hpp](http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp)⁶⁶⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename RandIter1, typename RandIter2, typename RandIter3,
typename Comp = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, RandIter3> merge(ExPolicy &&policy, RandIter1
                                                                    first1, RandIter1 last1, RandIter2
                                                                    first2, RandIter2 last2, RandIter3
                                                                    dest, Comp &&comp = Comp())
```

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in each of the original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges. Executed according to the policy.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$ applications of the comparison *comp* and each projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandIter1** – The type of the source iterators used (deduced) representing the first sorted range. This iterator type must meet the requirements of a random access iterator.
- **RandIter2** – The type of the source iterators used (deduced) representing the second sorted range. This iterator type must meet the requirements of a random access iterator.
- **RandIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

⁶⁶⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first range of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first range of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second range of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *RandIter1* and *RandIter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

Returns

The *merge* algorithm returns a *hpx::future<RandIter3>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter3* otherwise. The *merge* algorithm returns the destination iterator to the end of the *dest* range.

```
template<typename RandIter1, typename RandIter2, typename RandIter3, typename Comp =
hpx::parallel::detail::less>
RandIter3 merge(RandIter1 first1, RandIter1 last1, RandIter2 first2, RandIter2 last2, RandIter3 dest, Comp
&&comp = Comp())
```

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in each of the original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

Note: Complexity: Performs $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$ applications of the comparison *comp* and each projection.

Template Parameters

- **RandIter1** – The type of the source iterators used (deduced) representing the first sorted range. This iterator type must meet the requirements of a random access iterator.
- **RandIter2** – The type of the source iterators used (deduced) representing the second sorted range. This iterator type must meet the requirements of a random access iterator.
- **RandIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **first1** – Refers to the beginning of the first range of elements the algorithm will be applied to.

- **last1** – Refers to the end of the first range of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second range of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *RandIter1* and *RandIter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

Returns

The *merge* algorithm returns a *RandIter3*. The *merge* algorithm returns the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename RandIter, typename Comp = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> inplace_merge(ExPolicy &&policy, RandIter first,
                                                                    RandIter middle, RandIter last,
                                                                    Comp &&comp = Comp())
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in each of the original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. Executed according to the policy.

The assignments in the parallel *inplace_merge* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *inplace_merge* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs $O(\text{std::distance}(\text{first}, \text{last}))$ applications of the comparison *comp* and each projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *RandIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

Returns

The *inplace_merge* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns void otherwise. The *inplace_merge* algorithm returns the source iterator *last*.

```
template<typename RandIter, typename Comp = hpx::parallel::detail::less>
void inplace_merge(RandIter first, RandIter middle, RandIter last, Comp &&comp = Comp())
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in each of the original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

Note: Complexity: Performs $O(\text{std::distance}(\text{first}, \text{last}))$ applications of the comparison *comp* and each projection.

Template Parameters

- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *RandIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

Returns

The *inplace_merge* algorithm returns a *void*. The *inplace_merge* algorithm returns the source iterator *last*.

hpx::experimental::reduction_multiplies

Defined in header `hpx/algorithm.hpp`⁶⁶⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::multiplies<T>> reduction_multiplies(T
                                                                                                     &var)
```

The function template *reduction_multiplies* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::multiplies{ }` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_multiplies* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::multiplies{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note: In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.

⁶⁶⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::multiplies<T>> reduction_multiplies(T
                                                                    &var,
                                                                    T
                                                                    const
                                                                    &iden-
                                                                    tity)
```

hpx::generate, hpx::generate_n

Defined in header `hpx/algorithm.hpp`⁶⁶⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter, typename F>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> generate(ExPolicy &&policy, FwdIter
                                                                    first, FwdIter last, F &&f)
```

Assign each element in range [*first*, *last*) a value generated by the given function object *f*. Executed according to the policy.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

⁶⁶⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

`Ret fun();`

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *generate* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise.

```
template<typename FwdIter, typename F>  
void generate(FwdIter first, FwdIter last, F &&f)
```

Assign each element in range [*first*, *last*) a value generated by the given function object *f*.

Note: Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

`Ret fun();`

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *generate* algorithm returns void.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> generate_n(ExPolicy &&policy, FwdIter
first, Size count, F &&f)
```

Assigns each element in range $[first, first+)$ a value generated by the given function object f . Executed according to the policy.

The assignments in the parallel *generate_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly *count* invocations of f and assignments, for $count > 0$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires F to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

Ret <code>fun()</code> ;

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *generate_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. *generate_n* algorithm returns iterator one past the last element assigned if $count > 0$, *first* otherwise.

```
template<typename FwdIter, typename Size, typename F>
FwdIter generate_n(FwdIter first, Size count, F &&f)
```

Assigns each element in range $[first, first+)$ a value generated by the given function object f .

Note: Complexity: Exactly *count* invocations of *f* and assignments, for *count* > 0.

Template Parameters

- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

`Ret fun();`

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *generate_n* algorithm returns a *FwdIter*. *generate_n* algorithm returns iterator one past the last element assigned if *count*>0, *first* otherwise.

hpx::uninitialized_default_construct, hpx::uninitialized_default_construct_n

Defined in header `hpx/algorithm.hpp`⁶⁶⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename FwdIter>
void uninitialized_default_construct(FwdIter first, FwdIter last)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

⁶⁶⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

FwdIter – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *uninitialized_default_construct* algorithm returns nothing

```
template<typename ExPolicy, typename FwdIter>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> uninitialized_default_construct(ExPolicy
                                                                                               &&policy,
                                                                                               FwdIter
                                                                                               first,
                                                                                               FwdIter
                                                                                               last)
```

Constructs objects of type `typename iterator_traits<ForwardIt> ::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects. Executed according to the policy.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *uninitialized_default_construct* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns nothing otherwise.

```
template<typename FwdIter, typename Size>  
FwdIter uninitialized_default_construct_n(FwdIter first, Size count)
```

Constructs objects of type *typename iterator_traits<ForwardIt> ::value_type* in the uninitialized storage designated by the range *[first, first + count)* by default-initialization. If an exception is thrown during the initialization, the function has no effects.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_default_construct_n* algorithm returns a *returns FwdIter*. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Size>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_default_construct_n(ExPolicy  
                                                                                               &&pol-  
                                                                                               icy,  
                                                                                               FwdIter  
                                                                                               first,  
                                                                                               Size  
                                                                                               count)
```

Constructs objects of type *typename iterator_traits<ForwardIt> ::value_type* in the uninitialized storage designated by the range *[first, first + count)* by default-initialization. If an exception is thrown during the initialization, the function has no effects. Executed according to the policy.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_default_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_default_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_default_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

template<typename **I**, typename ...**Args**>

void **for_loop**(std::decay_t<*I*> first, *I* last, *Args*&&... args)

The *for_loop* implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble *for_each* from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of *for_loop* without specifying an execution policy is equivalent to specifying *hpx::execution::seq* as the execution policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

⁶⁷⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Effects: Applies f to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding f , an additional argument is passed to each application of f as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of f in the input sequence.

Complexity: Applies f exactly once for each element of the input sequence.

Remarks: If f returns a result, the result is ignored.

Note: As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note: The order of the elements of the input sequence is important for determining ordinal position of an application of f , even though the applications themselves may be unordered.

Template Parameters

- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

`<ignored> pred(I const& a, ...);`

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename I, typename ...Args>  
auto for_loop(ExPolicy &&policy, std::decay_t<I> first, I last, Args&&... args)
```

The `for_loop` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last - first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note: As described in the C++ standard, arithmetic on non-random-access iterators is performed using *advance* and *distance*.

Note: The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop* algorithm returns a *hpx::future<void>* if the execution policy is of type *hpx::execution::sequenced_task_policy* or *hpx::execution::parallel_task_policy* and returns *void* otherwise.

template<typename **I**, typename **S**, typename ...**Args**>

void **for_loop_strided**(*std::decay_t<I>* first, *I* last, *S* stride, *Args&&...* args)

The *for_loop_strided* implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble *for_each* from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of *for_loop* without specifying an execution policy is equivalent to specifying *hpx::execution::seq* as the execution policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last - first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note: As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note: The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if *I* has integral type or meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename I, typename S, typename ...Args>
auto for_loop_strided(ExPolicy &&policy, std::decay_t<I> first, I last, S stride, Args&&... args)
```

The `for_loop_strided` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note: As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note: The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if *I* has integral type or meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*) should expose a signature equivalent to:

`<ignored> pred(I const& a, ...);`

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The `for_loop_strided` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename I, typename Size, typename ...Args>
void for_loop_n(I first, Size size, Args&&... args)
```

The `for_loop_n` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop_n` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last - first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of f in the input sequence.

Complexity: Applies f exactly once for each element of the input sequence.

Remarks: If f returns a result, the result is ignored.

Note: As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note: The order of the elements of the input sequence is important for determining ordinal position of an application of f , even though the applications themselves may be unordered.

Template Parameters

- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **size** – Refers to the number of items the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename I, typename Size, typename ...Args>
auto for_loop_n(ExPolicy &&policy, I first, Size size, Args&&... args)
```

The `for_loop_n` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: I shall be an integral type or meet the requirements of an input iterator type. The $args$ parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, f . f shall meet the requirements of *MoveConstructible*.

Effects: Applies f to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the $args$ parameter pack. The length of the input sequence is $last - first$.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note: As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note: The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **size** – Refers to the number of items the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

`<ignored> pred(I const& a, ...);`

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The `for_loop_n` algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

template<typename **I**, typename **Size**, typename **S**, typename ...**Args**>

void **for_loop_n_strided**(*I* first, *Size* size, *S* stride, *Args*&&... args)

The `for_loop_n_strided` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note: As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note: The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **size** – Refers to the number of items the algorithm will be applied to.

- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if *I* has integral type or meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

`<ignored> pred(I const& a, ...);`

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename I, typename Size, typename S, typename ...Args>  
auto for_loop_n_strided(ExPolicy &&policy, I first, Size size, S stride, Args&&... args)
```

The `for_loop_n_strided` implements loop functionality over a range specified by integral or iterator bounds. For the iterator case, these algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator. Executed according to the policy.

Requires: *I* shall be an integral type or meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is *last* - *first*.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note: As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note: The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **I** – The type of the iteration variable. This could be an (forward) iterator type or an integral type.
- **Size** – The type of a non-negative integral value specifying the number of items to iterate over.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **size** – Refers to the number of items the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if I has integral type or meets the requirements of a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(I const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop_n_strided* algorithm returns a *hpx::future<void>* if the execution policy is of type *hpx::execution::sequenced_task_policy* or *hpx::execution::parallel_task_policy* and returns *void* otherwise.

hpx::partition, hpx::stable_partition, hpx::partition_copy

Defined in header [hpx/algorithm.hpp](#)⁶⁷¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename FwdIter, typename Pred, typename Proj = hpx::identity>
FwdIter partition(FwdIter first, FwdIter last, Pred &&pred, Proj &&proj = Proj())
```

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

⁶⁷¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: At most $2 * (\text{last} - \text{first})$ swaps. Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns *FwdIter*. The *partition* algorithm returns the iterator to the first element of the second group.

```
template<typename ExPolicy, typename FwdIter, typename Pred, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> partition(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter last, Pred &&pred, Proj
                                                                    &&proj = Proj())
```

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2 * (\text{last} - \text{first})$ swaps. Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *parallel_task_policy* and returns *FwdIter* otherwise. The *partition* algorithm returns the iterator to the first element of the second group.

```
template<typename BidirIter, typename F, typename Proj = hpx::identity>
BidirIter stable_partition(BidirIter first, BidirIter last, F &&f, Proj &&proj = Proj())
```

Permutes the elements in the range [first, last) such that there exists an iterator *i* such that for every iterator *j* in the range [first, *i*) `INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator *k* in the range [*i*, last), `INVOKE(f, INVOKE(proj, *k)) == false`

The invocations of *f* in the parallel *stable_partition* algorithm invoked without an execution policy object executes in sequential order in the calling thread.

Note: Complexity: At most $(last - first) * \log(last - first)$ swaps, but only linear number of swaps if there is enough extra memory. Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *stable_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range [first, *i*), $f(*j) \neq \text{false}$ `INVOKE(f, INVOKE(proj, *j)) \neq \text{false}`, and for every iterator *k* in the range [*i*, last), $f(*k) == \text{false}$ `INVOKE(f, INVOKE(proj, *k)) == \text{false}`. The relative order of the elements in both groups is preserved.

```
template<typename ExPolicy, typename BidirIter, typename F, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result_t<ExPolicy, BidirIter> stable_partition(ExPolicy &&policy,
                                                                              BidirIter first, BidirIter
                                                                              last, F &&f, Proj &&proj
                                                                              = Proj())
```

Permutes the elements in the range [first, last) such that there exists an iterator *i* such that for every iterator *j* in the range [first, *i*) `INVOKE(f, INVOKE(proj, *j)) \neq \text{false}`, and for every iterator *k* in the range [*i*, last), `INVOKE(f, INVOKE(proj, *k)) == \text{false}`

The invocations of *f* in the parallel *stable_partition* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The invocations of *f* in the parallel *stable_partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $(\text{last} - \text{first}) * \log(\text{last} - \text{first})$ swaps, but only linear number of swaps if there is enough extra memory. Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *stable_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range [first, *i*), $f(*j) \neq \text{false}$ INVOKE(*f*, INVOKE(*proj*, **j*)) $\neq \text{false}$, and for every iterator *k* in the range [*i*, last), $f(*k) == \text{false}$ INVOKE(*f*, INVOKE(*proj*, **k*)) $== \text{false}$. The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel_task_policy* the algorithm returns a *future<>* referring to this iterator.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred, typename Proj =
hpx::identity>
std::pair<FwdIter2, FwdIter3> partition_copy(FwdIter1 first, FwdIter1 last, FwdIter2 dest_true, FwdIter3
dest_false, Pred &&pred, Proj &&proj = Proj())
```

Copies the elements in the range, defined by [first, last), to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns *std::pair<OutIter1, OutIter2>*. The *partition_copy* algorithm returns the pair of the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred, typename Proj = hpx::identity>
```

```

parallel::util::detail::algorithm_result_t<ExPolicy, std::pair<FwdIter2, FwdIter3>> partition_copy(ExPolicy
&&pol-
icy,
FwdIter1
first,
FwdIter1
last,
FwdIter2
dest_true,
FwdIter3
dest_false,
Pred
&&pred,
Proj
&&proj
=
Proj())

```

Copies the elements in the range, defined by [first, last), to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred*, are copied to the range beginning at *dest_true*. The rest of the elements are copied to the range beginning at *dest_false*. The order of the elements is preserved.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition_copy* algorithm returns a `hpx::future<std::pair<OutIter1, OutIter2>>` if the execution policy is of type *parallel_task_policy* and returns `std::pair<OutIter1, OutIter2>` otherwise. The *partition_copy* algorithm returns the pair of the destination iterator to the end of the *dest_true* range, and the destination iterator to the end of the *dest_false* range.

hpx::make_heap

Defined in header `hpx/algorithm.hpp`⁶⁷².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename RndIter, typename Comp>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> make_heap(ExPolicy &&policy, RndIter first,  
                                                                    RndIter last, Comp &&comp)
```

Constructs a *max heap* in the range [first, last). Executed according to the policy.

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

⁶⁷² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $(3*N)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RndIter** – The type of the source iterators used for algorithm. This iterator must meet the requirements for a random access iterator.
- **Comp** – Comparison function object (i.e. an object that satisfies the requirements of Compare) which returns true if the first argument is less than the second. The signature of the comparison function should be equivalent to the following:

```
bool cmp(const Type1 &a, const Type2 &b);
```

While the signature does not need to have `const &`, the function must not modify the objects passed to it and must be able to accept all values of type (possibly *const*) *Type1* and *Type2* regardless of value category (thus, *Type1* & is not allowed, nor is *Type1* unless for *Type1* a move is equivalent to a copy. The types *Type1* and *Type2* must be such that an object of type *RandomIt* can be dereferenced and then implicitly converted to both of them.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *make_heap* algorithm returns a *hpx::future<void>* if the execution policy is of type *task_execution_policy* and returns *void* otherwise.

```
template<typename ExPolicy, typename RndIter>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> make_heap(ExPolicy &&policy, RndIter first,
                                                                    RndIter last)
```

Constructs a *max heap* in the range `[first, last)`. Uses the operator `<` for comparisons. Executed according to the policy.

The predicate operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *sequential_execution_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make_heap* algorithm invoked with an execution policy object of type *parallel_execution_policy* or *parallel_task_execution_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $(3*N)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RndIter** – The type of the source iterators used for algorithm. This iterator must meet the requirements for a random access iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.

Returns

The *make_heap* algorithm returns a *hpx::future<void>* if the execution policy is of type *task_execution_policy* and returns *void* otherwise.

```
template<typename RndIter, typename Comp>
void make_heap(RndIter first, RndIter last, Comp &&comp)
```

Constructs a *max heap* in the range $[\text{first}, \text{last})$.

Note: Complexity: at most $(3*N)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **RndIter** – The type of the source iterators used for algorithm. This iterator must meet the requirements for a random access iterator.
- **Comp** – Comparison function object (i.e. an object that satisfies the requirements of *Compare*) which returns true if the first argument is less than the second. The signature of the comparison function should be equivalent to the following:

```
bool cmp(const Type1 &a, const Type2 &b);
```

While the signature does not need to have `const &`, the function must not modify the objects passed to it and must be able to accept all values of type (possibly *const*) *Type1* and *Type2* regardless of value category (thus, *Type1 &* is not allowed, nor is *Type1* unless for *Type1* a move is equivalent to a copy. The types *Type1* and *Type2* must be such that an object of type *RandomIt* can be dereferenced and then implicitly converted to both of them.

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *make_heap* algorithm returns a *void*.

```
template<typename RndIter>
void make_heap(RndIter first, RndIter last)
    Constructs a max heap in the range [first, last).
```

Note: Complexity: at most $(3*N)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

RndIter – The type of the source iterators used for algorithm. This iterator must meet the requirements for a random access iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.

Returns

The *make_heap* algorithm returns a *void*.

hpx::reduce

Defined in header `hpx/algorithm.hpp`⁶⁷³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁶⁷³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename FwdIter, typename F, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> reduce(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter last, T init, F &&f)
```

Returns GENERALIZED_SUM(f, init, *first, ..., *(first + (last - first) - 1)). Executed according to the policy.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *f*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *reduce* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&. The types *Type1 Ret* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to any of those types.

Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter, typename T = typename
std::iterator_traits<FwdIter>::value_type>
util::detail::algorithm_result_t<ExPolicy, T> reduce(ExPolicy &&policy, FwdIter first, FwdIter last, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)). Executed according to the policy.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note: GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter>
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<FwdIter>::value_type>::type reduce(ExPolicy&&policy,
FwdIter first,
FwdIter last)
```

Returns GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1)). Executed according to the policy.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note: The type of the initial value (and the result type) *T* is determined from the value_type of the used *FwdIter*.

Note: GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise (where *T* is the value_type of *FwdIter*). The *reduce* algorithm returns the result of the generalized sum (applying operator $+$ ()) over the elements given by the input range $[first, last)$.

```
template<typename FwdIter, typename F, typename T = typename std::iterator_traits<FwdIter>::value_type>
T reduce(FwdIter first, FwdIter last, T init, F &&f)
```

Returns GENERALIZED_SUM(*f*, *init*, **first*, ..., *(*first* + (*last* - *first*) - 1)). Executed according to the policy.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(last - first)$ applications of the predicate *f*.

Note: GENERALIZED_SUM(*op*, *a*₁, ..., *a*_N) is defined as follows:

- *a*₁ when *N* is 1
 - *op*(GENERALIZED_SUM(*op*, *b*₁, ..., *b*_K), GENERALIZED_SUM(*op*, *b*_M, ..., *b*_N)), where:
 - *b*₁, ..., *b*_N may be any permutation of *a*₁, ..., *a*_N and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *reduce* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&. The types *Type1 Ret* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to any of those types.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename FwdIter, typename T = typename std::iterator_traits<FwdIter>::value_type>
T reduce(FwdIter first, FwdIter last, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)). Executed according to the policy.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note: GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename FwdIter>
std::iterator_traits<FwdIter>::value_type reduce(FwdIter first, FwdIter last)
```

Returns GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1)). Executed according to the policy.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note: The type of the initial value (and the result type) *T* is determined from the value_type of the used *FwdIter*.

Note: GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

FwdIter – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of an input iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns *T* (where T is the value_type of *FwdIter*). The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

hpx::find, hpx::find_if, hpx::find_if_not, hpx::find_end, hpx::find_first_of

Defined in header `hpx/algorithm.hpp`⁶⁷⁴.

namespace **hpx**

⁶⁷⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename FwdIter, typename T>
util::detail::algorithm_result_t<ExPolicy, FwdIter> find(ExPolicy &&policy, FwdIter first, FwdIter last, T
                                                         const &val)
```

Returns the first element in the range [first, last) that is equal to value. Executed according to the policy.

The comparison operations in the parallel *find* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most last - first applications of the operator==().

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to find (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **val** – the value to compare the elements to

Returns

The *find* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find* algorithm returns the first element in the range [first,last) that is equal to *val*. If no such element in the range of [first,last) is equal to *val*, then the algorithm returns *last*.

```
template<typename InIter, typename T>
InIter find(InIter first, InIter last, T const &val)
```

Returns the first element in the range [first, last) that is equal to value. Executed according to the policy.

Note: Complexity: At most last - first applications of the operator==().

Template Parameters

- **InIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.

- **T** – The type of the value to find (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **val** – the value to compare the elements to

Returns

The *find* algorithm returns a *InIter*. The *find* algorithm returns the first element in the range [first,last) that is equal to *val*. If no such element in the range of [first,last) is equal to *val*, then the algorithm returns *last*.

```
template<typename ExPolicy, typename FwdIter, typename F>
util::detail::algorithm_result_t<ExPolicy, FwdIter> find_if(ExPolicy &&policy, FwdIter first, FwdIter last,
                                                             F &&f)
```

Returns the first element in the range [first, last) for which predicate *f* returns true. Executed according to the policy.

The comparison operations in the parallel *find_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most last - first applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns true for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_if* algorithm returns the first element in the range `[first,last)` that satisfies the predicate *f*. If no such element exists that satisfies the predicate *f*, the algorithm returns *last*.

```
template<typename InIter, typename F>  
InIter find_if(InIter first, InIter last, F &&f)
```

Returns the first element in the range `[first, last)` for which predicate *f* returns true.

Note: Complexity: At most last - first applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns true for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if* algorithm returns a *InIter*. The *find_if* algorithm returns the first element in the range `[first,last)` that satisfies the predicate *f*. If no such element exists that satisfies the predicate *f*, the algorithm returns *last*.

```
template<typename ExPolicy, typename FwdIter, typename F>  
util::detail::algorithm_result_t<ExPolicy, FwdIter> find_if_not(ExPolicy &&policy, FwdIter first, FwdIter  
last, F &&f)
```

Returns the first element in the range `[first, last)` for which predicate *f* returns false. Executed according to the policy.

The comparison operations in the parallel *find_if_not* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_if_not* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most last - first applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns false for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if_not* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_if_not* algorithm returns the first element in the range `[first, last)` that does **not** satisfy the predicate *f*. If no such element exists that does not satisfy the predicate *f*, the algorithm returns *last*.

```
template<typename FwdIter, typename F>
FwdIter find_if_not(FwdIter first, FwdIter last, F &&f)
```

Returns the first element in the range `[first, last)` for which predicate *f* returns false.

Note: Complexity: At most last - first applications of the predicate.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns false for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if_not* algorithm returns a *FwdIter*. The *find_if_not* algorithm returns the first element in the range `[first, last)` that does **not** satisfy the predicate *f*. If no such element exists that does not satisfy the predicate *f*, the algorithm returns *last*.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
util::detail::algorithm_result_t<ExPolicy, FwdIter1> find_end(ExPolicy &&policy, FwdIter1 first1, FwdIter1
                                                             last1, FwdIter2 first2, FwdIter2 last2, Pred
                                                             &&op = Pred())
```

Returns the last subsequence of elements `[first2, last2)` found in the range `[first, last)` using the given predicate *op* to compare elements. Executed according to the policy.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *find_end* is available if the user decides to provide the algorithm their own predicate *op*.

Note: Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *replace* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_end* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_end* algorithm returns an iterator to the beginning of the last subsequence `[first2, last2)` in range `[first, last)`. If the length of the subsequence `[first2, last2)` is greater than the length of the range `[first1, last1)`, *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
util::detail::algorithm_result_t<ExPolicy, FwdIter1> find_end(ExPolicy &&policy, FwdIter1 first1, FwdIter1
                                                             last1, FwdIter2 first2, FwdIter2 last2)
```

Returns the last subsequence of elements `[first2, last2)` found in the range `[first, last)`. Elements are compared using *operator==*. Executed according to the policy.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_end* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_end* algorithm returns an iterator to the beginning of the last subsequence [first2, last2) in range [first, last). If the length of the subsequence [first2, last2) is greater than the length of the range [first1, last1), *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>  
FwdIter1 find_end(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns the last subsequence of elements [first2, last2) found in the range [first, last) using the given predicate *op* to compare elements.

This overload of *find_end* is available if the user decides to provide the algorithm their own predicate *op*.

Note: Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *replace* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_end* algorithm returns a *FwdIter1*. The *find_end* algorithm returns an iterator to the beginning of the last subsequence [first2, last2) in range [first, last). If the length of the subsequence [first2, last2) is greater than the length of the range [first1, last1), *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename FwdIter1, typename FwdIter2>
FwdIter1 find_end(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns the last subsequence of elements [first2, last2) found in the range [first, last). Elements are compared using *operator==*.

Note: Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_end* algorithm returns a *FwdIter1*. The *find_end* algorithm returns an iterator to the beginning of the last subsequence [first2, last2) in range [first, last). If the length of the subsequence [first2, last2) is greater than the length of the range [first1, last1), *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
util::detail::algorithm_result_t<ExPolicy, FwdIter1> find_first_of(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 s_first,
                                                                    FwdIter2 s_last, Pred &&op = Pred())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses binary predicate *op* to compare elements. Executed according to the policy.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *find_first_of* is available if the user decides to provide the algorithm their own predicate *op*.

Note: Complexity: at most ($S \cdot N$) comparisons where S = distance(s_first, s_last) and N = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.

- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_first_of* algorithm returns a *hpx::future<FwdIter1>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter1* otherwise. The *find_first_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
util::detail::algorithm_result_t<ExPolicy, FwdIter1> find_first_of(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 s_first,
                                                                    FwdIter2 s_last)
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Elements are compared using *operator==*. Executed according to the policy.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $(S \cdot N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_first_of* algorithm returns a *hpx::future<FwdIter1>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter1* otherwise. The *find_first_of* algorithm returns an iterator to the first element in the range [first, last) that is equal to an element from the range [s_first, s_last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
FwdIter1 find_first_of(FwdIter1 first, FwdIter1 last, FwdIter2 s_first, FwdIter2 s_last, Pred &&op =
    Pred())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses binary predicate *op* to compare elements.

This overload of *find_first_of* is available if the user decides to provide the algorithm their own predicate *op*.

Note: Complexity: at most ($S \cdot N$) comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_first_of* algorithm returns a *FwdIter1*. The *find_first_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter1 find_first_of(FwdIter1 first, FwdIter1 last, FwdIter2 s_first, FwdIter2 s_last)
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Elements are compared using *operator==*.

Note: Complexity: at most $(S \cdot N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_first_of* algorithm returns a *FwdIter1*. The *find_first_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename ExPolicy, typename BidIter, typename T>
```

```
util::detail::algorithm_result_t<ExPolicy, BidIter> find_last(ExPolicy &&policy, BidIter first, BidIter last, T const &val)
```

Returns the last element in the range `[first, last)` that is equal to *val*. Executed according to the policy.

The comparison operations in the parallel *find_last* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_last* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most *last - first* applications of the operator `==`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **BidIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **T** – The type of the value to find (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **val** – The value to find.

Returns

The *find_last* algorithm returns a *hpx::future<BidIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *BidIter* otherwise. The *find_last* algorithm returns an iterator to the last element in the range `[first, last)` that is equal to *val*. If no such element is found, the function returns *last*.

```
template<typename InIter, typename T>  
InIter find_last(InIter first, InIter last, T const &val)
```

Returns the last element in the range `[first, last)` that is equal to *val*.

Note: Complexity: At most *last - first* applications of the operator `==`.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to find (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **val** – The value to find.

Returns

The *find_last* algorithm returns a *InIter*. The *find_last* algorithm returns an iterator to the last element in the range [first, last) that is equal to *val*. If no such element is found, the function returns *last*.

```
template<typename ExPolicy, typename BidIter, typename F>
util::detail::algorithm_result_t<ExPolicy, BidIter> find_last_if(ExPolicy &&policy, BidIter first, BidIter
                                                                    last, F &&f)
```

Returns the last element in the range [first, last) for which predicate *f* returns true. Executed according to the policy.

The comparison operations in the parallel *find_last_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_last_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most *last - first* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **BidIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **F** – The type of the function/predicate to use (deduced). Must be callable with the type of the elements in the range.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The predicate to check.

Returns

The *find_last_if* algorithm returns a *hpx::future<BidIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *BidIter* otherwise. The *find_last_if* algorithm returns an iterator to the last element in the range [first, last) for which predicate *f* returns true. If no such element is found, the function returns *last*.

```
template<typename InIter, typename F>
InIter find_last_if(InIter first, InIter last, F &&f)
```

Returns the last element in the range [first, last) for which predicate *f* returns true.

Note: Complexity: At most *last - first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/predicate to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The predicate to check.

Returns

The *find_last_if* algorithm returns a *InIter*. The *find_last_if* algorithm returns an iterator to the last element in the range [first, last) for which predicate *f* returns true. If no such element is found, the function returns *last*.

```
template<typename ExPolicy, typename BidiIter, typename F>  
util::detail::algorithm_result_t<ExPolicy, BidiIter> find_last_if_not(ExPolicy &&policy, BidiIter first,  
                                                                    BidiIter last, F &&f)
```

Returns the last element in the range [first, last) for which predicate *f* returns false. Executed according to the policy.

The comparison operations in the parallel *find_last_if_not* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_last_if_not* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most *last - first* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **BidiIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **F** – The type of the function/predicate to use (deduced). Must be callable with the type of the elements in the range.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The predicate to check.

Returns

The *find_last_if_not* algorithm returns a *hpx::future<BidIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *BidIter* otherwise. The *find_last_if_not* algorithm returns an iterator to the last element in the range [first, last) for which predicate *f* returns false. If no such element is found, the function returns *last*.

```
template<typename InIter, typename F>
InIter find_last_if_not(InIter first, InIter last, F &&f)
```

Returns the last element in the range [first, last) for which predicate *f* returns false.

Note: Complexity: At most *last - first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/predicate to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The predicate to check.

Returns

The *find_last_if_not* algorithm returns a *InIter*. The *find_last_if_not* algorithm returns an iterator to the last element in the range [first, last) for which predicate *f* returns false. If no such element is found, the function returns *last*.

hpx::lexicographical_compare

Defined in header [hpx/algorithm.hpp](#)⁶⁷⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁶⁷⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename InIter1, typename InIter2, typename Pred = hpx::parallel::detail::less>  
bool lexicographical_compare(InIter1 first1, InIter1 last1, InIter2 first2, InIter2 last2, Pred &&pred)
```

Checks if the first range [first1, last1) is lexicographically less than the second range [first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: At most $2 * \min(N1, N2)$ applications of the comparison operation, where $N1 = \text{std::distance}(\text{first1}, \text{last})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Note: Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
 - The first mismatching element defines which range is lexicographically *less* or *greater* than the other
 - If one range is a prefix of another, the shorter range is lexicographically *less* than the other
 - If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
 - An empty range is lexicographically *less* than any non-empty range
 - Two empty ranges are lexicographically *equal*
-

Template Parameters

- **InIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to

Returns

The *lexicographically_compare* algorithm returns a *bool* if the execution policy object is not passed in. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred =
    hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> lexicographical_compare(ExPolicy
    &&policy,
    FwdIter1 first1,
    FwdIter1 last1,
    FwdIter2 first2,
    FwdIter2 last2,
    Pred &&pred)
```

Checks if the first range [first1, last1) is lexicographically less than the second range [first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical_compare* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2 * \min(N1, N2)$ applications of the comparison operation, where $N1 = \text{std::distance}(\text{first1}, \text{last})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Note: Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
 - The first mismatching element defines which range is lexicographically *less* or *greater* than the other
 - If one range is a prefix of another, the shorter range is lexicographically *less* than the other
 - If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
 - An empty range is lexicographically *less* than any non-empty range
 - Two empty ranges are lexicographically *equal*
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to

Returns

The *lexicographically_compare* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *lexicographically_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. *range [first2, last2)*, it returns false.

hpx::partial_sort_copy

Defined in header [hpx/algorithm.hpp](#)⁶⁷⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename InIter, typename RandIter, typename Comp = hpx::parallel::detail::less>
RandIter partial_sort_copy(InIter first, InIter last, RandIter d_first, RandIter d_last, Comp &&comp =
    Comp())
```

Sorts some of the elements in the range *[first, last)* in ascending order, storing the result in the range *[d_first, d_last)*. At most *d_last - d_first* of the elements are placed sorted to the range *[d_first, d_first + n)* where *n* is the number of elements to sort (*n = min(last - first, d_last - d_first)*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

⁶⁷⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Note: Complexity: $O(N \log(\min(D, N)))$, where $N = \text{std::distance}(\text{first}, \text{last})$ and $D = \text{std::distance}(\text{d_first}, \text{d_last})$ comparisons.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **RandIter** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **d_first** – Refers to the beginning of the destination range.
- **d_last** – Refers to the end of the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.

Returns

The *partial_sort_copy* algorithm returns a *RandomIt*. The algorithm returns an iterator to the element defining the upper boundary of the sorted range i.e. `d_first + min(last - first, d_last - d_first)`

```
template<typename ExPolicy, typename FwdIter, typename RandIter, typename Comp =
    hpx::parallel::detail::less>
parallel::util::detail::algorithm_result_t<ExPolicy, RandIter> partial_sort_copy(ExPolicy &&policy,
    FwdIter first, FwdIter
    last, RandIter d_first,
    RandIter d_last, Comp
    &&comp = Comp())
```

Sorts some of the elements in the range `[first, last)` in ascending order, storing the result in the range `[d_first, d_last)`. At most `d_last - d_first` of the elements are placed sorted to the range `[d_first, d_first + n)` where `n` is the number of elements to sort (`n = min(last - first, d_last - d_first)`). Executed according to the policy.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(N \log(\min(D, N)))$, where $N = \text{std::distance}(\text{first}, \text{last})$ and $D = \text{std::distance}(\text{d_first}, \text{d_last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **RandIter** – The type of the destination iterators used(deduced) This iterator type must meet the requirements of an random iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **d_first** – Refers to the beginning of the destination range.
- **d_last** – Refers to the end of the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.

Returns

The *partial_sort_copy* algorithm returns a `hpx::future<RandomIt>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator to the element defining the upper boundary of the sorted range i.e. `d_first + min(last - first, d_last - d_first)`

hpx::experimental::reduction

Defined in header `hpx/algorithm.hpp`⁶⁷⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

⁶⁷⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename T, typename Op>
constexpr hpx::parallel::detail::reduction_helper<T, std::decay_t<Op>> reduction(T &var, T const
&identity, Op
&&combiner)
```

The function template returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, a combiner function object, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses reduction objects by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the reduction object's combiner operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*. The expression

```
var = combiner(var, var)
```

shall be well-formed.

Note: In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation. For example if the combiner is `plus<T>`, incrementing the view would be consistent with the combiner but doubling it or assigning to it would not.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.
- **combiner** – [in] The binary function (object) used to perform a pairwise reduction on the elements.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of *identity*, and views are combined by invoking the copy of *combiner*, passing it the two views to be combined.

```
template<typename T, typename Op>
constexpr hpx::parallel::detail::reduction_helper<T, std::decay_t<Op>> reduction(T &var, Op
&&combiner)
```

hpx::fill, hpx::fill_n

Defined in header [hpx/algorithm.hpp](#)⁶⁷⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter, typename T>  
util::detail::algorithm_result_t<ExPolicy> fill(ExPolicy &&policy, FwdIter first, FwdIter last, T value)
```

Assigns the given value to the elements in the range [first, last). Executed according to the policy.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *void*).

```
template<typename FwdIter, typename T>
```

⁶⁷⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

void **fill**(*FwdIter* first, *FwdIter* last, *T* value)

Assigns the given value to the elements in the range [first, last).

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill* algorithm returns a *void*.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T>
util::detail::algorithm_result_t<ExPolicy, FwdIter> fill_n(ExPolicy &&policy, FwdIter first, Size count, T
                                                    value)
```

Assigns the given value value to the first count elements in the range beginning at first if count > 0. Does nothing otherwise. Executed according to the policy.

The comparisons in the parallel *fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, for count > 0.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *void*).

```
template<typename FwdIter, typename Size, typename T>  
FwdIter fill_n(FwdIter first, Size count, T value)
```

Assigns the given value value to the first count elements in the range beginning at first if count > 0. Does nothing otherwise.

Note: Complexity: Performs exactly *count* assignments, for count > 0.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *fill_n* algorithm returns a *FwdIter*.

hpx::set_intersection

Defined in header [hpx/algorithm.hpp](#)⁶⁷⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

⁶⁷⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename
Pred = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter3> set_intersection(ExPolicy &&policy,
                                                                 FwdIter1 first1,
                                                                 FwdIter1 last1,
                                                                 FwdIter2 first2,
                                                                 FwdIter2 last2,
                                                                 FwdIter3 dest, Pred
                                                                 &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator with sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_intersection* algorithm returns a *hpx::future<FwdIter3>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter3* otherwise. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =  
hpx::parallel::detail::less>  
FwdIter3 set_intersection(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, FwdIter3 dest,  
                          Pred &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *pred*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.

- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator with sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_intersection* algorithm returns a *FwdIter3*. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::nth_element

Defined in header `hpx/algorithm.hpp`⁶⁸⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename RandomIt, typename Pred = hpx::parallel::detail::less>
void nth_element(RandomIt first, RandomIt nth, RandomIt last, Pred &&pred = Pred())
```

nth_element is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element. Executed according to the policy.

⁶⁸⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *nth_element* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear in `std::distance(first, last)` on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

Template Parameters

- **RandomIt** – The type of the source begin, *nth*, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second. This defaults to `std::less<>`.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to *Type*. This defaults to `std::less<>`.

Returns

The *nth_element* algorithms returns nothing.

```
template<typename ExPolicy, typename RandomIt, typename Pred = hpx::parallel::detail::less>
void nth_element(ExPolicy &&policy, RandomIt first, RandomIt nth, RandomIt last, Pred &&pred =
    Pred())
```

nth_element is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth_element* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *nth_element* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in `std::distance(first, last)` on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source begin, nth, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second. This defaults to `std::less<>`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to *Type*. This defaults to `std::less<>`.

Returns

The *nth_element* algorithms returns nothing.

hpx::replace, hpx::replace_if, hpx::replace_copy, hpx::replace_copy_if

Defined in header `hpx/algorithm.hpp`⁶⁸¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename InIter, typename T = typename std::iterator_traits<InIter>::value_type>
void replace(InIter first, InIter last, T const &old_value, T const &new_value)
```

Replaces all elements satisfying specific criteria with *new_value* in the range `[first, last)`.

Effects: Substitutes elements referred by the iterator *it* in the range `[first, last)` with *new_value*, when the following corresponding conditions hold: `*it == old_value`

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

⁶⁸¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the old and new values to replace (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.

Returns

The *replace* algorithm returns a *void*.

```
template<typename ExPolicy, typename FwdIter, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, void> replace(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter last, T const &old_value, T
                                                                    const &new_value)
```

Replaces all elements satisfying specific criteria with *new_value* in the range [first, last). Executed according to the policy.

Effects: Substitutes elements referred by the iterator it in the range [first, last) with *new_value*, when the following corresponding conditions hold: **it == old_value*

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the old and new values to replace (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.

Returns

The *replace* algorithm returns a `hpx::future<void>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

```
template<typename Iter, typename Pred, typename T = typename std::iterator_traits<Iter>::value_type>
void replace_if(Iter first, Iter last, Pred &&pred, T const &new_value)
```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator *it* in the range [first, last) with *new_value*, when the following corresponding conditions hold: `INVOKE(f, *it) != false`

The assignments in the parallel *replace_if* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.

Returns

The *replace_if* algorithm returns *void*.

```
template<typename ExPolicy, typename FwdIter, typename Pred, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, void> replace_if(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter last, Pred &&pred, T
                                                                    const &new_value)
```

Replaces all elements satisfying specific criteria (for which predicate *f* returns true) with *new_value* in the range [first, last). Executed according to the policy.

Effects: Substitutes elements referred by the iterator *it* in the range [first, last) with *new_value*, when the following corresponding conditions hold: `INVOKE(f, *it) != false`

The assignments in the parallel *replace_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.

Returns

The *replace_if* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

```
template<typename InIter, typename OutIter, typename T = typename
std::iterator_traits<OutIter>::value_type>
```

```
OutIter replace_copy(InIter first, InIter last, OutIter dest, T const &old_value, T const &new_value)
```

Copies the all elements from the range [first, last) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (last - first)) either *new_value* or **(first + (it - result))* depending on whether the following corresponding condition holds: **(first + (i - result)) == old_value*

The assignments in the parallel *replace_copy* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the old and new values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.

Returns

The *replace_copy* algorithm returns an *OutIter* The *replace_copy* algorithm returns the Iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T = typename
std::iterator_traits<FwdIter2>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> replace_copy(ExPolicy &&policy,
                                                                                   FwdIter1 first, FwdIter1
                                                                                   last, FwdIter2 dest, T
                                                                                   const &old_value, T const
                                                                                   &new_value)
```

Copies the all elements from the range [first, last) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*. Executed according to the policy.

Effects: Assigns to every iterator it in the range $[result, result + (last - first))$ either `new_value` or $*(first + (it - result))$ depending on whether the following corresponding condition holds: $*(first + (i - result)) == old_value$

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the old and new values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.

Returns

The *replace_copy* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *replace_copy* algorithm returns the Iterator to the element past the last element copied.

```
template<typename InIter, typename OutIter, typename Pred, typename T = typename  
std::iterator_traits<OutIter>::value_type>
```

```
OutIter replace_copy_if(InIter first, InIter last, OutIter dest, Pred &&pred, T const &new_value)
```

Copies the all elements from the range $[first, last)$ to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range $[result, result + (last - first))$ either `new_value` or $*(first + (it - result))$ depending on whether the following corresponding condition holds: `INVOKE(f, *(first + (i - result))) != false`

The assignments in the parallel *replace_copy_if* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.

Returns

The *replace_copy_if* algorithm returns an *OutIter*. The *replace_copy_if* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred, typename T =
typename std::iterator_traits<FwdIter2>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> replace_copy_if(ExPolicy &&policy,
                                                                                      FwdIter1 first,
                                                                                      FwdIter1 last,
                                                                                      FwdIter2 dest, Pred
                                                                                      &&pred, T const
                                                                                      &new_value)
```

Copies the all elements from the range [first, last) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (last - first)) either *new_value* or **(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(f, *(first + (i - result))) != false`

The assignments in the parallel *replace_copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *replace_copy_if* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.

Returns

The *replace_copy_if* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *replace_copy_if* algorithm returns the iterator to the element in the destination range, one past the last element copied.

hpx::count, hpx::count_if

Defined in header [hpx/algorithm.hpp](#)⁶⁸².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter, typename T>
util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<FwdIter>::difference_type>::type count(ExPolicy
&&pol-
icy,
FwdIter
first,
FwdIter
last,
T
const
&value)
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*. Executed according to the policy.

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* comparisons.

Note: The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **FwdIter** – The type of the source iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to search for (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

⁶⁸² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.

Returns

The *count* algorithm returns a *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIterB>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename InIter, typename T>  
std::iterator_traits<InIter>::difference_type count(InIter first, InIter last, T const &value)
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

Note: Complexity: Performs exactly *last - first* comparisons.

Template Parameters

- **InIter** – The type of the source iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to search for (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.

Returns

The *count* algorithm returns a *difference_type* (where *difference_type* is defined by *std::iterator_traits<InIter>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename ExPolicy, typename FwdIter, typename F>  
util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<FwdIter>::difference_type>::type count_if(ExPolicy  
    &&pol-  
    icy,  
    FwdIter  
    first,  
    FwdIter  
    last,  
    F  
    &&f)
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true. Executed according to the policy.

Note: Complexity: Performs exactly *last - first* applications of the predicate.

Note: The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note: The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *count_if* algorithm returns *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename InIter, typename F>
std::iterator_traits<InIter>::difference_type count_if(InIter first, InIter last, F &&f)
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

Note: Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *count_if* algorithm returns *difference_type* (where a *difference_type* is defined by *std::iterator_traits<InIter>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

hpx::destroy, hpx::destroy_n

Defined in header `hpx/algorithm.hpp`⁶⁸³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter>  
util::detail::algorithm_result_t<ExPolicy> destroy(ExPolicy &&policy, FwdIter first, FwdIter last)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range [first, last). Executed according to the policy.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* operations.

⁶⁸³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

```
template<typename FwdIter>
void destroy(FwdIter first, FwdIter last)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

Note: Complexity: Performs exactly *last - first* operations.

Template Parameters

FwdIter – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns a *void*

```
template<typename ExPolicy, typename FwdIter, typename Size>
util::detail::algorithm_result_t<ExPolicy, FwdIter> destroy_n(ExPolicy &&policy, FwdIter first, Size count)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, first + count)`. Executed according to the policy.

The operations in the parallel *destroy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *destroy_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *destroy_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename FwdIter, typename Size>  
FwdIter destroy_n(FwdIter first, Size count)
```

Destroys objects of type *typename iterator_traits<ForwardIt>::value_type* in the range [first, first + count).

Note: Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *destroy_n* algorithm returns a *FwdIter* . The *destroy_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::stable_sort

Defined in header [hpx/algorithm.hpp](#)⁶⁸⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename RandomIt, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
void stable_sort(RandomIt first, RandomIt last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The assignments in the parallel *stable_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns *void*.

⁶⁸⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename RandomIt, typename Comp = hpx::parallel::detail::less, typename  
Proj = hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> stable_sort(ExPolicy &&policy, RandomIt first,  
                                                                    RandomIt last, Comp &&comp =  
                                                                    Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()). Executed according to the policy.

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

Returns

The *stable_sort* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

hpx::experimental::sort_by_key

Defined in header `hpx/algorithm.hpp`⁶⁸⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

```

template<typename ExPolicy, typename KeyIter, typename ValueIter, typename Compare =
detail::less>
util::detail::algorithm_result_t<ExPolicy, sort_by_key_result<KeyIter, ValueIter>> sort_by_key(ExPolicy
&&pol-
icy,
KeyIter
key_first,
KeyIter
key_last,
Val-
ueIter
value_first,
Com-
pare
&&comp
=
Com-
pare())

```

Sorts one range of data using keys supplied in another range. The key elements in the range [key_first, key_last) are sorted in ascending order with the corresponding elements in the value range moved to follow the sorted order. The algorithm is not stable, the order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()). Executed according to the policy.

A sequence is sorted with respect to a comparator *comp* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, *(i + n), *i) == false.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

⁶⁸⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Note: Complexity: $O(N \log(N))$, where $N = \text{std::distance}(\text{first}, \text{last})$ comparisons.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **KeyIter** – The type of the key iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **ValueIter** – The type of the value iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Compare** – The type of the function/function object to use (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **key_first** – Refers to the beginning of the sequence of key elements the algorithm will be applied to.
- **key_last** – Refers to the end of the sequence of key elements the algorithm will be applied to.
- **value_first** – Refers to the beginning of the sequence of value elements the algorithm will be applied to, the range of elements must match `[key_first, key_last)`
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.

Returns

The `sort_by_key` algorithm returns a `hpx::future<sort_by_key_result<KeyIter, ValueIter>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns *otherwise*. The algorithm returns a pair holding an iterator pointing to the first element after the last element in the input key sequence and an iterator pointing to the first element after the last element in the input value sequence.

hpx::uninitialized_move, hpx::uninitialized_move_n

Defined in header [hpx/algorithm.hpp](#)⁶⁸⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

template<typename **InIter**, typename **FwdIter**>
FwdIter **uninitialized_move**(*InIter* first, *InIter* last, *FwdIter* dest)

Moves the elements in the range, defined by `[first, last)`, to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in `[first, last)` are left in a valid but unspecified state.

Note: Complexity: Performs exactly *last - first* assignments.

⁶⁸⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move* algorithm returns *FwdIter*. The *uninitialized_move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> uninitialized_move(ExPolicy
                                                                                       &&policy,
                                                                                       FwdIter1 first,
                                                                                       FwdIter1 last,
                                                                                       FwdIter2 dest)
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state. Executed according to the policy.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move* algorithm returns a *hpx::future<FwdIter2>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

```
template<typename InIter, typename Size, typename FwdIter>  
std::pair<InIter, FwdIter> uninitialized_move_n(InIter first, Size count, FwdIter dest)
```

Moves the elements in the range $[first, first + count)$, starting from *first* and proceeding to $first + count - 1$, to another range beginning at *dest*. If an exception is thrown during the initialization, some objects in $[first, first + count)$ are left in a valid but unspecified state.

Note: Complexity: Performs exactly *count* movements, if $count > 0$, no move operations otherwise.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move_n* algorithm returns a *std::pair<InIter, FwdIter>*. The *uninitialized_move_n* algorithm returns A pair whose first element is an iterator to the element past the last element moved in the source range, and whose second element is an iterator to the element past the last element moved in the destination range.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2>  
parallel::util::detail::algorithm_result<ExPolicy, std::pair<FwdIter1, FwdIter2>>::type uninitialized_move_n(ExPolicy  
    &&pol-  
    istry,  
    FwdIter1  
    first,  
    Size  
    count,  
    FwdIter2  
    dest)
```

Moves the elements in the range $[first, first + count)$, starting from *first* and proceeding to $first + count - 1$, to another range beginning at *dest*. If an exception is thrown during the initialization, some objects in $[first, first + count)$ are left in a valid but unspecified state. Executed according to the policy.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move_n* algorithm returns a *hpx::future<std::pair<FwdIter1,FwdIter2>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::pair<FwdIter1,FwdIter2>* otherwise. The *uninitialized_move_n* algorithm returns A pair whose first element is an iterator to the element past the last element moved in the source range, and whose second element is an iterator to the element past the last element moved in the destination range.

hpx::experimental::reduction_bit_or

Defined in header [hpx/algorithm.hpp](http://github.com/THPXPProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp)⁶⁸⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

⁶⁸⁷ <http://github.com/THPXPProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_or<T>> reduction_bit_or(T &var)
```

The function template *reduction_bit_or* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::bit_or{ }` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_bit_or* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_or{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note: In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_or<T>> reduction_bit_or(T &var, T
                                                                                          const
                                                                                          &identity)
```

hpx::remove, hpx::remove_if

Defined in header `hpx/algorithm.hpp`⁶⁸⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

template<typename **FwdIter**, typename **T** = typename `std::iterator_traits<FwdIter>::value_type`>
FwdIter **remove**(*FwdIter* first, *FwdIter* last, *T* const &value)

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements that are equal to *value*.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the `operator==()`.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

Returns

The *remove* algorithm returns a *FwdIter*. The *remove* algorithm returns the iterator to the new end of the range.

template<typename **ExPolicy**, typename **FwdIter**, typename **T** = typename
`std::iterator_traits<FwdIter>::value_type`>
hpx::parallel::util::detail::algorithm_result_t<*ExPolicy*, *FwdIter*> **remove**(*ExPolicy* &&policy, *FwdIter* first,
FwdIter last, *T* const &value)

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements that are equal to *value*. Executed according to the policy.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

⁶⁸⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the `operator==()`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

Returns

The *remove* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove* algorithm returns the iterator to the new end of the range.

```
template<typename FwdIter, typename Pred>  
FwdIter remove_if(FwdIter first, FwdIter last, Pred &&pred)
```

Removes all elements satisfying specific criteria from the range `[first, last)` and returns a past-the-end iterator for the new end of the range. This version removes all elements for which predicate *pred* returns true.

The assignments in the parallel *remove_if* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *remove_if* algorithm returns a *FwdIter*. The *remove_if* algorithm returns the iterator to the new end of the range.

```
template<typename ExPolicy, typename FwdIter, typename Pred>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> remove_if(ExPolicy &&policy, FwdIter
first, FwdIter last, Pred
&&pred)
```

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements for which predicate *pred* returns true. Executed according to the policy.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *remove_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove_if* algorithm returns the iterator to the new end of the range.

hpx::is_heap, hpx::is_heap_until

Defined in header `hpx/algorithm.hpp`⁶⁸⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename RandIter, typename Comp = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> is_heap(ExPolicy &&policy, RandIter first,
                                                                    RandIter last, Comp &&comp =
                                                                    Comp())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using `operator<()`). Executed according to the policy.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

⁶⁸⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename RandIter, typename Comp = hpx::parallel::detail::less>
bool is_heap(RandIter first, RandIter last, Comp &&comp = Comp())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

Note: Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

Returns

The *is_heap* a *bool*. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename ExPolicy, typename RandIter, typename Comp = hpx::parallel::detail::less>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, RandIter> is_heap_until(ExPolicy &&policy,  
                                                                                   RandIter first, RandIter  
                                                                                   last, Comp &&comp =  
                                                                                   Comp())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()). Executed according to the policy.

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

Returns

The *is_heap_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename RandIter, typename Comp = hpx::parallel::detail::less>  
RandIter is_heap_until(RandIter first, RandIter last, Comp &&comp = Comp())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

Note: Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **RandIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

Returns

The *is_heap_until* algorithm returns a *RandIter*. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at first which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

hpx::copy, hpx::copy_n, hpx::copy_if

Defined in header [hpx/algorithm.hpp](#)⁶⁹⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> copy(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Executed according to the policy.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

⁶⁹⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2>  
FwdIter2 copy(FwdIter1 first, FwdIter1 last, FwdIter2 dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a *FwdIter2*. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> copy_n(ExPolicy &&policy, FwdIter1
                                                                    first, Size count, FwdIter2 dest)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. Executed according to the policy.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy_n* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *copy_n* algorithm returns Iterator in the destination range, pointing past the last element copied if count>0 or result otherwise.

```
template<typename FwdIter1, typename Size, typename FwdIter2>
FwdIter2 copy_n(FwdIter1 first, Size count, FwdIter2 dest)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy_n* algorithm returns a *FwdIter2*. The *copy_n* algorithm returns Iterator in the destination range, pointing past the last element copied if count>0 or result otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> copy_if(ExPolicy &&policy, FwdIter1  
first, FwdIter1 last, FwdIter2  
dest, Pred &&pred)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *f* returns true. The order of the elements that are not removed is preserved. Executed according to the policy.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

Returns

The *copy_if* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *copy_if* algorithm returns output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename Pred>
FwdIter2 copy_if(FwdIter1 first, FwdIter1 last, FwdIter2 dest, Pred &&pred)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *f* returns true. The order of the elements that are not removed is preserved.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

Returns

The *copy_if* algorithm returns a *FwdIter2*. The *copy_if* algorithm returns output iterator to the element in the destination range, one past the last element copied.

hpx::experimental::induction

Defined in header `hpx/algorithm.hpp`⁶⁹¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

template<typename **T**>

constexpr *hpx::parallel::detail::induction_stride_helper*<**T**> **induction**(**T** &&value, std::size_t stride)

The function template returns an induction object of unspecified type having a value type and encapsulating an initial *value* of that type and, optionally, a stride.

For each element in the input range, a looping algorithm over input sequence *S* computes an induction value from an induction variable and ordinal position *p* within *S* by the formula $i + p * \text{stride}$ if a stride was specified or $i + p$ otherwise. This induction value is passed to the element access function.

If the *value* argument to *induction* is a non-const lvalue, then that lvalue becomes the live-out object for the returned induction object. For each induction object that has a live-out object, the looping algorithm assigns the value of $i + n * \text{stride}$ to the live-out object upon return, where *n* is the number of elements in the input range.

Template Parameters

T – The value type to be used by the induction object.

Parameters

- **value** – [in] The initial value to use for the induction object
- **stride** – [in] The (optional) stride to use for the induction object (default: 1)

Returns

This returns an induction object with value type *T*, initial *value*, and (if specified) *stride*. If *T* is a lvalue of non-const type, *value* is used as the live-out object for the induction object; otherwise there is no live-out object.

template<typename **T**>

constexpr *hpx::parallel::detail::induction_helper*<**T**> **induction**(**T** &&value)

⁶⁹¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

hpx::reduce_by_key

Defined in header `hpx/algorithm.hpp`⁶⁹².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

```

template<typename ExPolicy, typename RanIter, typename RanIter2, typename FwdIter1,
typename FwdIter2, typename Compare = std::equal_to<typename
std::iterator_traits<RanIter>::value_type>, typename Func = std::plus<typename
std::iterator_traits<RanIter2>::value_type>>
util::detail::algorithm_result<ExPolicy, util::in_out_result<FwdIter1, FwdIter2>>::type reduce_by_key(ExPolicy
&&pol-
icy,
Ran-
Iter
key_first,
Ran-
Iter
key_last,
Ran-
Iter2
val-
ues_first,
FwdIter1
keys_output,
FwdIter2
val-
ues_output,
Com-
pare
&&comp
=
Com-
pare(),
Func
&&func
=
Func())

```

Reduce by Key performs an inclusive scan reduction operation on elements supplied in key/value pairs. The algorithm produces a single output value for each set of equal consecutive keys in [key_first, key_last). the value being the GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result))). for the run of consecutive matching keys. The number of keys supplied must match the number of values.

⁶⁹² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **RanIter** – The type of the key iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **RanIter2** – The type of the value iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **FwdIter1** – The type of the iterator representing the destination key range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination value range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Compare** – The type of the optional function/function object to use to compare keys (deduced). Assumed to be `std::equal_to` otherwise.
- **Func** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *reduce_by_key* requires *Func* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **key_first** – Refers to the beginning of the sequence of key elements the algorithm will be applied to.
- **key_last** – Refers to the end of the sequence of key elements the algorithm will be applied to.
- **values_first** – Refers to the beginning of the sequence of value elements the algorithm will be applied to.
- **keys_output** – Refers to the start output location for the keys produced by the algorithm.
- **values_output** – Refers to the start output location for the values produced by the algorithm.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **func** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1 Ret* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to any of those types.

Returns

The *reduce_by_key* algorithm returns a `hpx::future<pair<Iter1,Iter2>>` if the exe-

cution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *pair<Iter1,Iter2>* otherwise.

hpx::shift_right

Defined in header `hpx/algorithm.hpp`⁶⁹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename FwdIter, typename Size>
FwdIter shift_right(FwdIter first, FwdIter last, Size n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the end of the range. For every integer `i` in `[0, last - first - n)`, moves the element originally at position `first + i` to position `first`

- `n + i`.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: At most $(last - first) - n$ assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns *FwdIter*. The *shift_right* algorithm returns an iterator to the beginning of the resulting range. Specifically: If n is 0 or $n \geq (last - first)$, does nothing and returns *first* and *last* respectively. Otherwise returns *first + n*.

```
template<typename ExPolicy, typename FwdIter, typename Size>
```

⁶⁹³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter> **shift_right**(*ExPolicy* &&policy, *FwdIter* first, *FwdIter* last, *Size* n)

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i. Executed according to the policy.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most (last - first) - n assignments.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_right* algorithm returns an iterator to the beginning of the resulting range. Specifically: If *n* is 0, does nothing and returns *first*. If *n* >= (last - first), does nothing and returns *last*. Otherwise returns *first* + n.

hpx::experimental::reduction_min

Defined in header `hpx/algorithm.hpp`⁶⁹⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::min_of<T>> reduction_min(T
&var)
```

The function template *reduction_min* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::min_of{ }` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_min* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::min_of{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note: In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

⁶⁹⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::min_of<T>> reduction_min(T
                                                                    &var,
                                                                    T
                                                                    const
                                                                    &iden-
                                                                    tity)
```

hpx::move

Defined in header `hpx/algorithm.hpp`⁶⁹⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> move(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 dest)
```

Moves the elements in the range `[first, last)`, to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move. Executed according to the policy.

The move assignments in the parallel *move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The move assignments in the parallel *move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* move assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the move assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

⁶⁹⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

```
template<typename FwdIter1, typename FwdIter2>
FwdIter2 move(FwdIter1 first, FwdIter1 last, FwdIter2 dest)
```

Moves the elements in the range [first, last), to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

Note: Complexity: Performs exactly *last - first* move assignments.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a *FwdIter2*. The *move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

hpx::transform_reduce

Defined in header [hpx/algorithm.hpp](#)⁶⁹⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

⁶⁹⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename ExPolicy, typename FwdIter, typename T, typename Reduce, typename Convert>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy, FwdIter  
first, FwdIter last, T init,  
Reduce &&red_op, Convert  
&&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))). Executed according to the policy.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename InIter, typename T, typename Reduce, typename Convert>
T transform_reduce(InIter first, InIter last, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy,
                                                                              FwdIter1 first1, FwdIter1
                                                                              last1, FwdIter2 first2, T init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*. Executed according to the policy.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename InIter1, typename InIter2, typename T>
T transform_reduce(InIter1 first1, InIter1 last1, InIter2 first2, T init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note: Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **InIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as return values (deduced).

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns a *T*.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T, typename Reduce,
typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> transform_reduce(ExPolicy &&policy,
                                                                    FwdIter1 first1, FwdIter1
                                                                    last1, FwdIter2 first2, T init,
                                                                    Reduce &&red_op, Convert
                                                                    &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*. Executed according to the policy.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *red_op*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename InIter1, typename InIter2, typename T, typename Reduce, typename Convert>
T transform_reduce(ExPolicy &&policy, InIter1 first1, InIter1 last1, InIter2 first2, T init, Reduce
&&red_op, Convert &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note: Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **InIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *red_op*.

Returns

The *transform_reduce* algorithm returns a *T*.

hpx::uninitialized_fill, hpx::uninitialized_fill_n

Defined in header `hpx/algorithm.hpp`⁶⁹⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename FwdIter, typename T>
void uninitialized_fill(FwdIter first, FwdIter last, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range `[first, last)`. If an exception is thrown during the initialization, the function has no effects.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

⁶⁹⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns nothing

```
template<typename ExPolicy, typename FwdIter, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> uninitialized_fill(ExPolicy &&policy, FwdIter
                                                                    first, FwdIter last, T const
                                                                    &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects. Executed according to the policy.

The initializations in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The initializations in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns nothing otherwise.

```
template<typename FwdIter, typename Size, typename T>
FwdIter uninitialized_fill_n(FwdIter first, Size count, T const &value)
```

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply f to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill_n* algorithm returns a *FwdIter*. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_fill_n(ExPolicy
                                                                                       &&policy,
                                                                                       FwdIter first,
                                                                                       Size count, T
                                                                                       const &value)
```

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects. Executed according to the policy.

The initializations in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The initializations in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply f to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill_n* algorithm returns a `hpx::future<FwdIter>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `FwdIter` otherwise. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

hpx::rotate, hpx::rotate_copy

Defined in header `hpx/algorithm.hpp`⁶⁹⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

template<typename **FwdIter**>

FwdIter **rotate**(*FwdIter* first, *FwdIter* new_first, *FwdIter* last)

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element *new_first* becomes the first element of the new range and *new_first* - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

FwdIter – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **new_first** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a `FwdIter`. The *rotate* algorithm returns the iterator to the new location of the element pointed by *first*, equal to *first* + (*last* - *new_first*).

⁶⁹⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename FwdIter>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> rotate(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter new_first, FwdIter last)
```

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element *new_first* becomes the first element of the new range and *new_first* - 1 becomes the last element. Executed according to the policy.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Note: The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **new_first** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *rotate* algorithm returns the iterator equal to *first* + (*last* - *new_first*).

```
template<typename FwdIter, typename OutIter>
OutIter rotate_copy(FwdIter first, FwdIter new_first, FwdIter last, OutIter dest_first)
```

Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *new_first* becomes the first element of the new range and *new_first* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **OutIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **new_first** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Refers to the begin of the destination range.

Returns

The *rotate_copy* algorithm returns a output iterator, The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> rotate_copy(ExPolicy &&policy,
                                          FwdIter1 first, FwdIter1
                                          new_first, FwdIter1 last,
                                          FwdIter2 dest_first)
```

Copies the elements from the range [first, last), to another range beginning at *dest_first* in such a way, that the element *new_first* becomes the first element of the new range and *new_first* - 1 becomes the last element. Executed according to the policy.

The assignments in the parallel *rotate_copy* algorithm execute in sequential order in the calling thread.

The assignments in the parallel *rotate_copy* algorithm execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **new_first** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Refers to the begin of the destination range.

Returns

The *rotate_copy* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *parallel_task_policy* and returns `FwdIter2` otherwise. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

hpx::experimental::reduction_max

Defined in header `hpx/algorithm.hpp`⁶⁹⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **experimental**

Top-level namespace.

Functions

template<typename T>

constexpr `hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::max_of<T>>` **reduction_max**(T &var)

The function template *reduction_max* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::max_of{ }` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_max* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::max_of{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note: In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

⁶⁹⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::max_of<T>> reduction_max(T
                                                                                                     &var,
                                                                                                     T
                                                                                                     const
                                                                                                     &iden-
                                                                                                     tity)
```

hpx::transform_inclusive_scan

Defined in header `hpx/algorithm.hpp`⁷⁰⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename InIter, typename OutIter, typename BinOp, typename UnOp>
OutIter transform_inclusive_scan(InIter first, InIter last, OutIter dest, BinOp &&binary_op, UnOp
                                &&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result)))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *binary_op* nor *unary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The difference between *inclusive_scan* and *transform_inclusive_scan* is that *transform_inclusive_scan* includes the *i*th input element in the *i*th sum.

Note: Complexity: O(last - first) applications of each of *binary_op* and *unary_op*.

⁷⁰⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
 - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Binary *FunctionObject* that will be applied in to the result of *unary_op*, the results of other *binary_op*, and *init* if provided.
- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.

Returns

The *transform_inclusive_scan* algorithm returns a returns *OutIter*. The *transform_inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename BinOp, typename UnOp>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type transform_inclusive_scan(ExPolicy
                                                                                               &&policy,
                                                                                               FwdIter1
                                                                                               first,
                                                                                               FwdIter1
                                                                                               last,
                                                                                               FwdIter2
                                                                                               dest, BinOp
                                                                                               &&bi-
                                                                                               nary_op,
                                                                                               UnOp
                                                                                               &&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result)))). Executed according to the policy.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *binary_op* nor *unary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges $[first, last)$ or $[result, result + (last - first))$.

The difference between *inclusive_scan* and *transform_inclusive_scan* is that *transform_inclusive_scan* includes the *i*th input element in the *i*th sum.

Note: Complexity: $O(last - first)$ applications of each of *binary_op* and *unary_op*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
 - *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a1*, ..., *aK*), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *aM*, ..., *aN*)) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Binary *FunctionObject* that will be applied in to the result of *unary_op*, the results of other *binary_op*, and *init* if provided.
- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.

Returns

The *transform_inclusive_scan* algorithm returns a *hpx::future<FwdIter2>* if the execution

policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *transform_inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename OutIter, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<InIter>::value_type>
```

```
OutIter transform_inclusive_scan(InIter first, InIter last, OutIter dest, BinOp &&binary_op, UnOp
&&unary_op, T init)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, init, conv(*first), ..., conv(*(first + (i - result))))).

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *binary_op* nor *unary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The difference between *inclusive_scan* and *transform_inclusive_scan* is that *transform_inclusive_scan* includes the *i*th input element in the *i*th sum. If *binary_op* is not mathematically associative, the behavior of *transform_inclusive_scan* may be non-deterministic.

Note: Complexity: O(last - first) applications of each of *binary_op* and *unary_op*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
 - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) where 1 < K+1 = M <= N.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Binary *FunctionObject* that will be applied in to the result of *unary_op*, the results of other *binary_op*, and *init* if provided.

- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.
- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns a returns *OutIter*. The *transform_inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename BinOp, typename UnOp,
typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type transform_inclusive_scan(ExPolicy
                                                                                               &&policy,
                                                                                               FwdIter1
                                                                                               first,
                                                                                               FwdIter1
                                                                                               last,
                                                                                               FwdIter2
                                                                                               dest, BinOp
                                                                                               &&bi-
                                                                                               nary_op,
                                                                                               UnOp
                                                                                               &&unary_op,
                                                                                               T init)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(op, init, conv(*first), ..., conv(*(first + (i - result)))). Executed according to the policy.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_inclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *binary_op* nor *unary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The difference between *inclusive_scan* and *transform_inclusive_scan* is that *transform_inclusive_scan* includes the *i*th input element in the *i*th sum. If *binary_op* is not mathematically associative, the behavior of *transform_inclusive_scan* may be non-deterministic.

Note: Complexity: O(last - first) applications of each of *binary_op* and *unary_op*.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
 - op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) where 1 < K+1 = M ≤ N.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary_op** – Binary *FunctionObject* that will be applied in to the result of *unary_op*, the results of other *binary_op*, and *init* if provided.
- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.
- **init** – The initial value for the generalized sum.

Returns

The *transform_inclusive_scan* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *transform_inclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::is_partitioned

Defined in header [hpx/algorithm.hpp](#)⁷⁰¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁷⁰¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename FwdIter, typename Pred>
bool is_partitioned(FwdIter first, FwdIter last, Pred &&pred)
```

Determines if the range [first, last) is partitioned.

Note: Complexity: at most (N) predicate evaluations where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *is_partitioned* algorithm returns *bool*. The *is_partitioned* algorithm returns true if each element in the sequence for which pred returns true precedes those for which pred returns false. Otherwise *is_partitioned* returns false. If the range [first, last) contains less than two elements, the function is always true.

```
template<typename ExPolicy, typename FwdIter, typename Pred>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> is_partitioned(ExPolicy &&policy, FwdIter
first, FwdIter last, Pred
&&pred)
```

Determines if the range [first, last) is partitioned. Executed according to the policy.

The predicate operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (N) predicate evaluations where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *CopyConstructible* when using a parallel policy.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *is_partitioned* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range `[first, last)` contains less than two elements, the function is always true.

hpx::remove_copy, hpx::remove_copy_if

Defined in header `hpx/algorithm.hpp`⁷⁰².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename InIter, typename OutIter, typename T = typename  
std::iterator_traits<InIter>::value_type>  
OutIter remove_copy(InIter first, InIter last, OutIter dest, T const &value)
```

Copies the elements in the range, defined by `[first, last)`, to another range beginning at *dest*. Copies only the elements for which the comparison operator returns false when compare to value. The order of the elements that are not removed is preserved.

Effects: Copies all the elements referred to by the iterator it in the range `[first,last)` for which the following corresponding conditions do not hold: `*it == value`

⁷⁰² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *remove_copy* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*, here comparison operator.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type that the result of dereferencing *FwdIter1* is compared to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **value** – Value to be removed.

Returns

The *remove_copy* algorithm returns an *OutIter*. The *remove_copy* algorithm returns the iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T = typename
std::iterator_traits<InIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> remove_copy(ExPolicy &&policy,
                                          FwdIter1 first, FwdIter1
                                          last, FwdIter2 dest, T const
                                          &value)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the comparison operator returns false when compare to value. The order of the elements that are not removed is preserved. Executed according to the policy.

Effects: Copies all the elements referred to by the iterator it in the range [first,last) for which the following corresponding conditions do not hold: **it == value*

The assignments in the parallel *remove_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*, here comparison operator.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type that the result of dereferencing FwdIter1 is compared to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **value** – Value to be removed.

Returns

The *remove_copy* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *remove_copy* algorithm returns the iterator to the element past the last element copied.

```
template<typename InIter, typename OutIter, typename Pred>  
OutIter remove_copy_if(InIter first, InIter last, OutIter dest, Pred &&pred)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *pred* returns false. The order of the elements that are not removed is preserved.

Effects: Copies all the elements referred to by the iterator it in the range [first,last) for which the following corresponding conditions do not hold: `INVOKE(pred, *it) != false`.

The assignments in the parallel *remove_copy_if* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements to be removed. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *remove_copy_if* algorithm returns an *OutIter*. The *remove_copy_if* algorithm returns the iterator to the element past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> remove_copy_if(ExPolicy &&policy,
                                                                                   FwdIter1 first,
                                                                                   FwdIter1 last, FwdIter2
                                                                                   dest, Pred &&pred)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *pred* returns false. The order of the elements that are not removed is preserved. Executed according to the policy.

Effects: Copies all the elements referred to by the iterator it in the range [first,last) for which the following corresponding conditions do not hold: INVOKE(pred, *it) != false.

The assignments in the parallel *remove_copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_copy_if* requires *Pred* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements to be removed. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

Returns

The *remove_copy_if* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *remove_copy_if* algorithm returns the iterator to the element past the last element copied.

hpx::unique, hpx::unique_copy

Defined in header `hpx/algorithm.hpp`⁷⁰³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename FwdIter, typename Pred = hpx::parallel::detail::equal_to, typename Proj =  
hpx::identity>
```

```
FwdIter unique(FwdIter first, FwdIter last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

⁷⁰³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique* algorithm returns *FwdIter*. The *unique* algorithm returns the iterator to the new end of the range.

```
template<typename ExPolicy, typename FwdIter, typename Pred = hpx::parallel::detail::equal_to,
typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type unique(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter last, Pred &&pred =
                                                                    Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range. Executed according to the policy.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *unique* algorithm returns the iterator to the new end of the range.

```
template<typename InIter, typename OutIter, typename Pred = hpx::parallel::detail::equal_to, typename Proj = hpx::identity>
```

```
OutIter unique_copy(InIter first, InIter last, OutIter dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique_copy* algorithm returns a returns *OutIter*. The *unique_copy* algorithm returns the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred =
hpx::parallel::detail::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type unique_copy(ExPolicy &&policy,
FwdIter1 first, FwdIter1 last,
FwdIter2 dest, Pred &&pred
= Pred(), Proj &&proj =
Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied. Executed according to the policy.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs not more than *last - first* assignments, exactly *last - first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *Copy-Constructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique_copy* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

hpx::uninitialized_relocate, hpx::uninitialized_relocate_n

Defined in header `hpx/algorithm.hpp`⁷⁰⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename InIter1, typename InIter2, typename FwdIter>  
FwdIter uninitialized_relocate(InIter1 first, InIter2 last, FwdIter dest)
```

Relocates the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

⁷⁰⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *uninitialized_relocate* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: time: $O(n)$, space: $O(1)$ 1) For “trivially relocatable” underlying types (T) and a contiguous iterator range [first, last): $\text{std::distance}(\text{first}, \text{last}) * \text{sizeof}(T)$ bytes are copied. 2) For “trivially relocatable” underlying types (T) and a non-contiguous iterator range [first, last): $\text{std::distance}(\text{first}, \text{last})$ memory copies of $\text{sizeof}(T)$ bytes each are performed. 3) For “non-trivially relocatable” underlying types (T): $\text{std::distance}(\text{first}, \text{last})$ move assignments and destructions are performed.

Note: Declare a type as “trivially relocatable” using the `HPX_DECLARE_TRIVIALY_RELOCATABLE` macros found in `<hpx/type_support/is_trivially_relocatable.hpp>`.

Template Parameters

- **InIter1** – The type of the source iterator first (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the source iterator last (deduced). This iterator type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_relocate* algorithm returns *FwdIter*. The *uninitialized_relocate* algorithm returns the output iterator to the element in the destination range, one past the last element relocated.

```
template<typename ExPolicy, typename InIter1, typename InIter2, typename FwdIter>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_relocate(ExPolicy
                                                                                               &&policy,
                                                                                               InIter1 first,
                                                                                               InIter2 last,
                                                                                               FwdIter dest)
```

Relocates the elements in the range defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

The assignments in the parallel *uninitialized_relocate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: time: $O(n)$, space: $O(1)$ 1) For “trivially relocatable” underlying types (T) and a contiguous iterator range [first, last): $\text{std::distance}(\text{first}, \text{last}) * \text{sizeof}(T)$ bytes are copied. 2) For “trivially relocatable” underlying types (T) and a non-contiguous iterator range [first, last): $\text{std::distance}(\text{first}, \text{last})$ memory copies of $\text{sizeof}(T)$ bytes each are performed. 3) For “non-trivially relocatable” underlying types (T): $\text{std::distance}(\text{first}, \text{last})$ move assignments and destructions are performed.

Note: Declare a type as “trivially relocatable” using the `HPX_DECLARE_TRIVIALY_RELOCATABLE` macros found in `<hpx/type_support/is_trivially_relocatable.hpp>`.

Note: Parallel execution requires both *first* and *dest* to be contiguous iterators. If either iterator is non-contiguous, the algorithm cannot determine whether the source and destination ranges overlap, and will silently fall back to sequential execution regardless of the execution policy provided.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter1** – The type of the source iterator first (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the source iterator last (deduced). This iterator type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range. The assignments in the parallel *uninitialized_relocate_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Returns

The *uninitialized_relocate* algorithm returns a *hpx::future<FwdIter>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_relocate* algorithm returns the output iterator to the element in the destination range, one past the last element relocated.

```
template<typename BiIter1, typename BiIter2>  
BiIter2 uninitialized_relocate_backward(BiIter1 first, BiIter1 last, BiIter2 dest_last)
```

Relocates the elements in the range, defined by [first, last), to an uninitialized memory area ending at *dest_last*. The objects are processed in reverse order. If an exception is thrown during the the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

The assignments in the parallel *uninitialized_relocate* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: time: $O(n)$, space: $O(1)$ 1) For “trivially relocatable” underlying types (T) and a contiguous iterator range [first, last): $\text{std::distance}(\text{first}, \text{last}) * \text{sizeof}(T)$ bytes are copied. 2) For “trivially relocatable” underlying types (T) and a non-contiguous iterator range [first, last): $\text{std::distance}(\text{first}, \text{last})$ memory copies of $\text{sizeof}(T)$ bytes each are performed. 3) For “non-trivially relocatable” underlying types (T): $\text{std::distance}(\text{first}, \text{last})$ move assignments and destructions are performed.

Note: Declare a type as “trivially relocatable” using the `HPX_DECLARE_TRIVIALY_RELOCATABLE` macros found in `<hpx/type_support/is_trivially_relocatable.hpp>`.

Template Parameters

- **BiIter1** – The type of the source range (deduced). This iterator type must meet the requirements of a Bidirectional iterator.
- **BiIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a Bidirectional iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_last** – Refers to the beginning of the destination range.

Returns

The *uninitialized_relocate_backward* algorithm returns *BiIter2*. The *uninitialized_relocate_backward* algorithm returns the bidirectional iterator to the first element in the destination range.

```
template<typename ExPolicy, typename BiIter1, typename BiIter2>
hpx::parallel::util::detail::algorithm_result<ExPolicy, BiIter2> uninitialized_relocate_backward(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               Bi-
                                                                                               Iter1
                                                                                               first,
                                                                                               Bi-
                                                                                               Iter1
                                                                                               last,
                                                                                               Bi-
                                                                                               Iter2
                                                                                               dest_last)
```

Relocates the elements in the range, defined by [first, last), to an uninitialized memory area ending at *dest_last*. The order of the relocation of the objects depends on the execution policy. If an exception is thrown during the the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

The assignments in the parallel *uninitialized_relocate_backward* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Using the *uninitialized_relocate_backward* algorithm with the with a non-sequenced execution policy, will not guarantee the order of the relocation of the objects.

Note: Complexity: time: $O(n)$, space: $O(1)$ 1) For “trivially relocatable” underlying types (T) and a contiguous iterator range [first, last): $\text{std::distance}(\text{first}, \text{last}) * \text{sizeof}(T)$ bytes are copied. 2) For “trivially relocatable” underlying types (T) and a non-contiguous iterator range [first, last): $\text{std::distance}(\text{first}, \text{last})$ memory copies of $\text{sizeof}(T)$ bytes each are performed. 3) For “non-trivially relocatable” underlying types (T): $\text{std::distance}(\text{first}, \text{last})$ move assignments and destructions are performed.

Note: Declare a type as “trivially relocatable” using the `HPX_DECLARE_TRIVIALY_RELOCATABLE` macros found in `<hpx/type_support/is_trivially_relocatable.hpp>`.

Note: Parallel execution requires both *first* and *dest_last* to be contiguous iterators. If either iterator is non-contiguous, the algorithm cannot determine whether the source and destination ranges overlap, and will silently fall back to sequential execution regardless of the execution policy provided.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **BiIter1** – The type of the source range (deduced). This iterator type must meet the requirements of a Bidirectional iterator.
- **BiIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a Bidirectional iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_last** – Refers to the end of the destination range.

Returns

The *uninitialized_relocate_backward* algorithm returns a `hpx::future<FwdIter>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *BiIter2* otherwise. The *uninitialized_relocate_backward* algorithm returns the bidirectional iterator to the first element in the destination range.

```
template<typename InIter, typename Size, typename FwdIter>
```

FwdIter **uninitialized_relocate_n**(*InIter* first, *Size* count, *FwdIter* dest)

Relocates the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

The assignments in the parallel *uninitialized_relocate_n* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note: Complexity: time: $O(n)$, space: $O(1)$ 1) For “trivially relocatable” underlying types (*T*) and a contiguous iterator range [first, first+count): $\text{count} * \text{sizeof}(T)$ bytes are copied. 2) For “trivially relocatable” underlying types (*T*) and a non-contiguous iterator range [first, first+count): count memory copies of $\text{sizeof}(T)$ bytes each are performed. 3) For “non-trivially relocatable” underlying types (*T*): count move assignments and destructions are performed.

Note: Declare a type as “trivially relocatable” using the `HPX_DECLARE_TRIVIALY_RELOCATABLE` macros found in `<hpx/type_support/is_trivially_relocatable.hpp>`.

Template Parameters

- **InIter** – The type of the source iterator first (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to relocate.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_relocate_n* algorithm returns *FwdIter*. The *uninitialized_relocate_n* algorithm returns the output iterator to the element in the destination range, one past the last element relocated.

```
template<typename ExPolicy, typename InIter, typename Size, typename FwdIter>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_relocate_n(ExPolicy
                                                                                               &&policy,
                                                                                               InIter first,
                                                                                               Size count,
                                                                                               FwdIter
                                                                                               dest)
```

Relocates the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the move-construction of an element, all elements left in the input range, as well as all objects already constructed in the destination range are destroyed. After this algorithm completes, the source range should be freed or reused without destroying the objects.

The assignments in the parallel *uninitialized_relocate_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_relocate_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: time: $O(n)$, space: $O(1)$ 1) For “trivially relocatable” underlying types (T) and a contiguous iterator range [first, first+count): $\text{count} * \text{sizeof}(T)$ bytes are copied. 2) For “trivially relocatable” underlying types (T) and a non-contiguous iterator range [first, first+count): count memory copies of $\text{sizeof}(T)$ bytes each are performed. 3) For “non-trivially relocatable” underlying types (T): count move assignments and destructions are performed.

Note: Declare a type as “trivially relocatable” using the `HPX_DECLARE_TRIVIALY_RELOCATABLE` macros found in `<hpx/type_support/is_trivially_relocatable.hpp>`.

Note: Parallel execution requires both *first* and *dest* to be contiguous iterators. If either iterator is non-contiguous, the algorithm cannot determine whether the source and destination ranges overlap, and will silently fall back to sequential execution regardless of the execution policy provided.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter** – The type of the source iterator first (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to relocate.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_relocate_n* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_relocate_n* algorithm returns the output iterator to the element in the destination range, one past the last element relocated.

hpx::adjacent_difference

Defined in header `hpx/algorithm.hpp`⁷⁰⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename FwdIter1, typename FwdIter2>
FwdIter2 adjacent_difference(FwdIter1 first, FwdIter1 last, FwdIter2 dest)
```

Assigns each value in the range given by result its corresponding element in the range [first, last] and the one preceding it except *result, which is assigned *first.

Note: Complexity: Exactly (last - first) - 1 application of the binary operator and (last - first) assignments.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the input range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the output range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the sequence of elements the results will be assigned to.

Returns

The *adjacent_difference* algorithm returns a *FwdIter2*. The *adjacent_difference* algorithm returns an iterator to the element past the last element written.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> adjacent_difference(ExPolicy
                                                                                      &&policy,
                                                                                      FwdIter1 first,
                                                                                      FwdIter1 last,
                                                                                      FwdIter2 dest)
```

Assigns each value in the range given by result its corresponding element in the range [first, last] and the one preceding it except *result, which is assigned *first. Executed according to the policy.

The difference operations in the parallel *adjacent_difference* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

⁷⁰⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The difference operations in the parallel *adjacent_difference* invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly (last - first) - 1 application of the binary operator and (last - first) assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the input range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the output range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the sequence of elements the results will be assigned to.

Returns

The *adjacent_difference* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *adjacent_difference* algorithm returns an iterator to the element past the last element written.

```
template<typename FwdIter1, typename FwdIter2, typename Op>  
FwdIter2 adjacent_difference(FwdIter1 first, FwdIter1 last, FwdIter2 dest, Op &&op)
```

Assigns each value in the range given by result its corresponding element in the range [first, last] and the one preceding it except *result, which is assigned *first

Note: Complexity: Exactly (last - first) - 1 application of the binary operator and (last - first) assignments.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the input range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the output range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *Copy-Constructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the sequence of elements the results will be assigned to.
- **op** – The binary operator which returns the difference of elements. The signature should be equivalent to the following:

```
bool op(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter1* can be dereferenced and then implicitly converted to the dereferenced type of *dest*.

Returns

The *adjacent_difference* algorithm returns *FwdIter2*. The *adjacent_difference* algorithm returns an iterator to the element past the last element written.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Op>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> adjacent_difference(ExPolicy
                                                                                      &&policy,
                                                                                      FwdIter1 first,
                                                                                      FwdIter1 last,
                                                                                      FwdIter2 dest,
                                                                                      Op &&op)
```

Assigns each value in the range given by result its corresponding element in the range [first, last] and the one preceding it except *result, which is assigned *first

The difference operations in the parallel *adjacent_difference* invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The difference operations in the parallel *adjacent_difference* invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Exactly (last - first) - 1 application of the binary operator and (last - first) assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the input range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the output range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent_difference* requires *Op* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the sequence of elements the results will be assigned to.
- **op** – The binary operator which returns the difference of elements. The signature should be equivalent to the following:

```
bool op(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter1* can be dereferenced and then implicitly converted to the dereferenced type of *dest*.

Returns

The *adjacent_difference* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *adjacent_difference* algorithm returns an iterator to the element past the last element written.

hpx::all_of, hpx::any_of, hpx::none_of

Defined in header `hpx/algorithm.hpp`⁷⁰⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter, typename F>
util::detail::algorithm_result_t<ExPolicy, bool> none_of(ExPolicy &&policy, FwdIter first, FwdIter last, F
&&f)
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.

⁷⁰⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *none_of* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename InIter, typename F>
bool none_of(InIter first, InIter last, F &&f)
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

Note: Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *none_of* algorithm returns a *bool*. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename F>
util::detail::algorithm_result_t<ExPolicy, bool> any_of(ExPolicy &&policy, FwdIter first, FwdIter last, F
&&f)
```

Checks if unary predicate *f* returns true for at least one element in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *any_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *any_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename InIter, typename F>
bool any_of(InIter first, InIter last, F &&f)
```

Checks if unary predicate *f* returns true for at least one element in the range [first, last).

Note: Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *any_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *any_of* algorithm returns a *bool*. The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename F>
util::detail::algorithm_result_t<ExPolicy, bool> all_of(ExPolicy &&policy, FwdIter first, FwdIter last, F &&f)
```

Checks if unary predicate *f* returns true for all elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *all_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *all_of* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename InIter, typename F>  
bool all_of(InIter first, InIter last, F &&f)
```

Checks if unary predicate *f* returns true for all elements in the range [first, last).

Note: Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *all_of* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *all_of* algorithm returns a *bool*. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

hpx::reverse, hpx::reverse_copy

Defined in header `hpx/algorithm.hpp`⁷⁰⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename BidirIter>
void reverse(BidirIter first, BidirIter last)
```

Reverses the order of the elements in the range [first, last). Behaves as if applying *std::iter_swap* to every pair of iterators first+i, (*last-i*) - 1 for each non-negative *i* < (last-first)/2.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Template Parameters

BidirIter – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns *void*.

```
template<typename ExPolicy, typename BidirIter>
```

⁷⁰⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

hpx::parallel::util::detail::algorithm_result_t<*ExPolicy*, void> **reverse**(*ExPolicy* &&policy, *BidirIter* first, *BidirIter* last)

Reverses the order of the elements in the range [first, last). Behaves as if applying *std::iter_swap* to every pair of iterators first+i, (last-i) - 1 for each non-negative $i < (last - first) / 2$. Executed according to the policy.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first* and *last*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reverse* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

template<typename **BidirIter**, typename **OutIter**>
OutIter **reverse_copy**(*BidirIter* first, *BidirIter* last, *OutIter* dest)

Copies the elements from the range [first, last) to another range beginning at dest in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment $*(dest + (last - first) - 1 - i) = *(first + i)$ once for each non-negative $i < (last - first)$. If the source and destination ranges (that is, [first, last) and [dest, dest+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse_copy* algorithm execute in sequential order in the calling thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.

- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns an *OutIter*. The *reverse_copy* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename BidirIter, typename FwdIter>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> reverse_copy(ExPolicy &&policy,
                                          BidirIter first, BidirIter
                                          last, FwdIter dest)
```

Copies the elements from the range [first, last) to another range beginning at dest in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment $*(dest + (last - first) - 1 - i) = *(first + i)$ once for each non-negative $i < (last - first)$. If the source and destination ranges (that is, [first, last) and [dest, dest+(last-first)) respectively) overlap, the behavior is undefined. Executed according to the policy.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a bidirectional iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the begin of the destination range.

Returns

The *reverse_copy* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *reverse_copy* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::set_union

Defined in header [hpx/algorithm.hpp](#)⁷⁰⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename FwdIter3, typename  
Pred = hpx::parallel::detail::less>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter3> set_union(ExPolicy &&policy, FwdIter1  
first1, FwdIter1 last1,  
FwdIter2 first2, FwdIter2  
last2, FwdIter3 dest, Pred  
&&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, then all *m* elements will be copied from *[first1, last1)* to *dest*, preserving order, and then exactly *std::max(n-m, 0)* elements will be copied from *[first2, last2)* to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.

⁷⁰⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Op** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_union* algorithm returns a `hpx::future<FwdIter3>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter3* otherwise. The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =
hpx::parallel::detail::less>
FwdIter3 set_union(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, FwdIter3 dest, Pred
&&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, then all *m* elements will be copied from *[first1, last1)* to *dest*, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from *[first2, last2)* to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Op** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_union* algorithm returns a *FwdIter3*. The *set_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::reduce_deterministic

Defined in header `hpx/algorithm.hpp`⁷⁰⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ExPolicy, typename FwdIter, typename F, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> reduce_deterministic(ExPolicy &&policy,
                                          FwdIter first, FwdIter
                                          last, T init, F &&f)
```

Returns GENERALIZED_SUM(f, init, *first, ..., *(first + (last - first) - 1)). Executed according to the policy.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *f*.

Note: GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

⁷⁰⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *reduce* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1* *Ret* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to any of those types.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter, typename T = typename
std::iterator_traits<FwdIter>::value_type>
util::detail::algorithm_result_t<ExPolicy, T> reduce_deterministic(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter last, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)). Executed according to the policy.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note: GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:

- $b_1, \dots, b_N$ may be any permutation of $a_1, \dots, a_N$ and
- $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying `operator+()`) over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename FwdIter>
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<FwdIter>::value_type>::type reduce_deter
```

Returns `GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1))`. Executed according to the policy.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the `operator+()`.

Note: The type of the initial value (and the result type) T is determined from the `value_type` of the used *FwdIter*.

Note: `GENERALIZED_SUM(+, a1, ..., aN)` is defined as follows:

- a_1 when N is 1
 - `op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN))`, where:
 - $b_1, \dots, b_N$ may be any permutation of $a_1, \dots, a_N$ and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns T otherwise (where T is the `value_type` of *FwdIter*). The *reduce* algorithm returns the result of the generalized sum (applying operator`+`()) over the elements given by the input range `[first, last)`.

```
template<typename FwdIter, typename F, typename T = typename std::iterator_traits<FwdIter>::value_type>
T reduce_deterministic(FwdIter first, FwdIter last, T init, F &&f)
```

Returns `GENERALIZED_SUM(f, init, *first, ..., *(first + (last - first) - 1))`. Executed according to the policy.

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate f .

Note: `GENERALIZED_SUM(op, a1, ..., aN)` is defined as follows:

- a_1 when N is 1
- `op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN))`, where:
 - $b_1, \dots, b_N$ may be any permutation of $a_1, \dots, a_N$ and

– $1 < K+1 = M \leq N$.

Template Parameters

- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *reduce* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

Ret fun(const Type1 &a, const Type1 &b);
--

The signature does not need to have const&. The types *Type1 Ret* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to any of those types.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename FwdIter, typename T = typename std::iterator_traits<FwdIter>::value_type>
T reduce_deterministic(FwdIter first, FwdIter last, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)). Executed according to the policy.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note: GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

- **FwdIter** – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename FwdIter>
```

```
std::iterator_traits<FwdIter>::value_type reduce_deterministic(FwdIter first, FwdIter last)
```

Returns GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1)). Executed according to the policy.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note: The type of the initial value (and the result type) *T* is determined from the value_type of the used *FwdIter*.

Note: GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
 - op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.
-

Template Parameters

FwdIter – The type of the source begin and end iterators used (deduced). This iterator type must meet the requirements of an input iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns *T* (where *T* is the `value_type` of *FwdIter*). The *reduce* algorithm returns the result of the generalized sum (applying operator`+`()) over the elements given by the input range `[first, last)`.

hpx::swap_ranges

Defined in header `hpx/algorithm.hpp`⁷¹⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename FwdIter1, typename FwdIter2>
FwdIter2 swap_ranges(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2)
```

Exchanges elements between range `[first1, last1)` and another range starting at *first2*.

The swap operations in the parallel *swap_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note: Complexity: Linear in the distance between *first1* and *last1*.

Template Parameters

- **FwdIter1** – The type of the first range of iterators to swap (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the second range of iterators to swap (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.

Returns

The *swap_ranges* algorithm returns *FwdIter2*. The *swap_ranges* algorithm returns iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
```

⁷¹⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> swap_ranges(ExPolicy &&policy,
                                                                                   FwdIter1 first1, FwdIter1
                                                                                   last1, FwdIter2 first2)
```

Exchanges elements between range [first1, last1) and another range starting at *first2*. Executed according to the policy.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap_ranges* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Linear in the distance between *first1* and *last1*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the swap operations.
- **FwdIter1** – The type of the first range of iterators to swap (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the second range of iterators to swap (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.

Returns

The *swap_ranges* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *parallel_task_policy* and returns *FwdIter2* otherwise. The *swap_ranges* algorithm returns iterator to the element past the last element exchanged in the range beginning with *first2*.

hpx::uninitialized_value_construct, hpx::uninitialized_value_construct_n

Defined in header [hpx/algorithm.hpp](#)⁷¹¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

⁷¹¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Functions

```
template<typename FwdIter>
void uninitialized_value_construct(FwdIter first, FwdIter last)
```

Constructs objects of type `typename iterator_traits<ForwardIt> ::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

FwdIter – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *uninitialized_value_construct* algorithm returns nothing

```
template<typename ExPolicy, typename FwdIter>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> uninitialized_value_construct(ExPolicy
                                                                                       &&policy,
                                                                                       FwdIter first,
                                                                                       FwdIter last)
```

Constructs objects of type `typename iterator_traits<ForwardIt> ::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects. Executed according to the policy.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *uninitialized_value_construct* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns nothing otherwise.

```
template<typename FwdIter, typename Size>  
FwdIter uninitialized_value_construct_n(FwdIter first, Size count)
```

Constructs objects of type *typename iterator_traits<ForwardIt> ::value_type* in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_value_construct_n* algorithm returns a *FwdIter*. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Size>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> uninitialized_value_construct_n(ExPolicy  
                                                                                               &&pol-  
                                                                                               icy,  
                                                                                               FwdIter  
                                                                                               first,  
                                                                                               Size  
                                                                                               count)
```

Constructs objects of type *typename iterator_traits<ForwardIt> ::value_type* in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_value_construct_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *uninitialized_value_construct_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *uninitialized_value_construct_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

hpx::exclusive_scan

Defined in header [hpx/algorithm.hpp](#)⁷¹².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename InIter, typename OutIter, typename T>
OutIter exclusive_scan(InIter first, InIter last, OutIter dest, T init)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, ..., *(first + (i - result) - 1))

The reduce operations in the parallel *exclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

⁷¹² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate `std::plus<T>`.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
 - `GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)`
 - `GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN)` where $1 < K+1 = M \leq N$.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.

Returns

The *exclusive_scan* algorithm returns *OutIter*. The *exclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T>
util::detail::algorithm_result_t<ExPolicy, FwdIter2> exclusive_scan(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 dest, T init)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, ..., *(first + (i - result) - 1))`

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate `std::plus<T>`.

Note: GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
 - GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)
 - GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN) where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.

Returns

The *exclusive_scan* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *exclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename OutIter, typename T, typename Op>
```

```
OutIter exclusive_scan(InIter first, InIter last, OutIter dest, T init, Op &&op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, ..., *(first + (i - result) - 1)).

The reduce operations in the parallel *exclusive_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
 - `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.
-

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns *OutIter*. The *exclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Op, typename T>
util::detail::algorithm_result_t<ExPolicy, FwdIter2> exclusive_scan(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 dest, T init,
                                                                    Op &&op)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, ..., *(first + (i - result) - 1))`.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note: Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note: `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
 - `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where $1 < K+1 = M \leq N$.
-

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns a `hpx::future<OutIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *OutIter* otherwise. The *exclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::search, hpx::search_n

Defined in header [hpx/algorithm.hpp](http://github.com/HPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp)⁷¹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename FwdIter, typename FwdIter2, typename Pred = parallel::detail::equal_to>  
FwdIter search(FwdIter first, FwdIter last, FwdIter2 s_first, FwdIter2 s_last, Pred &&op = Pred())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

Note: Complexity: at most ($S \cdot N$) comparisons where S = distance(s_first, s_last) and N = distance(first, last).

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *search* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

⁷¹³ <http://github.com/HPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *search* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename FwdIter2, typename Pred =
parallel::detail::equal_to>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> search(ExPolicy &&policy, FwdIter first,
                                                                    FwdIter last, FwdIter2 s_first,
                                                                    FwdIter2 s_last, Pred &&op =
                                                                    Pred())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses a provided predicate to compare elements. Executed according to the policy.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most $(S*N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *search* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename FwdIter, typename Searcher>
FwdIter search(FwdIter first, FwdIter last, Searcher &&searcher)
```

Searches the range `[first, last)` using a searcher object.

Template Parameters

- **FwdIter** – The type of the source iterators (deduced). This iterator type must meet the requirements of a forward iterator.
- **Searcher** – A callable searcher object meeting the C++ Searcher requirements (e.g. `std::boyer_moore_searcher`).

Parameters

- **first** – Refers to the beginning of the sequence to search.
- **last** – Refers to the end of the sequence to search.
- **searcher** – A callable object performing the search.

Returns

An iterator to the beginning of the found subsequence, or *last* if no subsequence is found.

```
template<typename ExPolicy, typename FwdIter, typename Searcher>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> search(ExPolicy &&policy, FwdIter first,
                                                                           FwdIter last, Searcher
                                                                           &&searcher)
```

Searches the range `[first, last)` using a searcher object. Executed according to the policy.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced).
- **FwdIter** – The type of the source iterators (deduced).

- **Searcher** – A callable searcher object meeting the C++ Searcher requirements.

Parameters

- **policy** – The execution policy to use.
- **first** – Refers to the beginning of the sequence to search.
- **last** – Refers to the end of the sequence to search.
- **searcher** – A callable object performing the search.

Returns

The algorithm returns a `hpx::future<FwdIter>` if the execution policy is a task policy, or `FwdIter` otherwise.

```
template<typename FwdIter, typename FwdIter2, typename Pred = parallel::detail::equal_to>
FwdIter search_n(FwdIter first, std::size_t count, FwdIter2 s_first, FwdIter2 s_last, Pred &&op = Pred())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel `search_n` algorithm execute in sequential order in the calling thread.

Note: Complexity: at most (S*N) comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{count}$.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `search_n` requires `Pred` to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and

FwdIter2 can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *search_n* algorithm returns *FwdIter*. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [*s_first*, *s_last*) in range [*first*, *first*+*count*). If the length of the subsequence [*s_first*, *s_last*) is greater than the length of the range [*first*, *first*+*count*), *first* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename ExPolicy, typename FwdIter, typename FwdIter2, typename Pred =  
parallel::detail::equal_to>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> search_n(ExPolicy &&policy, FwdIter  
first, std::size_t count, FwdIter2  
s_first, FwdIter2 s_last, Pred  
&&op = Pred())
```

Searches the range [*first*, *last*) for any elements in the range [*s_first*, *s_last*). Uses a provided predicate to compare elements. Executed according to the policy.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: at most (*S***N*) comparisons where *S* = distance(*s_first*, *s_last*) and *N* = *count*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *search_n* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to*<>

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.

- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *search_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *search_n* algorithm returns an iterator to the beginning of the last subsequence [s_first, s_last) in range [first, first+count). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, first+count), *first* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

Pred
&&op
=
Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges [first1, last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The

⁷¹⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/algorithm.hpp>

resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*. Executed according to the policy.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly $\text{std::abs}(m-n)$ times. If $m > n$, then the last $m-n$ of those elements are copied from [first1, last1), otherwise the last $n-m$ elements are copied from [first2, last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

Returns

The *set_symmetric_difference* algorithm returns a *hpx::future<FwdIter3>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter3* otherwise. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename FwdIter3, typename Pred =
hpx::parallel::detail::less>
FwdIter3 set_symmetric_difference(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2,
                                FwdIter3 dest, Pred &&op = Pred())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *pred*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::abs(m-n)` times. If *m*>*n*, then the last *m-n* of those elements are copied from *[first1,last1)*, otherwise the last *n-m* elements are copied from *[first2,last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note: Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_symmetric_difference* algorithm returns a *FwdIter3*. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx/parallel/util/range.hpp

Defined in header `hpx/parallel/util/range.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **util**

Typedefs

```
template<typename Iterator, typename Sentinel = Iterator>
```

```
using range = hpx::util::iterator_range<Iterator, Sentinel>
```

Functions

```
template<typename Iter, typename Sent>
```

```
range<Iter, Sent> concat(range<Iter, Sent> const &it1, range<Iter, Sent> const &it2)
```

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2>
```

```
range<Iter2, Iter2> init_move(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const &src)
```

Move objects from the range `src` to `dest`.

Parameters

- **dest** – `[in]` : range where move the objects

- **src** – [**in**] : range from where move the objects

Returns

range with the objects moved and the size adjusted

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2>
range<Iter2, Sent2> uninit_move(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const
&src)
```

Move objects from the range src creating them in dest.

Parameters

- **dest** – [**in**] : range where move and create the objects
- **src** – [**in**] : range from where move the objects

Returns

range with the objects moved and the size adjusted

```
template<typename Iter, typename Sent>
void destroy_range(range<Iter, Sent> r)
```

destroy a range of objects

Parameters

r – [**in**] : range to destroy

```
template<typename Iter, typename Sent>
range<Iter, Sent> init(range<Iter, Sent> const &r, typename std::iterator_traits<Iter>::value_type
&val)
```

initialize a range of objects with the object val moving across them

Parameters

- **r** – [**in**] : range of elements not initialized
- **val** – [**in**] : object used for the initialization

Returns

range initialized

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Compare>
bool is_mergeable(range<Iter1, Sent1> const &src1, range<Iter2, Sent2> const &src2, Compare
comp)
```

: indicate if two ranges have a possible merge

Remark

Parameters

- **src1** – [**in**] : first range
- **src2** – [**in**] : second range
- **comp** – [**in**] : object for to compare elements

Returns

true : they can be merged false : they can't be merged

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Sent3, typename Compare>
range<Iter3, Sent3> full_merge(range<Iter3, Sent3> const &dest, range<Iter1, Sent1> const
&src1, range<Iter2, Sent2> const &src2, Compare comp)
```

Merge two contiguous ranges src1 and src2 , and put the result in the range dest, returning the range merged.

Parameters

- **dest** – [in] : range where locate the elements merged. the size of dest must be greater or equal than the sum of the sizes of src1 and src2
- **src1** – [in] : first range to merge
- **src2** – [in] : second range to merge
- **comp** – [in] : comparison object

Returns

range with the elements merged and the size adjusted

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Value,
typename Compare>
```

```
range<Value*> uninit_full_merge(range<Value*> const &dest, range<Iter1, Sent1> const
&src1, range<Iter2, Sent2> const &src2, Compare comp)
```

Merge two contiguous ranges src1 and src2 , and create and move the result in the uninitialized range dest, returning the range merged.

Parameters

- **dest** – [in] : range where locate the elements merged. the size of dest must be greater or equal than the sum of the sizes of src1 and src2. Initially is un-initialize memory
- **src1** – [in] : first range to merge
- **src2** – [in] : second range to merge
- **comp** – [in] : comparison object

Returns

range with the elements merged and the size adjusted

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Compare>
```

```
range<Iter2, Sent2> half_merge(range<Iter2, Sent2> const &dest, range<Iter1, Sent1> const
&src1, range<Iter2, Sent2> const &src2, Compare comp)
```

: Merge two buffers. The first buffer is in a separate memory

Parameters

- **dest** – [in] : range where finish the two buffers merged
- **src1** – [in] : first range to merge in a separate memory
- **src2** – [in] : second range to merge, in the final part of the range where deposit the final results
- **comp** – [in] : object for compare two elements of the type pointed by the Iter1 and Iter2

Returns

: range with the two buffers merged

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3,
typename Sent3, typename Compare>
```

```
bool in_place_merge_uncontiguous(range<Iter1, Sent1> const &src1, range<Iter2, Sent2>
const &src2, range<Iter3, Sent3> &aux, Compare comp)
```

: merge two non contiguous buffers src1 , src2, using the range aux as auxiliary memory

Remark

Parameters

- **src1** – [in] : first range to merge
- **src2** – [in] : second range to merge
- **aux** – [in] : auxiliary range used in the merge

- **comp** – [in] : object for to compare elements

Returns

true : not changes done false : changes in the buffers

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Compare>
range<Iter1, Sent1> in_place_merge(range<Iter1, Sent1> const &src1, range<Iter1, Sent1> const
&src2, range<Iter2, Sent2> &buf, Compare comp)

: merge two contiguous buffers ( src1, src2) using buf as auxiliary memory
```

Remark

Parameters

- **src1** – [in] : first range to merge
- **src2** – [in] : second range to merge
- **buf** – [in] : auxiliary memory used in the merge
- **comp** – [in] : object for to compare elements

Returns

true : not changes done false : changes in the buffers

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Compare>
void merge_flow(range<Iter1, Sent1> rng1, range<Iter2, Sent2> rbuf, range<Iter1, Sent1> rng2,
Compare cmp)
```

asio

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/asio/asio_util.hpp

Defined in header hpx/asio/asio_util.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

bool **get_endpoint**(std::string const &addr, std::uint16_t port, ::asio::ip::tcp::endpoint &ep, bool force_ipv4 = false)

std::string **get_endpoint_name**(::asio::ip::tcp::endpoint const &ep)

::asio::ip::tcp::endpoint **resolve_hostname**(std::string const &hostname, std::uint16_t port, ::asio::io_context &io_service, bool force_ipv4 = false)

detail::endpoint_iterator_type **connect_begin**(std::string const &address, std::uint16_t port, ::asio::io_context &io_service)

template<typename **Locality**>

detail::endpoint_iterator_type **connect_begin**(Locality const &loc, ::asio::io_context &io_service)

Returns an iterator which when dereferenced will give an endpoint suitable for a call to connect() related to this locality.

inline detail::endpoint_iterator_type **connect_end**()

detail::endpoint_iterator_type **accept_begin**(std::string const &address, std::uint16_t port, ::asio::io_context &io_service)

template<typename **Locality**>

detail::endpoint_iterator_type **accept_begin**(Locality const &loc, ::asio::io_context &io_service)

Returns an iterator which when dereferenced will give an endpoint suitable for a call to accept() related to this locality.

inline detail::endpoint_iterator_type **accept_end**()

assertion

See *Public API* for a list of names and headers that are part of the public *HPX* API.

HPX_ASSERT, HPX_ASSERT_MSG

Defined in header `hpx/assert.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_ASSERT(expr)

This macro asserts that *expr* evaluates to true.

If *expr* evaluates to false, The source location and *msg* is being printed along with the expression and additional. Afterward, the program is being aborted. The assertion handler can be customized by calling `hpx::assertion::set_assertion_handler()`.

Asserts are enabled if *HPX_DEBUG* is set. This is the default for *CMAKE_BUILD_TYPE*=Debug

Parameters

- **expr** – The expression to assert on. This can either be an expression that's convertible to bool or a callable which returns bool
- **msg** – The optional message that is used to give further information if the assert fails. This should be convertible to a `std::string`

HPX_ASSERT_MSG(expr, msg)

See also:

HPX_ASSERT

hpx/assertion/api.hpp

Defined in header `hpx/assertion/api.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **assertion**

Typedefs

using **assertion_handler** = void (*)(hpx::source_location const &loc, char const *expr, std::string const &msg)

The signature for an assertion handler.

Functions

assertion_handler **set_assertion_handler**(*assertion_handler* handler)

Set the assertion handler to be used within a program. If the handler has been set already once, the call to this function will be ignored.

Note: This function is not thread safe

hpx/assertion/evaluate_assert.hpp

Defined in header `hpx/assertion/evaluate_assert.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **assertion**

HPX_CURRENT_SOURCE_LOCATION, hpx::source_location

Defined in header [hpx/source_location.hpp](#)⁷¹⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

`std::ostream &operator<<(std::ostream &os, source_location const &loc)`

async_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::dataflow

Defined in header [hpx/future.hpp](#)⁷¹⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

template<typename **F**, typename ...**Ts**>
decltype(auto) **dataflow**(*F* &&*f*, *Ts*&&... *ts*)

The function template *dataflow* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a `hpx::future` that will eventually hold the result of that function call. Its behavior is similar to `hpx::async` with the exception that if one of the arguments is a *future*, then `hpx::dataflow` will wait for the *future* to be ready to launch the thread. Hence, the operation is delayed until all the arguments are ready.

hpx::sync

Defined in header [hpx/future.hpp](#)⁷¹⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

⁷¹⁵ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/source_location.hpp

⁷¹⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

⁷¹⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

Functions

```
template<typename F, typename ...Ts>
decltype(auto) sync(F &&f, Ts&&... ts)
```

The function template *sync* runs the function *f* synchronously and returns a *hpx::future* that will eventually hold the result of that function call.

hpx::async

Defined in header `hpx/future.hpp`⁷¹⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename F, typename ...Ts>
decltype(auto) async(F &&f, Ts&&... ts)
```

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a *hpx::future* that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being *hpx::launch::async* | *hpx::launch::deferred*. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the *async* flag is set (i.e. `(policy & hpx::launch::async) != 0`), then *async* executes the callable object *f* on a new thread of execution (with all thread-locals initialized) as if spawned by `hpx::thread(std::forward<F>(f), std::forward<Ts>(ts)...) ,` except that if the function *f* returns a value or throws an exception, it is stored in the shared state accessible through the *hpx::future* that *async* returns to the caller.
- If the *deferred* flag is set (i.e. `(policy & hpx::launch::deferred) != 0`), then *async* converts *f* and *ts...* the same way as by *hpx::thread* constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the *hpx::future* that *async* returned to the caller will cause the copy of *f* to be invoked (as a rvalue) with the copies of *ts...* (also passed as rvalues) in the current thread (which does not have to be the thread that originally called *hpx::async*). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same *hpx::future* will return the result immediately.
- If neither *hpx::launch::async* nor *hpx::launch::deferred*, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the *hpx::launch::async* and *hpx::launch::deferred* flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to *hpx::async* synchronizes-with (as defined in `std::memory_order`) the call to *f*, and the completion of *f* is sequenced-before making the shared state ready. If the *async* policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If `std::decay<Function>::type` or each type in `std::decay<Ts>::type` is not constructible from its corresponding argument, the program is ill-formed.

⁷¹⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to f

Returns

hpx::future referring to the shared state created by this call to *hpx::async*.

hpx::launch

Defined in header [hpx/future.hpp](#)⁷¹⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Enums

enum class **launch_policy** : *std::int8_t*

Values:

enumerator **async**

enumerator **deferred**

enumerator **task**

enumerator **sync**

enumerator **fork**

enumerator **apply**

enumerator **sync_policies**

enumerator **async_policies**

enumerator **all**

struct **launch** : public detail::policy_holder<>

#include <launch_policy.hpp> Launch policies for *hpx::async* etc.

⁷¹⁹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

Public Functions

inline constexpr **launch**() noexcept

Default constructor. This creates a launch policy representing all possible launch modes

inline constexpr **launch**(detail::async_policy const p) noexcept

Create a launch policy representing asynchronous execution.

inline constexpr **launch**(detail::task_policy const p) noexcept

Create a launch policy representing asynchronous execution, but disabled inline execution.

inline constexpr **launch**(detail::fork_policy const p) noexcept

Create a launch policy representing asynchronous execution. The new thread is executed in a preferred way

inline constexpr **launch**(detail::sync_policy const p) noexcept

Create a launch policy representing synchronous execution.

inline constexpr **launch**(detail::deferred_policy const p) noexcept

Create a launch policy representing deferred execution.

inline constexpr **launch**(detail::apply_policy const p) noexcept

Create a launch policy representing fire and forget execution.

template<typename **F**>

inline constexpr **launch**(detail::select_policy<*F*> const &p) noexcept

Create a launch policy that is dynamically selected at runtime.

template<typename **Launch**>

inline constexpr **launch**(*Launch* l, *threads::thread_priority* const priority, *threads::thread_stacksize* const stacksize, *threads::thread_schedule_hint* const hint) noexcept

Public Static Attributes

static const detail::async_policy **async**

Predefined launch policy representing asynchronous execution.

static const detail::task_policy **task**

Predefined launch policy representing asynchronous execution with disabled inline execution

static const detail::fork_policy **fork**

Predefined launch policy representing asynchronous execution. The new thread is executed in a preferred way

static const detail::sync_policy **sync**

Predefined launch policy representing synchronous execution.

static const detail::deferred_policy **deferred**

Predefined launch policy representing deferred execution.

static const detail::apply_policy **apply**

Predefined launch policy representing fire and forget execution.

static const detail::select_policy_generator **select**

Predefined launch policy representing delayed policy selection.

hpx::post

Defined in header [hpx/future.hpp](#)⁷²⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

template<typename **F**, typename ...**Ts**>
bool **post**(*F* &&*f*, *Ts*&&... *ts*)

Runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool). This is done in a fire-and-forget manner, meaning there is no return value or way to synchronize with the function execution (it does not return an `hpx::future` that would hold the result of that function call).

`hpx::post` is particularly useful when synchronization mechanisms as heavyweight as futures are not desired, and instead, more lightweight mechanisms like latches or atomic variables are preferred. Essentially, the `post` function enables the launch of a new thread without the overhead of creating a future.

Note: `hpx::post` is similar to `hpx::async` but does not return a future. This is why there is no way of finding out the result/failure of the execution of this function.

async_combinators

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::when_some

Defined in header [hpx/future.hpp](#)⁷²¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

⁷²⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

⁷²¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

Functions

```
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>>
future<when_some_result<Container>> when_some(std::size_t n, Iterator first, Iterator last)
```

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note: Calling this version of *when_some* where *first* == *last*, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

Returns

Returns a *when_some_result* holding the same list of futures as has been passed to *when_some* and indices pointing to ready futures.

- *future<when_some_result<Container<future<R>>>>*: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
future<when_some_result<Range>> when_some(std::size_t n, Range &&futures)
```

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note: Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A container holding an arbitrary amount of *future* or *shared_future* objects for which *when_some* should wait.

Returns

Returns a *when_some_result* holding the same list of futures as has been passed to *when_some* and indices pointing to ready futures.

- `future<when_some_result<Container<future<R>>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename ...Ts>  
future<when_some_result<tuple<future<T>...>>> > when_some(std::size_t n, Ts&&... futures)
```

The function *when_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The future returned by the function *when_some* becomes ready when at least *n* argument futures have become ready.

Note: Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_some* should wait.

Returns

Returns a *when_some_result* holding the same list of futures as has been passed to *when_some* and an index pointing to a ready future..

- `future<when_some_result<tuple<future<T0>, future<T1>...>>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- `future<when_some_result<tuple<>>>` if *when_some* is called with zero arguments. The returned future will be initially ready.

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>  
future<when_some_result<Container>> when_some_n(std::size_t n, InputIter first, std::size_t count)
```

The function *when_some_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The future returned by the function *when_some_n* becomes ready when at least *n* argument futures have become ready.

Note: Calling this version of *when_some_n* where `count == 0`, returns a future with the same elements as the arguments that is immediately ready. Possibly none of the futures in that container are ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_some_n* will not throw an exception, but the futures held in the output collection may.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

Returns

Returns a *when_some_result* holding the same list of futures as has been passed to *when_some* and indices pointing to ready futures.

- `future<when_some_result<Container<future<R>>>>>`: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Sequence>
```

```
struct when_some_result
```

```
#include <when_some.hpp> Result type for when_some, contains a sequence of futures and indices pointing to ready futures.
```

Public Members

```
std::vector<std::size_t> indices
```

List of indices of futures that have become ready.

```
Sequence futures
```

The sequence of futures as passed to `hpx::when_some`.

hpx::when_any

Defined in header `hpx/future.hpp`⁷²².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>
```

```
future<when_any_result<Container>>> when_any(InputIter first, InputIter last)
```

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_any* should wait.

Returns

Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- `future<when_any_result<Container<future<R>>>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
```

```
future<when_any_result<Range>>> when_any(Range &values)
```

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

values – [in] A range holding an arbitrary amount of *futures* or *shared_future* objects for which *when_any* should wait.

Returns

Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- `future<when_any_result<Container<future<R>>>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename ...T>
```

⁷²² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

future<*when_any_result*<*tuple*<*future*<*T*>...>>> **when_any**(*T*&&... futures)

function *when_any* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Parameters

futures – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_any* should wait.

Returns

Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- *future*<*when_any_result*<*tuple*<*future*<*T0*>, *future*<*T1*>...>>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- *future*<*when_any_result*<*tuple*<>>> if *when_any* is called with zero arguments. The returned future will be initially ready.

```
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>>
future<when_any_result<Container>> when_any_n(InputIter first, std::size_t count)
```

function *when_any_n* creates a future object that becomes when at least one element in a set of *future* and *shared_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

Note: None of the futures in the input sequence are invalidated.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_any_n* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

Returns

Returns a *when_any_result* holding the same list of futures as has been passed to *when_any* and an index pointing to a ready future.

- *future*<*when_any_result*<*Container*<*future*<*R*>>>>: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Sequence>
```

```
struct when_any_result
```

#include <*when_any.hpp*> Result type for *when_any*, contains a sequence of futures and an index pointing to a ready future.

Public Members

std::size_t **index**

The index of a future which has become ready.

Sequence **futures**

The sequence of futures as passed to `hpx::when_any`

`hpx::wait_some`

Defined in header `hpx/future.hpp`⁷²³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename **InputIter**>

void **wait_some**(*std::size_t* n, *InputIter* first, *InputIter* last)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

Note: The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the function to return.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.

template<typename **R**>

void **wait_some**(*std::size_t* n, *std::vector*<*future*<*R*>> &&futures)

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after n of them finished executing.

⁷²³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

Note: The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_some* should wait.

```
template<typename R, std::size_t N>
void wait_some(std::size_t n, std::array<future<R>, N> &&futures)
```

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The function *wait_some* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_some* should wait.

```
template<typename ...T>
void wait_some(std::size_t n, T&&... futures)
```

The function *wait_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The function *wait_all* returns after *n* futures have become ready. All input futures are still valid after *wait_some* returns.

Note: The function *wait_some* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_some* should wait.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
template<typename InputIter>  
void wait_some_n(std::size_t n, InputIter first, std::size_t count)
```

The function *wait_some_n* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

Note: The function *wait_some_n* returns after *n* futures have become ready. All input futures are still valid after *wait_some_n* returns.

Note: The function *wait_some_n* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_some_n_nothrow* instead.

Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *when_all* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

hpx::wait_all

Defined in header `hpx/future.hpp`⁷²⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

⁷²⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

Functions

```
template<typename InputIter>
void wait_all(InputIter first, InputIter last)
```

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note: The function *wait_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters

- **first** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all* should wait.
- **last** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_all* should wait.

```
template<typename R>
void wait_all(std::vector<future<R>> &&futures)
```

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note: The function *wait_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_all_nothrow* instead.

Parameters

- **futures** – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_all* should wait.

```
template<typename R, std::size_t N>
void wait_all(std::array<future<R>, N> &&futures)
```

The function *wait_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function *wait_all* returns after all futures have become ready. All input futures are still valid after *wait_all* returns.

Note: The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

Parameters

futures – A vector or array holding an arbitrary amount of *future* or *shared_future* objects for which `wait_all` should wait.

```
template<typename T>
void wait_all(hpx::future<T> const &f)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function `wait_all` returns after the future has become ready. The input future is still valid after `wait_all` returns.

Note: The function `wait_all` will rethrow any exceptions captured by the future while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

Parameters

f – A *future* or *shared_future* for which `wait_all` should wait.

```
template<typename ...T>
void wait_all(T&&... futures)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

Note: The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

Parameters

futures – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which `wait_all` should wait.

```
template<typename InputIter>
void wait_all_n(InputIter begin, std::size_t count)
```

The function `wait_all_n` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

Note: The function `wait_all_n` returns after all futures have become ready. All input futures are still valid after `wait_all_n` returns.

Note: The function `wait_all_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_n_nothrow` instead.

Parameters

- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which `wait_all_n` should wait.
- **count** – The number of elements in the sequence starting at *first*.

Returns

The function `wait_all_n` will return an iterator referring to the first element in the input sequence after the last processed element.

hpx::when_each

Defined in header `hpx/future.hpp`⁷²⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename F, typename Future>
future<void> when_each(F &&f, std::vector<Future> &&futures)
```

The function `when_each` is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared_future* objects for which `wait_each` should wait.

Returns

Returns a future representing the event of all input futures being ready.

```
template<typename F, typename Iterator>
```

⁷²⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

future<*Iterator*> **when_each**(*F* &&*f*, *Iterator* begin, *Iterator* end)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.

Returns

Returns a future representing the event of all input futures being ready.

template<typename **F**, typename ...**Ts**>
future<void> **when_each**(*F* &&*f*, *Ts*&&... futures)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_each* should wait.

Returns

Returns a future representing the event of all input futures being ready.

template<typename **F**, typename **Iterator**>
future<*Iterator*> **when_each_n**(*F* &&*f*, *Iterator* begin, *std::size_t* count)

The function *when_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

Returns

Returns a future holding the iterator pointing to the first element after the last one.

hpx/async_combinators/split_future.hpp

Defined in header `hpx/async_combinators/split_future.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename ...Ts>
inline tuple<future<Ts>...> split_future(future<tuple<Ts...>> &&f)
```

The function *split_future* is an operator allowing to split a given future of a sequence of values (any tuple, *std::pair*, or *std::array*) into an equivalent container of futures where each future represents one of the values from the original future. In some sense this function provides the inverse operation of *when_all*.

Note: The following cases are special:

```
tuple<future<void> > split_future(future<tuple<> > && f);
array<future<void>, 1> split_future(future<array<T, 0> > && f);
```

here the returned futures are directly representing the futures which were passed to the function.

Parameters

f – [in] A future holding an arbitrary sequence of values stored in a tuple-like container. This facility supports *hpx::tuple<>*, *std::pair<T1, T2>*, and *std::array<T, N>*

Returns

Returns an equivalent container (same container type as passed as the argument) of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

```
template<typename T>
inline std::vector<future<T>> split_future(future<std::vector<T>> &&f, std::size_t size)
```

The function *split_future* is an operator allowing to split a given future of a sequence of values (any `std::vector`) into a `std::vector` of futures where each future represents one of the values from the original `std::vector`. In some sense this function provides the inverse operation of *when_all*.

Parameters

- **f** – [in] A future holding an arbitrary sequence of values stored in a `std::vector`.
- **size** – [in] The number of elements the vector will hold once the input future has become ready

Returns

Returns a `std::vector` of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

hpx::wait_each

Defined in header `hpx/future.hpp`⁷²⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename F, typename Future>
void wait_each(F &&f, std::vector<Future> &&futures)
```

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that `std::size_t` is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_each* should wait.

```
template<typename F, typename Iterator>
```

⁷²⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

void **wait_each**(*F* &&*f*, *Iterator* begin, *Iterator* end)

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_each* should wait.

template<typename **F**, typename ...**T**>

void **wait_each**(*F* &&*f*, *T*&&... futures)

The function *wait_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait_each* returns after all futures have been become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_each* should wait.

template<typename **F**, typename **Iterator**>

void **wait_each_n**(*F* &&*f*, *Iterator* begin, *std::size_t* count)

The function *wait_each* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready.

Note: This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size_t* is

implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_each_n* should wait.
- **count** – The number of elements in the sequence starting at *first*.

hpx::wait_any

Defined in header [hpx/future.hpp](#)⁷²⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename InputIter>  
void wait_any(InputIter first, InputIter last)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which *wait_any* should wait.

```
template<typename R>  
void wait_any(std::vector<future<R>> &futures)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

⁷²⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

futures – [in] A vector holding an arbitrary amount of *future* or *shared_future* objects for which *wait_any* should wait.

```
template<typename R, std::size_t N>
void wait_any(std::array<future<R>, N> &futures)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

futures – [in] An array holding an arbitrary amount of *future* or *shared_future* objects for which *wait_any* should wait.

```
template<typename ...T>
void wait_any(T&&... futures)
```

The function *wait_any* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function *wait_any* returns after at least one future has become ready. All input futures are still valid after *wait_any* returns.

Note: The function *wait_any* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait_any_nothrow* instead.

Parameters

futures – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *wait_any* should wait.

```
template<typename InputIter>
void wait_any_n(InputIter first, std::size_t count)
```

The function *wait_any_n* is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

Note: The function `wait_any_n` returns after at least one future has become ready. All input futures are still valid after `wait_any_n` returns.

Note: The function `wait_any_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_n_nothrow` instead.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which `wait_any_n` should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

hpx::when_all

Defined in header `hpx/future.hpp`⁷²⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

```
template<typename InputIter, typename Container = vector<future<typename  
std::iterator_traits<InputIter>::value_type>>>
```

```
hpx::future<Container> when_all(InputIter first, InputIter last)
```

function `when_all` creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Calling this version of `when_all` where `first == last`, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by `when_all` will not throw an exception, but the futures held in the output collection may.

Parameters

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which `when_all` should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared_future* objects for which `when_all` should wait.

Returns

Returns a future holding the same list of futures as has been passed to `when_all`.

⁷²⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
hpx::future<Range> when_all(Range &&values)
```

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Calling this version of *when_all* where the input container is empty, returns a future with an empty container that is immediately ready. Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

values – [in] A range holding an arbitrary amount of *future* or *shared_future* objects for which *when_all* should wait.

Returns

Returns a future holding the same list of futures as has been passed to *when_all*.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type.

```
template<typename ...T>
hpx::future<hpx::tuple<hpx::future<T>...>> when_all(T&&... futures)
```

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: Each future and *shared_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when_all* will not throw an exception, but the futures held in the output collection may.

Parameters

futures – [in] An arbitrary number of *future* or *shared_future* objects, possibly holding different types for which *when_all* should wait.

Returns

Returns a future holding the same list of futures as has been passed to *when_all*.

- `future<tuple<future<T0>, future<T1>, future<T2>...>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- `future<tuple<>>` if *when_all* is called with zero arguments. The returned future will be initially ready.

```
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>>
```

hpx::future<Container> **when_all_n**(*InputIter* begin, *std::size_t* count)

function *when_all* creates a future object that becomes ready when all elements in a set of *future* and *shared_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Note: None of the futures in the input sequence are invalidated.

Parameters

- **begin** – [in] The iterator pointing to the first element of a sequence of *future* or *shared_future* objects for which *wait_all_n* should wait.
- **count** – [in] The number of elements in the sequence starting at *first*.

Throws

This – function will throw errors which are encountered while setting up the requested operation only. Errors encountered while executing the operations delivering the results to be stored in the futures are reported through the futures themselves.

Returns

Returns a future holding the same list of futures as has been passed to *when_all_n*.

- *future<Container<future<R>>>>*: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output vector will be the same as given by the input iterator.

hpx/async_sycl/sycl_executor.hpp

Defined in header hpx/async_sycl/sycl_executor.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename Executor, typename ...Ts>
decltype(auto) async(Executor &&exec, hpx::sycl::experimental::sycl_executor::queue_function_ptr_t<Ts...>
                    &&f, Ts&&... ts)
```

`hpx::async` overload for launching sycl queue member functions with an sycl executor

```
template<typename Executor, typename ...Ts>
bool apply(Executor &&exec, hpx::sycl::experimental::sycl_executor::queue_function_ptr_t<Ts...> &&f,
          Ts&&... ts)
```

`hpx::apply` overload for launching sycl queue member functions with an sycl executor

```
namespace execution
```

```
    namespace experimental
```

```
        namespace sycl
```

```
            namespace experimental
```

```
                struct sycl_executor
```

Public Types

```
using future_type = hpx::future<void>
```

```
template<typename ...Params>
```

```
using queue_function_ptr_t = ::sycl::event
(::sycl::queue::*)(std::conditional_t<std::is_trivial_v<std::remove_reference_t<Params>>,
std::decay_t<Params>, Params>...)
```

Default Implementation without the extra intel code_location parameter. Removes the reference for trivial types to make the function matching easier (see `sycl_stream.cpp` test)

Public Functions

```
template<typename sycl_device_selector>
inline explicit sycl_executor(sycl_device_selector const &selector)
```

Create a SYCL executor (based on a sycl queue)

```
~sycl_executor() = default
```

```
inline future_type get_future()
```

Get future for this command_queue (NOTE will be more efficient if an event is provided — otherwise a dummy kernel must be submitted to get an event)

```
inline future_type get_future(::sycl::event event)
```

Get future for that becomes ready when the given event completes.

```
template<typename ...Params>
```

```
inline void post(queue_function_ptr_t<Params...> &&queue_member_function, Params&&...
               args)
```

Invoke queue member function given queue and parameters — do not use event to return a `hpx::future` (One way)

```
template<typename ...Params>
inline hpx::future<void> async_execute(queue_function_ptr_t<Params...>
                                     &&queue_member_function, Params&&... args)
```

Invoke queue member function given queue and parameters — `hpx::future` tied to the `sycl` event / (two way)

```
inline ::sycl::device get_device() const
    Return the device used by the underlying SYCL queue.
```

```
inline ::sycl::context get_context() const
    Return the context used by the underlying SYCL queue.
```

```
inline ::sycl::queue &get_queue()
    Return the underlying queue for direct access.
```

Protected Attributes

```
::sycl::queue command_queue
```

cache

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/cache/local_cache.hpp

Defined in header `hpx/cache/local_cache.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace util
```

```
        namespace cache
```

```
        template<typename Key, typename Entry, typename UpdatePolicy = std::less<Entry>, typename
InsertPolicy = policies::always<Entry>, typename CacheStorage = std::map<Key, Entry>,
        typename Statistics = statistics::no_statistics>
        class local_cache
```

#include <hpx/cache/local_cache.hpp> The `local_cache` implements the basic functionality needed for a local (non-distributed) cache.

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache, must model the `CacheEntry` concept

- **UpdatePolicy** – A (optional) type specifying a (binary) function object used to sort the cache entries based on their ‘age’. The ‘oldest’ entries (according to this sorting criteria) will be discarded first if the maximum capacity of the cache is reached. The default is `std::less<Entry>`. The function object will be invoked using 2 entry instances of the type *Entry*. This type must model the UpdatePolicy model.
- **InsertPolicy** – A (optional) type specifying a (unary) function object used to allow global decisions whether a particular entry should be added to the cache or not. The default is *policies::always*, imposing no global insert related criteria on the cache. The function object will be invoked using the entry instance to be inserted into the cache. This type must model the InsertPolicy model.
- **CacheStorage** – A (optional) container type used to store the cache items. The container must be an associative and STL compatible container. The default is a `std::map<Key, Entry>`.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the CacheStatistics concept. The default value is the type `statistics::no_statistics` which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using **key_type** = *Key*

using **entry_type** = *Entry*

using **update_policy_type** = *UpdatePolicy*

using **insert_policy_type** = *InsertPolicy*

using **storage_type** = *CacheStorage*

using **statistics_type** = *Statistics*

using **value_type** = typename *entry_type*::value_type

using **size_type** = typename *storage_type*::size_type

using **storage_value_type** = typename *storage_type*::value_type

Public Functions

inline explicit **local_cache**(*size_type* max_size = 0, *update_policy_type* const &up = *update_policy_type*(), *insert_policy_type* const &ip = *insert_policy_type*())

Construct an instance of a *local_cache*.

Parameters

- **max_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.
- **up** – [in] An instance of the *UpdatePolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *UpdatePolicy* template parameter.
- **ip** – [in] An instance of the *InsertPolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *InsertPolicy* template parameter.

local_cache(*local_cache* const &other) = default

local_cache(*local_cache* &&other) = default

local_cache &**operator**=(*local_cache* const &other) = default

local_cache &**operator**=(*local_cache* &&other) = default

~local_cache() = default

inline constexpr *size_type* **size**() const noexcept

Return current size of the cache.

Returns

The current size of this cache instance.

inline constexpr *size_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

Note: The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get_size*.

Returns

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline bool **reserve**(*size_type* max_size)

Change the maximum size this cache can grow to.

Parameters

- **max_size** – [in] The new maximum size this cache will be allowed to grow to.

Returns

This function returns *true* if successful. It returns *false* if the new *max_size* is smaller than the current limit and the cache could not be shrunk to the new maximum size.

inline bool **holds_key**(*key_type* const &k) const

Check whether the cache currently holds an entry identified by the given key.

Note: This function does not call the entry's function `entry::touch`. It just checks if the cache contains an entry corresponding to the given key.

Parameters

k – [in] The key for the entry which should be looked up in the cache.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(key_type const &k, key_type &realkey, entry_type &val)

Get a specific entry identified by the given key.

Note: The function will call the entry's `entry::touch` function if the value corresponding to the provided key is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(key_type const &k, entry_type &val)

Get a specific entry identified by the given key.

Note: The function will call the entry's `entry::touch` function if the value corresponding to the provided key is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(key_type const &k, value_type &val)

Get a specific entry identified by the given key.

Note: The function will call the entry's `entry::touch` function if the value corresponding to the provided is found in the cache.

Parameters

- **k** – [in] The key for the entry which should be retrieved from the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding value.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns

false.

```
inline bool insert(key_type const &k, value_type const &val)
```

Insert a new element into this cache.

Note: This function invokes both, the insert policy as provided to the constructor and the function `entry::insert` of the newly constructed entry instance. If either of these functions returns *false* the key/value pair doesn't get inserted into the cache and the `insert` function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **val** – [in] The value which should be added to the cache.

Returns

This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```
inline bool insert(key_type const &k, value_type &&val)
```

```
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
```

```
inline bool insert(key_type const &k, Entry_ &&e)
```

Insert a new entry into this cache.

Note: This function invokes both, the insert policy as provided to the constructor and the function `entry::insert` of the provided entry instance. If either of these functions returns *false* the key/value pair doesn't get inserted into the cache and the `insert` function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **e** – [in] The entry which should be added to the cache.

Returns

This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```
template<typename Value, std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>, int> = 0>
```

```
inline bool update(key_type const &k, Value &&val)
```

Update an existing element in this cache.

Note: The function will call the entry's `entry::touch` function if the indexed value is found in the cache.

Note: The difference to the other overload of the `insert` function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the

cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename F, typename Value, typename =  
std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>>>  
inline bool update_if(key_type const &k, Value &&val, F &&f)
```

Update an existing element in this cache.

Note: The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>,  
entry_type>, int> = 0>  
inline bool update(key_type const &k, Entry_ &&e)
```

Update an existing entry in this cache.

Note: The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the whole cache entry, while the other overload replaces the cached value only, leaving the cache entry properties untouched.

Parameters

- **k** – [in] The key for the entry which should be updated in the cache.

- **e** – [in] The entry which should be used as a replacement for the existing entry in the cache. Any existing entry is first removed and then this entry is added.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func = policies::always<storage_value_type>>
inline size_type erase(Func &&ep = Func())
```

Remove stored entries from the cache for which the supplied function object returns true.

Parameters

ep – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*. Even then the entry might not be removed from the cache as its *entry::remove* function might return false.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

```
inline size_type erase()
```

Remove all stored entries from the cache.

Note: All entries are considered for removal, but in the end an entry might not be removed from the cache as its *entry::remove* function might return false. This function is very useful for instance in conjunction with an entry's *entry::remove* function enforcing additional criteria like entry expiration, etc.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

```
inline void clear()
```

Clear the cache.

Unconditionally removes all stored entries from the cache.

```
inline constexpr statistics_type const &get_statistics() const noexcept
```

Allow to access the embedded statistics instance.

Returns

This function returns a reference to the statistics instance embedded inside this cache

```
inline statistics_type &get_statistics() noexcept
```

hpx/cache/lru_cache.hpp

Defined in header `hpx/cache/lru_cache.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

template<typename **Key**, typename **Entry**, typename **Statistics** = *statistics::no_statistics*>

class **lru_cache**

#include <hpx/cache/lru_cache.hpp> The `lru_cache` implements the basic functionality needed for a local (non-distributed) LRU cache.

Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the `CacheStatistics` concept. The default value is the type `statistics::no_statistics` which does not collect any numbers, but provides empty stubs allowing the code to compile.

Public Types

using **key_type** = *Key*

using **entry_type** = *Entry*

using **statistics_type** = *Statistics*

using **entry_pair** = *std::pair<key_type, entry_type>*

using **storage_type** = *std::list<entry_pair>*

using **map_type** = *std::map<Key, typename storage_type::iterator>*

using **size_type** = *std::size_t*

Public Functions

inline explicit **lru_cache**(*size_type* max_size = 0)

Construct an instance of a *lru_cache*.

Parameters

max_size – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get_size* function.

lru_cache(*lru_cache* const &other) = default

lru_cache(*lru_cache* &&other) = default

lru_cache &**operator**=(*lru_cache* const &other) = default

lru_cache &**operator**=(*lru_cache* &&other) = default

~lru_cache() = default

inline constexpr *size_type* **size**() const noexcept

Return current size of the cache.

Returns

The current size of this cache instance.

inline constexpr *size_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

Note: The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get_size*.

Returns

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline void **reserve**(*size_type* max_size)

Change the maximum size this cache can grow to.

Parameters

max_size – [in] The new maximum size this cache will be allowed to grow to.

inline bool **holds_key**(*key_type* const &key) const

Check whether the cache currently holds an entry identified by the given key.

Note: This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

Parameters

key – [in] The key for the entry which should be looked up in the cache.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get_entry**(*key_type* const &key, *key_type* &realkey, *entry_type* &entry)

Get a specific entry identified by the given key.

Note: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Parameters

- **key** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &key, entry_type const &entry)
```

Get a specific entry identified by the given key.

Note: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Parameters

- **key** – [in] The key for the entry which should be retrieved from the cache.
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
template<typename Entry_, typename =  
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>  
inline bool insert(key_type const &key, Entry_ &&entry)
```

Insert a new entry into this cache.

Note: This function assumes that the entry is not in the cache already. Inserting an already existing entry is considered undefined behavior

Parameters

- **key** – [in] The key for the entry which should be added to the cache.
- **entry** – [in] The entry which should be added to the cache.

```
template<typename Entry_, typename =  
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>  
inline void update(key_type const &key, Entry_ &&entry)
```

Update an existing element in this cache.

Note: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the

cache entry properties.

Parameters

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The entry which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

```
template<typename F, typename Entry_,  
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>  
inline bool update_if(key_type const &key, Entry_ &&entry, F &&f)
```

Update an existing element in this cache.

Note: The function will “touch” the entry and mark it as recently used if the key was found in the cache.

Note: The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

Parameters

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func>  
inline size_type erase(Func const &ep)
```

Remove stored entries from the cache for which the supplied function object returns true.

Parameters

ep – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

```
inline size_type erase()
```

Remove all stored entries from the cache.

Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get_size* functions of the removed entries).

```
inline size_type clear()
```

Clear the cache.

Unconditionally removes all stored entries from the cache.

```
inline constexpr statistics_type const &get_statistics() const noexcept
```

Allow to access the embedded statistics instance.

Returns

This function returns a reference to the statistics instance embedded inside this cache

```
inline statistics_type &get_statistics() noexcept
```

enumerator **insert_entry**

enumerator **update_entry**

enumerator **erase_entry**

class **no_statistics**

Subclassed by *hpx::util::cache::statistics::local_statistics*

Public Static Functions

static inline constexpr void **got_hit**() noexcept

The function *got_hit* will be called by a cache instance whenever an entry got touched.

static inline constexpr void **got_miss**() noexcept

The function *got_miss* will be called by a cache instance whenever a requested entry has not been found in the cache.

static inline constexpr void **got_insertion**() noexcept

The function *got_insertion* will be called by a cache instance whenever a new entry has been inserted.

static inline constexpr void **got_eviction**() noexcept

The function *got_eviction* will be called by a cache instance whenever an entry has been removed from the cache because a new inserted entry let the cache grow beyond its capacity.

static inline constexpr void **clear**() noexcept

Reset all statistics.

static inline constexpr std::int64_t **get_get_entry_count**(bool) noexcept

The function *get_get_entry_count* returns the number of invocations of the *get_entry*() API function of the cache.

static inline constexpr std::int64_t **get_insert_entry_count**(bool) noexcept

The function *get_insert_entry_count* returns the number of invocations of the *insert_entry*() API function of the cache.

static inline constexpr std::int64_t **get_update_entry_count**(bool) noexcept

The function *get_update_entry_count* returns the number of invocations of the *update_entry*() API function of the cache.

static inline constexpr std::int64_t **get_erase_entry_count**(bool) noexcept

The function *get_erase_entry_count* returns the number of invocations of the *erase*() API function of the cache.

```
static inline constexpr std::int64_t get_get_entry_time(bool) noexcept
```

The function *get_get_entry_time* returns the overall time spent executing of the *get_entry()* API function of the cache.

```
static inline constexpr std::int64_t get_insert_entry_time(bool) noexcept
```

The function *get_insert_entry_time* returns the overall time spent executing of the *insert_entry()* API function of the cache.

```
static inline constexpr std::int64_t get_update_entry_time(bool) noexcept
```

The function *get_update_entry_time* returns the overall time spent executing of the *update_entry()* API function of the cache.

```
static inline constexpr std::int64_t get_erase_entry_time(bool) noexcept
```

The function *get_erase_entry_time* returns the overall time spent executing of the *erase()* API function of the cache.

```
struct update_on_exit
```

#include <no_statistics.hpp> Helper class to update timings and counts on function exit.

Public Functions

```
namespace cache
```

```
namespace entries
```

```
template<typename Value>
```

```
class entry
```

```
#include <hpx/cache/entries/entry.hpp>
```

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and less_than_comparable.

Subclassed by `hpx::util::cache::entries::fifo_entry< Value >`,
`hpx::util::cache::entries::lfu_entry< Value >`, `hpx::util::cache::entries::lru_entry< Value >`,
`hpx::util::cache::entries::size_entry< Value >`

Public Types

```
using value_type = Value
```

Public Functions

```
entry() = default
```

Any cache entry has to be default constructible.

```
inline explicit entry(value_type const &val)  
noexcept(std::is_nothrow_copy_constructible_v<value_type>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit entry(value_type &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline value_type &get() noexcept
```

Get a reference to the stored data value.

Note: This function is part of the CacheEntry concept

inline constexpr *value_type* const &**get**() const noexcept

Public Static Functions

static inline constexpr bool **touch**() noexcept

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

Note: It is possible to change the entry in a way influencing the sort criteria mandated by the UpdatePolicy. In this case the function should return *true* to indicate this to the cache, forcing to reorder the cache entries.

Note: This function is part of the CacheEntry concept

Returns

This function should return *true* if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

static inline constexpr bool **insert**() noexcept

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

Note: This function is part of the CacheEntry concept

Returns

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

static inline constexpr bool **remove**() noexcept

The function *remove* is called by a cache holding this instance whenever it is about to be removed from the cache.

Note: This function is part of the CacheEntry concept

Returns

The return value can be used to avoid removing this instance from the cache. If the value is *true* it is ok to remove the entry, otherwise it will stay in the cache.

static inline constexpr std::size_t **get_size**() noexcept

Return the 'size' of this entry. By default, the size of each entry is just one (1), which is sensible if the cache has a limit (capacity) measured in number of entries.

Private Members

value_type **value_**

Friends

friend auto operator (entry const &, entry const &)=default

Forwarding operator<=> allowing to compare entries instead of the values.

hpx/cache/entries/lfu_entry.hpp

Defined in header `hpx/cache/entries/lfu_entry.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **lfu_entry** : public `hpx::util::cache::entries::entry<Value>`

#include <hpx/cache/entries/lfu_entry.hpp> The `lfu_entry` type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least frequently used entries are discarded from the cache first.

Note: The `lfu_entry` conforms to the `CacheEntry` concept.

Note: This type can be used to model a 'most frequently used' cache policy if it is used with a `std::greater` as the caches' `UpdatePolicy` (instead of the default `std::less`).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

Public Functions

lfu_entry() = default

Any cache entry has to be default constructible.

```
inline explicit lfu_entry(Value const &val)
    noexcept(std::is_nothrow_constructible_v<base_type, Value
    const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit lfu_entry(Value &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline bool touch() noexcept
```

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LFU entry we store the reference count tracking the number of times this entry has been requested. This which will be used to compare the age of an entry during the invocation of the *operator<()*.

Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

```
inline constexpr unsigned long const &get_access_count() const noexcept
```

Private Types

```
using base_type = entry<Value>
```

Private Members

```
unsigned long ref_count_ = 0
```

Friends

```
inline friend auto operator<(lfu_entry const &lhs, lfu_entry const &rhs)
```

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been accessed less frequently (LFU).

```
inline friend auto operator>(lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator<= (lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator>= (lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator== (lfu_entry const &lhs, lfu_entry const &rhs)
```

```
inline friend auto operator!= (lfu_entry const &lhs, lfu_entry const &rhs)
```

hpx/cache/entries/fifo_entry.hpp

Defined in header `hpx/cache/entries/fifo_entry.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **fifo_entry** : public `hpx::util::cache::entries::entry<Value>`

#include <hpx/cache/entries/fifo_entry.hpp> The `fifo_entry` type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently inserted entries are discarded from the cache first.

Note: The `fifo_entry` conforms to the `CacheEntry` concept.

Note: This type can be used to model a 'last in first out' cache policy if it is used with a `std::greater` as the caches' `UpdatePolicy` (instead of the default `std::less`).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

Public Functions

fifo_entry() = default

Any cache entry has to be default constructible.

inline explicit **fifo_entry**(*Value* const &val)
noexcept(*std::is_nothrow_constructible_v<base_type, Value*
const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **fifo_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline constexpr bool **insert**()

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

Note: This function is part of the `CacheEntry` concept

Returns

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

```
inline constexpr time_point const &get_creation_time() const noexcept
```

Private Types

```
using base_type = entry<Value>
```

```

```
                template<typename Value>
```

class **lru_entry** : public *hpx::util::cache::entries::entry<Value>*

#include <hpx/cache/entries/lru_entry.hpp> The *lru_entry* type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently used entries are discarded from the cache first.

Note: The *lru_entry* conforms to the *CacheEntry* concept.

Note: This type can be used to model a 'most recently used' cache policy if it is used with a *std::greater* as the caches' *UpdatePolicy* (instead of the default *std::less*).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and *less_than_comparable*.

Public Functions

inline **lru_entry**()

Any cache entry has to be default constructible.

inline explicit **lru_entry**(*Value* const &val)
 noexcept(*std::is_nothrow_constructible_v<base_type, Value*
 const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **lru_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline bool **touch**()

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LRU entry we store the time of the last access which will be used to compare the age of an entry during the invocation of the *operator<()*.

Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's *UpdatePolicy*

inline constexpr *time_point* const &**get_access_time**() const noexcept

Returns the last access time of the entry.

Private Types

```
using base_type = entry<Value>
```

```
using time_point = std::chrono::steady_clock::time_point
```

Private Members

```
time_point access_time_
```

Friends

```
inline friend auto operator<(lru_entry const &lhs, lru_entry const &rhs)
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been accessed less recently (LRU).

```

```

hpx/cache/entries/size_entry.hpp

Defined in header `hpx/cache/entries/size_entry.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace util
```

```
        namespace cache
```

```
            namespace entries
```

```
                template<typename Value>
```

```
                class size_entry : public hpx::util::cache::entries::entry<Value>
```

#include `<hpx/cache/entries/size_entry.hpp>` The `size_entry` type can be used to store values in a cache which have a size associated (such as files, etc.). Using this type as the cache’s entry type makes sure that the entries with the biggest size are discarded from the cache first.

Note: The `size_entry` conforms to the `CacheEntry` concept.

Note: This type can be used to model a ‘discard smallest first’ cache policy if it is used with a `std::greater` as the caches’ `UpdatePolicy` (instead of the default `std::less`).

Template Parameters

Value – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

Public Functions

size_entry() = default

Any cache entry has to be default constructible.

```
inline explicit size_entry(Value const &val, std::size_t size = 0)
    noexcept(std::is_nothrow_constructible_v<base_type, Value
             const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit size_entry(Value &&val, std::size_t size = 0) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline constexpr std::size_t get_size() const noexcept
```

Return the ‘size’ of this entry.

Private Types

```
using base_type = entry<Value>
```

Private Members

```
std::size_t size_ = 0
```

Friends

```
inline friend auto operator<(size_entry const &lhs, size_entry const &rhs) noexcept
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has a bigger size.

```
inline friend auto operator>(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator<=(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator>=(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator==(size_entry const &lhs, size_entry const &rhs) noexcept
```

```
inline friend auto operator!=(size_entry const &lhs, size_entry const &rhs) noexcept
```

checkpoint_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/checkpoint_base/checkpoint_data.hpp

Defined in header `hpx/checkpoint_base/checkpoint_data.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

```
template<typename Container, typename ...Ts>
void save_checkpoint_data(Container &data, Ts&&... ts)
    save_checkpoint_data
```

`save_checkpoint_data` takes any number of objects which a user may wish to store in the given container.

Template Parameters

- **Container** – Container used to store the check-pointed data.
- **Ts** – Types of variables to checkpoint

Parameters

- **data** – Container instance used to store the checkpoint data
- **ts** – Variable instances to be inserted into the checkpoint.

```
template<typename ...Ts>
std::size_t prepare_checkpoint_data(Ts const&... ts)
    prepare_checkpoint_data
```

`prepare_checkpoint_data` takes any number of objects which a user may wish to store in a subsequent `save_checkpoint_data` operation. The function will return the number of bytes necessary to store the data that will be produced.

Template Parameters

- **Ts** – Types of variables to checkpoint

Parameters

- **ts** – Variable instances to be inserted into the checkpoint.

```
template<typename Container, typename ...Ts>
void restore_checkpoint_data(Container const &cont, Ts&&... ts)
    restore_checkpoint_data
```

`restore_checkpoint_data` takes any number of objects which a user may wish to restore from the given container. The sequence of objects has to correspond to the sequence of objects for the corresponding call to `save_checkpoint_data` that had used the given container instance.

Template Parameters

- **Container** – Container used to restore the check-pointed data.
- **Ts** – Types of variables to restore

Parameters

- **cont** – Container instance used to restore the checkpoint data
- **ts** – Variable instances to be restored from the container

```
struct checkpointing_tag

inline vector &operator=(vector &&other) noexcept

inline void assign(size_type count, T const &value)

template<typename InIter>
inline void assign(InIter first, InIter last)

inline void assign(std::initializer_list<T> ilist)

inline allocator_type get_allocator() const noexcept
    Returns the allocator associated with the container.

inline reference at(size_type pos)

inline const_reference at(size_type pos) const

inline reference operator[](size_type pos)

inline const_reference operator[](size_type pos) const

inline reference front()
    Returns a reference to the first element in the container. Calling front on an empty container is
    undefined.

inline const_reference front() const
    Returns a reference to the first element in the container. Calling front on an empty container is
    undefined.

inline reference back()
    Returns a reference to the last element in the container. Calling back on an empty container is
    undefined.

inline const_reference back() const
    Returns a reference to the last element in the container. Calling back on an empty container is
    undefined.

inline pointer data() noexcept
    Returns pointer to the underlying array serving as element storage. The pointer is such that range
    [data(); data() + size()) is always a valid range, even if the container is empty (data() is not
    dereference-able in that case).

inline const_pointer data() const noexcept
    Returns pointer to the underlying array serving as element storage. The pointer is such that range
    [data(); data() + size()) is always a valid range, even if the container is empty (data() is not
    dereference-able in that case).

inline T *device_data() const noexcept
    Returns a raw pointer corresponding to the address of the data allocated on the device.

inline std::size_t size() const noexcept

inline std::size_t capacity() const noexcept

```

inline bool **empty**() const noexcept

Returns: `size() == 0`.

inline void **resize**(*size_type*)

Effects: If `size <= size()`, equivalent to calling `pop_back()` `size()`

- `size` times. If `size() < size`, appends `size - size()` default-inserted elements to the sequence.

Requires: `T` shall be `MoveInsertable` and `DefaultInsertable` into `*this`.

Remarks: If an exception is thrown other than by the move constructor of a non-`CopyInsertable` `T` there are no effects.

inline void **resize**(*size_type*, *T* const&)

Effects: If `size <= size()`, equivalent to calling `pop_back()` `size() - size` times. If `size() < size`, appends `size - size()` copies of `val` to the sequence.

Requires: `T` shall be `CopyInsertable` into `*this`.

Remarks: If an exception is thrown there are no effects.

inline *iterator* **begin**() noexcept

inline *iterator* **end**() noexcept

inline *const_iterator* **cbegin**() const noexcept

inline *const_iterator* **cend**() const noexcept

inline *const_iterator* **begin**() const noexcept

inline *const_iterator* **end**() const noexcept

inline *reverse_iterator* **rbegin**() noexcept

inline *reverse_iterator* **rend**() noexcept

inline *const_reverse_iterator* **crbegin**() const noexcept

inline *const_reverse_iterator* **crend**() const noexcept

inline *const_reverse_iterator* **rbegin**() const noexcept

inline *const_reverse_iterator* **rend**() const noexcept

inline void **swap**(*vector* &other) noexcept

Effects: Exchanges the contents and `capacity()` of `*this` with that of `x`.

Complexity: Constant time.

inline void **clear**() noexcept

Effects: Erases all elements in the range `[begin(),end())`. Destroys all elements in 'a'. Invalidates all references, pointers, and iterators referring to the elements of `a` and may invalidate the past-the-end iterator.

Post: `a.empty()` returns true.

Complexity: Linear.

hpx/compute_local/host/block_fork_join_executor.hpp

Defined in header `hpx/compute_local/host/block_fork_join_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace execution
```

```
        namespace experimental
```

```
            class block_fork_join_executor
```

```
                #include <block_fork_join_executor.hpp> An executor with fork-join (blocking) semantics.
```

The *block_fork_join_executor* creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a *fork_join_executor* hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of `bulk_(a)sync_execute`.

This behaviour is similar to the plain *fork_join_executor* except that the *block_fork_join_executor* creates a hierarchy of *fork_join_executors*, one for each target used to initialize it.

Public Functions

```
inline explicit block_fork_join_executor(threads::thread_priority const priority =
                                         threads::thread_priority::bound,
                                         threads::thread_stacksize const stacksize =
                                         threads::thread_stacksize::small_,
                                         fork_join_executor::loop_schedule const
                                         schedule =
                                         fork_join_executor::loop_schedule::static_,
                                         std::chrono::nanoseconds const yield_delay =
                                         std::chrono::milliseconds(1))
```

Construct a *block_fork_join_executor*.

Note: This constructor will create one *fork_join_executor* for each numa domain

Parameters

- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be nostack.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

```
inline explicit block_fork_join_executor(std::vector<compute::host::target> const
                                         &targets, threads::thread_priority const priority =
                                         threads::thread_priority::bound,
                                         threads::thread_stacksize const stacksize =
                                         threads::thread_stacksize::small_,
                                         fork_join_executor::loop_schedule const
                                         schedule =
                                         fork_join_executor::loop_schedule::static_,
                                         std::chrono::nanoseconds const yield_delay =
                                         std::chrono::milliseconds(1))
```

Construct a *block_fork_join_executor*.

Note: This constructor will create one *fork_join_executor* for each given target

Parameters

- **targets** – The list of targets to use for thread placement
- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be nostack.
- **schedule** – The loop schedule of the parallel regions.
- **yield_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

```
namespace hpx
```

```
namespace threads
```

Enums

```
enum class thread_schedule_state : std::int8_t
```

The *thread_schedule_state* enumerator encodes the current state of a *thread* instance

Task Lifecycle State Transitions:

```
stateDiagram-v2
    %% Creation Phase
    [*] --> Staged : task_staged
    [*] --> Pending : task_created
    [*] --> Suspended : task_created
    Staged --> Pending : task_created

    %% Execution Loop
    Pending --> Active : task_executing
    Active --> Pending : task_yielded

    %% Sleep / Wake Cycle
    Active --> Suspended : task_suspended
    Suspended --> Pending : task_resumed

    %% Termination Paths
    Active --> Terminated : task_completed
    Active --> Deleted : task_completed (Inline fast-path)
    Pending --> Terminated : task_completed (Aborted)
    Suspended --> Terminated : task_completed (Aborted)

    %% Cleanup (Destruction / Recycling)
```

(continues on next page)

(continued from previous page)

```
Terminated --> Deleted : task_deleted
Deleted --> [*]
```

*Values:*enumerator **unknown**enumerator **active**

thread is currently active (running, has resources)

enumerator **pending**

thread is pending (ready to run, but no hardware resource available)

enumerator **suspended**

thread has been suspended (waiting for synchronization event, but still known and under control of the thread-manager)

enumerator **depleted**

thread has been depleted (deeply suspended, it is not known to the thread-manager)

enumerator **terminated**

thread has been stopped and may be garbage collected

enumerator **staged**

this is not a real thread state, but allows to reference staged task descriptions, which eventually will be converted into thread objects

enumerator **pending_do_not_schedule**

this is not a real thread state, but allows to create a thread in pending state without scheduling it (internal, do not use)

enumerator **pending_boost**

this is not a real thread state, but allows to suspend a thread in pending state without high priority rescheduling

enumerator **deleted**

thread has been stopped and was deleted

enum class **thread_priority** : *std::int8_t*

This enumeration lists all possible thread-priorities for HPX threads.

*Values:*enumerator **unknown**

enumerator **default_**

Will assign the priority of the task to the default (normal) priority.

enumerator **low**

Task goes onto a special low priority queue and will not be executed until all high/normal priority tasks are done, even if they are added after the low priority task.

enumerator **normal**

Task will be executed when it is taken from the normal priority queue, this is usually a first in-first-out ordering of tasks (depending on scheduler choice). This is the default priority.

enumerator **high_recursive**

The task is a high priority task and any child tasks spawned by this task will be made high priority as well - unless they are specifically flagged as non default priority.

enumerator **boost**

Same as *thread_priority_high* except that the thread will fall back to *thread_priority_normal* if resumed after being suspended.

enumerator **high**

Task goes onto a special high priority queue and will be executed before normal/low priority tasks are taken (some schedulers modify the behavior slightly and the documentation for those should be consulted).

enumerator **bound**

Task goes onto a special high priority queue and will never be stolen by another thread after initial assignment. This should be used for thread placement tasks such as OpenMP type for loops.

enumerator **initially_bound**

Task initially goes onto a special high priority queue and will never be stolen by another thread after initial assignment. If the thread is rescheduled later, it will use normal priority.

enum class **thread_restart_state** : *std::int8_t*

The *thread_restart_state* enumerator encodes the reason why a thread is being restarted

Values:

enumerator **unknown**

enumerator **signaled**

The thread has been signaled.

enumerator **timeout**

The thread has been reactivated after a timeout.

enumerator **terminate**

The thread needs to be terminated.

enumerator **abort**

The thread needs to be aborted.

enum class **thread_stacksize** : *std::int8_t*

A *thread_stacksize* references any of the possible stack-sizes for HPX threads.

Values:

enumerator **unknown**

enumerator **small_**

use small stack size (the underscore is to work around 'small' being defined to char on Windows)

enumerator **medium**

use medium sized stack size

enumerator **large**

use large stack size

enumerator **huge**

use very large stack size

enumerator **nostack**

this thread does not suspend (does not need a stack)

enumerator **current**

use size of current thread's stack

enumerator **default_**

use default stack size

enumerator **minimal**

use minimally stack size

enumerator **maximal**

use maximally stack size

enum class **thread_schedule_hint_mode** : *std::int8_t*

The type of hint given when creating new tasks.

Values:

enumerator **none**

A hint that leaves the choice of scheduling entirely up to the scheduler.

enumerator **thread**

A hint that tells the scheduler to prefer scheduling a task on the local thread number associated with this hint. Local thread numbers are indexed from zero. It is up to the scheduler to decide how to interpret thread numbers that are larger than the number of threads available to the scheduler. Typically, thread numbers will wrap around when too large.

enumerator **numa**

A hint that tells the scheduler to prefer scheduling a task on the NUMA domain associated with this hint. NUMA domains are indexed from zero. It is up to the scheduler to decide how to interpret NUMA domain indices that are larger than the number of available NUMA domains to the scheduler. Typically, indices will wrap around when too large.

enum class **thread_placement_hint** : *std::int8_t*

The type of hint given to the scheduler related to thread placement

The type of hint given to the scheduler related running a thread as a child directly in the context of the parent thread

Values:

enumerator **none**

No hint is specified. The implementation is free to chose what placement methods to use.

enumerator **depth_first**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core).

enumerator **breadth_first**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores).

enumerator **depth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core). Threads are being scheduled in reverse order.

enumerator **breadth_first_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores). Threads are being scheduled in reverse order.

enum class **thread_sharing_hint** : *std::int8_t*

The type of hint given to the scheduler related to whether it is ok to share the invoked function object between threads

Values:

enumerator **none**

No hint is specified. The implementation is free to chose what sharing methods to use.

enumerator **do_not_share_function**

A hint that tells the scheduler to avoid sharing the given function (object) between threads.

enumerator **do_not_combine_tasks**

A hint that tells the scheduler to avoid combining tasks on the same thread. This is important for tasks that may synchronize between each other, which could lead to deadlocks if those tasks are combined running by the same thread.

enum class **thread_execution_hint** : *std::int8_t*

Values:

enumerator **none**

No hint is specified. Always run the thread in its own execution environment.

enumerator **run_as_child**

Attempt to run the thread in the execution context of the parent thread.

Functions

std::ostream &**operator**<<(*std::ostream* &os, *thread_schedule_state* t)

char const ***get_thread_state_name**(*thread_schedule_state* state) noexcept

Returns the name of the given state.

Get the readable string representing the name of the given *thread_state* constant.

Parameters

state – this represents the thread state.

std::ostream &**operator**<<(*std::ostream* &os, *thread_priority* t)

char const ***get_thread_priority_name**(*thread_priority* priority) noexcept

Return the thread priority name.

Get the readable string representing the name of the given *thread_priority* constant.

Parameters

priority – this represents the thread priority.

std::ostream &**operator**<<(*std::ostream* &os, *thread_restart_state* t)

char const ***get_thread_state_ex_name**(*thread_restart_state* state) noexcept

Get the readable string representing the name of the given *thread_restart_state* constant.

char const ***get_thread_state_name**(*thread_state* state) noexcept

Get the readable string representing the name of the given *thread_state* constant.

std::ostream &**operator**<<(*std::ostream* &os, *thread_stacksize* t)

char const ***get_stack_size_enum_name**(*thread_stacksize* size) noexcept

Returns the stack size name.

Get the readable string representing the given stack size constant.

Parameters

size – this represents the stack size

constexpr bool **do_not_share_function**(*thread_sharing_hint* hint) noexcept

constexpr bool **do_not_combine_tasks**(*thread_sharing_hint* hint) noexcept

constexpr *thread_sharing_hint* **operator|**(*thread_sharing_hint* lhs, *thread_sharing_hint* rhs) noexcept

constexpr bool **run_as_child**(*thread_execution_hint* hint) noexcept

Variables

constexpr *thread_execution_hint* **default_runs_as_child_hint** = *thread_execution_hint::none*

Default value to use for runs-as-child mode (if *true*, then futures will attempt to execute associated threads directly if they have not started running).

struct **thread_schedule_hint**

#include <thread_enums.hpp> A hint given to a scheduler to guide where a task should be scheduled.

A scheduler is free to ignore the hint, or modify the hint to suit the resources available to the scheduler.

Public Functions

inline constexpr **thread_schedule_hint**() noexcept

Construct a default hint with mode *thread_schedule_hint_mode::none*.

inline explicit constexpr **thread_schedule_hint**(*std::int16_t* const thread_hint,
 thread_placement_hint placement =
 thread_placement_hint::none,
 thread_execution_hint runs_as_child =
 default_runs_as_child_hint,
 thread_sharing_hint sharing =
 thread_sharing_hint::none) noexcept

Construct a hint with mode *thread_schedule_hint_mode::thread* and the given hint as the local thread number.

inline constexpr **thread_schedule_hint**(*thread_schedule_hint_mode* const mode, *std::int16_t*
 const hint, *thread_placement_hint* placement =
 thread_placement_hint::none, *thread_execution_hint*
 runs_as_child = *default_runs_as_child_hint*,
 thread_sharing_hint sharing =
 thread_sharing_hint::none) noexcept

Construct a hint with the given mode and hint. The numerical hint is unused when the mode is *thread_schedule_hint_mode::none*.

inline explicit constexpr **thread_schedule_hint**(*thread_placement_hint* placement) noexcept

Construct a hint with the given placement hint.

inline explicit constexpr **thread_schedule_hint**(*thread_execution_hint* runs_as_child) noexcept

Construct a hint with the given execution hint.

inline explicit constexpr **thread_schedule_hint**(*thread_sharing_hint* sharing) noexcept

Construct a hint with the given sharing hint.

inline constexpr *thread_placement_hint* **placement_mode**() const noexcept

```

inline constexpr void placement_mode(thread_placement_hint bits) noexcept
inline constexpr thread_sharing_hint sharing_mode() const noexcept
inline constexpr void sharing_mode(thread_sharing_hint bits) noexcept
inline constexpr thread_execution_hint runs_as_child_mode() const noexcept
inline constexpr void runs_as_child_mode(thread_execution_hint bits) noexcept
inline constexpr void schedule_hint(std::int16_t core) noexcept

```

Public Members

std::int16_t **hint** = -1

The hint associated with the mode. The interpretation of this hint depends on the given mode.

thread_schedule_hint_mode **mode** = *thread_schedule_hint_mode::none*

The mode of the scheduling hint.

std::uint8_t **placement_mode_bits**

The mode of the desired thread placement.

std::uint8_t **sharing_mode_bits**

The mode of the desired sharing hint.

std::uint8_t **runs_as_child_mode_bits**

The thread will run as a child directly in the context of the current thread

datastructures

```
template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
```

```
T *any_cast(util::basic_any<IArch, OArch, Char, Copyable> *operand) noexcept
```

Performs type-safe access to the contained object.

Parameters

operand – target any object

Returns

If operand is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

```
template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
```

```
T const *any_cast(util::basic_any<IArch, OArch, Char, Copyable> const *operand) noexcept
```

Performs type-safe access to the contained object.

Parameters

operand – target any object

Returns

If operand is not a null pointer, and the *typeid* of the requested *T* matches that of the contents of *operand*, a pointer to the value contained by *operand*, otherwise a null pointer.

```
template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
```

```
T any_cast(util::basic_any<IArch, OArch, Char, Copyable> &operand)
```

Performs type-safe access to the contained object. Let *U* be *std::remove_cv_t<std::remove_reference_t<T>>*. The program is ill-formed if *std::is_constructible_v<T, U&>* is false.

Parameters

operand – target any object

Returns

*static_cast<T>(*std::any_cast<U>(&operand))*

```
template<typename T, typename IArch, typename OArch, typename Char, typename Copyable>
```

```
T const &any_cast(util::basic_any<IArch, OArch, Char, Copyable> const &operand)
```

Performs type-safe access to the contained object. Let *U* be *std::remove_cv_t<std::remove_reference_t<T>>*. The program is ill-formed if *std::is_constructible_v<T, const U&>* is false.

Parameters

operand – target any object

Returns

*static_cast<T>(*std::any_cast<U>(&operand))*

```
struct bad_any_cast : public bad_cast
```

#include <any.hpp> Defines a type of object to be thrown by the value-returning forms of *hpx::any_cast* on failure.

Public Functions

inline **bad_any_cast**(*std::type_info* const &src, *std::type_info* const &dest)

Constructs a new *bad_any_cast* object with an implementation-defined null-terminated byte string which is accessible through *what()*.

inline char const ***what**() const noexcept override

Returns the explanatory string.

Note: Implementations are allowed but not required to override *what()*.

Returns

Pointer to a null-terminated string with explanatory information. The string is suitable for conversion and display as a *std::wstring*. The pointer is guaranteed to be valid at least until the exception object from which it is obtained is destroyed, or until a non-const member function (e.g. copy assignment operator) on the exception object is called.

hpx::ignore, hpx::tuple, hpx::tuple_size, hpx::tuple_element, hpx::make_tuple, hpx::tie, hpx::forward_as_tuple, hpx::tuple_cat, hpx::get

Defined in header [hpx/tuple.hpp](#)⁷³⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

Functions

template<typename ...**Ts**>
constexpr *tuple*<util::decay_unwrap_t<**Ts**>...> **make_tuple**(**Ts**&&... ts)

Provides compile-time indexed access to the types of the elements of the tuple.

template<typename ...**Ts**>
constexpr *tuple*<**Ts**&&...> **forward_as_tuple**(**Ts**&&... ts)

Constructs a tuple of references to the arguments in args suitable for forwarding as an argument to a function. The tuple has rvalue reference data members when rvalues are used as arguments, and otherwise has lvalue reference data members.

Parameters

ts – zero or more arguments to construct the tuple from

Returns

hpx::tuple object created as if by

`hpx::tuple<Ts&&...>(HPX_FORWARD(Ts, ts)...)`

template<typename ...**Ts**>
constexpr *tuple*<**Ts**&...> **tie**(**Ts**&... ts)

Creates a tuple of lvalue references to its arguments or instances of *hpx::ignore*.

Parameters

ts – zero or more lvalue arguments to construct the tuple from.

Returns

hpx::tuple object containing lvalue references.

template<typename ...**Tuples**>
constexpr auto **tuple_cat**(*Tuples*&&... tuples)

Constructs a tuple that is a concatenation of all tuples in **tuples**. The behavior is undefined if any type in `std::decay_t<Tuples>...` is not a specialization of *hpx::tuple*. However, an implementation may choose to support types (such as `std::array` and `std::pair`) that follow the tuple-like protocol.

Parameters

tuples – - zero or more tuples to concatenate

Returns

hpx::tuple object composed of all elements of all argument tuples constructed from `hpx::get<Is>(HPX_FORWARD(UTuple,t))` for each individual element.

template<std::size_t **I**>

⁷³⁰ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/tuple.hpp

```
util::at_index<I, Ts...>::type &get() noexcept
```

Extracts the *I*th element from the tuple. *I* must be an integer value in $[0, \text{sizeof} \dots (\text{Ts}))$.

```
template<std::size_t I>
```

```
util::at_index<I, Ts...>::type const &get() const noexcept
```

Extracts the *I*th element from the tuple. *I* must be an integer value in $[0, \text{sizeof} \dots (\text{Ts}))$.

Variables

```
constexpr hpx::detail::ignore_type ignore = {}
```

An object of unspecified type such that any value can be assigned to it with no effect. Intended for use with *hpx::tie* when unpacking a *hpx::tuple*, as a placeholder for the arguments that are not used. While the behavior of *hpx::ignore* outside of *hpx::tie* is not formally specified, some code guides recommend using *hpx::ignore* to avoid warnings from unused return values of `[[nodiscard]]` functions.

```
template<typename ...Ts>
```

```
class tuple
```

#include <tuple.hpp> Class template *hpx::tuple* is a fixed-size collection of heterogeneous values. It is a generalization of *hpx::pair*. If *std::is_trivially_destructible<Ti>::value* is true for every *Ti* in *Ts*, the destructor of tuple is trivial.

Param Ts...

the types of the elements that the tuple stores.

```
template<std::size_t I, typename T, typename Enable = void>
```

```
struct tuple_element
```

#include <tuple.hpp> Provides compile-time indexed access to the types of the elements of a tuple-like type.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

```
template<typename T>
```

```
struct tuple_size
```

#include <tuple.hpp> Provides access to the number of elements in a tuple-like type as a compile-time constant expression.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

hpx::any, hpx::make_any

Defined in header `hpx/any.hpp`⁷³¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename IArch, typename OArch, typename Char>
```

```
class basic_any<IArch, OArch, Char, std::true_type>

```

debugging

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx/debugging/print.hpp

Defined in header hpx/debugging/print.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

errors

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx/errors/exception_list.hpp

Defined in header `hpx/errors/exception_list.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **exception_list** : public *hpx::exception*

#include <exception_list.hpp> The class *exception_list* is a container of *exception_ptr* objects parallel algorithms may use to communicate uncaught exceptions encountered during parallel execution to the caller of the algorithm

The type *exception_list::const_iterator* fulfills the requirements of a forward iterator.

Public Types

using **iterator** = *exception_list_type::const_iterator*
bidirectional iterator

Public Functions

inline *std::size_t* **size()** const noexcept

The number of *exception_ptr* objects contained within the *exception_list*.

Note: Complexity: Constant time.

inline *exception_list_type::const_iterator* **begin()** const noexcept

An iterator referring to the first *exception_ptr* object contained within the *exception_list*.

inline *exception_list_type::const_iterator* **end()** const noexcept

An iterator which is the past-the-end value for the *exception_list*.

hpx/errors/macros.hpp

Defined in header `hpx/errors/macros.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_THROW_EXCEPTION(errcode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX_THROW_EXCEPTION* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the `hpx::error` code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_EXCEPTION(hpx::error::no_success, "raise_exception",
        "simulated error");
}
```

Example:

HPX_THROW_BAD_ALLOC(f)

Throw a `hpx::bad_alloc_exception` initialized from the given parameters.

The macro `HPX_THROW_BAD_ALLOC` can be used to throw a `hpx::exception`. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the `hpx::error` code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
    // Throw a hpx::exception initialized from the given parameters.
    // Additionally associate with this exception some detailed
    // diagnostic information about the throw-site.
    HPX_THROW_BAD_ALLOC("raise_exception", "simulated error");
}
```

Example:

HPX_THROWS_IF(ec, errcode, f, ...)

Either throw a `hpx::exception` or initialize `hpx::error_code` from the given parameters.

The macro `HPX_THROWS_IF` can be used to either throw a `hpx::exception` or to initialize a `hpx::error_code` from the given parameters. If `&ec == &hpx::throws`, the semantics of this macro are equivalent to `HPX_THROW_EXCEPTION`. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

The parameter `errcode` holds the `hpx::error` code from which the new exception should be initialized. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

HPX_THROWS_BAD_ALLOC_IF(ec, f)

Either throw a `hpx::bad_alloc_exception` or `hpx::error_code` to `out_of_memory`.

The macro `HPX_THROWS_BAD_ALLOC_IF` can be used to either throw a `hpx::bad_alloc_exception` or to initialize a `hpx::error_code` to `hpx::error::out_of_memory`. If `&ec == &hpx::throws`, the semantics of this macro

are equivalent to `HPX_THROW_BAD_ALLOC`. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

HPX_DEFINE_ERROR_INFO(NAME, TYPE)

`hpx::error_code`

Defined in header `hpx/system_error.hpp`⁷³².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Unnamed Group

inline *error_code* **make_error_code**(*std::exception_ptr* const &*e*)

inline *error_code* **make_error_code**(*error* *e*, *throwmode* *mode* = *throwmode::plain*)

Returns a new *error_code* constructed from the given parameters.

inline *error_code* **make_error_code**(*error* *e*, *char* const **func*, *char* const **file*, *long* *line*, *throwmode* *mode* = *throwmode::plain*)

inline *error_code* **make_error_code**(*error* *e*, *char* const **msg*, *throwmode* *mode* = *throwmode::plain*)

Returns *error_code*(*e*, *msg*, *mode*).

inline *error_code* **make_error_code**(*error* *e*, *char* const **msg*, *char* const **func*, *char* const **file*, *long* *line*, *throwmode* *mode* = *throwmode::plain*)

inline *error_code* **make_error_code**(*error* *e*, *std::string* const &*msg*, *throwmode* *mode* = *throwmode::plain*)

Returns *error_code*(*e*, *msg*, *mode*).

inline *error_code* **make_error_code**(*error* *e*, *std::string* const &*msg*, *char* const **func*, *char* const **file*, *long* *line*, *throwmode* *mode* = *throwmode::plain*)

Functions

std::error_category const &**get_hpx_category**() noexcept

Returns generic HPX error category used for new errors.

std::error_category const &**get_hpx_rethrow_category**() noexcept

Returns generic HPX error category used for errors re-thrown after the exception has been de-serialized.

inline *error_code* **make_success_code**(*throwmode* *mode* = *throwmode::plain*)

Returns *error_code*(*hpx::error::success*, “success”, *mode*).

class **error_code** : public *error_code*

#include <error_code.hpp> A *hpx::error_code* represents an arbitrary error condition.

The class *hpx::error_code* describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.

⁷³² http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/system_error.hpp

Note: Class `hpx::error_code` is an adjunct to error reporting by exception

Public Functions

inline explicit **error_code**(*throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

mode – The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Throws

nothing –

explicit **error_code**(*error* e, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter *e* holds the *hpx::error* code the new exception should encapsulate.
- **mode** – The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Throws

nothing –

error_code(*error* e, char const **func*, char const **file*, long *line*, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter *e* holds the *hpx::error* code the new exception should encapsulate.
- **func** – The name of the function where the error was raised.
- **file** – The file name of the code where the error was raised.
- **line** – The line number of the code line where the error was raised.
- **mode** – The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Throws

nothing –

error_code(*error* e, char const **msg*, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter *e* holds the *hpx::error* code the new exception should encapsulate.
- **msg** – The parameter *msg* holds the error message the new exception should encapsulate.
- **mode** – The parameter *mode* specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Throws

`std::bad_alloc` – (if allocation of a copy of the passed string fails).

error_code(*error* e, char const **msg*, char const **func*, char const **file*, long *line*, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter *e* holds the *hpx::error* code the new exception should encapsulate.

- **msg** – The parameter **msg** holds the error message the new exception should encapsulate.
- **func** – The name of the function where the error was raised.
- **file** – The file name of the code where the error was raised.
- **line** – The line number of the code line where the error was raised.
- **mode** – The parameter **mode** specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Throws

std::bad_alloc – (if allocation of a copy of the passed string fails).

error_code(*error* e, *std::string* const &msg, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter **e** holds the *hpx::error* code the new exception should encapsulate.
- **msg** – The parameter **msg** holds the error message the new exception should encapsulate.
- **mode** – The parameter **mode** specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Throws

std::bad_alloc – (if allocation of a copy of the passed string fails).

error_code(*error* e, *std::string* const &msg, *char* const *func, *char* const *file, *long* line, *throwmode* mode = *throwmode::plain*)

Construct an object of type *error_code*.

Parameters

- **e** – The parameter **e** holds the *hpx::error* code the new exception should encapsulate.
- **msg** – The parameter **msg** holds the error message the new exception should encapsulate.
- **func** – The name of the function where the error was raised.
- **file** – The file name of the code where the error was raised.
- **line** – The line number of the code line where the error was raised.
- **mode** – The parameter **mode** specifies whether the constructed *hpx::error_code* belongs to the error category *hpx_category* (if *mode* is *plain*, this is the default) or to the category *hpx_category_rethrow* (if *mode* is *rethrow*).

Throws

std::bad_alloc – (if allocation of a copy of the passed string fails).

error_code(*error_code*&&) = default

error_code &**operator**=(*error_code*&&) = default

~error_code() = default

std::string **get_message**() const

Return a reference to the error message stored in the *hpx::error_code*.

Throws

nothing –

inline void **clear**()

Clear this *error_code* object. The postconditions of invoking this method are.

- **value()** == *hpx::error::success* and **category()** == *hpx::get_hpx_category()*

error_code(*error_code* const &rhs)

Copy constructor for *error_code*

Note: This function maintains the error category of the left hand side if the right hand side is a success code.

error_code &**operator**=(*error_code* const &rhs)
 Assignment operator for *error_code*

Note: This function maintains the error category of the left hand side if the right hand side is a success code.

Private Functions

error_code(int err, *hpx::exception* const &e)
 explicit **error_code**(*std::exception_ptr* const &e)

Private Members

std::exception_ptr **exception_**

Friends

hpx/errors/exception_fwd.hpp

Defined in header `hpx/errors/exception_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Enums

enum class **throwmode** : *std::uint8_t*
 Encode error category for new *error_code*.

Values:

enumerator **plain**

enumerator **rethrow**

enumerator **lightweight**

Functions

constexpr bool **operator&**(*throwmode* lhs, *throwmode* rhs) noexcept

Variables

error_code throws

Predefined *error_code* object used as “throw on error” tag.

The predefined *hpx::error_code* object *hpx::throws* is supplied for use as a “throw on error” tag.

Functions that specify an argument in the form ‘*error_code*& ec=throws’ (with appropriate namespace qualifiers), have the following error handling semantics:

If &ec != &throws and an error occurred: ec.value() returns the implementation specific error number for the particular error that occurred and ec.category() returns the error_category for ec.value().

If &ec != &throws and an error did not occur, ec.clear().

If an error occurs and &ec == &throws, the function throws an exception of type *hpx::exception* or of a type derived from it. The exception’s *get_errorcode()* member function returns a reference to a *hpx::error_code* object with the behavior as specified above.

hpx::exception

Defined in header [hpx/exception.hpp](#)⁷³³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Typedefs

⁷³³ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/exception.hpp

`std::string get_error_what(exception_info const &xi)`

Return the error message of the thrown exception.

The function `hpx::get_error_what` can be used to extract the diagnostic information element representing the error message as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()` `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The error message stored in the exception. If the exception instance does not hold this information, the function will return an empty string.

`error get_error(hpx::exception const &e)`

Return the error code value of the exception thrown.

The function `hpx::get_error` can be used to extract the diagnostic information element representing the error value code as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

e – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception`, `hpx::error_code`, or `std::exception_ptr`.

Throws

nothing –

Returns

The error value code of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return `hpx::naming::invalid_locality_id`.

`error get_error(hpx::error_code const &e)`

`std::string get_error_function_name(hpx::exception_info const &xi)`

Return the function name from which the exception was thrown.

The function `hpx::get_error_function_name` can be used to extract the diagnostic information element representing the name of the function as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_file_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The name of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string get_error_file_name(hpx::exception_info const &xi)`

Return the (source code) file name of the function from which the exception was thrown.

The function `hpx::get_error_file_name` can be used to extract the diagnostic information element representing the name of the source file as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_line_number()`, `hpx::get_error_os_thread()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The name of the source file of the function from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

```
long get_error_line_number(hpx::exception_info const &xi)
```

Return the line number in the (source code) file of the function from which the exception was thrown.

The function `hpx::get_error_line_number` can be used to extract the diagnostic information element representing the line number as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_os_thread()`,
`hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`, `hpx::get_error()`,
`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

nothing –

Returns

The line number of the place where the exception was thrown. If the exception instance does not hold this information, the function will return -1.

```
class bad_alloc_exception : public hpx::exception, public bad_alloc
```

Public Functions

```
bad_alloc_exception()
```

Construct a `hpx::bad_alloc_exception`.

```
error_code get_error_code(throwmode mode = throwmode::plain) const noexcept
```

The function `get_error_code()` returns a `hpx::error_code` which represents the same error condition as this `hpx::exception` instance.

Parameters

mode – The parameter `mode` specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `throwmode::plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

Public Static Functions

```
static inline constexpr error get_error() noexcept
```

The function `get_error()` returns `hpx::error::out_of_memory`

Throws

nothing –

class **exception** : public system_error

#include <exception.hpp> A *hpx::exception* is the main exception type used by HPX to report errors.

The *hpx::exception* type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by *hpx::bad_alloc_exception*, *hpx::exception_list*

Public Functions

explicit **exception**(error e = *hpx::error::success*)

Construct a *hpx::exception* from a *hpx::error*.

Parameters

e – The parameter **e** holds the *hpx::error* code the new exception should encapsulate.

explicit **exception**(std::system_error const &e)

Construct a *hpx::exception* from a *boost::system_error*.

explicit **exception**(std::error_code const &e)

Construct a *hpx::exception* from a *boost::system::error_code* (this is new for Boost V1.69). This constructor is required to compensate for the changes introduced as a resolution to LWG3162 (<https://cplusplus.github.io/LWG/issue3162>).

exception(error e, char const *msg, throwmode mode = *throwmode::plain*)

Construct a *hpx::exception* from a *hpx::error* and an error message.

Parameters

- e** – The parameter **e** holds the *hpx::error* code the new exception should encapsulate.
- msg** – The parameter **msg** holds the error message the new exception should encapsulate.
- mode** – The parameter **mode** specifies whether the returned *hpx::error_code* belongs to the error category *hpx_category* (if **mode** is *plain*, this is the default) or to the category *hpx_category_rethrow* (if **mode** is *rethrow*).

exception(error e, std::string const &msg, throwmode mode = *throwmode::plain*)

Construct a *hpx::exception* from a *hpx::error* and an error message.

Parameters

- e** – The parameter **e** holds the *hpx::error* code the new exception should encapsulate.
- msg** – The parameter **msg** holds the error message the new exception should encapsulate.
- mode** – The parameter **mode** specifies whether the returned *hpx::error_code* belongs to the error category *hpx_category* (if **mode** is *plain*, this is the default) or to the category *hpx_category_rethrow* (if **mode** is *rethrow*).

~exception() override

Destruct a *hpx::exception*

Throws

nothing –

error **get_error**() const noexcept

The function *get_error()* returns the *hpx::error* code stored in the referenced instance of a *hpx::exception*. It returns the *hpx::error* code this exception instance was constructed from.

Throws

nothing –

error_code **get_error_code**(*throwmode* mode = *throwmode::plain*) const noexcept

The function `get_error_code()` returns a `hpx::error_code` which represents the same error condition as this `hpx::exception` instance.

Parameters

mode – The parameter `mode` specifies whether the returned `hpx::error_code` belongs to the error category `hpx_category` (if `mode` is `throwmode::plain`, this is the default) or to the category `hpx_category_rethrow` (if `mode` is `rethrow`).

struct **thread_interrupted** : public *exception*

`#include <exception.hpp>` A `hpx::thread_interrupted` is the exception type used by HPX to interrupt a running HPX thread.

The `hpx::thread_interrupted` type is the exception type used by HPX to interrupt a running thread.

A running thread can be interrupted by invoking the `interrupt()` member function of the corresponding `hpx::thread` object. When the interrupted thread next executes one of the specified interruption points (or if it is currently blocked whilst executing one) with interruption enabled, then a `hpx::thread_interrupted` exception will be thrown in the interrupted thread. If not caught, this will cause the execution of the interrupted thread to terminate. As with any other exception, the stack will be unwound, and destructors for objects of automatic storage duration will be executed.

If a thread wishes to avoid being interrupted, it can create an instance of `hpx::this_thread::disable_interruption`. Objects of this class disable interruption for the thread that created them on construction, and restore the interruption state to whatever it was before on destruction.

```
void f()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::disable_interruption di2;
            // interruption still disabled
        } // di2 destroyed, interruption state restored
        // interruption still disabled
    } // di destroyed, interruption state restored
    // interruption now enabled
}
```

The effects of an instance of `hpx::this_thread::disable_interruption` can be temporarily reversed by constructing an instance of `hpx::this_thread::restore_interruption`, passing in the `hpx::this_thread::disable_interruption` object in question. This will restore the interruption state to what it was when the `hpx::this_thread::disable_interruption` object was constructed, and then disable interruption again when the `hpx::this_thread::restore_interruption` object is destroyed.

```
void g()
{
    // interruption enabled here
    {
        hpx::this_thread::disable_interruption di;
        // interruption disabled
        {
            hpx::this_thread::restore_interruption ri(di);
```

(continues on next page)

(continued from previous page)

```
        // interruption now enabled
    } // ri destroyed, interruption disable again
} // di destroyed, interruption state restored
// interruption now enabled
}
```

At any point, the interruption state for the current thread can be queried by calling `hpx::this_thread::interruption_enabled()`.

hpx/errors/error.hpp

Defined in header `hpx/errors/error.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_ERROR_UNSCOPED_ENUM_DEPRECATION_MSG

namespace **hpx**

Enums

enum class **error** : `std::int16_t`

Possible error conditions.

This enumeration lists all possible error conditions which can be reported from any of the API functions.

Values:

enumerator **success**

The operation was successful.

enumerator **no_success**

The operation did failed, but not in an unexpected manner.

enumerator **not_implemented**

The operation is not implemented.

enumerator **out_of_memory**

The operation caused an out of memory condition.

enumerator **bad_action_code**

enumerator **bad_component_type**

The specified component type is not known or otherwise invalid.

enumerator **network_error**

A generic network error occurred.

enumerator **version_too_new**

The version of the network representation for this object is too new.

enumerator **version_too_old**

The version of the network representation for this object is too old.

enumerator **version_unknown**

The version of the network representation for this object is unknown.

enumerator **unknown_component_address**

enumerator **duplicate_component_address**

The given global id has already been registered.

enumerator **invalid_status**

The operation was executed in an invalid status.

enumerator **bad_parameter**

One of the supplied parameters is invalid.

enumerator **internal_server_error**

enumerator **service_unavailable**

enumerator **bad_request**

enumerator **repeated_request**

enumerator **lock_error**

enumerator **duplicate_console**

There is more than one console locality.

enumerator **no_registered_console**

There is no registered console locality available.

enumerator **startup_timed_out**

enumerator **uninitialized_value**

enumerator **bad_response_type**

enumerator **deadlock**

enumerator **assertion_failure**

enumerator **null_thread_id**

Attempt to invoke an API function from a non-HPX thread.

enumerator **invalid_data**

enumerator **yield_aborted**

The yield operation was aborted.

enumerator **dynamic_link_failure**

enumerator **commandline_option_error**

One of the options given on the command line is erroneous.

enumerator **serialization_error**

There was an error during serialization of this object.

enumerator **unhandled_exception**

An unhandled exception has been caught.

enumerator **kernel_error**

The OS kernel reported an error.

enumerator **broken_task**

The task associated with this future object is not available anymore.

enumerator **task_moved**

The task associated with this future object has been moved.

enumerator **task_already_started**

The task associated with this future object has already been started.

enumerator **future_already_retrieved**

The future object has already been retrieved.

enumerator **promise_already_satisfied**

The value for this future object has already been set.

enumerator **future_does_not_support_cancellation**

The future object does not support cancellation.

enumerator **future_can_not_be_cancelled**

The future can't be canceled at this time.

enumerator **no_state**

The future object has no valid shared state.

enumerator **broken_promise**

The promise has been deleted.

enumerator **thread_resource_error**

enumerator **future_cancelled**

enumerator **thread_cancelled**

enumerator **thread_not_interruptable**

enumerator **duplicate_component_id**

The component type has already been registered.

enumerator **unknown_error**

An unknown error occurred.

enumerator **bad_plugin_type**

The specified plugin type is not known or otherwise invalid.

enumerator **filesystem_error**

The specified file does not exist or other filesystem related error.

enumerator **bad_function_call**

equivalent of `std::bad_function_call`

enumerator **task_canceled_exception**

`parallel::task_canceled_exception`

enumerator **task_block_not_active**

`task_region` is not active

enumerator **out_of_range**

Equivalent to `std::out_of_range`.

enumerator **length_error**

Equivalent to `std::length_error`.

enumerator **migration_needs_retry**

migration failed because of global race, retry

hpx::execution::experimental::auto_chunk_size

Defined in header [hpx/execution.hpp](#)⁷³⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

⁷³⁶ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/execution.hpp

Typedefs

```
typedef hpx::execution::experimental::auto_chunk_size instead
```

```
namespace experimental
```

```
struct auto_chunk_size
```

#include <auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

Public Functions

```
inline explicit constexpr auto_chunk_size(std::uint64_t const num_iters_for_timing = 0)
                                         noexcept
```

Construct an `auto_chunk_size` executor parameters object

Note: Default constructed `auto_chunk_size` executor parameter types will use 80 microseconds as the minimal time for which any of the scheduled chunks should run.

```
inline explicit auto_chunk_size(hpx::chrono::steady_duration const &rel_time, std::uint64_t
                                const num_iters_for_timing = 0) noexcept
```

Construct an `auto_chunk_size` executor parameters object

Parameters

- **rel_time** – [in] The time duration to use as the minimum to decide how many loop iterations should be combined.
- **num_iters_for_timing** – [in] The number of iterations to use for the timing operation

`hpx/execution/executors/adaptive_static_chunk_size.hpp`

Defined in header `hpx/execution/executors/adaptive_static_chunk_size.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace execution
```

```
namespace experimental
```

```
struct adaptive_static_chunk_size
```

#include <adaptive_static_chunk_size.hpp> Loop iterations are divided into pieces of size `chunk_size` and then assigned to threads. If `chunk_size` is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note: This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

adaptive_static_chunk_size() = default

Construct a `adaptive_static_chunk_size` executor parameters object

Note: By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

inline explicit constexpr **adaptive_static_chunk_size**(*std::size_t* const chunk_size)
noexcept

Construct a `adaptive_static_chunk_size` executor parameters object

Parameters

chunk_size – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

hpx/execution/executors/execution_information.hpp

Defined in header `hpx/execution/executors/execution_information.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

Variables

constexpr struct *hpx::execution::experimental::has_pending_closures_t* **has_pending_closures**

constexpr struct *hpx::execution::experimental::get_pu_mask_t* **get_pu_mask**

constexpr struct *hpx::execution::experimental::set_scheduler_mode_t* **set_scheduler_mode**

struct **get_pu_mask_t**

#include <execution_information.hpp> Retrieve the bitmask describing the processing units the given thread is allowed to run on

All threads::executors invoke `sched.get_pu_mask()`.

Note: If the executor does not support this operation, this call will always invoke `hpx::threads::get_pu_mask()`

Param exec

[in] The executor object to use for querying the number of pending tasks.

Param topo

[in] The topology object to use to extract the requested information.

Param thread_num

[in] The sequence number of the thread to retrieve information for.

Public Functions

```
template<typename Executor>
inline decltype(auto) operator() (Executor &&exec, threads::topology &topo, std::size_t
                                     thread_num) const
```

```
template<typename Executor>
inline decltype(auto) operator() (Executor&&, threads::topology &topo, std::size_t
                                     thread_num) const
```

```
struct has_pending_closures_t
```

#include <execution_information.hpp> Retrieve whether this executor has operations pending or not.

Note: If the executor does not expose this information, this call will always return *false*

Param exec

[in] The executor object to use to extract the requested information for.

Public Functions

```
template<typename Executor>
inline decltype(auto) operator() (Executor &&exec) const
```

```
template<typename Executor>
inline decltype(auto) operator() (Executor&&) const
```

```
struct set_scheduler_mode_t
```

#include <execution_information.hpp> Set various modes of operation on the scheduler underneath the given executor.

Note: This calls `exec.set_scheduler_mode(mode)` if it exists; otherwise it does nothing.

Param exec

[in] The executor object to use.

Param mode

[in] The new mode for the scheduler to pick up

Public Functions

```
template<typename Executor, typename Mode>  
inline void operator() (Executor &&exec, Mode const &mode) const
```

```
template<typename Executor, typename Mode>  
inline void operator() (Executor&&, Mode const&) const
```

hpx::execution::experimental::num_cores

Defined in header [hpx/execution.hpp](#)⁷³⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace execution
```

```
        namespace experimental
```

```
            struct num_cores
```

```
                #include <num_cores.hpp> Control number of cores in executors which need a functionality for  
                setting the number of cores to be used by an algorithm directly
```

Public Functions

```
inline explicit constexpr num_cores(std::size_t const cores = 1) noexcept  
    Construct a num_cores executor parameters object
```

Note: make sure the minimal number of cores is and the maximum number of cores is what's available to HPX

hpx::execution::experimental::static_chunk_size

Defined in header [hpx/execution.hpp](#)⁷³⁸.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace execution
```

```
        namespace experimental
```

⁷³⁷ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/execution.hpp

⁷³⁸ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/execution.hpp

struct **static_chunk_size**

#include <static_chunk_size.hpp> Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note: This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

Public Functions

static_chunk_size() = default

Construct a static_chunk_size executor parameters object

Note: By default, the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

inline explicit constexpr **static_chunk_size**(std::size_t const chunk_size) noexcept

Construct a static_chunk_size executor parameters object

Parameters

chunk_size – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

hpx::execution::experimental::persistent_auto_chunk_size

Defined in header [hpx/execution.hpp](#)⁷³⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **persistent_auto_chunk_size**

#include <persistent_auto_chunk_size.hpp> Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

⁷³⁹ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/execution.hpp

Public Functions

```
inline explicit constexpr persistent_auto_chunk_size(std::uint64_t const  
                                                    num_iters_for_timing = 0) noexcept
```

Construct an `persistent_auto_chunk_size` executor parameters object

Note: Default constructed `persistent_auto_chunk_size` executor parameter types will use 0 microseconds as the execution time for each chunk and 80 microseconds as the minimal time for which any of the scheduled chunks should run.

```
inline explicit persistent_auto_chunk_size(hpx::chrono::steady_duration const &time_cs,  
                                           std::uint64_t const num_iters_for_timing = 0)  
                                           noexcept
```

Construct an `persistent_auto_chunk_size` executor parameters object

Parameters

- **time_cs** – The execution time for each chunk.
- **num_iters_for_timing** – [in] The number of iterations to use for measuring the execution time of one iteration

```
inline persistent_auto_chunk_size(hpx::chrono::steady_duration const &time_cs,  
                                  hpx::chrono::steady_duration const &rel_time,  
                                  std::uint64_t const num_iters_for_timing = 0)  
                                  noexcept
```

Construct an `persistent_auto_chunk_size` executor parameters object

Parameters

- **rel_time** – [in] The time duration to use as the minimum to decide how many loop iterations should be combined.
- **time_cs** – The execution time for each chunk.
- **num_iters_for_timing** – [in] The number of iterations to use for measuring the execution time of one iteration

hpx/execution/executors/default_parameters.hpp

Defined in header `hpx/execution/executors/default_parameters.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **default_parameters**

#include <default_parameters.hpp> Loop iterations are divided into pieces of size *chunk_size* and then assigned to threads. If *chunk_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

Note: This executor parameters type is equivalent to OpenMP's `STATIC` scheduling directive.

Public Functions

default_parameters() = default

Construct a default_parameters executor parameters object

Note: By default, the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

hpx::execution::experimental::max_num_chunks

Defined in header `hpx/execution.hpp`⁷⁴⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **max_num_chunks**

#include <max_num_chunks.hpp> Loop iterations are divided into not more than *num_chunks* partitions that are assigned to threads. If *num_chunks* is not specified, the number of chunks is determined based on the number of available cores.

Public Functions

max_num_chunks() = default

Construct a max_num_chunks executor parameters object

Note: By default, the number of chunks is determined from the number of available cores.

inline explicit constexpr **max_num_chunks**(std::size_t const num_chunks) noexcept

Construct a max_num_chunks executor parameters object

Parameters

num_chunks – [in] The optional number of chunks to use to run on a single thread.

⁷⁴⁰ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/execution.hpp

hpx/execution/executors/execution_parameters_fwd.hpp

struct **collect_execution_parameters_t**

#include <execution_parameters_fwd.hpp> Collect various parameters of the chunking for this parallel algorithm execution

Note: This calls `params.mark_begin_execution(exec)` if it exists; otherwise it does nothing.

Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param num_elements

[in] The overall number of elements for the algorithm.

Param num_cores

[in] The overall number of cores to utilize for the algorithm.

Param num_chunks

[in] The overall number of chunks for the algorithm.

Param chunk_size

[in] The size of the chunks created for the algorithm.

Public Functions

template<typename **Parameters**, typename **Executor**>

inline decltype(auto) **operator()** (*Parameters* &¶ms, *Executor* &&exec, *std::size_t* num_elements, *std::size_t* num_cores, *std::size_t* num_chunks, *std::size_t* chunk_size) const

struct **get_chunk_size_t**

#include <execution_parameters_fwd.hpp> Return the number of invocations of the given function *f* which should be combined into a single task

Param params

[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num_tasks*.

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param iteration_duration

[in] The time one of the tasks require to be executed.

Param cores

[in] The number of cores the number of chunks should be determined for.

Param num_tasks

[in] The number of tasks the chunk size should be determined for

Return

The size of the chunks (number of iterations per chunk) that should be used for parallel execution.

Public Functions

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &&params, Executor &&exec,
                                   hpx::chrono::steady_duration const &iteration_duration,
                                   std::size_t cores, std::size_t num_tasks) const

template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &&params, Executor &&exec, std::size_t cores,
                                   std::size_t num_tasks) const
```

```
template<>
```

```

```

```
struct mark_begin_execution_t
```

```
#include <execution_parameters_fwd.hpp> Mark the begin of a parallel algorithm execution
```

Note: This calls `params.mark_begin_execution(exec)` if it exists; otherwise it does nothing.

Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Public Functions

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &&params, Executor &&exec) const
```

```
struct mark_end_execution_t
```

```
#include <execution_parameters_fwd.hpp> Mark the end of a parallel algorithm execution
```

Note: This calls `params.mark_end_execution(exec)` if it exists; otherwise it does nothing.

Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Public Functions

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &&params, Executor &&exec) const
```

```
struct mark_end_of_scheduling_t
```

```
#include <execution_parameters_fwd.hpp> Mark the end of scheduling tasks during parallel algorithm execution
```

Note: This calls `params.mark_begin_execution(exec)` if it exists; otherwise it does nothing.

Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Public Functions

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator()(Parameters &&params, Executor &&exec) const
```

struct **mark_partition_t**

#include <execution_parameters_fwd.hpp> Mark custom point in parallel algorithm execution

Note: This calls `params.mark_partition(exec, partition, args...)` if it exists; otherwise it does nothing.

Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Public Functions

```
template<typename Parameters, typename Executor, typename ...Args>
inline decltype(auto) operator()(Parameters &&params, Executor &&exec, std::size_t
                                partition, Args&&... args) const
```

struct **maximal_number_of_chunks_t**

#include <execution_parameters_fwd.hpp> Return the largest reasonable number of chunks to create for a single algorithm invocation.

Param params

[in] The executor parameters object to use for determining the number of chunks for the given number of *cores*.

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param cores

[in] The number of cores the number of chunks should be determined for.

Param num_tasks

[in] The number of tasks the chunk size should be determined for

Public Functions

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator()(Parameters &&params, Executor &&exec, std::size_t cores,
                                   std::size_t num_tasks) const
```

```
struct measure_iteration_t
```

#include <execution_parameters_fwd.hpp> Return the measured execution time for one iteration based on running the given function.

Note: The parameter *f* is expected to be a nullary function returning a `std::size_t` representing the number of iteration the function has already executed (i.e. which don't have to be scheduled anymore).

Param params

[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num_tasks*.

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param f

[in] The function which will be optionally scheduled using the given executor.

Param num_tasks

[in] The number of tasks the chunk size should be determined for

Return

The execution time for one of the tasks.

Public Functions

```
template<typename Parameters, typename Executor, typename F>
inline decltype(auto) operator()(Parameters &&params, Executor &&exec, F &&f,
                                   std::size_t num_tasks) const
```

```
struct null_parameters_t
```

```
struct processing_units_count_t
```

#include <execution_parameters_fwd.hpp> Retrieve the number of (kernel-)threads used by the associated executor.

Note: This calls `params.processing_units_count(Executor&&)` if it exists; otherwise it forwards the request to the executor parameters object.

Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

Param exec

[in] The executor object which will be used for scheduling of the loop iterations.

Param iteration_duration

[in] The time one of the tasks require to be executed.

Param num_tasks

[in] The number of tasks the number of cores should be determined for

Return

The number of cores to use

Public Functions

```
template<typename Parameters, typename Executor>

hpx::execution::experimental::guided_chunk_size

Defined in header `hpx/execution.hpp`⁷⁴¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
    namespace execution
```

```
        namespace experimental
```

```
            struct guided_chunk_size
```

#include <guided_chunk_size.hpp> Iterations are dynamically assigned to threads in blocks as threads request those until no blocks remain to be assigned. Similar to `dynamic_chunk_size` except that the block size decreases each time a number of loop iterations is given to a thread. The size of the initial block is proportional to *number_of_iterations / number_of_cores*. Subsequent blocks are proportional to *number_of_iterations_remaining / number_of_cores*. The optional chunk size parameter defines the minimum block size. The default chunk size is 1.

Note: This executor parameters type is equivalent to OpenMP's GUIDED scheduling directive.

Public Functions

```
guided_chunk_size() = default
```

Construct an `dynamic_chunk_size` executor parameters object

Note: Default constructed `dynamic_chunk_size` executor parameter types will use a chunk size of '1'.

⁷⁴¹ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/execution.hpp

```
inline explicit constexpr guided_chunk_size(std::size_t const min_chunk_size) noexcept
```

Construct a `guided_chunk_size` executor parameters object

Parameters

min_chunk_size – [in] The optional minimal chunk size to use as the minimal number of loop iterations to schedule together. The default minimal chunk size is 1.

hpx/execution/executors/rebind_executor.hpp

Defined in header `hpx/execution/executors/rebind_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace execution
```

```

```
struct dynamic_chunk_size
```

#include <dynamic_chunk_size.hpp> Loop iterations are divided into pieces of size *chunk_size* and then dynamically scheduled among the threads; when a thread finishes one chunk, it is dynamically assigned another. If *chunk_size* is not specified, the default chunk size is 1.

Note: This executor parameters type is equivalent to OpenMP's DYNAMIC scheduling directive.

Public Functions

dynamic_chunk_size() = default

Construct an `dynamic_chunk_size` executor parameters object

Note: Default constructed `dynamic_chunk_size` executor parameter types will use a chunk size of '1'.

```
inline explicit constexpr dynamic_chunk_size(std::size_t chunk_size) noexcept
```

Construct a `dynamic_chunk_size` executor parameters object

Parameters

chunk_size – [in] The optional chunk size to use as the number of loop iterations to schedule together. The default chunk size is 1.

⁷⁴² http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/execution.hpp

constexpr struct *hpx::parallel::execution::async_invoke_t* **async_invoke**

constexpr struct *hpx::parallel::execution::sync_invoke_t* **sync_invoke**

struct **async_execute_t**

#include <execution.hpp> Customization point for asynchronous execution agent creation.

This asynchronously creates a single function invocation `f()` using the associated executor.

Note: Executors have to implement only `async_execute()`. All other functions will be emulated by this or other customization points in terms of this single basic primitive. However, some executors will naturally specialize all operations for maximum efficiency.

Note: This is valid for one way executors (calls `make_ready_future(exec.sync_execute(f, ts...))` if it exists) and for two-way executors (calls `exec.async_execute(f, ts...)` if it exists).

Param exec

[in] The executor object to use for scheduling of the function *f*.

Param f

[in] The function which will be scheduled using the given executor.

Param ts

[in] Additional arguments to use to invoke *f*.

Return

`f(ts...)`'s result through a future

Public Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

struct **async_invoke_t**

#include <execution.hpp> Asynchronously invoke the given set of nullary functions, each on its own execution agent

This creates a group of function invocations whose ordering is given by the `execution_category` associated with the executor.

All exceptions thrown by invocations of the functions are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This calls `exec.async_invoke(fs...)` if it exists; otherwise it executes `async_execute(fs)` for each *fs*.

Param exec

[in] The executor object to use for scheduling of the functions *fs*.

Param fs

[in] The functions which will be scheduled using the given executor.

Return

The return type of `executor_type::async_invoke` if defined by `executor_type`. Otherwise, a `future<void>` representing finishing the execution of all functions *fs*.

Public Functions

```
template<typename Executor, typename F, typename ...Fs>
inline decltype(auto) operator() (Executor &&exec, F &&f, Fs&&... fs) const
```

```
template<executor_any Executor, typename F, typename ...Fs>
inline decltype(auto) operator() (Executor &&exec, F &&f, Fs&&... fs) const
```

```
struct bulk_async_execute_t
```

```
#include <execution.hpp> Bulk form of asynchronous execution agent creation.
```

This asynchronously creates a group of function invocations $f(i)$ whose ordering is given by the `execution_category` associated with the executor.

Here i takes on all values in the index space implied by `shape`. All exceptions thrown by invocations of $f(i)$ are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This is deliberately different from the `bulk_async_execute` customization points specified in P0443. The `bulk_async_execute` customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note: This calls `exec.bulk_async_execute(f, shape, ts...)` if it exists; otherwise it executes `async_execute(f, shape, ts...)` as often as needed.

Param `exec`

[in] The executor object to use for scheduling of the function f .

Param `f`

[in] The function which will be scheduled using the given executor.

Param `shape`

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to f .

Param `ts`

[in] Additional arguments to use to invoke f .

Return

The return type of `executor_type::bulk_async_execute` if defined by `executor_type`. Otherwise, a vector of futures holding the returned values of each invocation of f .

Public Functions

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
    const
```

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline auto operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts) const ->
    decltype(HPX_FORWARD(Executor,
        exec).bulk_async_execute(HPX_FORWARD(F, f), shape,
        HPX_FORWARD(Ts, ts)...))
```

```
template<executor_any Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
    const
```

```
template<executor_any Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
    const
```

```
struct bulk_sync_execute_t
```

#include <execution.hpp> Bulk form of synchronous execution agent creation.

This synchronously creates a group of function invocations $f(i)$ whose ordering is given by the `execution_category` associated with the executor. The function synchronizes the execution of all scheduled functions with the caller.

Here i takes on all values in the index space implied by `shape`. All exceptions thrown by invocations of $f(i)$ are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This is deliberately different from the `bulk_sync_execute` customization points specified in P0443. The `bulk_sync_execute` customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note: This calls `exec.bulk_sync_execute(f, shape, ts...)` if it exists; otherwise it executes `sync_execute(f, shape, ts...)` as often as needed.

Param exec

[in] The executor object to use for scheduling of the function f .

Param f

[in] The function which will be scheduled using the given executor.

Param shape

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to f .

Param ts

[in] Additional arguments to use to invoke f .

Return

The return type of `executor_type::bulk_sync_execute` if defined by `executor_type`. Otherwise, a vector holding the returned values of each invocation of f except when f returns void, which case void is returned.

Public Functions

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
    const
```

```
template<executor_any Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
    const
```

```
template<executor_any Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
    const
```

```
struct bulk_then_execute_t
```

#include <execution.hpp> Bulk form of execution agent creation depending on a given future.

This creates a group of function invocations $f(i)$ whose ordering is given by the `execution_category` associated with the executor.

Here i takes on all values in the index space implied by `shape`. All exceptions thrown by invocations of $f(i)$ are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This is deliberately different from the `then_sync_execute` customization points specified in P0443. The `bulk_then_execute` customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

Note: This calls `exec.bulk_then_execute(f, shape, pred, ts...)` if it exists; otherwise it executes `sync_execute(f, shape, pred.share(), ts...)` (if this executor is also an `OneWayExecutor`), or `async_execute(f, shape, pred.share(), ts...)` (if this executor is also a `TwoWayExecutor`) - as often as needed.

Param `exec`

[in] The executor object to use for scheduling of the function f .

Param `f`

[in] The function which will be scheduled using the given executor.

Param `shape`

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to f .

Param `predecessor`

[in] The future object the execution of the given function depends on.

Param `ts`

[in] Additional arguments to use to invoke f .

Return

The return type of `executor_type::bulk_then_execute` if defined by `executor_type`. Otherwise, a vector holding the returned values of each invocation of f .

Public Functions

```
template<typename Executor, typename F, typename Shape, typename Future, typename
...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Future
&&predecessor, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename Shape, typename Future, typename
...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Future
&&predecessor, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename Shape, typename Future, typename
...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Future
&&predecessor, Ts&&... ts) const
```

struct **post_t**

#include <execution.hpp> Customization point for asynchronous fire & forget execution agent creation.

This asynchronously (fire & forget) creates a single function invocation *f*() using the associated executor.

Note: This is valid for two-way executors (calls *exec.post(f, ts...)*, if available, otherwise it calls *exec.async_execute(f, ts...)* while discarding the returned future), and for non-blocking two-way executors (calls *exec.post(f, ts...)* if it exists).

Param *exec*

[in] The executor object to use for scheduling of the function *f*.

Param *f*

[in] The function which will be scheduled using the given executor.

Param *ts*

[in] Additional arguments to use to invoke *f*.

Public Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

struct **sync_execute_t**

#include <execution.hpp> Customization point for synchronous execution agent creation.

This synchronously creates a single function invocation *f*() using the associated executor. The execution of the supplied function synchronizes with the caller

Note: It will call *exec.sync_execute(f, ts...)* if the executor exposes a corresponding member function. For two-way executors it will invoke *async_execute* and wait for the task's completion

before returning.

Param exec

[in] The executor object to use for scheduling of the function *f*.

Param f

[in] The function which will be scheduled using the given executor.

Param ts

[in] Additional arguments to use to invoke *f*.

Return

f(*ts...*)'s result

Public Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

struct **sync_invoke_t**

#include <execution.hpp> Synchronously invoke the given set of nullary functions, each on its own execution agent

This creates a group of function invocations whose ordering is given by the *execution_category* associated with the executor.

All exceptions thrown by invocations of the functions are reported in a manner consistent with parallel algorithm execution through the returned future.

Note: This calls *exec.sync_invoke(fs...)* if it exists; otherwise it executes *sync_execute(fs)* for each *fs*.

Param exec

[in] The executor object to use for scheduling of the functions *fs*.

Param fs

[in] The functions which will be scheduled using the given executor.

Return

The return type of *executor_type::async_invoke* if defined by *executor_type*.

Public Functions

```
template<typename Executor, typename F, typename ...Fs>
inline decltype(auto) operator() (Executor &&exec, F &&f, Fs&&... fs) const
```

```
template<executor_any Executor, typename F, typename ...Fs>
inline decltype(auto) operator() (Executor &&exec, F &&f, Fs&&... fs) const
```

struct **then_execute_t**

#include <execution.hpp> Customization point for execution agent creation depending on a given future.

This creates a single function invocation `f()` using the associated executor after the given future object has become ready.

Note: This is valid for two-way executors (calls `exec.then_execute(f, predecessor, ts...)` if it exists) and for one way executors (calls `predecessor.then(bind(f, ts...))`).

Param `exec`

[in] The executor object to use for scheduling of the function `f`.

Param `f`

[in] The function which will be scheduled using the given executor.

Param `predecessor`

[in] The future object the execution of the given function depends on.

Param `ts`

[in] Additional arguments to use to invoke `f`.

Return

`f(ts...)`'s result through a future

Public Functions

```
template<typename Executor, typename F, typename Future, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, F &&f, Future &&predecessor, Ts&&...
                                ts) const
```

```
template<executor_any Executor, typename F, typename Future, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, F &&f, Future &&predecessor, Ts&&...
                                ts) const
```

namespace experimental
```

hpx/executors/thread_pool_continues_on_sender.hpp

Defined in header `hpx/executors/thread_pool_continues_on_sender.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Domain-optimized `continues_on` sender for HPX thread pool schedulers.

When `stdexec::continues_on` is applied with an HPX `thread_pool_scheduler`, the generic `stdexec` implementation creates two operation states: one for the source sender and one for the scheduler hop (`schedule_from`). This double-state overhead adds ~1 us per task in microbenchmarks.

This header provides a custom sender that replaces the generic path by:

1. Connecting the source sender to a lightweight receiver that captures the downstream receiver and the scheduler.
2. On `set_value`: if we are already on the same HPX thread pool, forwarding inline; otherwise, posting a single HPX task to forward the values.

This eliminates the intermediate `__storage_for_t`, the second operation state, and the `run_loop` overhead.

```
namespace hpx
```

```
    namespace execution
```

```
        namespace experimental
```

hpx/executors/restricted_thread_pool_executor.hpp

Defined in header `hpx/executors/restricted_thread_pool_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```

```

Typedefs

```
using sequenced_task_policy = detail::sequenced_task_policy_shim<sequenced_executor,  
hpx::traits::executor_parameters_type_t<sequenced_executor>>
```

Extension: The class `sequenced_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may not be parallelized (has to run sequentially).

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the `sequenced_policy`.

⁷⁴³ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/execution.hpp

```
using sequenced_policy = detail::sequenced_policy_shim<sequenced_executor,
hpx::traits::executor_parameters_type_t<sequenced_executor>>
```

The class `sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.

```
using parallel_task_policy = detail::parallel_task_policy_shim<parallel_executor,
hpx::traits::executor_parameters_type_t<parallel_executor>>
```

Extension: The class `parallel_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the `parallel_policy`.

```
using parallel_policy = detail::parallel_policy_shim<parallel_executor,
hpx::traits::executor_parameters_type_t<parallel_executor>>
```

The class `parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

```
using parallel_unsequenced_task_policy =
detail::parallel_unsequenced_task_policy_shim<parallel_executor,
hpx::traits::executor_parameters_type_t<parallel_executor>>
```

The class `parallel_unsequenced_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

```
using parallel_unsequenced_policy =
detail::parallel_unsequenced_policy_shim<parallel_executor,

struct **parallel_policy_executor_base**

#include <parallel_executor.hpp> A *parallel_executor* creates groups of parallel execution agents which execute in threads implicitly created by the executor. This executor prefers continuing with the creating thread first before executing newly created threads.

This executor conforms to the concepts of a *TwoWayExecutor*, and a *BulkTwoWayExecutor*

Subclassed by *hpx::execution::parallel_policy_executor< Policy, HierarchicalSpawning >*, *hpx::execution::parallel_policy_executor< Policy, true >*, *hpx::execution::parallel_policy_executor< Policy >*

Public Types

using **execution_category** = *std::conditional_t<std::is_same_v<Policy, launch::sync_policy>, sequenced_execution_tag, parallel_execution_tag>*

Associate the *parallel_execution_tag* executor tag type as a default with this executor, except if the given launch policy is sync.

using **executor_parameters_type** = *experimental::default_parameters*

Associate the *default_parameters* executor parameters type as a default with this executor.

Public Functions

inline **parallel_policy_executor_base**(*parallel_policy_executor_base* const &rhs) noexcept

inline *parallel_policy_executor_base* &**operator=**(*parallel_policy_executor_base* const &rhs) noexcept

constexpr ~**parallel_policy_executor_base**() = default

namespace **hpx**

namespace **parallel**

namespace **execution**

namespace **this_thread**

Functions

hpx::execution::parallel_executor **get_executor**(*error_code* &ec = *throws*)

Returns a reference to the executor that was used to create the current thread.

Throws

If `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw a *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

namespace **threads**

Functions

hpx::execution::parallel_executor **get_executor**(thread_id_type const &id, error_code &ec = throws)

Returns a reference to the executor that was used to create the given thread.

Throws

If `&ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw a *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

hpx/executors/explicit_scheduler_executor.hpp

Defined in header `hpx/executors/explicit_scheduler_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/filesystem/api.hpp

Defined in header `hpx/filesystem/api.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

This file provides a compatibility layer using Boost.Filesystem for the C++17 filesystem library. It is *not* intended to be a complete compatibility layer. It only contains functions required by the HPX codebase. It also provides some functions only available in Boost.Filesystem when using C++17 filesystem.

```
namespace hpx
```

```
    namespace filesystem
```

Functions

inline path **initial_path**()

inline *std::string* **to_string**(path const &p)

inline *std::string* **basename**(path const &p)

inline path **canonical**(path const &p, path const &base)

inline path **canonical**(path const &p, path const &base, *std::error_code* &ec)

namespace **filesystem**

functional

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx::bind, hpx::placeholders::_1, hpx::placeholders::_2, ..., hpx::placeholders::_9

Defined in header [hpx/functional.hpp](#)⁷⁴⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

Functions

```
template<typename F, typename ...Ts>
constexpr detail::bound<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>, util::decay_unwrap_t<Ts>...> bind(F
&&f,
Ts&&...
vs)
```

The function template *bind* generates a forwarding call wrapper for *f*. Calling this wrapper is equivalent to invoking *f* with some of its arguments bound to *vs*.

Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- **vs** – list of arguments to bind, with the unbound arguments replaced by the placeholders *_1, _2, _3...* of namespace *hpx::placeholders*

Returns

A function object of unspecified type *T*, for which

`hpx::is_bind_expression<T>::value == true.`

⁷⁴⁴ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

namespace placeholders

The *hpx::placeholders* namespace contains the placeholder objects $[_1, \dots, _N]$ where N is an implementation defined maximum number.

When used as an argument in a *hpx::bind* expression, the placeholder objects are stored in the generated function object, and when that function object is invoked with unbound arguments, each placeholder $_N$ is replaced by the corresponding N th unbound argument.

The types of the placeholder objects are `DefaultConstructible` and `CopyConstructible`, their default copy/move constructors do not throw exceptions, and for any placeholder $_N$, the type `hpx::is_placeholder<decltype(_N)>` is defined, where `hpx::is_placeholder<decltype(_N)>` is derived from `std::integral_constant<int, N>`.

Variables

```
constexpr detail::placeholder<1> _1 = {}
```

```
constexpr detail::placeholder<2> _2 = {}
```

```
constexpr detail::placeholder<3> _3 = {}
```

```
constexpr detail::placeholder<4> _4 = {}
```

```
constexpr detail::placeholder<5> _5 = {}
```

```
constexpr detail::placeholder<6> _6 = {}
```

```
constexpr detail::placeholder<7> _7 = {}
```

```
constexpr detail::placeholder<8> _8 = {}
```

```
constexpr detail::placeholder<9> _9 = {}
```

namespace serialization**Functions**

```
template<typename Archive, typename F, typename ...Ts>
void serialize(Archive &ar, ::hpx::detail::bound<F, Ts...> &bound, unsigned int const version = 0)
```

```
template<typename Archive, std::size_t I>
constexpr void serialize(Archive&, ::hpx::detail::placeholder<I>&, unsigned int const = 0) noexcept
```

hpx::invoke_fused, hpx::invoke_fused_r

Defined in header [hpx/functional.hpp](#)⁷⁴⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

Functions

```
template<typename F, typename Tuple>
constexpr detail::invoke_fused_result_t<F, Tuple> invoke_fused(F &&f, Tuple &&t) noexcept(
    noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple> {},
    HPX_FORWARD(F, f),
    HPX_FORWARD(Tuple, t))))
```

Invokes the given callable object *f* with the content of the sequenced type *t* (tuples, pairs).

Note: This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

Parameters

- **f** – Must be a callable object. If *f* is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to `hpx::get`.

Throws

`std::exception` – like objects thrown by call to object *f* with the arguments contained in the sequenceable type *t*.

Returns

The result of the callable object when it's called with the content of the given sequenced type.

```
template<typename R, typename F, typename Tuple>
constexpr R invoke_fused_r(F &&f, Tuple &&t) noexcept(
    noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple> {},
    HPX_FORWARD(F, f), HPX_FORWARD(Tuple, t))))
```

Invokes the given callable object *f* with the content of the sequenced type *t* (tuples, pairs).

Note: This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

Note: The difference between `hpx::invoke_fused` and `hpx::invoke_fused_r` is that the later allows to specify the return type as well.

⁷⁴⁵ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

Parameters

- **f** – Must be a callable object. If **f** is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to `hpx::get`.

Throws

`std::exception` – like objects thrown by call to object **f** with the arguments contained in the sequenceable type **t**.

Template Parameters

R – The result type of the function when it's called with the content of the given sequenced type.

Returns

The result of the callable object when it's called with the content of the given sequenced type.

hpx::function

Defined in header `hpx/functional.hpp`⁷⁴⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

template<typename **Sig**, bool **Serializable** = false>

class **function**

#include <function.hpp> Class template `hpx::function` is a general-purpose polymorphic function wrapper. Instances of `hpx::function` can store, copy, and invoke any CopyConstructible Callable target `—` functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to data members. The stored callable object is called the target of `hpx::function`. If an `hpx::function` contains no target, it is called empty. Invoking the target of an empty `hpx::function` results in `hpx::error::bad_function_call` exception being thrown. `hpx::function` satisfies the requirements of CopyConstructible and CopyAssignable.

template<typename **R**, typename ...**Ts**, bool **Serializable**>

hpx::bind_back

Defined in header [hpx/functional.hpp](#)⁷⁴⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

Functions

```
template<typename F, typename ...Ts>
constexpr hpx::detail::bound_back<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>, util::decay_unwrap_t<Ts>...> bind
```

Function templates `bind_back` generate a forwarding call wrapper for `f`. Calling this wrapper is equivalent to invoking `f` with its last `sizeof...(Ts)` parameters bound to `vs`.

Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- **vs** – list of the arguments to bind to the last `sizeof...(Ts)` parameters of `f`

Returns

A function object of type `T` that is unspecified, except that the types of objects returned by two calls to `hpx::bind_back` with the same arguments are the same.

```
template<typename F>
constexpr std::decay_t<F> bind_back(F &&f)
```

namespace **serialization**

Functions

```
template<typename Archive, typename F, typename ...Ts>
void serialize(Archive &ar, ::hpx::detail::bound_back<F, Ts...> &bound, unsigned int const version =
    0)
```

hpx::mem_fn

Defined in header [hpx/functional.hpp](#)⁷⁴⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

⁷⁴⁸ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

⁷⁴⁹ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

Functions

```
template<typename M, typename C>
constexpr detail::mem_fn<M C::*> mem_fn(M C::* pm) noexcept
```

Function template `hpx::mem_fn` generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a `hpx::mem_fn`.

Parameters

pm – pointer to member that will be wrapped

Returns

a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result_t<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let `fn` be the call wrapper returned by a call to `hpx::mem_fn` with a pointer to member `pm`. Then the expression `fn(t,a2,...,aN)` is equivalent to `HPX_INVOKE(pm,t,a2,...,aN)`. Thus, the return type of `operator()` is `std::result_of<decltype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decltype(pm),Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decltype(pm),Ts&&...>`. Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)...`.

```
template<typename R, typename C, typename ...Ps>
constexpr detail::mem_fn<R (C::*)(Ps...)> mem_fn(R (C::* pm)(Ps...)) noexcept
```

Function template `hpx::mem_fn` generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a `hpx::mem_fn`.

Parameters

pm – pointer to member that will be wrapped

Returns

a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result_t<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let `fn` be the call wrapper returned by a call to `hpx::mem_fn` with a pointer to member `pm`. Then the expression `fn(t,a2,...,aN)` is equivalent to `HPX_INVOKE(pm,t,a2,...,aN)`. Thus, the return type of `operator()` is `std::result_of<decltype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decltype(pm),Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decltype(pm),Ts&&...>`. Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)...`.

```
template<typename R, typename C, typename ...Ps>
constexpr detail::mem_fn<R (C::*)(Ps...) const> mem_fn(R (C::* pm)(Ps...) const) noexcept
```

Function template `hpx::mem_fn` generates wrapper objects for pointers to members, which can store, copy, and invoke a pointer to member. Both references and pointers (including smart pointers) to an object can be used when invoking a `hpx::mem_fn`.

Parameters

pm – pointer to member that will be wrapped

Returns

a call wrapper of unspecified type with the following member:

```
template <typename... Ts>
constexpr typename util::invoke_result<MemberPointer, Ts...>::type
operator()(Ts&&... vs) noexcept;
```

Let `fn` be the call wrapper returned by a call to `hpx::mem_fn` with a pointer to member `pm`. Then the expression `fn(t,a2,...,aN)` is equivalent to `HPX_INVOKE(pm,t,a2,...,aN)`. Thus, the return type of `operator()` is `std::result_of<decltype(pm)(Ts&&...)>::type` or equivalently `std::invoke_result_t<decltype(pm),Ts&&...>`, and the value in `noexcept` specifier is equal to `std::is_nothrow_invocable_v<decltype(pm),Ts&&...>`. Each argument in `vs` is perfectly forwarded, as if by `std::forward<Ts>(vs)...`.

hpx::bind_front

Defined in header `hpx/functional.hpp`⁷⁵⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

Functions

```
template<typename F, typename ...Ts>
constexpr detail::bound_front<std::decay_t<F>, util::make_index_pack_t<sizeof...(Ts)>, util::decay_unwrap_t<Ts>...> bind_front(F &&f, Ts... ts)
```

Function template `bind_front` generates a forwarding call wrapper for `f`. Calling this wrapper is equivalent to invoking `f` with its first `sizeof...(Ts)` parameters bound to `vs`.

Parameters

- **f** – Callable object (function object, pointer to function, reference to function, pointer to member function, or pointer to data member) that will be bound to some arguments
- **vs** – list of the arguments to bind to the first or `sizeof...(Ts)` parameters of `f`

Returns

A function object of type `T` that is unspecified, except that the types of objects returned by two calls to `hpx::bind_front` with the same arguments are the same.

```
template<typename F>
constexpr std::decay_t<F> bind_front(F &&f)
```

namespace **serialization**

⁷⁵⁰ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

Functions

```
template<typename Archive, typename F, typename ...Ts>
void serialize(Archive &ar, ::hpx::detail::bound_front<F, Ts...> &bound, unsigned int const version =
    0)
```

hpx::move_only_function

Defined in header [hpx/functional.hpp](#)⁷⁵¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

```
template<typename Sig, bool Serializable = false>
```

```
class move_only_function
```

#include <move_only_function.hpp> Class template *hpx::move_only_function* is a general-purpose polymorphic function wrapper. *hpx::move_only_function* objects can store and invoke any constructible (not required to be move constructible) Callable target [§8212](#); functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to member objects.

The stored callable object is called the target of *hpx::move_only_function*. If an *hpx::move_only_function* contains no target, it is called empty. Unlike *hpx::function*, invoking an empty *hpx::move_only_function* results in undefined behavior.

*hpx::move_only_function*s supports every possible combination of cv-qualifiers, ref-qualifiers, and noexcept-specifiers not including volatile provided in its template parameter. These qualifiers and specifier (if any) are added to its operator(). *hpx::move_only_function* satisfies the requirements of MoveConstructible and MoveAssignable, but does not satisfy CopyConstructible or CopyAssignable.

```
template<typename R, typename ...Ts, bool Serializable>
```

```
class move_only_function<R(Ts...), Serializable> : public util::detail::basic_function<R(Ts...), false,
    Serializable>
```

Public Types

```
using result_type = R
```

Public Functions

```
inline constexpr move_only_function(std::nullptr_t = nullptr) noexcept
```

```
move_only_function(move_only_function const&) = delete
```

```
move_only_function(move_only_function&&) noexcept = default
```

```
move_only_function &operator=(move_only_function const&) = delete
```

⁷⁵¹ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

```
move_only_function &operator=(move_only_function&&) noexcept = default

~move_only_function() = default

template<typename F, typename FD = std::decay_t<F>, typename Enable1 =
std::enable_if_t<!std::is_same_v<FD, move_only_function>>, typename Enable2 =
std::enable_if_t<is_invocable_r_v<R, FD&, Ts...>>>
inline move_only_function(F &&f)

template<typename F, typename FD = std::decay_t<F>, typename Enable1 =
std::enable_if_t<!std::is_same_v<FD, move_only_function>>, typename Enable2 =
std::enable_if_t<is_invocable_r_v<R, FD&, Ts...>>>
inline move_only_function &operator=(F &&f)
```

Private Types

```
using base_type = util::detail::basic_function<R(Ts...), false, Serializable>
```

namespace **distributed**

Typedefs

```
template<typename Sig>

using move_only_function = hpx::move_only_function<Sig, true>
```

hpx::function_ref

Defined in header `hpx/function_ref.hpp`⁷⁵².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

template<typename Sig>

class **function_ref**

#include <function_ref.hpp> *function_ref* class is a vocabulary type with reference semantics for passing entities to call.

An example use case that benefits from higher-order functions is `retry(n, f)` which attempts to call `f` up to `n` times synchronously until success. This example might model the real-world scenario of repeatedly querying a flaky web service.

```
using payload = std::optional< /* ... */ >;
// Repeatedly invokes `action` up to `times` repetitions.
// Immediately returns if `action` returns a valid `payload`.
// Returns `std::nullopt` otherwise.
payload retry(size_t times, /* ????? */ action);
```

⁷⁵² http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/function_ref.hpp

The passed-in action should be a callable entity that takes no arguments and returns a payload. This can be done with function pointers, `hpx::function` or a template but it is much simpler with `function_ref` as seen below:

```
payload retry(size_t times, function_ref<payload()> action);
```

```
template<typename R, typename ...Ts>
```

```
class function_ref<R(Ts...)>
```

Public Functions

```
template<typename F, typename FD = std::decay_t<F>, typename Enable =
std::enable_if_t<!std::is_same_v<FD, function_ref> && is_invocable_r_v<R, F&, Ts...>>>
inline function_ref(F &&f)
```

```
inline function_ref(function_ref const &other) noexcept
```

```
template<typename F, typename FD = std::decay_t<F>, typename Enable =
std::enable_if_t<!std::is_same_v<FD, function_ref> && is_invocable_r_v<R, F&, Ts...>>>
inline function_ref &operator=(F &&f)
```

```
inline function_ref &operator=(function_ref const &other) noexcept
```

```
template<typename F, typename T = std::remove_reference_t<F>, typename Enable =
std::enable_if_t<!std::is_pointer_v<T>>>
inline void assign(F &&f)
```

```

```

Private Static Functions

```
template<typename T>  
static inline constexpr VTable const *get_vtable() noexcept
```

```
namespace util
```

hpx::experimental::scope_success

Defined in header `hpx/experimental/scope.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

Top level namespace.

```
namespace experimental
```

Functions

```
template<typename F>  
auto scope_success(F &&f)
```

The class template `scope_success` is a general-purpose scope guard intended to call its exit function when a scope is normally exited.

Template Parameters

F – type of stored exit function

Parameters

f – stored exit function

hpx::experimental::scope_exit

Defined in header `hpx/experimental/scope.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

Top level namespace.

```
namespace experimental
```

Functions

```
template<typename F>
auto scope_exit(F &&f)
```

The class template `scope_exit` is a general-purpose scope guard intended to call its exit function when a scope is exited.

Template Parameters

F – type of stored exit function

Parameters

f – stored exit function

hpx::experimental::scope_fail

Defined in header `hpx/experimental/scope.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

namespace **experimental**

Functions

```
template<typename F>
auto scope_fail(F &&f)
```

The class template `scope_fail` is a general-purpose scope guard intended to call its exit function when a scope is exited via an exception.

Template Parameters

F – type of stored exit function

Parameters

f – stored exit function

hpx::is_placeholder

Defined in header `hpx/functional.hpp`⁷⁵³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level namespace.

template<typename T>

struct **is_placeholder**

#include <is_placeholder.hpp> If *T* is a standard, Boost, or HPX placeholder (`_1`, `_2`, `_3`, ...) then this template is derived from `std::integral_constant<int,1>`, `std::integral_constant<int,2>`, `std::integral_constant<int,3>`, respectively. Otherwise, it is derived from `std::integral_constant<int,0>`.

⁷⁵³ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

The template may be specialized for any user-defined T type: the specialization must satisfy *UnaryTypeTrait* with base characteristic of `std::integral_constant<int,N>` with $N > 0$ to indicate that T should be treated as N'th placeholder type. `hpx::bind` uses `hpx::is_placeholder` to detect placeholders for unbound arguments.

hpx::is_bind_expression

Defined in header `hpx/functional.hpp`⁷⁵⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level namespace.

Variables

template<typename T>

constexpr bool **is_bind_expression_v** = `is_bind_expression<T>::value`

template<typename T>

struct **is_bind_expression** : public `std::is_bind_expression<T>`

#include <is_bind_expression.hpp> If T is the type produced by a call to `hpx::bind`, this template is derived from `std::true_type`. For any other type, this template is derived from `std::false_type`.

This template may be specialized for a user-defined type T to implement *UnaryTypeTrait* with base characteristic of `std::true_type` to indicate that T should be treated by `hpx::bind` as if it were the type of a bind subexpression: when a bind-generated function object is invoked, a bound argument of this type will be invoked as a function object and will be given all the unbound arguments passed to the bind-generated object.

Subclassed by `hpx::is_bind_expression< T const >`

template<typename T>

struct **is_bind_expression**<T const> : public `hpx::is_bind_expression<T>`

futures

See *Public API* for a list of names and headers that are part of the public HPX API.

⁷⁵⁴ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

hpx::promise

Defined in header `hpx/future.hpp`⁷⁵⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename R, typename Allocator>
```

```
struct uses_allocator<hpx::promise<R>, Allocator> : public true_type
```

```
namespace hpx
```

```
    Top level HPX namespace.
```

```
    template<typename R>
```

```
        class promise : public hpx::detail::promise_base<R>
```

#include <promise.hpp> The class template `hpx::promise` provides a facility to store a value or an exception that is later acquired asynchronously via a `hpx::future` object created by the `hpx::promise` object. Note that the `hpx::promise` object is meant to be used only once. Each promise is associated with a shared state, which contains some state information and a result which may be not yet evaluated, evaluated to a value (possibly void) or evaluated to an exception. A promise may do three things with the shared state:

- **make ready**: the promise stores the result or the exception in the shared state. Marks the state ready and unblocks any thread waiting on a future associated with the shared state.
- **release**: the promise gives up its reference to the shared state. If this was the last such reference, the shared state is destroyed. Unless this was a shared state created by `hpx::async` which is not yet ready, this operation does not block.
- **abandon**: the promise stores the exception of type `hpx::future_error` with error code `hpx::error::broken_promise`, makes the shared state ready, and then releases it. The promise is the “push” end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in `hpx::memory_order`) the successful return from any function that is waiting on the shared state (such as `hpx::future::get`). Concurrent access to the same shared state may conflict otherwise: for example multiple callers of `hpx::shared_future::get` must either all be read-only or provide external synchronization.

Public Functions

```
promise() = default
```

```
template<typename Allocator>
```

```
inline promise(std::allocator_arg_t, Allocator const &a)
```

hpx/futures/future_fwd.hpp

Defined in header hpx/futures/future_fwd.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

template<typename **R**>

class **future**

#include <future_fwd.hpp> The class template *hpx::future* provides a mechanism to access the result of asynchronous operations:

- An asynchronous operation (created via *hpx::async*, *hpx::packaged_task*, or *hpx::promise*) can provide a *hpx::future* object to the creator of that asynchronous operation.

- The creator of the asynchronous operation can then use a variety of methods to query, wait for, or extract a value from the `hpx::future`. These methods may block if the asynchronous operation has not yet provided a value.
- When the asynchronous operation is ready to send a result to the creator, it can do so by modifying shared state (e.g. `hpx::promise::set_value`) that is linked to the creator's `hpx::future`. Note that `hpx::future` references shared state that is not shared with any other asynchronous return objects (as opposed to `hpx::shared_future`).

```
template<typename R>
```

```
class promise : public hpx::detail::promise_base<R>
```

```
    #include <promise.hpp>
```

```
template<typename R>
```

```
class shared_future
```

```
    #include <future_fwd.hpp> The class template hpx::shared_future provides a mechanism to access the result of asynchronous operations, similar to hpx::future, except that multiple threads are allowed to wait for the same shared state. Unlike hpx::future, which is only moveable (so only one instance can refer to any particular asynchronous result), hpx::shared_future is copyable and multiple shared future objects may refer to the same shared state. Access to the same shared state from multiple threads is safe if each thread does it through its own copy of a shared_future object.
```

```
namespace lcos
```

```
namespace lcos
```

Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

```
template<typename R, typename U, typename Conv>
```

```
hpx::future<R> make_future(hpx::future<U> &&f, Conv &&conv)
```

Converts any future of type U to any other future of type R based on a given conversion function: `R conv(U)`.

```
template<typename R, typename U>
```

⁷⁵⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

```
hpx::future<R> make_future(hpx::shared_future<U> f)
```

Converts any *shared_future* of type U to any other future of type R based on an existing conversion path from U to R.

```
template<typename R, typename U, typename Conv>
```

```
hpx::future<R> make_future(hpx::shared_future<U> f, Conv &&conv)
```

Converts any future of type U to any other future of type R based on an existing conversion path from U to R.

```
template<typename R>
```

```
hpx::shared_future<R> make_shared_future(hpx::future<R> &&f) noexcept
```

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

```
template<typename R>
```

```
hpx::shared_future<R> &make_shared_future(hpx::shared_future<R> &f) noexcept
```

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

```
template<typename R>
```

```
hpx::shared_future<R> &&make_shared_future(hpx::shared_future<R> &&f) noexcept
```

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

```
template<typename R>
```

```
hpx::shared_future<R> const &make_shared_future(hpx::shared_future<R> const &f) noexcept
```

Converts any future or *shared_future* of type T to a corresponding *shared_future* of type T.

```
template<typename T, typename Allocator, typename ...Ts>
```

```
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> make_ready_future_alloc(Allocator const &a, Ts&&... ts)
```

Creates a pre-initialized future object with allocator (extension)

```
template<typename T, typename ...Ts>
```

```
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> make_ready_future(Ts&&... ts)
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, `valid() == true` and `is_ready() == true`.

```
template<int DeductionGuard = 0, typename Allocator, typename T>
```

```
future<hpx::util::decay_unwrap_t<T>> make_ready_future_alloc(Allocator const &a, T &&init)
```

```
template<int DeductionGuard = 0, typename T>
```

```
future<hpx::util::decay_unwrap_t<T>> make_ready_future(T &&init)
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, `valid() == true` and `is_ready() == true`.

```
template<typename T>
```

```
future<T> make_exceptional_future(std::exception_ptr const &e)
```

Creates a pre-initialized future object which holds the given error (extension)

```
template<typename T, typename E>
```

```
future<T> make_exceptional_future(E e)
```

Creates a pre-initialized future object which holds the given error (extension)

```
template<int DeductionGuard = 0, typename T>
```

```
future<hpx::util::decay_unwrap_t<T>> make_ready_future_at(hpx::chrono::steady_time_point const
                                                         &abs_time, T &&init)
```

Creates a pre-initialized future object which gets ready at a given point in time (extension)

```
template<int DeductionGuard = 0, typename T>
future<hpx::util::decay_unwrap_t<T>> make_ready_future_after(hpx::chrono::steady_duration const
                                                            &rel_time, T &&init)
```

Creates a pre-initialized future object which gets ready after a given point in time (extension)

```
template<typename Allocator>
inline future<void> make_ready_future_alloc(Allocator const &a)
```

```
future<void> make_ready_future()
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, `valid() == true` and `is_ready() == true`.

```
inline future<void> make_ready_future_at(hpx::chrono::steady_time_point const &abs_time)
```

Creates a pre-initialized future object which gets ready at a given point in time (extension)

```
inline future<void> make_ready_future_after(hpx::chrono::steady_duration const &rel_time)
```

Creates a pre-initialized future object which gets ready after a given point in time (extension)

```
template<typename R>
```

```
class future
```

```
    #include <future_fwd.hpp>
```

```

hpx::packaged_task

Defined in header `hpx/future.hpp`⁷⁵⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Sig, typename Allocator>
```

⁷⁵⁷ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/future.hpp>

```
struct uses_allocator<hpx::packaged_task<Sig>, Allocator> : public true_type
```

```
namespace hpx
```

```
    Top level HPX namespace.
```

```
    template<typename Sig>
```

```
    class packaged_task
```

```
        #include <packaged_task.hpp> The class template hpx::packaged_task wraps any Callable` target (function, lambda expression, bind expression, or another function object) so that it can be invoked asynchronously. Its return value or exception thrown is stored in a shared state which can be accessed through hpx::future objects. Just like hpx::function, hpx::packaged_task is a polymorphic, allocator-aware container: the stored callable target may be allocated on heap or with a provided allocator.
```

```
    template<typename R, typename ...Ts>

io_service

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/io_service/io_service_pool.hpp

Defined in header `hpx/io_service/io_service_pool.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace util
```

```
class io_service_pool
```

```
#include <io_service_pool.hpp> A pool of io_service objects.
```

Public Functions

explicit **io_service_pool**(*std::size_t* pool_size = 2, *threads::policies::callback_notifier* const ¬ifier = *threads::policies::callback_notifier*(), char const *pool_name = "", char const *name_postfix = "")

Construct the *io_service* pool.

Parameters

- **pool_size** – [in] The number of threads to run to serve incoming requests
- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

explicit **io_service_pool**(*threads::policies::callback_notifier* const ¬ifier, char const *pool_name = "", char const *name_postfix = "")

Construct the *io_service* pool.

Parameters

- **notifier** – [in]
- **pool_name** – [in]
- **name_postfix** – [in]

io_service_pool(*io_service_pool* const&) = delete

io_service_pool(*io_service_pool*&&) = delete

io_service_pool &**operator**=(*io_service_pool* const&) = delete

io_service_pool &**operator**=(*io_service_pool*&&) = delete

~io_service_pool()

bool **run**(bool join_threads = true, *barrier* *startup = nullptr) const

Run all *io_service* objects in the pool. If *join_threads* is true this will also wait for all threads to complete

bool **run**(*std::size_t* num_threads, bool join_threads = true, *barrier* *startup = nullptr) const

Run all *io_service* objects in the pool. If *join_threads* is true this will also wait for all threads to complete

void **stop**() const

Stop all *io_service* objects in the pool.

void **join**() const

Join all *io_service* threads in the pool.

void **clear**() const

Clear all internal data structures.

void **wait**() const

Wait for all work to be done.

bool **stopped**() const

::asio::io_context &**get_io_service**(int index = -1) const

Get an *io_service* to use.

std::thread &**get_os_thread_handle**(*std::size_t* thread_num) const

access underlying thread handle

```
std::size_t size() const noexcept
    Get number of threads associated with this I/O service.

void thread_run(std::size_t index, barrier *startup = nullptr) const
    Activate the thread index for this thread pool.

char const *get_name() const noexcept
    Return name of this pool.

void init(std::size_t pool_size) const
```

Private Members

detail::io_service_pool_base *pool_
```

lcos_local

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::lcos::local::and_gate

Defined in header `hpx/modules/lcos_local.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace lcos
```

```
        namespace local
```

```
        struct and_gate : public hpx::lcos::local::base_and_gate<hpx::no_mutex>
            #include <and_gate.hpp> An AND-gate synchronization primitive that fires once all of its expected inputs have been received.
```

Note: This type is not thread-safe. It has to be protected from concurrent access by different threads by the code using instances of this type.

Public Functions

```
inline explicit and_gate(std::size_t const count = 0)
    Construct an and_gate from the number of participants to synchronize the control flow with.
```

Parameters

count – The number of inputs that need to be received before the gate is triggered.

```
and_gate(and_gate const&) = delete
    and_gate is not copyable nor is it copy-assignable.
```

and_gate &operator=(*and_gate* const&) = delete

and_gate(*and_gate* &&rhs) = default

and_gate is movable and move-assignable.

and_gate &operator=(*and_gate* &&rhs) = default

~and_gate() = default

template<typename **Lock**, typename **Ptr** = *std::nullptr_t*>

inline *hpx::future*<void> **get_future**(*Lock* &l, *Ptr* generation_value = nullptr, *error_code* &ec = *hpx::throws*)

Get a future allowing to wait for the gate to fire.

Template Parameters

- **Lock** – Type of the lock object used by the caller to protect the gate.
- **Ptr** – Type of the (optional) pointer used to receive the current generation value.

Parameters

- **l** – The lock object that is currently holding the gate's associated (outer) lock.
- **generation_value** – [out] Optional pointer to a variable that will receive the current generation value of the gate.
- **ec** – Used to hold error information if the operation fails.

Returns

A future that becomes ready once the gate has fired.

template<typename **Lock**, typename **Ptr** = *std::nullptr_t*>

inline *hpx::shared_future*<void> **get_shared_future**(*Lock* &l, *Ptr* generation_value = nullptr, *error_code* &ec = *hpx::throws*)

Get a shared future allowing to wait for the gate to fire.

Template Parameters

- **Lock** – Type of the lock object used by the caller to protect the gate.
- **Ptr** – Type of the (optional) pointer used to receive the current generation value.

Parameters

- **l** – The lock object that is currently holding the gate's associated (outer) lock.
- **generation_value** – [out] Optional pointer to a variable that will receive the current generation value of the gate.
- **ec** – Used to hold error information if the operation fails.

Returns

A shared future that becomes ready once the gate has fired.

template<typename **Lock**, typename **F** = *std::nullptr_t*>

inline bool **set**(*std::size_t* which, *Lock* &l, *F* &&f = nullptr, *error_code* &ec = *hpx::throws*)

Set the data which has to go into the segment **which**.

Template Parameters

- **Lock** – Type of the lock object used by the caller to protect the gate.
- **F** – Type of the (optional) callback function invoked once the gate is triggered.

Parameters

- **which** – The zero-based index of the segment (input) to set.
- **l** – The lock object that is currently holding the gate's associated (outer) lock.
- **f** – Optional callback that is invoked, with **l** held, when this call causes the gate to fire.
- **ec** – Used to hold error information if the operation fails.

Returns

true if this call caused the gate to fire (i.e. all inputs have now been received), **false** otherwise.

template<typename **Lock**>

```
inline void synchronize(std::size_t generation_value, Lock &l, char const *function_name =  
                        "and_gate::synchronize", error_code &ec = throws)
```

Wait for the generational counter to reach the requested stage.

Template Parameters

Lock – Type of the lock object used by the caller to protect the gate.

Parameters

- **generation_value** – The generation the caller waits for the gate to reach.
- **l** – The lock object that is currently holding the gate’s associated (outer) lock.
- **function_name** – The name to be used for error reporting.
- **ec** – Used to hold error information if the operation fails.

Private Types

```
using base_type = base_and_gate<hpx::no_mutex>
```

```
template<typename Mutex = hpx::spinlock>
```

```
struct base_and_gate
```

#include <and_gate.hpp> A gate that waits for a fixed number of participants to “arrive” before releasing all waiters (an AND-synchronization primitive).

The *base_and_gate* implements a synchronization construct similar to a countdown latch/barrier: it is initialized with a number of expected participants (“segments”). Each participant signals its arrival, and once all expected participants have arrived, futures obtained from *get_future()* become ready and callbacks passed to *set()* are invoked.

After firing, the gate can be reused for subsequent synchronization rounds. The generation is advanced explicitly with *next_generation()*. Callers can use the generation number to guard against stale/late notifications from a previous round.

Note: Not copyable, but movable. Moving invalidates the moved-from object’s generation (set to an invalid-generation sentinel).

Note: Typically used via *hpx::lcos::local::and_gate* rather than directly.

Template Parameters

Mutex – The mutex type protecting internal state. Defaults to *hpx::spinlock*.

Public Functions

```
inline explicit base_and_gate(std::size_t const count = 0)
```

Construct a *base_and_gate* from the number of participants to synchronize the control flow with.

Parameters

count – The number of inputs that need to be received before the gate is triggered.

```
base_and_gate(base_and_gate const &rhs) = delete
```

base_and_gate is not copyable nor is it copy-assignable.

```
base_and_gate &operator=(base_and_gate const &rhs) = delete
```

```
inline base_and_gate(base_and_gate &&rhs) noexcept
```

Move-construct a *base_and_gate*, leaving *rhs* in a moved-from state.

Parameters

rhs – The *base_and_gate* to move from.

```
inline base_and_gate &operator=(base_and_gate &&rhs) noexcept
```

Move-assign a *base_and_gate*, leaving *rhs* in a moved-from state.

Parameters

rhs – The *base_and_gate* to move from.

Returns

A reference to **this*.

```
~base_and_gate() = default
```

```
template<typename Ptr = std::nullptr_t>
```

```
inline hpx::future<void> get_future(Ptr generation_value = nullptr, error_code &ec =  
                                hpx::throws)
```

Get a future allowing to wait for the gate to fire.

Template Parameters

Ptr – Type of the (optional) pointer used to receive the current generation value.

Parameters

- **generation_value** – [out] Optional pointer to a variable that will receive the current generation value of the gate.
- **ec** – Used to hold error information if the operation fails.

Returns

A future that becomes ready once the gate has fired.

```
template<typename Ptr = std::nullptr_t>
```

```
inline hpx::shared_future<void> get_shared_future(Ptr generation_value = nullptr,  
                                                error_code &ec = hpx::throws)
```

Get a shared future allowing to wait for the gate to fire.

Template Parameters

Ptr – Type of the (optional) pointer used to receive the current generation value.

Parameters

- **generation_value** – [out] Optional pointer to a variable that will receive the current generation value of the gate.
- **ec** – Used to hold error information if the operation fails.

Returns

A shared future that becomes ready once the gate has fired.

```
template<typename F = std::nullptr_t>
```

```
inline bool set(std::size_t which, F &&f = nullptr, error_code &ec = throws)
```

Mark the segment *which* as received.

Template Parameters

F – Type of the (optional) callback function invoked once the gate is triggered.

Parameters

- **which** – The zero-based index of the segment (input) to set.
- **f** – Optional callback that is invoked, with the outer lock held, when this call causes the gate to fire.
- **ec** – Used to hold error information if the operation fails.

Returns

true if this call caused the gate to fire (i.e. all inputs have now been received), *false* otherwise.

```
inline void synchronize(std::size_t generation_value, char const *function_name =  
                        "base_and_gate<>::synchronize", error_code &ec = throws)
```

Wait for the generational counter to reach the requested stage.

Parameters

- **generation_value** – The generation the caller waits for the gate to reach.
- **function_name** – The name to be used for error reporting.
- **ec** – Used to hold error information if the operation fails.

```
template<typename Lock>
inline std::size_t next_generation(Lock &l, std::size_t const new_generation =
                                static_cast<std::size_t>(-1), error_code &ec = throws)
```

Advance the generational counter of the gate, unblocking any waiters whose requested generation has now been reached.

Template Parameters

Lock – Type of the lock object used by the caller to protect the gate; must already be locked when this overload is called.

Parameters

- **l** – The lock object that is currently holding the gate’s associated (outer) lock.
- **new_generation** – The generation value the gate’s counter should be reset to before being advanced; if not given the gate is simply advanced to the next generation. The returned generation value is one beyond this value.
- **ec** – Used to hold error information if the operation fails.

Returns

The new generation value of the gate.

```
inline std::size_t next_generation(std::size_t new_generation = static_cast<std::size_t>(-1),
                                error_code &ec = throws)
```

Advance the generational counter of the gate, unblocking any waiters whose requested generation has now been reached.

Parameters

- **new_generation** – The generation value the gate’s counter should be reset to before being advanced; if not given the gate is simply advanced to the next generation. The returned generation value is one beyond this value.
- **ec** – Used to hold error information if the operation fails.

Returns

The new generation value of the gate.

```
template<typename Lock>
inline std::size_t generation(Lock &l) const noexcept
```

Query the current generation value of the gate.

Template Parameters

Lock – Type of the lock object used by the caller to protect the gate; must already be locked when this overload is called.

Parameters

l – The lock object that is currently holding the gate’s associated (outer) lock.

Returns

The current generation value of the gate.

```
inline std::size_t generation() const noexcept
```

Query the current generation value of the gate.

Returns

The current generation value of the gate.

pack_traversal

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/pack_traversal/pack_traversal_async.hpp

Defined in header `hpx/pack_traversal/pack_traversal_async.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

```
template<typename Visitor, typename ...T>
auto traverse_pack_async(Visitor &&visitor, T&&... pack) ->
    decltype(detail::apply_pack_transform_async(HPX_FORWARD(Visitor,
        visitor), HPX_FORWARD(T, pack)...))
```

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus, we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
// The synchronous overload is called for each object, // it may
return false to suspend the current control. // In that case the
overload below is called. template <typename T> bool
operator()(async_traverse_visit_tag, T&& element) {
    return true;
}

// The asynchronous overload this is called when the //
synchronous overload returned false. // In addition to the
current visited element the overload is // called with a
continuation callable object which resumes the // traversal when
it's called later. // The continuation next may be stored and
called later or // dropped completely to abort the traversal
early. template <typename T, typename N> void
operator()(async_traverse_detach_tag, T&& element, N&& next) { }

// The overload is called when the traversal was finished. // As
argument the whole pack is passed over which we // traversed
asynchronously. template <typename T> void
operator()(async_traverse_complete_tag, T&& pack) { }
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally, the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.

Returns

A `hpx::intrusive_ptr` that references an instance of the given visitor object.

hpx::functional::unwrap, hpx::functional::unwrap_n, hpx::functional::unwrap_all, hpx::unwrap, hpx::unwrap_n, hpx::unwrap_all, hpx::unwrapping, hpx::unwrapping_n, hpx::unwrapping_all

Defined in header `hpx/unwrap.hpp`⁷⁵⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename ...Args>
auto unwrap(Args&&... args) -> decltype(util::detail::unwrap_depth_impl<1U>(HPX_FORWARD(Args,
    args)...))
```

A helper function for retrieving the actual result of any `hpx::future` like type which is wrapped in an arbitrary way.

Unwraps the given pack of arguments, so that any `hpx::future` object is replaced by its future result type in the argument pack:

- `hpx::future<int> -> int`
- `hpx::future<std::vector<float>> -> std::vector<float>`
- `std::vector<future<float>> -> std::vector<float>`

The function is capable of unwrapping `hpx::future` like objects that are wrapped inside any container or tuple like type, see `hpx::util::map_pack()` for a detailed description about which surrounding types are supported. Non `hpx::future` like types are permitted as arguments and passed through.

```
hpx::unwrap(hpx::make_ready_future(0));

// Multiple arguments hpx::tuple<int, int> i2 =
    hpx::unwrap(hpx::make_ready_future(1),
        hpx::make_ready_future(2));
```

Note: This function unwraps the given arguments until the first traversed nested `hpx::future` which corresponds to an unwrapping depth of one. See `hpx::unwrap_n()` for a function which unwraps the given arguments to a particular depth or `hpx::unwrap_all()` that unwraps all future like objects recursively which are contained in the arguments.

Parameters

args – the arguments that are unwrapped which may contain any arbitrary future or non-future type.

Throws

`std::exception` – like objects in case any of the given wrapped `hpx::future` objects were resolved through an exception. See `hpx::future::get()` for details.

Returns

Depending on the count of arguments this function returns a `hpx::tuple` containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

⁷⁵⁸ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/unwrap.hpp

```
template<std::size_t Depth, typename ...Args>
auto unwrap_n(Args&&... args) ->
    decltype(util::detail::unwrap_depth_impl<Depth>(HPX_FORWARD(Args, args)...))
```

An alternative version of `hpx::unwrap()`, which unwraps the given arguments to a certain depth of `hpx::future` like objects.

See `unwrap` for a detailed description.

Template Parameters

Depth – The count of `hpx::future` like objects which are unwrapped maximally.

```
template<typename ...Args>
auto unwrap_all(Args&&... args) ->
    decltype(util::detail::unwrap_depth_impl<0U>(HPX_FORWARD(Args, args)...))
```

An alternative version of `hpx::unwrap()`, which unwraps the given arguments recursively so that all contained `hpx::future` like objects are replaced by their actual value.

See `hpx::unwrap()` for a detailed description.

```
template<typename T>
auto unwrapping(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<1U>(HPX_FORWARD(T, callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap()` function and then passes the result to the given callable object.

```
        return left + right;
    });

    int i1 = callable(hpx::make_ready_future(1),
                     hpx::make_ready_future(2));
```

See `hpx::unwrap()` for a detailed description.

Parameters

callable – the callable object which is called with the result of the corresponding `unwrap` function.

```
template<std::size_t Depth, typename T>
auto unwrapping_n(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<Depth>(HPX_FORWARD(T,
    callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_n()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

```
template<typename T>
auto unwrapping_all(T &&callable) ->
    decltype(util::detail::functional_unwrap_depth_impl<0U>(HPX_FORWARD(T,
    callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_all()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

namespace **functional**

struct **unwrap**

#include <unwrap.hpp> A helper function object for functionally invoking `hpx::unwrap`. For more information please refer to its documentation.

struct **unwrap_all**

#include <unwrap.hpp> A helper function object for functionally invoking `hpx::unwrap_all`. For more information please refer to its documentation.

template<std::size_t **Depth**>

struct **unwrap_n**

#include <unwrap.hpp> A helper function object for functionally invoking `hpx::unwrap_n`. For more information please refer to its documentation.

hpx/pack_traversal/pack_traversal.hpp

Defined in header `hpx/pack_traversal/pack_traversal.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

template<typename Mapper, typename...
T> < unspecified > map_pack (Mapper &&mapper, T &&... pack)

Maps the pack with the given mapper.

This function tries to visit all plain elements which may be wrapped in:

- homogeneous containers (`std::vector`, `std::list`)
- heterogeneous containers (`hpx::tuple`, `std::pair`, `std::array`) and re-assembles the pack with the result of the mapper. Mapping from one type to a different one is supported.

Elements that aren't accepted by the mapper are routed through and preserved through the hierarchy.

```
// Maps all integers to floats
map_pack([](int value) {
    return float(value);
},
1, hpx::make_tuple(2, std::vector<int>{3, 4}), 5);
```

Throws

`std::exception` – like objects which are thrown by an invocation to the mapper.

Parameters

- **mapper** – A callable object, which accept an arbitrary type and maps it to another type or the same one.
- **pack** – An arbitrary variadic pack which may contain any type.

Returns

The mapped element or in case the pack contains multiple elements, the pack is wrapped into a `hpx::tuple`.

preprocessor

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/preprocessor/nargs.hpp

Defined in header `hpx/preprocessor/nargs.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines**HPX_PP_NARGS(...)**

Expands to the number of arguments passed in

Example Usage:

```
HPX_PP_NARGS(hpx, pp, nargs)
HPX_PP_NARGS(hpx, pp)
HPX_PP_NARGS(hpx)
```

Expands to:

```
3
2
1
```

Parameters

- ... – The variadic number of arguments

hpx/preprocessor/stringize.hpp

Defined in header `hpx/preprocessor/stringize.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_STRINGIZE(X)

The `HPX_PP_STRINGIZE` macro stringizes its argument after it has been expanded.

The passed argument `X` will expand to "`X`". Note that the stringizing operator (`#`) prevents arguments from expanding. This macro circumvents this shortcoming.

Parameters

- **X** – The text to be converted to a string literal

hpx/preprocessor/cat.hpp

Defined in header `hpx/preprocessor/cat.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_CAT(A, B)

Concatenates the tokens `A` and `B` into a single token. Evaluates to `AB`

Parameters

- **A** – First token
- **B** – Second token

hpx/preprocessor/expand.hpp

Defined in header `hpx/preprocessor/expand.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_EXPAND(X)

The `HPX_PP_EXPAND` macro performs a double macro-expansion on its argument.

This macro can be used to produce a delayed preprocessor expansion.

Example:

```
#define MACRO(a, b, c) (a)(b)(c)
#define ARGS() (1, 2, 3)

HPX_PP_EXPAND(MACRO ARGS()) // expands to (1)(2)(3)
```

Parameters

- **X** – Token to be expanded twice

hpx/preprocessor/strip_parens.hpp

Defined in header `hpx/preprocessor/strip_parens.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_PP_STRIP_PARENS(X)

For any symbol *X*, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to *X* itself without error.

The original implementation of this macro is from Steven Watanbe as shown in <http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-td2591973.html#a2591976>

```
HPX_PP_STRIP_PARENS(no_parens)
HPX_PP_STRIP_PARENS((with_parens))
```

Example Usage:

This produces the following output

```
no_parens
with_parens
```

Parameters

- **X** – Symbol to strip parens from

resiliency

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/resiliency/replay_executor.hpp

Defined in header `hpx/resiliency/replay_executor.hpp`.

runtime_configuration

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::runtime_mode

Defined in header `hpx/init.hpp`⁷⁵⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Enums

enum class **runtime_mode** : *std::int8_t*

A HPX runtime can be executed in two different modes: console mode and worker mode.

Values:

enumerator **invalid**

enumerator **console**

The runtime is the console locality.

enumerator **worker**

The runtime is a worker locality.

enumerator **connect**

The runtime is a worker locality connecting late

enumerator **local**

The runtime is fully local.

⁷⁵⁹ http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/init_runtime/include/hpx/init.hpp

enumerator **default_**

The runtime mode will be determined based on the command line arguments

enumerator **last**

Functions

char const ***get_runtime_mode_name**(runtime_mode state) noexcept

Get the readable string representing the name of the given runtime_mode constant.

runtime_mode **get_runtime_mode_from_name**(std::string const &mode)

Returns the internal representation (runtime_mode constant) from the readable string representing the name.

This represents the internal representation from the readable string representing the name.

Parameters

mode – this represents the runtime mode

HPX_REGISTER_COMPONENT_MODULE

Defined in header hpx/components.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Defines

HPX_REGISTER_COMMANDLINE_REGISTRY(RegistryType, componentname)

The macro *HPX_REGISTER_COMMANDLINE_REGISTRY* is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_COMMANDLINE_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_COMMANDLINE_OPTIONS()

The macro *HPX_REGISTER_COMMANDLINE_OPTIONS* is used to define the required Hpx.Plugin entry point for the command line option registry. This macro has to be used in not more than one compilation unit of a component module.

HPX_REGISTER_COMMANDLINE_OPTIONS_DYNAMIC()

HPX_REGISTER_COMPONENT_FACTORY(componentname)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the component factories.

HPX_REGISTER_COMPONENT_MODULE()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module. Ungated: a component may live in a shared library, in a statically linked build, or directly in the application executable.

HPX_REGISTER_COMPONENT_MODULE_DYNAMIC()

HPX_REGISTER_COMPONENT_REGISTRY(RegistryType, componentname)

This macro is used to register the given component factory with Hpx.Plugin. This macro has to be used for each of the components.

HPX_REGISTER_COMPONENT_REGISTRY_DYNAMIC(RegistryType, componentname)

HPX_REGISTER_REGISTRY_MODULE()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a component module. Ungated: see HPX_REGISTER_COMPONENT_MODULE.

HPX_REGISTER_REGISTRY_MODULE_DYNAMIC()

HPX_REGISTER_PLUGIN_BASE_REGISTRY(PluginType, name)

This macro is used to register the given plugin factory with Hpx.Plugin. This macro has to be used for each of the plugins. Ungated, matching the component analog (HPX_REGISTER_COMPONENT_REGISTRY).

HPX_REGISTER_PLUGIN_REGISTRY_MODULE()

This macro is used to define the required Hpx.Plugin entry points. This macro has to be used in exactly one compilation unit of a plugin module. Ungated: a plugin may live in a shared library, in a statically linked build, or directly in the application executable.

HPX_REGISTER_PLUGIN_REGISTRY_MODULE_DYNAMIC()

HPX_DECLARE_FACTORY_STATIC(name, base)

HPX_DEFINE_FACTORY_STATIC(module, name, base)

HPX_INIT_REGISTRY_MODULE_STATIC(name, base)

HPX_INIT_REGISTRY_FACTORY_STATIC(name, componentname, base)

HPX_INIT_REGISTRY_COMMANDLINE_STATIC(name, base)

HPX_INIT_REGISTRY_PLUGIN_FACTORY_STATIC(name, pluginname, base)

hpx/runtime_configuration/plugin_registry_base.hpp

Defined in header hpx/runtime_configuration/plugin_registry_base.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **plugins**

struct **plugin_registry_base**

#include <plugin_registry_base.hpp> The plugin_registry_base has to be used as a base class for all plugin registries.

Public Functions

virtual `~plugin_registry_base()` = default

virtual bool **get_plugin_info**(*std::vector<std::string> &fillini*) = 0

Return the configuration information for any plugin implemented by this module

Parameters

fillini – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all plugins implemented in this module.

Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

inline virtual void **init**(int*, char***, *util::runtime_configuration&*)

hpx/runtime_configuration/component_registry_base.hpp

Defined in header `hpx/runtime_configuration/component_registry_base.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

struct **component_registry_base**

#include <component_registry_base.hpp> The `component_registry_base` has to be used as a base class for all component registries.

Public Functions

virtual `~component_registry_base()` = default

virtual bool **get_component_info**(*std::vector<std::string> &fillini*, *std::string const &filepath*,
bool *is_static* = false) = 0

Return the ini-information for all contained components.

Parameters

- **fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** – [in]
- **is_static** – [in]

Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

virtual void **register_component_type**() = 0

Register the component type represented by this component.

hpx::components::component_commandline_base

Defined in header `hpx/components.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace components
```

```

```

```
            #include <component_commandline_base.hpp> The component_commandline_base has to be used  
            as a base class for all component command-line line handling registries.
```

Public Functions

```
        virtual ~component_commandline_base() = default
```

```
        virtual hpx::program_options::options_description add_commandline_options() = 0
```

```
            Return any additional command line options valid for this component.
```

Note: This function will be executed by the runtime system during system startup.

Returns

The module is expected to fill a `options_description` object with any additional command line options this component will handle.

runtime_local

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/runtime_local/service_executors.hpp

Defined in header `hpx/runtime_local/service_executors.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
    namespace execution
```

```
        namespace experimental
```

Enums

```
enum class service_executor_type : std::uint8_t
```

Values:

```
enumerator io_thread_pool
```

Selects creating a service executor using the I/O pool of threads

```
enumerator parcel_thread_pool
```

Selects creating a service executor using the parcel pool of threads

```
enumerator timer_thread_pool
```

Selects creating a service executor using the timer pool of threads

```
enumerator main_thread
```

Selects creating a service executor using the main thread

```
struct io_pool_executor : public hpx::execution::experimental::service_executor
```

Public Functions

```

hpx::execution::experimental::timer_pool_executor

Public Functions

explicit **service_executor**(*service_executor_type* t, char const *name_suffix = "")

struct **timer_pool_executor** : public *hpx::execution::experimental::service_executor*

Public Functions

timer_pool_executor()

hpx::get_locality_name

Defined in header [hpx/runtime.hpp](#)⁷⁶⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::string **get_locality_name**()

Return the name of the locality this function is called on.

This function returns the name for the locality on which this function is called.

See also:

future<std::string> **get_locality_name**(hpx::id_type const& id)

Returns

This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcelports.

hpx::shutdown_function_type, hpx::register_pre_shutdown_function, hpx::register_shutdown_function

Defined in header [hpx/runtime.hpp](#)⁷⁶¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

⁷⁶⁰ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

⁷⁶¹ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

Typedefs

using **shutdown_function_type** = *hpx::move_only_function*<void()>

The type of the function which is registered to be executed as a shutdown or pre-shutdown function.

Functions

void **register_pre_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during *hpx::finalize()* but guaranteed before any shutdown function is executed (system-wide)

Any of the functions registered with *register_pre_shutdown_function* are guaranteed to be executed by an HPX thread during the execution of *hpx::finalize()* before any of the registered shutdown functions are executed (see: *hpx::register_shutdown_function()*).

See also:

hpx::register_shutdown_function()

Note: If this function is called while the pre-shutdown functions are being executed, or after that point, it will raise an *invalid_status* exception.

Parameters

f – [in] The function to be registered to run by an HPX thread as a pre-shutdown function.

void **register_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed by a HPX thread during *hpx::finalize()* but guaranteed after any pre-shutdown function is executed (system-wide)

Any of the functions registered with *register_shutdown_function* are guaranteed to be executed by an HPX thread during the execution of *hpx::finalize()* after any of the registered pre-shutdown functions are executed (see: *hpx::register_pre_shutdown_function()*).

See also:

hpx::register_pre_shutdown_function()

Note: If this function is called while the shutdown functions are being executed, or after that point, it will raise an *invalid_status* exception.

Parameters

f – [in] The function to be registered to run by an HPX thread as a shutdown function.

hpx::get_initial_num_localities, hpx::get_num_localities

Defined in header [hpx/runtime.hpp](#)⁷⁶².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

`std::uint32_t get_initial_num_localities()`

Return the number of localities which were registered at startup for the running application.

The function `get_initial_num_localities` returns the number of localities which were connected to the console at application startup.

See also:

`hpx::find_all_localities`, `hpx::get_num_localities`

Note: As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of `hpx::exception`.

`hpx::future<std::uint32_t> get_num_localities()`

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console. The returned future represents the actual result.

See also:

`hpx::find_all_localities`, `hpx::get_num_localities`

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

`std::uint32_t get_num_localities(launch::sync_policy, error_code &ec = throws)`

Return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console.

See also:

`hpx::find_all_localities`, `hpx::get_num_localities`

Note: This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

⁷⁶² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx/runtime_local/thread_pool_helpers.hpp

Defined in header `hpx/runtime_local/thread_pool_helpers.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **resource**

Functions

std::size_t **get_num_thread_pools()**

Return the number of thread pools currently managed by the *resource_partitioner*

std::size_t **get_num_threads()**

Return the number of threads in all thread pools currently managed by the *resource_partitioner*

std::size_t **get_num_threads**(*std::string* const &pool_name)

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

std::size_t **get_num_threads**(*std::size_t* pool_index)

Return the number of threads in the given thread pool currently managed by the *resource_partitioner*

std::size_t **get_pool_index**(*std::string* const &pool_name)

Return the internal index of the pool given its name.

std::string const &**get_pool_name**(*std::size_t* pool_index)

Return the name of the pool given its internal index.

threads::thread_pool_base &**get_thread_pool**(*std::string* const &pool_name)

Return the name of the pool given its name.

threads::thread_pool_base &**get_thread_pool**(*std::size_t* pool_index)

Return the thread pool given its internal index.

bool **pool_exists**(*std::string* const &pool_name)

Return true if the pool with the given name exists.

bool **pool_exists**(*std::size_t* pool_index)

Return true if the pool with the given index exists.

namespace **threads**

Functions

`std::int64_t get_thread_count(thread_schedule_state state = thread_schedule_state::unknown)`

The function `get_thread_count` returns the number of currently known threads.

Note: If `state == unknown` this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters

state – [in] This specifies the thread-state for which the number of threads should be retrieved.

`std::int64_t get_thread_count(thread_priority priority, thread_schedule_state state = thread_schedule_state::unknown)`

The function `get_thread_count` returns the number of currently known threads.

Note: If `state == unknown` this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

Parameters

- **priority** – [in] This specifies the thread-priority for which the number of threads should be retrieved.
- **state** – [in] This specifies the thread-state for which the number of threads should be retrieved.

`std::int64_t get_idle_core_count()`

The function `get_idle_core_count` returns the number of currently idling threads (cores).

`mask_type get_idle_core_mask()`

The function `get_idle_core_mask` returns a bit-mask representing the currently idling threads (cores).

`bool enumerate_threads(hpx::function<bool(thread_id_type)> const &f, thread_schedule_state state = thread_schedule_state::unknown)`

The function `enumerate_threads` will invoke the given function `f` for each thread with a matching thread state.

Parameters

- **f** – [in] The function which should be called for each matching thread. Returning ‘false’ from this function will stop the enumeration process.
- **state** – [in] This specifies the thread-state for which the threads should be enumerated.

hpx/runtime_local/custom_exception_info.hpp

Defined in header `hpx/runtime_local/custom_exception_info.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

`std::string diagnostic_information(exception_info const &xi)`

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function `hpx::diagnostic_information` can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

See also:

`hpx::get_error_locality_id()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`,
`hpx::get_error_config()`, `hpx::get_error_state()`

Parameters

xi – The parameter `e` will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if any of the required allocation operations fail)

Returns

The formatted string holding all the available diagnostic information stored in the given exception instance.

`std::string default_diagnostic_information(std::exception_ptr const &e)`

`std::uint32_t get_error_locality_id(hpx::exception_info const &xi) noexcept`

Return the locality id where the exception was thrown.

The function `hpx::get_error_locality_id` can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`,
`hpx::get_error_config()`, `hpx::get_error_state()`

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

nothing –

Returns

The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return *hpx::naming::invalid_locality_id*.

std::string **get_error_host_name**(*hpx::exception_info* const &xi)

Return the hostname of the locality where the exception was thrown.

The function *hpx::get_error_host_name* can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

See also:

hpx::diagnostic_information() *hpx::get_error_process_id()*, *hpx::get_error_function_name()*,
hpx::get_error_file_name(), *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*,
hpx::get_error_thread_id(), *hpx::get_error_thread_description()*, *hpx::get_error()*
hpx::get_error_backtrace(), *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*,
hpx::get_error_state()

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

std::bad_alloc – (if one of the required allocations fails)

Returns

The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

std::int64_t **get_error_process_id**(*hpx::exception_info* const &xi) noexcept

Return the (operating system) process id of the locality where the exception was thrown.

The function *hpx::get_error_process_id* can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_function_name()*,
hpx::get_error_file_name(), *hpx::get_error_line_number()*, *hpx::get_error_os_thread()*,
hpx::get_error_thread_id(), *hpx::get_error_thread_description()*, *hpx::get_error()*,
hpx::get_error_backtrace(), *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*,
hpx::get_error_state()

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

nothing –

Returns

The process id of the OS-process which threw the exception. If the exception instance does not hold this information, the function will return 0.

`std::string get_error_env(hpx::exception_info const &xi)`

Return the environment of the OS-process at the point the exception was thrown.

The function `hpx::get_error_env` can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string get_error_backtrace(hpx::exception_info const &xi)`

Return the stack backtrace from the point the exception was thrown.

The function `hpx::get_error_backtrace` can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,
`hpx::get_error()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,
`hpx::get_error_state()`

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The stack back trace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::size_t` **get_error_os_thread**(*hpx::exception_info* const &xi) noexcept

Return the sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

The function *hpx::get_error_os_thread* can be used to extract the diagnostic information element representing the sequence number of the OS-thread as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*,
hpx::get_error_function_name(), *hpx::get_error_file_name()*, *hpx::get_error_line_number()*,
hpx::get_error_thread_id(), *hpx::get_error_thread_description()*, *hpx::get_error()*,
hpx::get_error_backtrace(), *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*,
hpx::get_error_state()

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

nothing –

Returns

The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size(-1)`.

`std::size_t` **get_error_thread_id**(*hpx::exception_info* const &xi) noexcept

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function *hpx::get_error_thread_id* can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*,
hpx::get_error_function_name(), *hpx::get_error_file_name()*, *hpx::get_error_line_number()*,
hpx::get_error_os_thread(), *hpx::get_error_thread_description()*, *hpx::get_error()*,
hpx::get_error_backtrace(), *hpx::get_error_env()*, *hpx::get_error_what()*, *hpx::get_error_config()*,
hpx::get_error_state()

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

nothing –

Returns

The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size_t(0)`.

`std::string` **get_error_thread_description**(*hpx::exception_info* const &xi)

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function *hpx::get_error_thread_description* can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*,
hpx::get_error_function_name(), *hpx::get_error_file_name()*, *hpx::get_error_line_number()*,
hpx::get_error_os_thread(), *hpx::get_error_thread_id()*, *hpx::get_error_backtrace()*,
hpx::get_error_env(), *hpx::get_error()*, *hpx::get_error_state()*, *hpx::get_error_what()*,
hpx::get_error_config()

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

Any additionally available thread description of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string` **get_error_config**(*hpx::exception_info* const &xi)

Return the HPX configuration information point from which the exception was thrown.

The function *hpx::get_error_config* can be used to extract the HPX configuration information element representing the full HPX configuration information as stored in the given exception instance.

See also:

hpx::diagnostic_information(), *hpx::get_error_host_name()*, *hpx::get_error_process_id()*,
hpx::get_error_function_name(), *hpx::get_error_file_name()*, *hpx::get_error_line_number()*,
hpx::get_error_os_thread(), *hpx::get_error_thread_id()*, *hpx::get_error_backtrace()*,
hpx::get_error_env(), *hpx::get_error()*, *hpx::get_error_state()*, *hpx::get_error_what()*,
hpx::get_error_thread_description()

Parameters

xi – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception_info*, *hpx::error_code*, *std::exception*, or *std::exception_ptr*.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

Any additionally available HPX configuration information the point from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string get_error_state(hpx::exception_info const &xi)`

Return the HPX runtime state information at which the exception was thrown.

The function `hpx::get_error_state` can be used to extract the HPX runtime state information element representing the state the runtime system is currently in as stored in the given exception instance.

See also:

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_backtrace()`,
`hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_what()`, `hpx::get_error_thread_description()`

Parameters

xi – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

Throws

`std::bad_alloc` – (if one of the required allocations fails)

Returns

The point runtime state at the point at which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

hpx/runtime_local/runtime_local.hpp

Defined in header `hpx/runtime_local/runtime_local.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

void **set_error_handlers**(`hpx::util::runtime_configuration` const &cfg)

class **runtime**

Public Types

using **notification_policy_type** = *threads::policies::callback_notifier*

Generate a new notification policy instance for the given thread name prefix

using **hpx_main_function_type** = int()

The *hpx_main_function_type* is the default function type usable as the main HPX thread function.

using **hpx_errorsink_function_type** = void(*std::uint32_t*, *std::string* const&)

Public Functions

virtual *notification_policy_type* **get_notification_policy**(char const *prefix,
runtime_local::os_thread_type type)

state **get_state**() const

void **set_state**(state s)

explicit **runtime**(*hpx::util::runtime_configuration* rtcfg, bool initialize)

Construct a new HPX runtime instance.

virtual **~runtime**()

The destructor makes sure all HPX runtime services are properly shut down before exiting.

void **on_exit**(*hpx::function*<void()> const &f)

Manage list of functions to call on exit.

void **starting**()

Manage runtime ‘stopped’ state.

void **stopping**()

Call all registered on_exit functions.

bool **stopped**() const

This accessor returns whether the runtime instance has been stopped.

hpx::util::runtime_configuration &**get_config**()

access configuration information

hpx::util::runtime_configuration const &**get_config**() const

std::size_t **get_instance_number**() const

util::thread_mapper &**get_thread_mapper**() const

Return a reference to the internal PAPI thread manager.

threads::topology const &**get_topology**() const

virtual int **run**(*hpx::function*<*hpx_main_function_type*> const &func)

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

Note: The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

Parameters

func – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

Returns

This function will return the value as returned as the result of the invocation of the function object given by the parameter **func**.

virtual int **run**()

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

Returns

This function will always return 0 (zero).

virtual void **rethrow_exception**()

Rethrow any stored exception (to be called after *stop()*)

virtual int **start**(*hpx::function<hpx_main_function_type>* const &func, bool blocking = false)

Start the runtime system.

Parameters

- **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx_main_function_type*.
- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally.

Returns

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter **func**. Otherwise, it will return zero.

virtual int **start**(bool blocking = false)

Start the runtime system.

Parameters

blocking – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally .

Returns

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter **func**. Otherwise, it will return zero.

virtual int **wait**()

Wait for the shutdown action to be executed.

Returns

This function will return the value as returned as the result of the invocation of the function object given by the parameter **func**.

virtual void **stop**(bool blocking = true)

Initiate termination of the runtime system.

Parameters

blocking – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

virtual int **suspend**()

Suspend the runtime system.

virtual int **resume**()

Resume the runtime system.

virtual int **finalize**(double)

virtual bool **is_networking_enabled**()

Return true if networking is enabled.

virtual *hpx::threads::threadmanager* &**get_thread_manager**()

Allow access to the thread manager instance used by the HPX runtime.

virtual *std::string* **here**() const

Returns a string of the locality endpoints (usable in debug output)

virtual bool **report_error**(*std::size_t* num_thread, *std::exception_ptr* const &e, bool terminate_all = true)

Report a non-recoverable error to the runtime system.

Parameters

- **num_thread** – [in] The number of the operating system thread the error has been detected in.
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] signal whether all localities should be terminated

virtual bool **report_error**(*std::exception_ptr* const &e, bool terminate_all = true)

Report a non-recoverable error to the runtime system.

Note: This function will retrieve the number of the current shepherd thread and forward to the `report_error` function above.

Parameters

- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate_all** – [in] signal whether all localities should be terminated

virtual void **add_pre_startup_function**(*startup_function_type* f)

Add a function to be executed inside a HPX thread before `hpx_main` but guaranteed to be executed before any startup function registered with `add_startup_function`.

Note: The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

Parameters

f – The function ‘f’ will be called from inside a HPX thread before `hpx_main` is executed.

This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add_startup_function**(*startup_function_type* f)

Add a function to be executed inside a HPX thread before `hpx_main`

Parameters

f – The function ‘f’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add_pre_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed inside a HPX thread during `hpx::finalize`, but guaranteed before any of the shutdown functions is executed.

Note: The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

Parameters

f – The function ‘f’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual void **add_shutdown_function**(*shutdown_function_type* f)

Add a function to be executed inside a HPX thread during `hpx::finalize`

Parameters

f – The function ‘f’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual `hpx::util::io_service_pool` ***get_thread_pool**(char const *name)

Access one of the internal thread pools (io_service instances) HPX is using to perform specific tasks. The three possible values for the argument `name` are “main_pool”, “io_pool”, “parcel_pool”, and “timer_pool”. For any other argument value the function will return zero.

virtual bool **register_thread**(char const *name, `std::size_t` num = 0, bool service_thread = true, *error_code* &ec = throws)

Register an external OS-thread with HPX.

This function should be called from any OS-thread which is external to HPX (not created by HPX), but which needs to access HPX functionality, such as setting a value on a promise or similar.

‘main’, ‘io’, ‘timer’, ‘parcel’, ‘worker’

Note: The function will compose a thread name of the form ‘<name>-thread#<num>’ which is used to register the thread. It is the user’s responsibility to ensure that each (composed) thread name is unique. HPX internally uses the following names for the threads it creates, do not reuse those:

Note: This function should be called for each thread exactly once. It will fail if it is called more than once.

Parameters

- **name** – [in] The name to use for thread registration.
- **num** – [in] The sequence number to use for thread registration. The default for this parameter is zero.
- **service_thread** – [in] The thread should be registered as a service thread. The default for this parameter is ‘true’. Any service threads will be pinned to cores not currently used by any of the HPX worker threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function will return whether the requested operation succeeded or not.

virtual bool **unregister_thread()**

Unregister an external OS-thread with HPX.

This function will unregister any external OS-thread from HPX.

Note: This function should be called for each thread exactly once. It will fail if it is called more than once. It will fail as well if the thread has not been registered before (see *register_thread*).

Returns

This function will return whether the requested operation succeeded or not.

virtual runtime_local::os_thread_data **get_os_thread_data**(std::string const &label) const

Access data for a given OS thread that was previously registered by *register_thread*.

virtual bool **enumerate_os_threads**(hpx::function<bool(runtime_local::os_thread_data const&)> const &f) const

Enumerate all OS threads that have registered with the runtime.

notification_policy_type::on_startstop_type **on_start_func**() const

notification_policy_type::on_startstop_type **on_stop_func**() const

notification_policy_type::on_error_type **on_error_func**() const

notification_policy_type::on_startstop_type **on_start_func**(notification_policy_type::on_startstop_type&&)

notification_policy_type::on_startstop_type **on_stop_func**(notification_policy_type::on_startstop_type&&)

notification_policy_type::on_error_type **on_error_func**(notification_policy_type::on_error_type&&)

virtual std::uint32_t **get_locality_id**(error_code &ec) const

virtual std::size_t **get_num_worker_threads**() const

virtual std::uint32_t **get_num_localities**(hpx::launch::sync_policy, error_code &ec) const

virtual std::uint32_t **get_initial_num_localities**() const

virtual hpx::future<std::uint32_t> **get_num_localities**() const

virtual std::string **get_locality_name**() const

virtual std::uint32_t **assign_cores**(std::string const&, std::uint32_t)

virtual std::uint32_t **assign_cores**()

namespace **threads**

Functions

```
char const *get_stack_size_name(std::ptrdiff_t size)
    Returns the stack size name.

    Get the readable string representing the given stack size constant.
    Parameters
        size – this represents the stack size

std::ptrdiff_t get_default_stack_size()
    Returns the default stack size.

    Get the default stack size in bytes.

std::ptrdiff_t get_stack_size(thread_stacksize size)
    Returns the stack size corresponding to the given stack size enumeration.

    Get the stack size corresponding to the given stack size enumeration.
    Parameters
        size – this represents the stack size
```

namespace **util**

Functions

bool **retrieve_commandline_arguments**(*hpx::program_options::options_description* const &app_options, *hpx::program_options::variables_map* &vm)

bool **retrieve_commandline_arguments**(*std::string* const &app_name, *hpx::program_options::variables_map* &vm)

hpx/runtime_local/report_error.hpp

Defined in header `hpx/runtime_local/report_error.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

void **report_error**(*std::size_t* num_thread, *std::exception_ptr* const &e)

The function `report_error` reports the given exception to the console.

void **report_error**(*std::exception_ptr* const &e)

The function `report_error` reports the given exception to the console.

hpx/runtime_local/thread_hooks.hpp

Defined in header `hpx/runtime_local/thread_hooks.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

threads::policies::callback_notifier::on_startstop_type **get_thread_on_start_func**()

Retrieve the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *register_thread_on_start_func*).

Note: This function can be called before the HPX runtime is initialized.

Returns

The currently installed error handler function.

threads::policies::callback_notifier::on_startstop_type **get_thread_on_stop_func()**

Retrieve the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *register_thread_on_stop_func*).

Note: This function can be called before the HPX runtime is initialized.

Returns

The currently installed error handler function.

threads::policies::callback_notifier::on_error_type **get_thread_on_error_func()**

Retrieve the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *register_thread_on_error_func*).

Note: This function can be called before the HPX runtime is initialized.

Returns

The currently installed error handler function.

threads::policies::callback_notifier::on_startstop_type **register_thread_on_start_func**(*threads::policies::callback_notifier::*
&&f)

Set the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *get_thread_on_start_func*).

Note: This function can be called before the HPX runtime is initialized.

Parameters

f – The function to install as the new start handler.

Returns

The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

threads::policies::callback_notifier::on_startstop_type **register_thread_on_stop_func**(*threads::policies::callback_notifier::*
&&f)

Set the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *get_thread_on_stop_func*).

Note: This function can be called before the HPX runtime is initialized.

Parameters

f – The function to install as the new stop handler.

Returns

The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

threads::policies::callback_notifier::on_error_type **register_thread_on_error_func**(*threads::policies::callback_notifier::on_error_type* f)

Set the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *get_thread_on_error_func*).

Note: This function can be called before the HPX runtime is initialized.

Parameters

f – The function to install as the new error handler.

Returns

The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

hpx::startup_function_type, hpx::register_pre_startup_function, hpx::register_startup_function

Defined in header [hpx/runtime.hpp](#)⁷⁶³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Typedefs

using **startup_function_type** = *hpx::move_only_function*<void()>

The type of the function which is registered to be executed as a startup or pre-startup function.

Functions

void **register_pre_startup_function**(*startup_function_type* f)

Add a function to be executed by a HPX thread before *hpx_main* but guaranteed before any startup function is executed (system-wide).

Any of the functions registered with *register_pre_startup_function* are guaranteed to be executed by an HPX thread before any of the registered startup functions are executed (see *hpx::register_startup_function*()).

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

⁷⁶³ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

See also:

`hpx::register_startup_function()`

Note: If this function is called while the pre-startup functions are being executed or after that point, it will raise an `invalid_status` exception.

Parameters

f – [in] The function to be registered to run by an HPX thread as a pre-startup function.

void **register_startup_function**(*startup_function_type* f)

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed after any pre-startup function is executed (system-wide).

Any of the functions registered with `register_startup_function` are guaranteed to be executed by an HPX thread after any of the registered pre-startup functions are executed (see: `hpx::register_pre_startup_function()`), but before `hpx_main` is being called.

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

See also:

`hpx::register_pre_startup_function()`

Note: If this function is called while the startup functions are being executed or after that point, it will raise an `invalid_status` exception.

Parameters

f – [in] The function to be registered to run by an HPX thread as a startup function.

`hpx/runtime_local/get_os_thread_count.hpp`

Defined in header `hpx/runtime_local/get_os_thread_count.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

`std::size_t get_os_thread_count()`

Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

`std::size_t get_os_thread_count(threads::executor const &exec)`

Return the number of worker OS- threads used by the given executor to execute HPX threads.

This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

Parameters

exec – [in] The executor to be used.

namespace **threads**

hpx::get_thread_name

Defined in header [hpx/runtime.hpp](#)⁷⁶⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

`std::string get_thread_name()`

Return the name of the calling thread.

This function returns the name of the calling thread. This name uniquely identifies the thread in the context of HPX. If the function is called while no HPX runtime system is active, the result will be “<unknown>”.

hpx::get_locality_id

Defined in header [hpx/runtime.hpp](#)⁷⁶⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

⁷⁶⁴ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

⁷⁶⁵ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

Functions

`std::uint32_t get_locality_id(error_code &ec = throws)`

Return the number of the locality this function is being called from.

This function returns the id of the current locality.

Note: The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by `get_num_localities()`).

Note: As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of `hpx::exception`.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters

ec – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`hpx/runtime_local/get_worker_thread_num.hpp`

Defined in header `hpx/runtime_local/get_worker_thread_num.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

`hpx/runtime_local/component_startup_shutdown_base.hpp`

Defined in header `hpx/runtime_local/component_startup_shutdown_base.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

struct **component_startup_shutdown_base**

#include <component_startup_shutdown_base.hpp> The `component_startup_shutdown_base` has to be used as a base class for all component startup/shutdown registries.

Public Functions

virtual `~component_startup_shutdown_base()` = default

virtual bool **get_startup_function**(*startup_function_type* &startup, bool &pre_startup) = 0

Return any startup function for this component.

Parameters

- **startup** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_startup** – [in, out] Will be set to true if the returned startup function is executed during the first round of calls.

Returns

Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

virtual bool **get_shutdown_function**(*shutdown_function_type* &shutdown, bool &pre_shutdown) = 0

Return any startup function for this component.

Parameters

- **shutdown** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre_shutdown** – [in, out] Will be set to true if the returned shutdown function is executed during the first round of calls.

Returns

Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

hpx/runtime_local/termination_detection.hpp

Defined in header `hpx/runtime_local/termination_detection.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **local**

Functions

void **termination_detection**()

Wait for all local HPX threads to complete execution.

This function blocks the calling thread until all HPX worker threads on the current locality have completed their work and become idle. It performs local termination detection by waiting for the thread manager to drain all pending tasks.

Example:

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>

int hpx_main()
{
    // Launch some asynchronous work
    for (int i = 0; i < 100; ++i)
    {
        hpx::post([]{ /* do work */ });
    }

    // Wait for all local threads to complete
    hpx::local::termination_detection();

    return hpx::finalize();
}
```

Note: This function should be called from an HPX thread or after the HPX runtime has been initialized.

Throws

`hpx::exception` – if called when the runtime is not in a valid state (e.g., before initialization or after shutdown).

bool **termination_detection**(*hpx::chrono::steady_duration* const &timeout)

Wait for all local HPX threads to complete with a timeout.

This function blocks the calling thread until either all HPX worker threads have completed their work, or the specified timeout duration has elapsed.

See also:

`termination_detection()`

Example:

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <chrono>

int hpx_main()
{
    // Launch some work
    hpx::post([]{ /* long running task */ });

    // Wait up to 5 seconds
    if (!hpx::local::termination_detection(std::chrono::seconds(5)))
    {
        std::cerr << "Warning: Work did not complete within timeout\n";
        // Implement fallback strategy
    }
}
```

(continues on next page)

(continued from previous page)

```

    return hpx::finalize();
}

```

Parameters

timeout – Maximum duration to wait for termination. The function will return false if this duration elapses before all threads complete.

Throws

hpx::exception – if called when the runtime is not in a valid state.

Returns

true if all threads completed before the timeout, false if the timeout elapsed.

bool **termination_detection**(*hpx::chrono::steady_time_point* const &deadline)

Wait for all local HPX threads to complete until a deadline.

This function blocks the calling thread until either all HPX worker threads have completed their work, or the specified deadline time point is reached.

See also:

termination_detection(std::chrono::duration<double>)

Example:

```

#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <chrono>

int hpx_main()
{
    auto deadline = std::chrono::steady_clock::now() +
        std::chrono::seconds(10);

    hpx::post([]{ /* work */ });

    if (!hpx::local::termination_detection(deadline))
    {
        std::cerr << "Deadline reached\n";
    }

    return hpx::finalize();
}

```

Parameters

deadline – Absolute time point when waiting should stop. The function will return false if this time is reached before all threads complete.

Throws

hpx::exception – if called when the runtime is not in a valid state.

Returns

true if all threads completed before the deadline, false if the deadline was reached.

bool **termination_detection**(*hpx::stop_token* stop_token, *hpx::chrono::steady_duration* const &timeout =

hpx::chrono::steady_duration((hpx::chrono::steady_clock::duration::max)()))

Wait for all local HPX threads with cancellation support.

This function blocks the calling thread until all HPX worker threads have completed, the timeout elapses, or a stop is requested via the `stop_token`. This enables cooperative cancellation of the wait operation.

See also:

`termination_detection(std::chrono::duration<double>)`

Example:

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <hpx/stop_token.hpp>
#include <chrono>

int hpx_main()
{
    hpx::stop_source stop_src;

    // In shutdown handler
    hpx::thread shutdown_thread([&stop_src]() {
        hpx::this_thread::sleep_for(std::chrono::seconds(30));
        stop_src.request_stop();
    });

    hpx::post([]{ /* work */ });

    // Wait with cancellation support
    bool completed = hpx::local::termination_detection(
        stop_src.get_token(),
        std::chrono::minutes(1)
    );

    if (!completed)
    {
        std::cerr << "Cancelled or timed out\n";
    }

    shutdown_thread.join();
    return hpx::finalize();
}
```

Parameters

- **stop_token** – Token that can be used to request cancellation of the wait operation.
- **timeout** – Maximum duration to wait. Defaults to maximum duration (effectively infinite).

Throws

`hpx::exception` – if called when the runtime is not in a valid state.

Returns

true if all threads completed, false if timeout elapsed or stop was requested.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

bool **register_thread**(*runtime* *rt, char const *name, *error_code* &ec = throws)

Register the current kernel thread with HPX, this should be done once for each external OS-thread intended to invoke HPX functionality. Calling this function more than once will return false.

void **unregister_thread**(*runtime* *rt)

Unregister the thread from HPX, this should be done once in the end before the external thread exists.

runtime_local::os_thread_data **get_os_thread_data**(*std::string* const &label)

Access data for a given OS thread that was previously registered by *register_thread*. This function must be called from a thread that was previously registered with the runtime.

bool **enumerate_os_threads**(*hpx::function*<bool(*os_thread_data* const&)> const &f)

Enumerate all OS threads that have registered with the runtime.

std::size_t **get_runtime_instance_number**()

Return the runtime instance number associated with the runtime instance the current thread is running in.

bool **register_on_exit**(*hpx::function*<void()> const&)

Register a function to be called during system shutdown.

bool **is_starting**()

Test whether the runtime system is currently being started.

This function returns whether the runtime system is currently being started or not, e.g. whether the current state of the runtime system is *hpx::state::startup*

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

bool **tolerate_node_faults**()

Test if HPX runs in fault-tolerant mode.

This function returns whether the runtime system is running in fault-tolerant mode

bool **is_running**()

Test whether the runtime system is currently running.

This function returns whether the runtime system is currently running or not, e.g. whether the current state of the runtime system is *hpx::state::running*

⁷⁶⁶ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

bool **is_stopped()**

Test whether the runtime system is currently stopped.

This function returns whether the runtime system is currently stopped or not, e.g. whether the current state of the runtime system is *hpx::state::stopped*

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

bool **is_stopped_or_shutting_down()**

Test whether the runtime system is currently being shut down.

This function returns whether the runtime system is currently being shut down or not, e.g. whether the current state of the runtime system is *hpx::state::stopped* or *hpx::state::shutdown*

Note: This function needs to be executed on a HPX-thread. It will return false otherwise.

std::size_t **get_num_worker_threads()**

Return the number of worker OS- threads used to execute HPX threads.

This function returns the number of OS-threads used to execute HPX threads. If the function is called while no HPX runtime system is active, it will return zero.

std::uint64_t **get_system_uptime()**

Return the system uptime measure on the thread executing this call.

This function returns the system uptime measured in nanoseconds for the thread executing this call. If the function is called while no HPX runtime system is active, it will return zero.

namespace **threads**

hpx::mutex, hpx::timed_mutex

Defined in header [hpx/mutex.hpp](#)⁷⁶⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

class **mutex**

#include <mutex.hpp> *mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. *mutex* offers exclusive, non-recursive ownership semantics:

- A calling thread owns a mutex from the time that it successfully calls either *lock* or *try_lock* until it calls *unlock*.
- When a thread owns a *mutex*, all other threads will block (for calls to *lock*) or receive a *false* return value (for *try_lock*) if they attempt to claim ownership of the *mutex*.
- A calling thread must not own the *mutex* prior to calling *lock* or *try_lock*.

The behavior of a program is undefined if a *mutex* is destroyed while still owned by any threads, or a thread terminates while owning a *mutex*. The mutex class satisfies all requirements of [Mutex](#)⁷⁶⁹ and [StandardLayoutType](#)⁷⁷⁰.

hpx::mutex is neither copyable nor movable.

Subclassed by *hpx::timed_mutex*

Public Functions

mutex(mutex const&) = delete

hpx::mutex is neither copyable nor movable

mutex(mutex&&) = delete

mutex &**operator**=(mutex const&) = delete

mutex &**operator**=(mutex&&) = delete

⁷⁶⁸ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/mutex.hpp

```
inline HPX_HOST_DEVICE_CONSTEXPR mutex(char const*const = "") noexcept
```

Constructs the *mutex*. The *mutex* is in unlocked state after the constructor completes.

Note: Because the default constructor is *constexpr*, static mutexes are initialized as part of static non-local initialization, before any dynamic non-local initialization begins. This makes it safe to lock a *mutex* in a constructor of any static object.

Parameters

description – description of the *mutex*.

```
~mutex()
```

Destroys the *mutex*. The behavior is undefined if the *mutex* is owned by any thread or if any thread terminates while holding any ownership of the *mutex*.

```
void lock(char const *description, error_code &ec = throws)
```

Locks the *mutex*. If another thread has already locked the *mutex*, a call to *lock* will block execution until the lock is acquired. If *lock* is called by a thread that already owns the *mutex*, the behavior is undefined: for example, the program may deadlock. *hpx::mutex* can detect the invalid usage and throws a *std::system_error* with error condition *resource_deadlock_would_occur* instead of deadlocking. Prior *unlock()* operations on the same *mutex* synchronize- with (as defined in *std::memory_order*) this operation.

Note: *lock()* is usually not called directly: *std::unique_lock*, *std::scoped_lock*, and *std::lock_guard* are used to manage exclusive locking.

Parameters

- **description** – Description of the *mutex*
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

void lock returns *void*.

```
inline void lock(error_code &ec = throws)
```

Locks the *mutex*. If another thread has already locked the *mutex*, a call to *lock* will block execution until the lock is acquired. If *lock* is called by a thread that already owns the *mutex*, the behavior is undefined: for example, the program may deadlock. *hpx::mutex* can detect the invalid usage and throws a *std::system_error* with error condition *resource_deadlock_would_occur* instead of deadlocking. Prior *unlock()* operations on the same *mutex* synchronize - with(as defined in *std::memory_order*) this operation.

Note: *lock()* is usually not called directly: *std::unique_lock*, *std::scoped_lock*, and *std::lock_guard* are used to manage exclusive locking. This overload essentially calls *void lock(char const* description, error_code& ec =throws);* with *description* as *mutex::lock*.

Parameters

- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

void lock returns *void*.

```
bool try_lock(char const *description, error_code &ec = throws)
```

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise

returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If *try_lock* is called by a thread that already owns the *mutex*, the behavior is undefined. Prior *unlock()* operation on the same mutex synchronizes-with (as defined in *std::memory_order*) this operation if it returns *true*. Note that prior *lock()* does not synchronize with this operation if it returns *false*.

Parameters

- **description** – Description of the *mutex*
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool try_lock returns *true* on successful lock acquisition, otherwise returns *false*.

inline **bool try_lock**(*error_code* &ec = *throws*)

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If *try_lock* is called by a thread that already owns the *mutex*, the behavior is undefined. Prior *unlock()* operation on the same mutex synchronizes-with (as defined in *std::memory_order*) this operation if it returns *true*. Note that prior *lock()* does not synchronize with this operation if it returns *false*.

Note: This overload essentially calls

```
void try_lock(char const* description,
              error_code& ec = throws);
```

with *description* as *mutex::try_lock*.

Parameters

- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool try_lock returns *true* on successful lock acquisition, otherwise returns *false*.

void **unlock**(*error_code* &ec = *throws*)

Unlocks the *mutex*. The *mutex* must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation *synchronizes-with* (as defined in *std::memory_order*) any subsequent *lock* operation that obtains ownership of the same *mutex*.

Parameters

- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

unlock returns *void*.

class **timed_mutex** : private *hpx::mutex*

#include <mutex.hpp> The *timed_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In a manner similar to *mutex*, *timed_mutex* offers exclusive, non-recursive ownership semantics. In addition, *timed_mutex* provides the ability to attempt to claim ownership of a *timed_mutex* with a timeout via the member functions *try_lock_for()* and *try_lock_until()*. The *timed_mutex* class satisfies all requirements of *TimedMutex*⁷⁷¹ and *StandardLayoutType*⁷⁷².

hpx::timed_mutex is neither copyable nor movable.

Public Functions

timed_mutex(*timed_mutex* const&) = delete

hpx::timed_mutex is neither copyable nor movable

timed_mutex(*timed_mutex*&&) = delete

timed_mutex &**operator**=(*timed_mutex* const&) = delete

timed_mutex &**operator**=(*timed_mutex*&&) = delete

timed_mutex(char const *const description = "")

Constructs a timed_mutex. The mutex is in unlocked state after the call.

Parameters

description – Description of the timed_mutex.

~timed_mutex()

Destroys the timed_mutex. The behavior is undefined if the mutex is owned by any thread or if any thread terminates while holding any ownership of the mutex.

bool **try_lock_until**(hpx::chrono::steady_time_point const &abs_time, char const *description, error_code &ec = throws)

Tries to lock the mutex. Blocks until specified *abs_time* has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *abs_time* has already passed, this function behaves like try_lock(). As with try_lock(), this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point before *abs_time*. Prior unlock() operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If try_lock_until is called by a thread that already owns the mutex, the behavior is undefined.

Parameters

- **abs_time** – time point to block until
- **description** – Description of the timed_mutex
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool try_lock_until returns *true* if the lock was acquired successfully, otherwise *false*.

inline bool **try_lock_until**(hpx::chrono::steady_time_point const &abs_time, error_code &ec = throws)

Tries to lock the mutex. Blocks until specified *abs_time* has been reached or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *abs_time* has already passed, this function behaves like try_lock(). As with try_lock(), this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point before *abs_time*. Prior unlock() operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If try_lock_until is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls

```
bool try_lock_until(
    hpx::chrono::steady_time_point const& abs_time,
    char const* description, error_code& ec = throws);
```

with *description* as mutex::try_lock_until.

Parameters

- **abs_time** – time point to block until
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool *try_lock_until* returns *true* if the lock was acquired successfully, otherwise *false*.

```
inline bool try_lock_for(hpx::chrono::steady_duration const &rel_time, char const *description,  
                          error_code &ec = throws)
```

Tries to lock the mutex. Blocks until specified *rel_time* has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *rel_time* is less or equal *rel_time.zero()*, the function behaves like *try_lock()*. This function may block for longer than *rel_time* due to scheduling or resource contention delays. As with *try_lock()*, this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point during *rel_time*. Prior *unlock()* operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If *try_lock_for* is called by a thread that already owns the mutex, the behavior is undefined.

Parameters

- **rel_time** – minimum duration to block for
- **description** – Description of the timed_mutex
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool *try_lock_for* returns *true* if the lock was acquired successfully, otherwise *false*.

```
inline bool try_lock_for(hpx::chrono::steady_duration const &rel_time, error_code &ec = throws)
```

Tries to lock the mutex. Blocks until specified *rel_time* has elapsed or the lock is acquired, whichever comes first. On successful lock acquisition returns *true*, otherwise returns *false*. If *rel_time* is less or equal *rel_time.zero()*, the function behaves like *try_lock()*. This function may block for longer than *rel_time* due to scheduling or resource contention delays. As with *try_lock()*, this function is allowed to fail spuriously and return *false* even if the mutex was not locked by any other thread at some point during *rel_time*. Prior *unlock()* operation on the same mutex *synchronizes-with* (as defined in *std::memory_order*) this operation if it returns *true*. If *try_lock_for* is called by a thread that already owns the mutex, the behavior is undefined.

Note: This overload essentially calls

```
bool try_lock_for(  
    hpx::chrono::steady_duration const& rel_time,  
    char const* description, error_code& ec = throws)
```

with *description* as *mutex::try_lock_for*.

Parameters

- **rel_time** – minimum duration to block for
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool *try_lock_for* returns *true* if the lock was acquired successfully, otherwise *false*.

```
void lock(char const *description, error_code &ec = throws)
```

Locks the mutex. If another thread has already locked the mutex, a call to *lock* will block execution until the lock is acquired. If *lock* is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. *hpx::mutex* can detect the invalid usage and

throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlocking. Prior `unlock()` operations on the same mutex synchronize- with (as defined in `std::memory_order`) this operation.

Note: `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking.

Parameters

- **description** – Description of the *mutex*
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

`void lock` returns *void*.

inline void **lock**(*error_code* &ec = *throws*)

Locks the mutex. If another thread has already locked the mutex, a call to `lock` will block execution until the lock is acquired. If `lock` is called by a thread that already owns the mutex, the behavior is undefined: for example, the program may deadlock. `hpx::mutex` can detect the invalid usage and throws a `std::system_error` with error condition `resource_deadlock_would_occur` instead of deadlocking. Prior `unlock()` operations on the same mutex synchronize - with(as defined in `std::memory_order`) this operation.

Note: `lock()` is usually not called directly: `std::unique_lock`, `std::scoped_lock`, and `std::lock_guard` are used to manage exclusive locking. This overload essentially calls `void lock(char const* description, error_code& ec =throws);` with *description* as `mutex::lock`.

Parameters

- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

`void lock` returns *void*.

bool **try_lock**(char const *description, *error_code* &ec = *throws*)

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If `try_lock` is called by a thread that already owns the *mutex*, the behavior is undefined. Prior `unlock()` operation on the same mutex synchronizes-with (as defined in `std::memory_order`) this operation if it returns *true*. Note that prior `lock()` does not synchronize with this operation if it returns *false*.

Parameters

- **description** – Description of the *mutex*
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

`bool try_lock` returns *true* on successful lock acquisition, otherwise returns *false*.

inline bool **try_lock**(*error_code* &ec = *throws*)

Tries to lock the *mutex*. Returns immediately. On successful lock acquisition returns *true*, otherwise returns *false*. This function is allowed to fail spuriously and return *false* even if the *mutex* is not currently locked by any other thread. If `try_lock` is called by a thread that already owns the *mutex*, the behavior is undefined. Prior `unlock()` operation on the same mutex synchronizes-with (as defined in `std::memory_order`) this operation if it returns *true*. Note that prior `lock()` does not synchronize with this operation if it returns *false*.

Note: This overload essentially calls

```
void try_lock(char const* description,
              error_code& ec = throws);
```

with *description* as `mutex::try_lock`.

Parameters

ec – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

`bool try_lock` returns *true* on successful lock acquisition, otherwise returns *false*.

void **unlock**(error_code &ec = throws)

Unlocks the *mutex*. The *mutex* must be locked by the current thread of execution, otherwise, the behavior is undefined. This operation *synchronizes-with* (as defined in *std::memory_order*) any subsequent *lock* operation that obtains ownership of the same *mutex*.

Parameters

ec – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

unlock returns *void*.

namespace **threads**

Typedefs

using **thread_id_ref_type** = *thread_id_ref*

using **thread_self** = *coroutines::detail::coroutine_self*

Functions

thread_id **get_self_id**() noexcept

The function *get_self_id* returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

thread_self ***get_self_ptr**() noexcept

The function *get_self_ptr* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

hpx::spinlock

Defined in header `hpx/mutex.hpp`⁷⁷³.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Typedefs

using **spinlock** = detail::spinlock<true>

spinlock is a type of lock that causes a thread attempting to obtain it to check for its availability while waiting in a loop continuously.

using **spinlock_no_backoff** = detail::spinlock<false>

hpx::shared_mutex

Defined in header `hpx/shared_mutex.hpp`⁷⁷⁴.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Typedefs

using **shared_mutex** = detail::shared_mutex<>

The *shared_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In contrast to other mutex types which facilitate exclusive access, a *shared_mutex* has two levels of access:

- *shared* - several threads can share ownership of the same mutex.
- *exclusive* - only one thread can own the mutex.

If one thread has acquired the exclusive lock (through *lock*, *try_lock*), no other threads can acquire the lock (including the shared). If one thread has acquired the shared lock (through *lock_shared*, *try_lock_shared*), no other thread can acquire the exclusive lock, but can acquire the shared lock. Only when the exclusive lock has not been acquired by any thread, the shared lock can be acquired by multiple threads. Within one thread, only one lock (shared or exclusive) can be acquired at the same time. Shared mutexes are especially useful when shared data can be safely read by any number of threads simultaneously, but a thread may only write the same data when no other thread is reading or writing at the same time. The *shared_mutex* class satisfies all requirements of *SharedMutex* and *StandardLayoutType*.

⁷⁷³ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/mutex.hpp

hpx::once_flag, hpx::call_once

Defined in header [hpx/mutex.hpp](#)⁷⁷⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename F, typename ...Args>  
void call_once(once_flag &flag, F &&f, Args&&... args)
```

Executes the Callable object *f* exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time *call_once* is called, flag indicates that *f* was already called, *call_once* returns right away (such a call to *call_once* is known as passive).
- Otherwise, *call_once* invokes `std::forward<Callable>(f)` with the arguments `std::forward<Args>(args)...` (as if by `hpx::invoke`). Unlike the `hpx::thread` constructor or `hpx::async`, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. (such a call to *call_once* is known as active).
 - If that invocation throws an exception, it is propagated to the caller of *call_once*, and the flag is not flipped so that another call will be attempted (such a call to *call_once* is known as exceptional).
 - If that invocation returns normally (such a call to *call_once* is known as returning), the flag is flipped, and all other calls to *call_once* with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to *call_once* are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

Note: If concurrent calls to *call_once* pass different functions *f*, it is unspecified which *f* will be called. The selected function runs in the same thread as the *call_once* invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using `hpx::call_once`. The POSIX equivalent of this function is *pthread_once*.

Parameters

- **flag** – an object, for which exactly one function gets executed
- **f** – Callable object to invoke
- **args** – arguments to pass to the function

Throws

`std::system_error` – if any condition prevents calls to *call_once* from executing as specified or any exception thrown by *f*

⁷⁷⁵ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/mutex.hpp

struct **once_flag**

#include <once.hpp> The class `hpx::once_flag` is a helper structure for `hpx::call_once`. An object of type `hpx::once_flag` that is passed to multiple calls to `hpx::call_once` allows those calls to coordinate with each other such that only one of the calls will actually run to completion. `hpx::once_flag` is neither copyable nor movable.

Public Functions

once_flag(*once_flag* const&) = delete

once_flag(*once_flag*&&) = delete

once_flag &**operator**=(*once_flag* const&) = delete

once_flag &**operator**=(*once_flag*&&) = delete

inline **once_flag**() noexcept

Constructs an `once_flag` object. The internal state is set to indicate that no function has been called yet.

Private Members

std::atomic<long> **status_**

lcos::local::event **event_**

Friends

template<typename **F**, typename ...**Args**>

friend void **call_once**(*once_flag* &flag, *F* &&*f*, *Args*&&... args)

Executes the Callable object *f* exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time `call_once` is called, flag indicates that *f* was already called, `call_once` returns right away (such a call to `call_once` is known as passive).
- Otherwise, `call_once` invokes `std::forward<Callable>(f)` with the arguments `std::forward<Args>(args)...` (as if by `hpx::invoke`). Unlike the `hpx::thread` constructor or `hpx::async`, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. (such a call to `call_once` is known as active).
 - If that invocation throws an exception, it is propagated to the caller of `call_once`, and the flag is not flipped so that another call will be attempted (such a call to `call_once` is known as exceptional).
 - If that invocation returns normally (such a call to `call_once` is known as returning), the flag is flipped, and all other calls to `call_once` with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to `call_once` are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

Note: If concurrent calls to *call_once* pass different functions *f*, it is unspecified which *f* will be called. The selected function runs in the same thread as the *call_once* invocation it was passed to. Initialization of function-local statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using `hpx::call_once`. The POSIX equivalent of this function is *pthread_once*.

Parameters

- **flag** – an object, for which exactly one function gets executed
- **f** – Callable object to invoke
- **args** – arguments to pass to the function

Throws

`std::system_error` – if any condition prevents calls to *call_once* from executing as specified or any exception thrown by *f*

`hpx::recursive_mutex`

Defined in header `hpx/mutex.hpp`⁷⁷⁶.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Typedefs

using **recursive_mutex** = detail::recursive_mutex_impl<>

`hpx::condition_variable`, `hpx::condition_variable_any`, `hpx::cv_status`

Defined in header `hpx/condition_variable.hpp`⁷⁷⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Enums

enum class **cv_status**

The scoped enumeration `hpx::cv_status` describes whether a timed wait returned because of timeout or not. `hpx::cv_status` is used by the *wait_for* and *wait_until* member functions of `hpx::condition_variable` and `hpx::condition_variable_any`.

Values:

⁷⁷⁶ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/mutex.hpp

⁷⁷⁷ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/condition_variable.hpp

enumerator **no_timeout**

The condition variable was awakened with *notify_all*, *notify_one*, or spuriously

enumerator **timeout**

the condition variable was awakened by timeout expiration

enumerator **error**

there was an error

class **condition_variable**

#include <condition_variable.hpp> The `condition_variable` class is a synchronization primitive that can be used to block a thread, or multiple threads at the same time, until another thread both modifies a shared variable (the condition), and notifies the `condition_variable`.

The thread that intends to modify the shared variable has to

- i. acquire a `hpx::mutex` (typically via `std::lock_guard`)
- ii. perform the modification while the lock is held
- iii. execute *notify_one* or *notify_all* on the *condition_variable* (the lock does not need to be held for notification)

Even if the shared variable is atomic, it must be modified under the mutex in order to correctly publish the modification to the waiting thread. Any thread that intends to wait on `condition_variable` has to

- i. acquire a `std::unique_lock<hpx::mutex>`, on the same mutex as used to protect the shared variable
- ii. either
 - A. check the condition, in case it was already updated and notified
 - B. execute *wait*, *await_for*, or *wait_until*. The wait operations atomically release the mutex and suspend the execution of the thread.
 - C. When the condition variable is notified, a timeout expires, or a spurious wakeup occurs, the thread is awakened, and the mutex is atomically reacquired. The thread should then check the condition and resume waiting if the wake-up was spurious. or
- A. use the predicated overload of *wait*, *wait_for*, and *wait_until*, which takes care of the three steps above.

`hpx::condition_variable` works only with `std::unique_lock<hpx::mutex>`. This restriction allows for maximal efficiency on some platforms. `hpx::condition_variable_any` provides a condition variable that works with any [BasicLockable](#)⁷⁷⁸ object, such as `std::shared_lock`.

Condition variables permit concurrent invocation of the *wait*, *wait_for*, *wait_until*, *notify_one* and *notify_all* member functions.

The class `hpx::condition_variable` is a [StandardLayoutType](#)⁷⁷⁹. It is not [CopyConstructible](#)⁷⁸⁰, [MoveConstructible](#)⁷⁸¹, [CopyAssignable](#)⁷⁸², or [MoveAssignable](#)⁷⁸³.

Public Functions

inline **condition_variable**()

Construct an object of type `hpx::condition_variable`.

~condition_variable() = default

Destroys the object of type `hpx::condition_variable`.

IOW, `~condition_variable()` can execute before a signaled thread returns from a wait. If this happens with `condition_variable`, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the `condition_variable` object and the member functions *wait* (*wait_for*, etc.).

Note: Preconditions: There is no thread blocked on **this*. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on **this* once the destructor has been started, especially when the waiting threads are calling the *wait* functions in a loop or using the overloads of *wait*, *wait_for*, or *wait_until* that take a predicate. end note]

condition_variable(*condition_variable* const&) = delete

condition_variable(*condition_variable*&&) = delete

condition_variable &**operator=**(*condition_variable* const&) = delete

condition_variable &**operator=**(*condition_variable*&&) = delete

inline void **notify_one**(*error_code* &ec = *throws*) const

If any threads are waiting on **this*, calling *notify_one* unblocks one of the waiting threads.

Parameters

ec – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

notify_one returns *void*.

inline void **notify_all**(*error_code* &ec = *throws*) const

Unblocks all threads currently waiting for **this*.

Parameters

ec – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

notify_all returns *void*.

template<typename **Mutex**>

inline void **wait**(*std::unique_lock*<*Mutex*> &lock, *error_code* &ec = *throws*)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred())==true`).

Atomically unlocks lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when *notify_all*() or *notify_one*() is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.
 A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters

Mutex – Type of mutex to wait on.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

wait returns *void*.

```
template<typename Mutex, typename Predicate>
```

```
inline void wait(std::unique_lock<Mutex> &lock, Predicate pred, error_code& = throws)
```

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred())==true`).

Equivalent to

```
while (!pred()) {  
    wait(lock);  
}
```

This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after *wait(lock)* exits, which means that lock can be used to guard access to *pred()*.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.
 A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters

- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate *pred* function.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **pred** – Predicate which returns *false* if the waiting should be continued (`bool(pred())==false`). The signature of the predicate function should be equivalent to the following: `bool pred()`;

Returns

wait returns *void*.

```
template<typename Mutex>
```

```
inline cv_status wait_until(std::unique_lock<Mutex> &lock, hpx::chrono::steady_time_point const  
    &abs_time, error_code &ec = throws)
```

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred())==true`).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when *notify_all()* or *notify_one()* is executed, or when the

absolute time point *abs_time* is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and *wait_until* exits.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.
A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters

Mutex – Type of mutex to wait on.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **abs_time** – Represents the time when waiting should be stopped
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

cv_status wait_until returns *hpx::cv_status::timeout* if the absolute timeout specified by *abs_time* was reached and *hpx::cv_status::no_timeout* otherwise.

```
template<typename Mutex, typename Predicate>
inline bool wait_until(std::unique_lock<Mutex> &lock, hpx::chrono::steady_time_point const
                      &abs_time, Predicate pred, error_code &ec = throws)
```

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (*bool(pred())==true*).

Equivalent to

```
while (!pred()) {
    if (wait_until(lock, abs_time) == hpx::cv_status::timeout) {
        return pred();
    }
}
return true;
```

This overload may be used to ignore spurious wakeups.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.
A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters

- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate *pred* function.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **abs_time** – Represents the time when waiting should be stopped
- **pred** – Predicate which returns *false* if the waiting should be continued (*bool(pred())==false*). The signature of the predicate function should be equivalent to the following: *bool pred()*;
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool wait_until returns *false* if the predicate *pred* still evaluates to false after the *abs_time*

timeout has expired, otherwise *true*. If the timeout had already expired, evaluates and returns the result of *pred*.

```
template<typename Mutex>
inline cv_status wait_for(std::unique_lock<Mutex> &lock, hpx::chrono::steady_duration const
    &rel_time, error_code &ec = throws)
```

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when *notify_all()* or *notify_one()* is executed, or when the relative timeout *rel_time* expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and *wait_for()* exits.

The standard recommends that a steady clock be used to measure the duration. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

B. Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.

Template Parameters

Mutex – Type of mutex to wait on.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **rel_time** – represents the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

cv_status hpx::cv_status::timeout if the relative timeout specified by *rel_time* expired, *hpx::cv_status::no_timeout* otherwise.

```
template<typename Mutex, typename Predicate>
inline bool wait_for(std::unique_lock<Mutex> &lock, hpx::chrono::steady_duration const &rel_time,
    Predicate pred, error_code &ec = throws)
```

Equivalent to.

```
return wait_until(lock,
    hpx::chrono::steady_clock::now() + rel_time,
    hpx::move(pred));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied (*bool(pred())==true*).

The standard recommends that a steady clock be used to measure the duration. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

Note: 1. Calling this function if *lock.mutex()* is not locked by the current thread is undefined behavior.

A. Calling this function if *lock.mutex()* is not the same mutex as the one used by all other threads that are currently waiting on the same condition variable is undefined behavior.

Template Parameters

- **Mutex** – Type of mutex to wait on.
- **Predicate** – Type of predicate *pred* function.

Parameters

- **lock** – *unique_lock* that must be locked by the current thread
- **rel_time** – represents the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **pred** – Predicate which returns *false* if the waiting should be continued (`bool(pred())==false`). The signature of the predicate function should be equivalent to the following: `bool pred()`;
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

`bool wait_for` returns *false* if the predicate *pred* still evaluates to *false* after the *rel_time* timeout expired, otherwise *true*.

Protected Functions

```
template<typename Mutex, typename Predicate>
inline cv_status wait_until_pred(std::unique_lock<Mutex> &lock, hpx::chrono::steady_time_point
                                const &abs_time, Predicate wait_cond, error_code &ec = throws)
```

Private Types

```

```

Private Members

```
hpx::util::cache_aligned_data_derived<data_type> data_
```

```
class condition_variable_any
```

`#include <condition_variable.hpp>` The `condition_variable_any` class is a generalization of `hpx::condition_variable`. Whereas `hpx::condition_variable` works only on `std::unique_lock<std::mutex>`, a `condition_variable_any` can operate on any lock that meets the [BasicLockable](#)⁷⁸⁴ requirements.

See `hpx::condition_variable` for the description of the semantics of condition variables. It is not [CopyConstructible](#)⁷⁸⁵, [MoveConstructible](#)⁷⁸⁶, [CopyAssignable](#)⁷⁸⁷, or [MoveAssignable](#)⁷⁸⁸.

Public Functions

inline **condition_variable_any**()

Constructs an object of type `hpx::condition_variable_any`.

~condition_variable_any() = default

Destroys the object of type `hpx::condition_variable_any`.

It is only safe to invoke the destructor if all threads have been notified. It is not required that they have exited their respective wait functions: some threads may still be waiting to reacquire the associated lock, or may be waiting to be scheduled to run after reacquiring it.

The programmer must ensure that no threads attempt to wait on **this* once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or are using the overloads of the wait functions that take a predicate.

Preconditions: There is no thread blocked on **this*. [Note: That is, all threads have been notified; they could subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on **this* once the destructor has been started, especially when the waiting threads are calling the *wait* functions in a loop or using the overloads of *wait*, *wait_for*, or *wait_until* that take a predicate. end note]

IOW, `~condition_variable_any()` can execute before a signaled thread returns from a wait. If this happens with `condition_variable_any`, that waiting thread will attempt to lock the destructed mutex. To fix this, there must be shared ownership of the data members between the `condition_variable_any` object and the member functions `wait` (`wait_for`, etc.).

condition_variable_any(*condition_variable_any* const&) = delete

condition_variable_any(*condition_variable_any*&&) = delete

condition_variable_any &**operator=**(*condition_variable_any* const&) = delete

condition_variable_any &**operator=**(*condition_variable_any*&&) = delete

inline void **notify_one**(*error_code* &ec = *throws*) const

If any threads are waiting on **this*, calling *notify_one* unblocks one of the waiting threads.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock. However, some implementations (in particular many implementations of pthreads) recognize this situation and avoid this “hurry up and wait” scenario by transferring the waiting thread from the condition variable’s queue directly to the queue of the mutex within the notify call, without waking it up.

Notifying while under the lock may nevertheless be necessary when precise scheduling of events is required, e.g. if the waiting thread would exit the program if the condition is satisfied, causing destruction of the notifying thread’s condition variable. A spurious wakeup after mutex unlock but before notify would result in notify called on a destroyed object.

Note: The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Parameters

ec – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

notify_one returns *void*.

inline void **notify_all**(*error_code* &ec = *throws*) const

Unblocks all threads currently waiting for **this*.

The notifying thread does not need to hold the lock on the same mutex as the one held by the waiting thread(s); in fact doing so is a pessimization, since the notified thread would immediately block again, waiting for the notifying thread to release the lock.

Note: The effects of *notify_one()/notify_all()* and each of the three atomic parts of *wait()/wait_for()/wait_until()* (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to *notify_one()* was made.

Parameters

ec – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

notify_all returns *void*.

template<typename **Lock**>

inline void **wait**(*Lock* &lock, *error_code* &ec = *throws*)

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (*bool(pred())==true*).

Atomically unlocks lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when *notify_all()* or *notify_one()* is executed. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and wait exits.

The effects of *notify_one()/notify_all()* and each of the three atomic parts of *wait()/wait_for()/wait_until()* (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to *notify_one()* was made.

Note: If these functions fail to meet the postconditions (lock is locked by the calling thread), *std::terminate* is called. For example, this could happen if re-locking the mutex throws an exception.

Template Parameters

Lock – Type of *lock*.

Parameters

- **lock** – An object of type *Lock* that meets the [BasicLockable](#)⁷⁸⁹ requirements, which must be locked by the current thread
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

wait returns *void*.

```
template<typename Lock, typename Predicate>
inline void wait(Lock &lock, Predicate pred, error_code& = throws)
```

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred())==true`).

Equivalent to

```
while (!pred()) {
    wait(lock);
}
```

This overload may be used to ignore spurious awakenings while waiting for a specific condition to become true. Note that lock must be acquired before entering this method, and it is reacquired after *wait(lock)* exits, which means that lock can be used to guard access to *pred()*.

The effects of *notify_one()/notify_all()* and each of the three atomic parts of *wait()/wait_for()/wait_until()* (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to *notify_one()* was made.

Note: If these functions fail to meet the postconditions (lock is locked by the calling thread), `std::terminate` is called. For example, this could happen if re-locking the mutex throws an exception.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the [BasicLockable](#)⁷⁹⁰ requirements, which must be locked by the current thread
- **pred** – predicate which returns `false` if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred()`.

Returns

wait returns *void*.

```
template<typename Lock>
inline cv_status wait_until(Lock &lock, hpx::chrono::steady_time_point const &abs_time, error_code
    &ec = throws)
```

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when *notify_all()* or *notify_one()* is executed, or when the absolute time point *abs_time* is reached. It may also be unblocked spuriously. When unblocked, regardless of the reason, lock is reacquired and *wait_until* exits.

Note: The effects of *notify_one()/notify_all()* and each of the three atomic parts of *wait()/wait_for()/wait_until()* (unlock+wait, wakeup, and lock) take place in a single total order that

can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

Lock – Type of *lock*.

Parameters

- **lock** – an object of type *Lock* that meets the requirements of `BasicLockable`⁷⁹¹, which must be locked by the current thread
- **abs_time** – represents the time when waiting should be stopped.
- **ec** – used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

`cv_status::hpx::cv_status::timeout` if the absolute timeout specified by *abs_time* was reached, `hpx::cv_status::no_timeout` otherwise.

template<typename **Lock**, typename **Predicate**>

inline bool **wait_until**(*Lock* &lock, *hpx::chrono::steady_time_point* const &abs_time, *Predicate* pred, *error_code* &ec = *throws*)

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

Equivalent to

```
while (!pred()) {
    if (wait_until(lock, timeout_time) == hpx::cv_status::timeout) {
        return pred();
    }
}
return true;
```

This overload may be used to ignore spurious wakeups.

Note: The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the requirements of `BasicLockable`⁷⁹², which must be locked by the current thread
- **abs_time** – represents the time when waiting should be stopped.
- **pred** – predicate which returns *false* if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool *false* if the predicate *pred* still evaluates to *false* after the *abs_time* timeout expired, otherwise true. If the timeout had already expired, evaluates and returns the result of *pred*.

```
template<typename Lock>
inline cv_status wait_for(Lock &lock, hpx::chrono::steady_duration const &rel_time, error_code &ec
                        = throws)
```

Atomically releases lock, blocks the current executing thread, and adds it to the list of threads waiting on **this*. The thread will be unblocked when *notify_all()* or *notify_one()* is executed, or when the relative timeout *rel_time* expires. It may also be unblocked spuriously. When unblocked, regardless of the reason, *lock* is reacquired and *wait_for()* exits.

The effects of *notify_one()/notify_all()* and each of the three atomic parts of *wait()/wait_for()/wait_until()* (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to *notify_one()* was made.

Note: Even if notified under lock, this overload makes no guarantees about the state of the associated predicate when returning due to timeout.

Template Parameters

Lock – Type of *lock*.

Parameters

- **lock** – an object of type *Lock* that meets the [BasicLockable⁷⁹³](#) requirements, which must be locked by the current thread.
- **rel_time** – an object of type *hpx::chrono::duration* representing the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to *hpx::chrono::steady_clock::now()*.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

cv_status hpx::cv_status::timeout if the relative timeout specified by *rel_time* expired, *hpx::cv_status::no_timeout* otherwise.

```
template<typename Lock, typename Predicate>
inline bool wait_for(Lock &lock, hpx::chrono::steady_duration const &rel_time, Predicate pred,
                    error_code &ec = throws)
```

Equivalent to.

```
return wait_until(lock,
                  hpx::chrono::steady_clock::now() + rel_time,
                  std::move(pred));
```

This overload may be used to ignore spurious awakenings by looping until some predicate is satisfied (*bool(pred()) == true*).

Note: The effects of *notify_one()/notify_all()* and each of the three atomic parts of *wait()/wait_for()/wait_until()* (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a

thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the [BasicLockable](#)⁷⁹⁴ requirements, which must be locked by the current thread.
- **rel_time** – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- **pred** – predicate which returns *false* if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

`bool false` if the predicate *pred* still evaluates to *false* after the *rel_time* timeout expired, otherwise *true*.

```
template<typename Lock, typename Predicate>
```

```
inline bool wait(Lock &lock, stop_token token, Predicate pred, error_code &ec = throws)
```

wait causes the current thread to block until the condition variable is notified or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred())==true`).

An interruptible wait: registers the `condition_variable_any` for the duration of `wait()`, to be notified if a stop request is made on the given `token`’s associated stop-state; it is then equivalent to

```
while (!token.stop_requested()) {  
    if (pred()) return true;  
    wait(lock);  
}  
return pred();
```

Note that the returned value indicates whether *pred* evaluated to *true*, regardless of whether there was a stop requested or not.

Note: The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the [BasicLockable](#)⁷⁹⁵ requirements, which must be locked by the current thread
- **token** – a `hpx::stop_token` to register interruption for
- **pred** – predicate which returns *false* if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`

- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool result of *pred()*.

```
template<typename Lock, typename Predicate>
inline bool wait_until(Lock &lock, stop_token stoken, hpx::chrono::steady_time_point const
                        &abs_time, Predicate pred, error_code &ec = throws)
```

wait_until causes the current thread to block until the condition variable is notified, a specific time is reached, or a spurious wakeup occurs, optionally looping until some predicate is satisfied (`bool(pred()) == true`).

An interruptible wait: registers the *condition_variable_any* for the duration of *wait_until()*, to be notified if a stop request is made on the given stoken’s associated stop-state; it is then equivalent to

```
while (!stoken.stop_requested()) {
    if (pred())
        return true;
    if (wait_until(lock, timeout_time) == hpx::cv_status::timeout)
        return pred();
}
return pred();
```

Note: The effects of *notify_one()/notify_all()* and each of the three atomic parts of *wait()/wait_for()/wait_until()* (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for *notify_one()* to, for example, be delayed and unblock a thread that started waiting just after the call to *notify_one()* was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the requirements of [BasicLockable](#)⁷⁹⁶, which must be locked by the current thread.
- **stoken** – a *hpx::stop_token* to register interruption for.
- **abs_time** – represents the time when waiting should be stopped.
- **pred** – predicate which returns *false* if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred();`.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

bool *pred()*, regardless of whether the timeout was met or stop was requested.

```
template<typename Lock, typename Predicate>
inline bool wait_for(Lock &lock, stop_token stoken, hpx::chrono::steady_duration const &rel_time,
                    Predicate pred, error_code &ec = throws)
```

Equivalent to.

```
return wait_until(lock, std::move(stoken),
                 hpx::chrono::steady_clock::now() + rel_time,
                 std::move(pred));
```

Note: The effects of `notify_one()/notify_all()` and each of the three atomic parts of `wait()/wait_for()/wait_until()` (unlock+wait, wakeup, and lock) take place in a single total order that can be viewed as modification order of an atomic variable: the order is specific to this individual condition variable. This makes it impossible for `notify_one()` to, for example, be delayed and unblock a thread that started waiting just after the call to `notify_one()` was made.

Template Parameters

- **Lock** – Type of *lock*.
- **Predicate** – Type of *pred*.

Parameters

- **lock** – an object of type *Lock* that meets the [BasicLockable](#)⁷⁹⁷ requirements, which must be locked by the current thread.
- **stoken** – a `hpx::stop_token` to register interruption for.
- **rel_time** – an object of type `hpx::chrono::duration` representing the maximum time to spend waiting. Note that *rel_time* must be small enough not to overflow when added to `hpx::chrono::steady_clock::now()`.
- **pred** – predicate which returns *false* if the waiting should be continued (`bool(pred()) == false`). The signature of the predicate function should be equivalent to the following: `bool pred()` ;.
- **ec** – Used to hold error code value originated during the operation. Defaults to *throws* — A special ‘throw on error’ *error_code*.

Returns

`bool pred()`, regardless of whether the timeout was met or stop was requested.

hpx::nostopstate, hpx::stop_callback, hpx::stop_source, hpx::stop_token, hpx::nostopstate_t

Defined in header [hpx/stop_token.hpp](#)⁷⁹⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

template<typename **Callback**>

stop_callback(*stop_token*, *Callback*) -> *stop_callback*<*Callback*>

The `stop_callback` class template provides an RAII object type that registers a callback function for an associated `hpx::stop_token` object, such that the callback function will be invoked when the `hpx::stop_token`'s associated `hpx::stop_source` is requested to stop. Callback functions registered via `stop_callback`'s constructor are invoked either in the same thread that successfully invokes `request_stop()` for a `hpx::stop_source` of the `stop_callback`'s associated `hpx::stop_token`; or if stop has already been requested prior to the constructor's registration, then the callback is invoked in the thread constructing the `stop_callback`. More than one `stop_callback` can be created for the same `hpx::stop_token`, from the same or different threads concurrently. No guarantee is provided for the order in which they will be executed, but they will be invoked synchronously; except for `stop_callback(s)` constructed after stop has already been requested for the `hpx::stop_token`, as described previously. If an invocation of a callback exits via an exception then `hpx::terminate` is called. `hpx::stop_callback` is not *CopyConstructible*, *CopyAssignable*, *MoveConstructible*, nor *MoveAssignable*. The template param `Callback` type must be both *invocable* and *destructible*. Any return value is ignored.

Variables

```
constexpr nostopstate_t nostopstate = {}
```

This is a constant object instance of `hpx::nostopstate_t` for use in constructing an empty `hpx::stop_source`, as a placeholder value in the non-default constructor.

```
struct nostopstate_t
```

#include <stop_token.hpp> Unit type intended for use as a placeholder in `hpx::stop_source` non-default constructor, that makes the constructed `hpx::stop_source` empty with no associated stop-state.

Public Functions

```
explicit nostopstate_t() = default
```

```
template<typename Callback>
```

```
class stop_callback
```

```
class stop_source
```

#include <stop_token.hpp> The `stop_source` class provides the means to issue a stop request, such as for `hpx::jthread` cancellation. A stop request made for one `stop_source` object is visible to all `stop_sources` and `hpx::stop_tokens` of the same associated stop-state; any `hpx::stop_callback(s)` registered for associated `hpx::stop_token(s)` will be invoked, and any `hpx::condition_variable_any` objects waiting on associated `hpx::stop_token(s)` will be awoken. Once a stop is requested, it cannot be withdrawn. Additional stop requests have no effect.

Note: For the purposes of `hpx::jthread` cancellation the `stop_source` object should be retrieved from the `hpx::jthread` object using `get_stop_source()`; or stop should be requested directly from the `hpx::jthread` object using `request_stop()`. This will then use the same associated stop-state as that passed into the `hpx::jthread`'s invoked function argument (i.e., the function being executed on its thread). For other uses, however, a `stop_source` can be constructed separately using the default constructor, which creates new stop-state.

Public Functions

```
inline stop_source()
```

```
inline explicit stop_source(nostopstate_t) noexcept
```

```
inline stop_source(stop_source const &rhs) noexcept
```

```
stop_source(stop_source&&) noexcept = default
```

```
inline stop_source &operator=(stop_source const &rhs) noexcept
```

```
stop_source &operator=(stop_source&&) noexcept = default
```

```
inline ~stop_source()
```

```

```

class **stop_token**

#include <stop_token.hpp> The `stop_token` class provides the means to check if a stop request has been made or can be made, for its associated `hpx::stop_source` object. It is essentially a thread-safe “view” of the associated stop-state. The *stop_token* can also be passed to the constructor of `hpx::stop_callback`, such that the callback will be invoked if the *stop_token*’s associated `hpx::stop_source` is requested to stop. And *stop_token* can be passed to the interruptible waiting functions of `hpx::condition_variable_any`, to interrupt the condition variable’s wait if stop is requested.

Note: A `stop_token` object is not generally constructed independently, but rather retrieved from a `hpx::jthread` or `hpx::stop_source`. This makes it share the same associated stop-state as the `hpx::jthread` or `hpx::stop_source`.

hpx::binary_semaphore

Defined in header [hpx/semaphore.hpp](#)⁷⁹⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **binary_semaphore**

#include <binary_semaphore.hpp> A binary semaphore is a semaphore object that has only two states. `binary_semaphore` is an alias for specialization of `hpx::counting_semaphore` with *LeastMaxValue* being 1. HPX's implementation of `binary_semaphore` is more efficient than the default implementation of a counting semaphore with a unit resource count (`hpx::counting_semaphore`).

⁷⁹⁹ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/semaphore.hpp

Public Functions

binary_semaphore(*binary_semaphore* const&) = delete

binary_semaphore &**operator**=(*binary_semaphore* const&) = delete

binary_semaphore(*binary_semaphore*&&) = delete

binary_semaphore &**operator**=(*binary_semaphore*&&) = delete

explicit **binary_semaphore**(*std::ptrdiff_t* value = 1)

Constructs an object of type `hpx::binary_semaphore` with the internal counter initialized to *value*.

Parameters

value – The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.

~binary_semaphore() = default

void **release**(*std::ptrdiff_t* update = 1)

Atomically increments the internal counter by the value of *update*. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in *acquire*, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of *try_acquire* that observe the result of the effects.

Throws

std::system_error –

Parameters

update – the amount to increment the internal counter by

Pre

Both *update* ≥ 0 and *update* $\leq \text{max}() - \text{counter}$ are *true*, where *counter* is the value of the internal counter.

bool **try_acquire**() noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns

true if it decremented the internal counter, otherwise *false*

void **acquire**()

Repeatedly performs the following steps, in order:

- Evaluates *try_acquire*. If the result is *true*, returns.

Blocks on **this* until counter is greater than zero.

Throws

std::system_error –

Returns

void.

bool **try_acquire_until**(*hpx::chrono::steady_time_point* const &*abs_time*)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *abs_time* time point has been passed.

Parameters

abs_time – the earliest time the function must wait until in order to fail

Throws

`std::system_error` –

Returns

true if it decremented the internal counter, otherwise *false*.

```
bool try_acquire_for(hpx::chrono::steady_duration const &rel_time)
```

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *rel_time* duration has been exceeded.

Throws

`std::system_error` –

Parameters

rel_time – the minimum duration the function must wait for to fail

Returns

true if it decremented the internal counter, otherwise *false*

Public Static Functions

```
static constexpr std::ptrdiff_t max() noexcept
```

Returns The maximum value of counter. This value is greater than or equal to *LeastMaxValue*.

Returns

The internal counter's maximum possible value, as a *std::ptrdiff_t*.

hpx/synchronization/sliding_semaphore.hpp

Defined in header `hpx/synchronization/sliding_semaphore.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

Typedefs

```
using sliding_semaphore = sliding_semaphore_var<>
```

```
template<typename Mutex = hpx::spinlock>
```

```
class sliding_semaphore_var
```

#include <sliding_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Sliding semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. The difference to a counting semaphore is that a sliding semaphore will not limit the number of

threads which are allowed to proceed, but will make sure that the difference between the (arbitrary) number passed to set and wait does not exceed a given threshold.

Public Functions

sliding_semaphore_var(*sliding_semaphore_var* const&) = delete

sliding_semaphore_var &**operator**=(*sliding_semaphore_var* const&) = delete

sliding_semaphore_var(*sliding_semaphore_var*&&) = delete

sliding_semaphore_var &**operator**=(*sliding_semaphore_var*&&) = delete

inline explicit **sliding_semaphore_var**(*std::int64_t* max_difference, *std::int64_t* lower_limit = 0) noexcept

Construct a new sliding semaphore.

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

inline void **set_max_difference**(*std::int64_t* max_difference, *std::int64_t* lower_limit = 0) noexcept

Set/Change the difference that will cause the semaphore to trigger

Parameters

- **max_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower_limit** – [in] The initial lower limit.

inline void **wait**(*std::int64_t* upper_limit)

Wait for the semaphore to be signaled.

Parameters

- **upper_limit** – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

inline bool **try_wait**(*std::int64_t* upper_limit = 1)

Try to wait for the semaphore to be signaled.

Parameters

- **upper_limit** – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower_limit which was set by *signal()* is larger than the max_difference.

Returns

The function returns true if the calling thread would not block if it was calling *wait()*.

inline void **signal**(*std::int64_t* lower_limit)

Signal the semaphore.

Parameters

- **lower_limit** – [in] The new lower limit. This will update the current lower limit of this semaphore. It will also re-schedule all suspended threads for which their associated upper limit is not larger than the lower limit plus the max_difference.

inline *std::int64_t* **signal_all**()

```
template<std::ptrdiff_t LeastMaxValue = PTRDIFF_MAX>
```

```
class counting_semaphore
```

#include <counting_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike `hpx::mutex` a `counting_semaphore` is not tied to threads of execution — acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on `counting_semaphore` can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of `hpx::counting_semaphore` are not [DefaultConstructible](#)⁸⁰¹, [CopyConstructible](#)⁸⁰², [MoveConstructible](#)⁸⁰³, [CopyAssignable](#)⁸⁰⁴, or [MoveAssignable](#)⁸⁰⁵.

⁸⁰⁰ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/semaphore.hpp

Note: `counting_semaphore`'s `try_acquire()` can spuriously fail.

Template Parameters

LeastMaxValue – `counting_semaphore` allows more than one concurrent access to the same resource, for at least *LeastMaxValue* concurrent accessors. As its name indicates, the *LeastMaxValue* is the minimum max value, not the actual max value. Thus `max()` can yield a number larger than *LeastMaxValue*.

Public Functions

`counting_semaphore(counting_semaphore const&) = delete`

`counting_semaphore &operator=(counting_semaphore const&) = delete`

`counting_semaphore(counting_semaphore&&) = delete`

`counting_semaphore &operator=(counting_semaphore&&) = delete`

explicit `counting_semaphore(std::ptrdiff_t value)`

Constructs an object of type `hpx::counting_semaphore` with the internal counter initialized to *value*.

Parameters

value – The initial value of the internal semaphore lock count. Normally this value should be zero (which is the default), values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set.

`~counting_semaphore()` = default

void `release(std::ptrdiff_t update = 1)`

Atomically increments the internal counter by the value of *update*. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in `acquire`, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of *try_acquire* that observe the result of the effects.

Throws

`std::system_error` –

Parameters

update – the amount to increment the internal counter by

Pre

Both `update >= 0` and `update <= max() - counter` are *true*, where *counter* is the value of the internal counter.

bool `try_acquire()` noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns

true if it decremented the internal counter, otherwise *false*

void `acquire()`

Repeatedly performs the following steps, in order:

- Evaluates `try_acquire`. If the result is *true*, returns.

- Blocks on **this* until counter is greater than zero.

Throws

`std::system_error` –

Returns

void.

bool **try_acquire_until**(*hpx::chrono::steady_time_point* const &*abs_time*)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *abs_time* time point has been passed.

Parameters

abs_time – the earliest time the function must wait until in order to fail

Throws

`std::system_error` –

Returns

true if it decremented the internal counter, otherwise *false*.

bool **try_acquire_for**(*hpx::chrono::steady_duration* const &*rel_time*)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *rel_time* duration has been exceeded.

Throws

`std::system_error` –

Parameters

rel_time – the minimum duration the function must wait for to fail

Returns

true if it decremented the internal counter, otherwise *false*

Public Static Functions

static constexpr *std::ptrdiff_t* **max**() noexcept

Returns The maximum value of counter. This value is greater than or equal to *LeastMaxValue*.

Returns

The internal counter's maximum possible value, as a *std::ptrdiff_t*.

template<typename **Mutex** = *hpx::spinlock*, int **N** = 0>

class **counting_semaphore_var**

#include <counting_semaphore.hpp> A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike *hpx::mutex* a *counting_semaphore_var* is not tied to threads of execution — acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on *counting_semaphore_var* can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template `counting_semaphore_var` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of `hpx::counting_semaphore_var` are not [DefaultConstructible](#)⁸⁰⁶, [CopyConstructible](#)⁸⁰⁷, [MoveConstructible](#)⁸⁰⁸, [CopyAssignable](#)⁸⁰⁹, or [MoveAssignable](#)⁸¹⁰.

Note: `counting_semaphore_var`'s `try_acquire()` can spuriously fail.

Template Parameters

- **Mutex** – Type of mutex
- **N** – The initial value of the internal semaphore lock count.

Public Functions

explicit **counting_semaphore_var**(*std::ptrdiff_t* value = *N*)

Constructs an object of type `hpx::counting_semaphore_value` with the internal counter initialized to *N*.

Parameters

value – The initial value of the internal semaphore lock count. Normally this value should be zero, values greater than zero are equivalent to the same number of signals pre-set, and negative values are equivalent to the same number of waits pre-set. Defaults to *N* (which in turn defaults to zero).

counting_semaphore_var(*counting_semaphore_var* const&) = delete

counting_semaphore_var &**operator**=(*counting_semaphore_var* const&) = delete

void **wait**(*std::ptrdiff_t* count = 1)

Wait for the semaphore to be signaled.

Parameters

count – The value by which the internal lock count will be decremented. At the same time this is the minimum value of the lock count at which the thread is not yielded.

bool **try_wait**(*std::ptrdiff_t* count = 1)

Try to wait for the semaphore to be signaled.

Parameters

count – The value by which the internal lock count will be decremented. At the same time this is the minimum value of the lock count at which the thread is not yielded.

Returns

`try_wait` returns true if the calling thread was able to acquire the requested amount of credits. `try_wait` returns false if not sufficient credits are available at this point in time.

void **signal**(*std::ptrdiff_t* count = 1)

Signal the semaphore.

Parameters

count – The value by which the internal lock count will be incremented.

`std::ptrdiff_t` **signal_all()**

Unblock all acquirers.

Returns

`std::ptrdiff_t` internal lock count after the operation.

void **release**(`std::ptrdiff_t` update = 1)

Atomically increments the internal counter by the value of `update`. Any thread(s) waiting for the counter to be greater than 0, such as due to being blocked in `acquire`, will subsequently be unblocked.

Note: Synchronization: Strongly happens before invocations of `try_acquire` that observe the result of the effects.

Throws

`std::system_error` –

Parameters

update – the amount to increment the internal counter by

Pre

Both `update >= 0` and `update <= max() - counter` are *true*, where *counter* is the value of the internal counter.

bool **try_acquire**() noexcept

Tries to atomically decrement the internal counter by 1 if it is greater than 0; no blocking occurs regardless.

Returns

true if it decremented the internal counter, otherwise *false*

void **acquire**()

Repeatedly performs the following steps, in order:

- Evaluates `try_acquire`. If the result is *true*, returns.
- Blocks on `*this` until counter is greater than zero.

Throws

`std::system_error` –

Returns

void.

bool **try_acquire_until**(`hpx::chrono::steady_time_point` const &`abs_time`)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *abs_time* time point has been passed.

Parameters

abs_time – the earliest time the function must wait until in order to fail

Throws

`std::system_error` –

Returns

true if it decremented the internal counter, otherwise *false*.

bool **try_acquire_for**(`hpx::chrono::steady_duration` const &`rel_time`)

Tries to atomically decrement the internal counter by 1 if it is greater than 0; otherwise blocks until it is greater than 0 and can successfully decrement the internal counter, or the *rel_time* duration has been exceeded.

Throws

`std::system_error` –

Parameters

rel_time – the minimum duration the function must wait for to fail

Returns

true if it decremented the internal counter, otherwise *false*

Public Static Functions

static constexpr `std::ptrdiff_t` **max**() noexcept

Returns The maximum value of counter. This value is greater than or equal to *LeastMaxValue*.

Returns

The internal counter's maximum possible value, as a `std::ptrdiff_t`.

Private Types

using **mutex_type** = *Mutex*

hpx::latch

Defined in header `hpx/latch.hpp`⁸¹¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **latch**

#include <latch.hpp> Latches are a thread coordination mechanism that allow one or more threads to block until an operation is completed. An individual latch is a single-use object; once the operation has been completed, the latch cannot be reused.

Subclassed by *hpx::lcos::local::latch*

Public Functions

latch(*latch* const&) = delete

latch(*latch*&&) = delete

latch &**operator**=(*latch* const&) = delete

latch &**operator**=(*latch*&&) = delete

inline explicit **latch**(*std::ptrdiff_t* const count)

Initialize the latch

Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.

~latch() = default

Requires: No threads are blocked at the synchronization point.

Note: May be called even if some threads have not yet returned from *wait()* or *count_down_and_wait()*, provided that counter_ is 0.

Note: The destructor might not return until all threads have exited *wait()* or *count_down_and_wait()*.

Note: It is the caller's responsibility to ensure that no other thread enters *wait()* after one thread has called the destructor. This may require additional coordination.

inline void **count_down**(*std::ptrdiff_t* const update)

Decrements counter_ by n. Does not block.

Requires: counter_ >= n and n >= 0.

Synchronization: Synchronizes with all calls that block on this latch and with all *try_wait* calls on this latch that return true .

Throws

Nothing. –

inline bool **try_wait**() const noexcept

Returns: With very low probability false. Otherwise, counter == 0.

inline void **wait**() const

If counter_ is 0, returns immediately. Otherwise, blocks the calling thread at the synchronization point until counter_ reaches 0.

Throws

Nothing. –

inline void **arrive_and_wait**(*std::ptrdiff_t* update = 1)

Effects: Equivalent to: *count_down*(update); *wait*();

Public Static Functions

static inline constexpr std::ptrdiff_t() max () noexcept

Returns: The maximum value of counter that the implementation supports.

bool **notified_**

namespace **lcos**

namespace **local**

class **latch** : public *hpx::latch*

#include <latch.hpp> A latch maintains an internal `counter_` that is initialized when the latch is created. Threads may block at a synchronization point waiting for `counter_` to be decremented to 0. When `counter_` reaches 0, all such blocked threads are released.

Calls to `countdown_and_wait()`, `count_down()`, `wait()`, `is_ready()`, `count_up()`, and `reset()` behave as atomic operations.

Note: A `hpx::latch` is not an LCO in the sense that it has no global id, and it can't be triggered using the action (parcel) mechanism. Use `hpx::distributed::latch` instead if this is required. It is just a low level synchronization primitive allowing to synchronize a given number of *threads*.

Public Functions

latch(*latch* const&) = delete

latch(*latch*&&) = delete

latch &**operator**=(*latch* const&) = delete

latch &**operator**=(*latch*&&) = delete

inline explicit **latch**(*std::ptrdiff_t* const count)

Initialize the latch

Requires: count >= 0. Synchronization: None Postconditions: counter_ == count.

~latch() = default

Requires: No threads are blocked at the synchronization point.

Note: May be called even if some threads have not yet returned from *wait()* or *count_down_and_wait()*, provided that counter_ is 0.

Note: The destructor might not return until all threads have exited *wait()* or *count_down_and_wait()*.

Note: It is the caller's responsibility to ensure that no other thread enters *wait()* after one thread has called the destructor. This may require additional coordination.

inline void **count_down_and_wait**()

Decrements counter_ by 1 . Blocks at the synchronization point until counter_ reaches 0.

Requires: counter_ > 0.

Synchronization: Synchronizes with all calls that block on this latch and with all *is_ready* calls on this latch that return true.

Throws

Nothing. –

inline bool **is_ready**() const noexcept

Returns: counter_ == 0. Does not block.

Throws

Nothing. –

inline void **abort_all**() const

inline void **count_up**(*std::ptrdiff_t* const n)

Increments counter_ by n. Does not block.

Requires: n >= 0.

Throws

Nothing. –

```
inline void reset(std::ptrdiff_t const n)
```

Reset counter_ to n. Does not block.

Requires: n >= 0.

Throws

Nothing. –

```
inline bool reset_if_needed_and_count_up(std::ptrdiff_t const n, std::ptrdiff_t const count)
```

Effects: Equivalent to: if (*is_ready()*) reset(count); count_up(n); Returns: true if the latch was reset

hpx::barrier

Defined in header [hpx/barrier.hpp](#)⁸¹².

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

```
template<typename OnCompletion = detail::empty_oncompletion>
```

```
class barrier
```

#include <barrier.hpp> A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier. [Note: A barrier is useful for managing repeated tasks that are handled by multiple threads. - end note] Each barrier phase consists of the following steps:

- The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
- When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the `CompletionFunction` template parameter, the completion step is run as part of the call to `arrive` or `arrive_and_drop` that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.
- When the completion step finishes, the expected count is reset to what was specified by the expected argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run. The phase completion step that is executed at the end of each phase has the following effects:

- Invokes the completion function, equivalent to `completion()`.
- Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object's member functions other than `wait` are called while the completion step is in progress.

Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.

⁸¹² <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/barrier.hpp>

CompletionFunction shall meet the Cpp17MoveConstructible (Table 28) and Cpp17Destructible (Table 32) requirements. `std::is_nothrow_invocable_v<CompletionFunction&>` shall be true.

The default value of the CompletionFunction template parameter is an unspecified type, such that, in addition to satisfying the requirements of CompletionFunction, it meets the Cpp17DefaultConstructible requirements (Table 27) and `completion()` has no effects.

`barrier::arrival_token` is an unspecified type, such that it meets the Cpp17MoveConstructible (Table 28), Cpp17MoveAssignable (Table 30), and Cpp17Destructible (Table 32) requirements.

Public Types

using **arrival_token** = bool

Public Functions

inline explicit constexpr **barrier**(*std::ptrdiff_t* expected, *OnCompletion* completion = *OnCompletion()*)

Preconditions: `expected >= 0` is true and `expected <= max()` is true.

Effects: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to `expected`. Initializes completion with `std::move(f)`. Starts the first phase. [Note: If `expected` is 0 this object can only be destroyed.- end note]

Throws: Any exception thrown by CompletionFunction's move constructor.

~barrier() = default

inline *arrival_token* **arrive**(*std::ptrdiff_t* update = 1)

Preconditions: `update > 0` is true, and `update` is less than or equal to the expected count for the current barrier phase.

Effects: Constructs an object of type `arrival_token` that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by `update`.

Synchronization: The call to `arrive` strongly happens before the start of the phase completion step for the current phase.

Error conditions: Any of the error conditions allowed for mutex types ([`thread.mutex.requirements.mutex`]). [Note: This call can cause the completion step for the current phase to start.- end note]

Throws

system_error – when an exception is required ([`thread.req.exception`]).

Returns

: The constructed `arrival_token` object.

inline void **wait**(*arrival_token* &&*old_phase*) const

Preconditions: `arrival` is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

Effects: Blocks at the synchronization point associated with `HPX_MOVE(arrival)` until the phase completion step of the synchronization point's phase is run. [Note: If `arrival` is associated with the synchronization point for a previous phase, the call returns immediately. - end note]

Throws

system_error – when an exception is required ([`thread.req.exception`]). Error conditions: Any of the error conditions allowed for mutex types ([`thread.mutex.requirements.mutex`]).

inline void **arrive_and_wait**()

Effects: Equivalent to: wait(arrive()).

inline void **arrive_and_drop**()

Preconditions: The expected count for the current barrier phase is greater than zero.

Effects: Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

Synchronization: The call to arrive_and_drop strongly happens before the start of the phase completion step for the current phase.

Throws

system_error – when an exception is required ([thread.req.exception]). Error conditions:

Any of the error conditions allowed for mutex types ([thread.mutex.requirements.mutex]).

[Note: This call can cause the completion step for the current phase to start.- end note]

tag_invoke

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx::invoke

Defined in header `hpx/functional.hpp`⁸¹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Functions

```
template<typename F, typename ...Ts>
constexpr util::invoke_result_t<F, Ts&&...> invoke(F &&f, Ts&&... vs)
    noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F,
    f), HPX_FORWARD(Ts, vs)...)))
```

Invokes the given callable object `f` with the content of the argument pack `vs`

Note: This function is similar to `std::invoke` (C++17)

Parameters

- **f** – Requires to be a callable object. If `f` is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- **vs** – An arbitrary pack of arguments

Throws

`std::exception` – like objects thrown by call to object `f` with the argument types `vs`.

Returns

The result of the callable object when it's called with the given argument types.

```
template<typename R, typename F, typename ...Ts>
constexpr R invoke_r(F &&f, Ts&&... vs) noexcept(noexcept(HPX_INVOKE(HPX_FORWARD(F, f),
    HPX_FORWARD(Ts, vs)...)))
```

Template Parameters

R – The result type of the function when it's called with the content of the given argument types `vs`.

namespace **functional**

struct **invoke**

⁸¹³ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

Public Functions

```
template<typename F, typename ...Ts>
inline constexpr util::invoke_result_t<F, Ts&&...> operator()(F &&f, Ts&&... vs) const noexcept(
    noexcept(HPX_INVOKE(HPX_FORWARD(F, f), HPX_FORWARD(Ts, vs)...)))
```

```
template<typename R>
```

```
struct invoke_r
```

Public Functions

See *Public API* for a list of names and headers that are part of the public HPX API.

hpx/thread_pool_util/thread_pool_suspension_helpers.hpp

Defined in header `hpx/thread_pool_util/thread_pool_suspension_helpers.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
namespace threads
```

Functions

```
hpx::future<void> resume_processing_unit(thread_pool_base &pool, std::size_t virt_core)
```

Resumes the given processing unit. When the processing unit has been resumed the returned future will be ready.

Note: Can only be called from an HPX thread. Use `resume_processing_unit_cb` or to resume the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **virt_core** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.

Returns

A `future<void>` which is ready when the given processing unit has been resumed.

```
void resume_processing_unit_cb(thread_pool_base &pool, hpx::function<void()> callback,  
                               std::size_t virt_core, error_code &ec = throws)
```

Resumes the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been resumed.

Note: Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to resume.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
hpx::future<void> suspend_processing_unit(thread_pool_base &pool, std::size_t virt_core)
```

Suspends the given processing unit. When the processing unit has been suspended the returned future will be ready.

Note: Can only be called from an HPX thread. Use `suspend_processing_unit_cb` or to suspend the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to suspend a processing unit from.
- **virt_core** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.

Throws

`hpx::exception` – if called from outside the HPX runtime.

Returns

A `future<void>` which is ready when the given processing unit has been suspended.

```
void suspend_processing_unit_cb(hpx::function<void()> callback, thread_pool_base &pool,  
                               std::size_t virt_core, error_code &ec = throws)
```

Suspends the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been suspended.

Note: Requires that the pool has `threads::policies::enable_elasticity` set.

Parameters

- **pool** – [in] The thread pool to suspend a processing unit from.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt_core** – [in] The processing unit to suspend.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

hpx::future<void> **resume_pool**(*thread_pool_base* &pool)

Resumes the thread pool. When the all OS threads on the thread pool have been resumed the returned future will be ready.

Note: Can only be called from an HPX thread. Use `resume_cb` or `resume_direct` to suspend the pool from outside HPX.

Parameters

pool – [in] The thread pool to resume.

Throws

hpx::exception – if called from outside the HPX runtime.

Returns

A *future<void>* which is ready when the thread pool has been resumed.

void **resume_pool_cb**(*thread_pool_base* &pool, *hpx::function<void()>* callback, *error_code* &ec = *throws*)

Resumes the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been resumed.

Parameters

- **pool** – [in] The thread pool to resume.
- **callback** – [in] called when the thread pool has been resumed.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

hpx::future<void> **suspend_pool**(*thread_pool_base* &pool)

Suspends the thread pool. When the all OS threads on the thread pool have been suspended the returned future will be ready.

Note: Can only be called from an HPX thread. Use `suspend_cb` or `suspend_direct` to suspend the pool from outside HPX. A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

pool – [in] The thread pool to suspend.

Throws

hpx::exception – if called from outside the HPX runtime.

Returns

A *future<void>* which is ready when the thread pool has been suspended.

void **suspend_pool_cb**(*thread_pool_base* &pool, *hpx::function<void()>* callback, *error_code* &ec = *throws*)

Suspends the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been suspended.

Note: A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

- **pool** – [in] The thread pool to suspend.
- **callback** – [in] called when the thread pool has been suspended.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

hpx::exception – if called from an HPX thread which is running on the pool itself.

hpx::unlock_guard

Defined in header `hpx/mutex.hpp`⁸¹⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

template<typename **Lock**>

class **relock_guard**

#include <unlock_guard.hpp> The class *relock_guard* is a mutex wrapper that provides a convenient mechanism for reacquiring a lock that was released by an *unlock_guard*, for the duration of a scoped block.

relock_guard performs the opposite functionality of *unlock_guard* within an already-unlocked section.

When a *relock_guard* object is created, it takes ownership of the underlying *Lock* associated with the given *unlock_guard* by locking it. When control leaves the scope in which the *relock_guard* object was created, the *relock_guard* is destructed and the underlying *Lock* is released again (unlocked), restoring the unlocked state managed by the enclosing *unlock_guard*. In this way, *relock_guard* allows a temporarily locked section to be nested within an unlocked section created by *unlock_guard*.

Note: *relock_guard* is non-copyable and non-movable.

Template Parameters

Lock – The type of the lockable object managed by the associated *unlock_guard*.

⁸¹⁵ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/mutex.hpp

Public Functions

```
inline explicit relock_guard(unlock_guard<Lock> &ul) noexcept
relock_guard(relock_guard const&) = delete
relock_guard(relock_guard&&) = delete
relock_guard &operator=(relock_guard const&) = delete
relock_guard &operator=(relock_guard&&) = delete
inline ~relock_guard()
```

Private Members

```
unlock_guard<Lock> &ul_
```

```
template<typename Lock>
```

```
class unlock_guard
```

#include <unlock_guard.hpp> The class *unlock_guard* is a mutex wrapper that provides a convenient mechanism for releasing a mutex for the duration of a scoped block.

unlock_guard performs the opposite functionality of *lock_guard*.

When a *lock_guard* object is created, it attempts to take ownership of the mutex it is given. When control leaves the scope in which the *lock_guard* object was created, the *lock_guard* is destructed and the mutex is released. Accordingly, when an *unlock_guard* object is created, it attempts to release the ownership of the mutex it is given. So, when control leaves the scope in which the *unlock_guard* object was created, the *unlock_guard* is destructed and the mutex is owned again. In this way, the mutex is unlocked in the constructor and locked in the destructor, so that one can have an unlocked section within a locked one.

Note: *unlock_guard* is non-copyable and non-movable.

Template Parameters

Lock – The type of the lockable object managed by the *unlock_guard*.

Public Functions

```
inline explicit unlock_guard(Lock &l) noexcept
unlock_guard(unlock_guard const&) = delete
unlock_guard(unlock_guard&&) = delete

threading

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx::jthread

Defined in header *hpx/jthread.hpp*.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

inline void **swap**(*jthread* &lhs, *jthread* &rhs) noexcept

class **jthread**

#include <jthread.hpp> The class *jthread* represents a single thread of execution. It has the same general behavior as *hpx::thread*, except that *jthread* automatically rejoins on destruction, and can be cancelled/stopped in certain situations. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, *hpx::terminate* is called. The top-level function may communicate its return value or an exception to the caller via *hpx::promise* or by modifying shared variables (which may require synchronization, see *hpx::mutex* and *hpx::atomic*) Unlike *hpx::thread*, the *jthread* logically holds an internal private member of type *hpx::stop_source*, which maintains a shared stop-state. The *jthread* constructor accepts a function that takes a *hpx::stop_token* as its first argument, which will be passed in by the *jthread* from its internal *stop_source*. This allows the function to check if stop has been requested during its execution, and return if it has. *hpx::jthread* objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may be not associated with any *jthread* objects (after detach). No two *hpx::jthread* objects may represent the same thread of execution; *hpx::jthread* is not *CopyConstructible* or *CopyAssignable*, although it is *MoveConstructible* and *MoveAssignable*.

Public Types

```

namespace **this_thread**

Functions

thread::id **get_id**() noexcept

Returns the id of the current thread.

void **yield**() noexcept

Provides a hint to the implementation to reschedule the execution of threads, allowing other threads to run.

Note: The exact behavior of this function depends on the implementation, in particular on the mechanics of the OS scheduler in use and the state of the system. For example, a first-in-first-out realtime scheduler (SCHED_FIFO in Linux) would suspend the current thread and put it on the back of the queue of the same-priority threads that are ready to run (and if there are no other threads at the same priority, yield has no effect).

void **yield_to**(*thread::id* const&) noexcept

threads::thread_priority **get_priority**() noexcept

std::ptrdiff_t **get_stack_size**() noexcept

void **interruption_point**()

bool **interruption_enabled**()

bool **interruption_requested**()

void **interrupt**()

void **sleep_until**(*hpx::chrono::steady_time_point* const &*abs_time*)

Blocks the execution of the current thread until specified *abs_time* has been reached.

It is recommended to use the clock tied to *abs_time*, in which case adjustments of the clock may be taken into account. Thus, the duration of the block might be more or less than *abs_time*-*Clock::now*() at the time of the call, depending on the direction of the adjustment and whether it is honored by the implementation. The function also may block until after *abs_time* has been reached due to process scheduling or resource contention delays.

Parameters

abs_time – absolute time to block until

```
inline void sleep_for(hpx::chrono::steady_duration const &rel_time)
```

Blocks the execution of the current thread for at least the specified *rel_time*. This function may block for longer than *rel_time* due to scheduling or resource contention delays.

It is recommended to use a steady clock to measure the duration. If an implementation uses a system clock instead, the wait time may also be sensitive to clock adjustments.

Parameters

rel_time – time duration to sleep

```
std::size_t get_thread_data()
```

```
std::size_t set_thread_data(std::size_t)
```

threading_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/threading_base/thread_description.hpp

Defined in header `hpx/threading_base/thread_description.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

std::ostream &**operator<<**(*std::ostream*&, *thread_description* const&)

std::string **as_string**(*thread_description* const &desc)

threads::thread_description **get_thread_description**(*thread_id_type* const &id, *error_code* &ec = *throws*)

The function `get_thread_description` is part of the thread related API allows to query the description of one of the threads known to the thread-manager.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the description of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the string “<unknown>”.

threads::thread_description **set_thread_description**(*thread_id_type* const &id, *threads::thread_description* const &desc = *threads::thread_description*(), *error_code* &ec = *throws*)

threads::thread_description **get_thread_lco_description**(*thread_id_type* const &id, *error_code* &ec = *throws*)

```

threads::thread_description set_thread_lco_description(thread_id_type const &id,
                                                    threads::thread_description const &desc
                                                    = threads::thread_description(),
                                                    error_code &ec = throws)

```

```
namespace util
```

Typedefs

```
using instead = hpx::threads::thread_description
```

hpx/threading_base/register_thread.hpp

Defined in header `hpx/threading_base/register_thread.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace threads
```

Functions

```
template<typename F>  
thread_function_type make_thread_function(F &&f)
```

```
template<typename F, typename ...Ts>  
thread_function_type make_thread_function_nullary(F &&f, Ts&&... ts)
```

```
void register_thread(threads::thread_init_data &data, threads::thread_pool_base *pool,  
                   threads::thread_id_ref_type &id, error_code &ec = hpx::throws)
```

Create a new *thread* using the given data.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

invalid_status – if the runtime system has not been started yet.

Returns

This function will return the internal id of the newly created HPX-thread.

```

threads::thread_id_ref_type register_thread(threads::thread_init_data &data,
                                             threads::thread_pool_base *pool, error_code &ec =
                                             hpx::throws)

```

```

void register_thread(threads::thread_init_data &data, threads::thread_id_ref_type &id, error_code
                    &ec = throws)

```

Create a new *thread* using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

invalid_status – if the runtime system has not been started yet.

Returns

This function will return the internal id of the newly created HPX-thread.

```

threads::thread_id_ref_type register_thread(threads::thread_init_data &data, error_code &ec =
                                             throws)

```

```

thread_id_ref_type register_work(threads::thread_init_data &data, threads::thread_pool_base *pool,
                                error_code &ec = hpx::throws)

```

Create a new work item using the given data.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

invalid_status – if the runtime system has not been started yet.

```

thread_id_ref_type register_work(threads::thread_init_data &data, error_code &ec = throws)

```

Create a new work item using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **data** – [in] The data to use for creating the thread.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

invalid_status – if the runtime system has not been started yet.

hpx::annotated_function

Defined in header [hpx/functional.hpp](#)⁸¹⁷.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

```
template<typename F>  
constexpr F &&annotated_function(F &&f, char const* = nullptr) noexcept
```

Returns a function annotated with the given annotation.

Annotating includes setting the thread description per thread id.

Parameters

f – Function to annotate

```
template<typename F>  
constexpr F &&annotated_function(F &&f, std::string const&) noexcept
```

hpx/threading_base/thread_helpers.hpp

Defined in header `hpx/threading_base/thread_helpers.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **this_thread**

Functions

```
threads::thread_restart_state suspend(threads::thread_schedule_state state, threads::thread_id_type  
nextid, threads::thread_description const &description =  
threads::thread_description("this_thread::suspend"),  
hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note: Must be called from within a HPX-thread.

⁸¹⁷ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/functional.hpp

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(threads::thread_schedule_state state =
                                           threads::thread_schedule_state::pending,
                                           threads::thread_description const &description =
                                           threads::thread_description("this_thread::suspend"),
                                           hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

Note: Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
                                       threads::thread_id_type id, threads::thread_description const
                                       &description =
                                       threads::thread_description("this_thread::suspend"),
                                       hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

Note: Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
                                           threads::thread_description const &description =
                                           threads::thread_description("this_thread::suspend"),
                                           hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads at the given time.

Note: Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,  
                                             threads::thread_description const &description =  
                                             threads::thread_description("this_thread::suspend"),  
                                             hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

Note: Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,  
                                             threads::thread_id_type const &id,  
                                             threads::thread_description const &description =  
                                             threads::thread_description("this_thread::suspend"),  
                                             hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

Note: Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

```
inline threads::thread_restart_state suspend(std::uint64_t ms, threads::thread_description const  
                                             &description =  
                                             threads::thread_description("this_thread::suspend"),  
                                             hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets

the new state of this thread to *suspended* and schedules a wakeup for this threads after the given time (specified in milliseconds).

Note: Must be called from within a HPX-thread.

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

threads::thread_pool_base ***get_pool**(*hpx::error_code* &ec = *hpx::throws*)

Returns a pointer to the pool that was used to run the current thread

Throws

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

namespace **threads**

Functions

thread_state **set_thread_state**(*thread_id_type* const &id, *thread_schedule_state* state = *thread_schedule_state::pending*, *thread_restart_state* stateex = *thread_restart_state::signaled*, *thread_priority* priority = *thread_priority::normal*, bool retry_on_active = true, *hpx::error_code* &ec = *hpx::throws*)

Set the thread state of the *thread* referenced by the *thread_id* *id*.

Note: If the thread referenced by the parameter *id* is in *thread_state::active* state this function schedules a new thread which will set the state of the thread as soon as it is not active anymore. The function returns *thread_state::active* in this case.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the previous state of the thread referenced by the *id* parameter. It will return one of the values as defined by the *thread_state* enumeration. If the thread is not known to the thread-manager the return value will be *thread_state::unknown*.

```
thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_time_point
                                     const &abs_time, std::atomic<bool> *started,
                                     thread_schedule_state state = thread_schedule_state::pending,
                                     thread_restart_state stateex = thread_restart_state::timeout,
                                     thread_priority priority = thread_priority::normal, bool
                                     retry_on_active = true, hpx::error_code &ec = hpx::throws)
```

Set the thread state of the *thread* referenced by the *thread_id id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (at the given time)

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **abs_time** – [in] Absolute point in time for the new thread to be run
- **started** – [in,out] A helper variable allowing to track the state of the timer helper thread
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

```
inline thread_id_ref_type set_thread_state(thread_id_type const &id,
                                           hpx::chrono::steady_time_point const &abs_time,
                                           thread_schedule_state state =
                                           thread_schedule_state::pending, thread_restart_state
                                           stateex = thread_restart_state::timeout, thread_priority
                                           priority = thread_priority::normal, bool retry_on_active
                                           = true, hpx::error_code &= throws)
```

```
inline thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_duration
                                           const &rel_time, thread_schedule_state state =
                                           thread_schedule_state::pending, thread_restart_state
                                           stateex = thread_restart_state::timeout, thread_priority
                                           priority = thread_priority::normal, bool retry_on_active
                                           = true, hpx::error_code &ec = hpx::throws)
```

Set the thread state of the *thread* referenced by the *thread_id id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (after the given duration)

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the

result code using the parameter *ec*. Otherwise, it throws an instance of `hpx::exception`.

Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **rel_time** – [in] Time duration after which the new thread should be run
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry_on_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

thread_state **get_thread_state**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*)
noexcept

The function `get_thread_backtrace` is part of the thread related API allows to query the currently stored thread back trace (which is captured during thread suspension).

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of `hpx::exception`. The function `get_thread_state` is part of the thread related API. It queries the state of one of the threads known to the thread-manager.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of `hpx::exception`.

Parameters

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.
- **id** – [in] The thread id of the thread the state should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the currently captured stack back trace of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the zero.

Returns

This function returns the thread state of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be *terminated*.

`std::size_t` **get_thread_phase**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*) noexcept

The function `get_thread_phase` is part of the thread related API. It queries the phase of one of the threads known to the thread-manager.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of `hpx::exception`.

Parameters

- **id** – [in] The thread id of the thread the phase should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the thread phase of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be ~0.

```
bool get_thread_interruption_enabled(thread_id_type const &id, hpx::error_code &ec =  
                                     hpx::throws)
```

Returns whether the given thread can be interrupted at this point.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns *true* if the given thread can be interrupted at this point in time. It will return *false* otherwise.

```
bool set_thread_interruption_enabled(thread_id_type const &id, bool enable, hpx::error_code  
                                     &ec = hpx::throws)
```

Set whether the given thread can be interrupted at this point.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should receive the new value.
- **enable** – [in] This value will determine the new interruption enabled status for the given thread.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns the previous value of whether the given thread could have been interrupted.

```
bool get_thread_interruption_requested(thread_id_type const &id, hpx::error_code &ec =  
                                     hpx::throws)
```

Returns whether the given thread has been flagged for interruption.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Returns

This function returns *true* if the given thread was flagged for interruption. It will return *false* otherwise.

void **interrupt_thread**(thread_id_type const &id, bool flag, *hpx::error_code* &ec = *hpx::throws*)

Flag the given thread for interruption.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **flag** – [in] The flag encodes whether the thread should be interrupted (if it is *true*), or 'uninterrupted' (if it is *false*).
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline void **interrupt_thread**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*)

void **interruption_point**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*)

Interrupt the current thread at this point if it was canceled. This will throw a *thread_interrupted* exception, which will cancel the thread.

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread which should be interrupted.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::thread_priority **get_thread_priority**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*) noexcept

Return priority of the given thread

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::ptrdiff_t **get_stack_size**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*) noexcept

Return stack size of the given thread

Note: As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

Parameters

- **id** – [in] The thread id of the thread whose priority is queried.

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

threads::thread_pool_base ***get_pool**(thread_id_type const &id, *hpx::error_code* &ec = *hpx::throws*)

Returns a pointer to the pool that was used to run the current thread

Throws

If – &ec != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield_aborted* if it is signaled with *wait_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null_thread_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid_status*.

hpx::get_worker_thread_num, hpx::get_local_worker_thread_num, hpx::get_local_worker_thread_num, hpx::get_thread_pool_num, hpx::get_thread_pool_num

Defined in header [hpx/runtime.hpp](#)⁸¹⁸.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Functions

std::size_t **get_worker_thread_num**() noexcept

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by *get_os_thread_count()*).

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

std::size_t **get_worker_thread_num**(*error_code* &ec) noexcept

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by *get_os_thread_count()*). It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

⁸¹⁸ <http://github.com/TheHPXProject/hpx/blob/unknown/libs/full/include/include/hpx/runtime.hpp>

Parameters

ec – [in,out] this represents the error status on exit (obsolete, ignored).

`std::size_t get_local_worker_thread_num()` noexcept

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t get_local_worker_thread_num(error_code &ec)` noexcept

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters

ec – [in,out] this represents the error status on exit (obsolete, ignored).

`std::size_t get_thread_pool_num()` noexcept

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t get_thread_pool_num(error_code &ec)` noexcept

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

Note: The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

Note: This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

Parameters

ec – [in,out] this represents the error status on exit (obsolete, ignored).

namespace **threads**

hpx::scoped_annotation

Defined in header [hpx/functional.hpp](#)⁸¹⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

struct **scoped_annotation**

#include <scoped_annotation.hpp> *scoped_annotation* associates a **name** with a section of code (scope). It can be used to visualize code execution in profiling tools like *Intel VTune*, *Apex Profiler*, etc. That allows analyzing performance to figure out which part(s) of code is (are) responsible for performance degradation, etc.

Public Functions

scoped_annotation(*scoped_annotation* const&) = delete

hpx/threading_base/threading_base_fwd.hpp

Defined in header `hpx/threading_base/threading_base_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

thread_data ***get_self_id_data**() noexcept

The function *get_self_id_data* returns the data of the HPX thread id associated with the current thread (or nullptr if the current thread is not a HPX thread).

thread_self &**get_self**()

The function *get_self* returns a reference to the (OS thread specific) self reference to the current HPX thread.

thread_self ***get_self_ptr**() noexcept

The function *get_self_ptr* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

thread_self_impl_type ***get_ctx_ptr**()

The function *get_ctx_ptr* returns a pointer to the internal data associated with each coroutine.

thread_self ***get_self_ptr_checked**(*error_code* &ec = *throws*)

The function *get_self_ptr_checked* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

thread_id_type **get_self_id**() noexcept

The function *get_self_id* returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

HPX_DEPRECATED_V (2, 0, "hpx::threads::get_outer_self_id is deprecated, use " "hpx::threads::get_self_id instead") inline thread_id_type get_outer_self_id() noexcept

The function *get_outer_self_id* returns the HPX thread id of the current outer thread (or zero if the current thread is not a HPX thread). This now always returns the same as *get_self_id*, even for directly executed threads.

thread_id_type **get_parent_id**() noexcept

The function *get_parent_id* returns the HPX thread id of the current thread's parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

std::size_t **get_parent_phase**() noexcept

The function *get_parent_phase* returns the HPX phase of the current thread's parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::ptrdiff_t` **get_self_stacksize()** noexcept

The function `get_self_stacksize` returns the stack size of the current thread (or zero if the current thread is not a HPX thread).

`thread_stacksize` **get_self_stacksize_enum()** noexcept

The function `get_self_stacksize_enum` returns the stack size of the `/`.

`std::uint32_t` **get_parent_locality_id()** noexcept

The function `get_parent_locality_id` returns the id of the locality of the current thread's parent (or zero if the current thread is not a HPX thread).

Note: This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_PARENT_REFERENCE` being defined.

`std::uint64_t` **get_self_component_id()** noexcept

The function `get_self_component_id` returns the lva of the component the current thread is acting on

Note: This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_TARGET_ADDRESS` being defined.

namespace **policies**

namespace **tracing**

hpx/threading_base/thread_data.hpp

Defined in header `hpx/threading_base/thread_data.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

constexpr `thread_data` ***get_thread_id_data**(`thread_id_ref_type` const &tid) noexcept

constexpr `thread_data` ***get_thread_id_data**(`thread_id_type` const &tid) noexcept

constexpr `tracing::region_init_data` **get_region_init_data**(`thread_data` const*) noexcept

constexpr `tracing::fiber_region_init_data` **get_fiber_region_init_data**(`thread_data` const*)
noexcept

class **thread_data** : public thread_data_reference_counting

#include <thread_data.hpp> A *thread* is the representation of a HPX thread. It's a first class object in HPX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the *thread-manager*.

A *thread* encapsulates:

- A thread status word (see the functions *thread::get_state* and *thread::set_state*)
- A function to execute (the thread function)
- A frame (in this implementation this is a block of memory used as the threads stack)
- A block of registers (not implemented yet)

Generally, *threads* are not created or executed directly. All functionality related to the management of *threads* is implemented by the thread-manager.

Public Types

using **mutex_type** = util::detail::spinlock_no_backoff

Public Functions

thread_data(thread_data const&) = delete

thread_data(thread_data&&) = delete

thread_data &**operator**=(thread_data const&) = delete

thread_data &**operator**=(thread_data&&) = delete

inline thread_state **get_state**(std::memory_order const order = std::memory_order_acquire) const noexcept

The *get_state* function queries the state of this thread instance.

Note: This function will seldom be used directly. Most of the time the state of a thread will be retrieved by using the function *threadmanager::get_state*.

Returns

This function returns the current state of this thread. It will return one of the values as defined by the *thread_state* enumeration.

inline thread_state **set_state**(thread_schedule_state const state, thread_restart_state state_ex = thread_restart_state::unknown, std::memory_order const load_order = std::memory_order_acquire, std::memory_order const exchange_order = std::memory_order_acq_rel) const noexcept

The *set_state* function changes the state of this thread instance.

Note: This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the thread-manager. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status *threadmanager::set_state* should be used.

Parameters

- **state** – [in] The new state to be set for the thread.
- **state_ex** – [in]
- **load_order** – [in]
- **exchange_order** – [in]

```
inline bool set_state_tagged(thread_schedule_state const newstate, thread_state const
                             &prev_state, thread_state &new_tagged_state, std::memory_order
                             const exchange_order = std::memory_order_acq_rel) const
    noexcept
```

```
inline bool restore_state(thread_state const new_state, thread_state const old_state,
                          std::memory_order const load_order = std::memory_order_relaxed,
                          std::memory_order const load_exchange =
                          std::memory_order_acq_rel) const noexcept
```

The `restore_state` function changes the state of this thread instance depending on its current state. It will change the state atomically only if the current state is still the same as passed as the second parameter. Otherwise, it won't touch the thread state of this instance.

Note: This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the `threadmanager`. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status `threadmanager::set_state` should be used.

Parameters

- **new_state** – [in] The new state to be set for the thread.
- **old_state** – [in] The old state of the thread which still has to be the current state.
- **load_order** – [in]
- **load_exchange** – [in]

Returns

This function returns *true* if the state has been changed successfully

```
inline bool restore_state(thread_schedule_state const new_state, thread_restart_state const
                          state_ex, thread_state old_state, std::memory_order const
                          load_exchange = std::memory_order_acq_rel) const noexcept
```

```
char const *get_fiber_name() const noexcept
```

```

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

Functions

`std::ostream &operator<<(std::ostream &os, thread_pool_base const &thread_pool)`

class **thread_pool_base**

#include <thread_pool_base.hpp> The base class used to manage a pool of OS threads.

Public Functions

virtual void **suspend_processing_unit_direct**(`std::size_t virt_core, error_code &ec = throws`)
= 0

Suspends the given processing unit. Blocks until the processing unit has been suspended.

Parameters

- **virt_core** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **resume_processing_unit_direct**(`std::size_t virt_core, error_code &ec = throws`)
= 0

Resumes the given processing unit. Blocks until the processing unit has been resumed.

Parameters

- **virt_core** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **resume_direct**(`error_code &ec = throws`) = 0

Resumes the thread pool. Blocks until all OS threads on the thread pool have been resumed.

Parameters

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **suspend_direct**(`error_code &ec = throws`) = 0

Suspends the thread pool. Blocks until all OS threads on the thread pool have been suspended.

Note: A thread pool cannot be suspended from an HPX thread running on the pool itself.

Parameters

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

Throws

- *hpx::exception* – if called from an HPX thread which is running on the pool itself.

hpx/threadmanager/threadmanager.hpp

Defined in header `hpx/threadmanager/threadmanager.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

class **threadmanager**

#include <threadmanager.hpp> The *thread-manager* class is the central instance of management for all (non-depleted) threads

Public Types

using **notification_policy_type** = *threads::policies::callback_notifier*

using **pool_type** = *std::unique_ptr<thread_pool_base>*

using **pool_vector** = *std::vector<pool_type>*

Public Functions

threadmanager(*hpx::util::runtime_configuration &rtcfg_, notification_policy_type ¬ifier, detail::network_background_callback_type network_background_callback = detail::network_background_callback_type()*)

threadmanager(*threadmanager const&*) = delete

threadmanager(*threadmanager&&*) = delete

threadmanager &operator=(*threadmanager const&*) = delete

threadmanager &operator=(*threadmanager&&*) = delete

~threadmanager()

void **init**() const

void **create_pools**()

void **print_pools**(std::ostream&) const

FIXME move to private and add `—hpx::printpools` cmd line option.

thread_pool_base &**default_pool**() const

thread_pool_base &**get_pool**(std::string const &pool_name) const

thread_pool_base &**get_pool**(pool_id_type const &pool_id) const

thread_pool_base &**get_pool**(std::size_t thread_index) const

bool **pool_exists**(std::string const &pool_name) const

bool **pool_exists**(std::size_t pool_index) const

thread_id_ref_type **register_work**(thread_init_data &data, *error_code* &ec = *throws*) const

The function *register_work* adds a new work item to the thread manager. It doesn't immediately create a new *thread*, it just adds the task parameters (function, initial state and description) to the internal management data structures. The thread itself will be created when the number of existing threads drops below the number of threads specified by the constructors *max_count* parameter.

Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **ec** –

void **register_thread**(thread_init_data &data, *thread_id_ref_type* &id, *error_code* &ec = *throws*) const

The function *register_thread* adds a new work item to the thread manager. It creates a new *thread*, adds it to the internal management data structures, and schedules the new thread, if appropriate.

Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **id** – [out] This parameter will hold the id of the created thread. This id is guaranteed to be validly initialized before the thread function is executed.
- **ec** –

bool **run**() const

Run the thread manager's work queue. This function instantiates the specified number of OS threads in each pool. All OS threads are started to execute the function *tfunc*.

Returns

The function returns *true* if the thread manager has been started successfully, otherwise it returns *false*.

void **stop**(bool blocking = true) const

Forcefully stop the thread-manager.

Parameters

blocking –

bool **is_busy**() const

bool **is_idle**() const

void **wait**() const

bool **wait_for**(*hpx::chrono::steady_duration* const &rel_time) const

template<typename **StopToken**>

inline bool **wait_for**(*StopToken* &&stop_token, *hpx::chrono::steady_duration* const &rel_time)
const

void **suspend**() const

void **resume**() const

hpx::state **status**() const

Return whether the thread manager is still running This returns the “minimal state”, i.e. the state of the least advanced thread pool

std::int64_t **get_thread_count**(*thread_schedule_state* state = *thread_schedule_state::unknown*,
thread_priority priority = *thread_priority::default_*, *std::size_t*
num_thread = static_cast<*std::size_t*>(-1), bool reset = false)
const

return the number of HPX-threads with the given state

Note: This function locks the internal OS lock in the thread manager

std::int64_t **get_idle_core_count**() const

mask_type **get_idle_core_mask**() const

std::int64_t **get_background_thread_count**() const

bool **enumerate_threads**(*hpx::function*<bool(*thread_id_type*)> const &f, *thread_schedule_state*
state = *thread_schedule_state::unknown*) const

void **abort_all_suspended_threads**() const

bool **cleanup_terminated**(bool delete_all) const

std::size_t **get_os_thread_count**() const

Return the number of OS threads running in this thread-manager.

This function will return correct results only if the thread-manager is running.

std::thread &**get_os_thread_handle**(*std::size_t* num_thread) const

void **report_error**(*std::size_t* num_thread, *std::exception_ptr* const &e) const

API functions forwarding to notification policy.

This notifies the thread manager that the passed exception has been raised. The exception will be routed through the notifier and the scheduler (which will result in it being passed to the runtime object, which in turn will report it to the console, etc.).

mask_type **get_used_processing_units**() const

Returns the mask identifying all processing units used by this thread manager.

hwloc_bitmap_ptr **get_pool_numa_bitmap**(*std::string* const &pool_name) const

```

constexpr struct `hpx::parallel::execution::sync_execute_after_t` **sync_execute_after**

struct **async_execute_after_t**

#include <timed_execution_fwd.hpp> Customization point of asynchronous execution agent creation supporting timed execution.

This asynchronously creates a single function invocation `f()` using the associated executor at the given point in time.

Note: This calls `exec.async_execute_after(rel_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::async_execute()` on the underlying non-time-scheduled execution agent.

Param exec

[in] The executor object to use for scheduling of the function *f*.

Param rel_time

[in] The duration of time after which the given function should be scheduled to run.

Param f

[in] The function which will be scheduled using the given executor.

Param ts...

[in] Additional arguments to use to invoke *f*.

Return

`f(ts...)`'s result through a future

Public Functions

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const
                                     &rel_time, F &&f, Ts&&... ts) const
```

```

Defined in header [hpx/chrono.hpp](#)⁸²⁰.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace chrono
```

```
struct high_resolution_clock
```

#include <high_resolution_clock.hpp> Class *hpx::chrono::high_resolution_clock* represents the clock with the smallest tick period provided by the implementation. It may be an alias of *std::chrono::system_clock* or *std::chrono::steady_clock*, or a third, independent clock. *hpx::chrono::high_resolution_clock* meets the requirements of *TrivialClock*.

Public Static Functions

```
static inline std::uint64_t now() noexcept
    returns a std::chrono::time_point representing the current value of the clock
```

```
static inline constexpr std::uint64_t() min () noexcept
```

```
static inline constexpr std::uint64_t() max () noexcept
```

⁸²⁰ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/chrono.hpp

hpx::chrono::high_resolution_timer

Defined in header [hpx/chrono.hpp](#)⁸²¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **chrono**

class **high_resolution_timer**

#include <high_resolution_timer.hpp> *high_resolution_timer* is a timer object which measures the elapsed time

Public Types

enum class **init**

Values:

enumerator **no_init**

Public Functions

inline **high_resolution_timer**() noexcept

inline explicit constexpr **high_resolution_timer**(*init*) noexcept

inline explicit constexpr **high_resolution_timer**(double t) noexcept

inline void **restart**() noexcept

restarts the timer

inline double **elapsed**() const noexcept

returns the elapsed time in seconds

inline *std::int64_t* **elapsed_microseconds**() const noexcept

returns the elapsed time in microseconds

inline *std::int64_t* **elapsed_nanoseconds**() const noexcept

returns the elapsed time in nanoseconds

⁸²¹ http://github.com/TheHPXProject/hpx/blob/unknown/libs/core/include_local/include/hpx/chrono.hpp

Public Static Functions

static inline double **now**() noexcept
returns the current time

static inline constexpr double **elapsed_max**() noexcept
returns the estimated maximum value for *elapsed*()

static inline constexpr double **elapsed_min**() noexcept
returns the estimated minimum value for *elapsed*()

Protected Static Functions

static inline *std::uint64_t* **take_time_stamp**() noexcept

Private Members

std::uint64_t **start_time_**

~topology()

inline *std::size_t* **get_socket_number**(*std::size_t* num_thread, [[maybe_unused]] *error_code* &ec = *throws*) const noexcept

Return the Socket number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline *std::size_t* **get_numa_node_number**(*std::size_t* num_thread, [[maybe_unused]] *error_code* &ec = *throws*) const noexcept

Return the NUMA node number of the processing unit the given thread is running on.

Parameters

- **num_thread** – [in]

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

inline *std::size_t* **get_numa_distance**(*std::size_t* node_a, *std::size_t* node_b) const noexcept

Return the hardware latency distance between two NUMA nodes. Values are sourced from hwloc's distance matrix when available; otherwise a standard default (10 = local, 20 = remote) is returned.

Parameters

- **node_a** – [in] logical index of the first NUMA node
- **node_b** – [in] logical index of the second NUMA node

mask_cref_type **get_machine_affinity_mask**(*error_code* &ec = *throws*) const noexcept

Return a bit mask where each set bit corresponds to a processing unit available to the application.

Parameters

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_type **get_service_affinity_mask**(mask_cref_type used_processing_units, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the service threads in the application.

Parameters

- **used_processing_units** – [in] This is the mask of processing units which are not available for service threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_socket_affinity_mask**(*std::size_t* num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the socket it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_numa_node_affinity_mask**(*std::size_t* num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the NUMA domain it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_core_affinity_mask**(*std::size_t* num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the core it is running on.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_cref_type **get_thread_affinity_mask**(*std::size_t* num_thread, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread.

Parameters

- **num_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **set_thread_affinity_mask**(mask_cref_type mask, *error_code* &ec = *throws*) const

Use the given bit mask to set the affinity of the given thread. Each set bit corresponds to a processing unit the thread will be allowed to run on.

Note: Use this function on systems where the affinity must be set from inside the thread itself.

Parameters

- **mask** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask_type **get_thread_affinity_mask_from_lva**(void const *lva, *error_code* &ec = *throws*) const

Return a bit mask where each set bit corresponds to a processing unit co-located with the memory the given address is currently allocated on.

Parameters

- **lva** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **print_affinity_mask**(*std::ostream* &os, *std::size_t* num_thread, mask_cref_type m, *std::string* const &pool_name) const

Prints the given mask *m* to os in a human-readable form.

bool **reduce_thread_priority**(*error_code* &ec = *throws*) const

Reduce thread priority of the current thread.

Parameters

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

std::size_t **get_number_of_sockets**() const

Return the number of available NUMA domains.

std::size_t **get_number_of_numa_nodes**() const

Return the number of available NUMA domains.

std::size_t **get_number_of_cores**() const

Return the number of available cores.

std::size_t **get_number_of_pus**() const noexcept

Return the number of available hardware processing units.

std::size_t **get_number_of_numa_node_cores**(*std::size_t* numa) const

Return number of cores in given numa domain.

std::size_t **get_number_of_numa_node_pus**(*std::size_t* numa) const

Return number of processing units in a given numa domain.

std::size_t **get_number_of_socket_pus**(*std::size_t* socket) const

Return number of processing units in a given socket.

```

std::size_t get_number_of_core_pus(std::size_t core) const
    Return number of processing units in given core.

std::size_t get_number_of_socket_cores(std::size_t socket) const
    Return number of cores units in given socket.

inline std::size_t get_core_number(std::size_t num_thread, error_code& = throws) const

std::size_t get_pu_number(std::size_t num_core, std::size_t num_pu, error_code &ec = throws)
    const

std::size_t get_cache_size(mask_cref_type mask, int level) const
    Return the size of the cache associated with the given mask.

mask_type get_cpubind_mask(error_code &ec = throws) const

mask_type get_cpubind_mask(std::thread &handle, error_code &ec = throws) const

hwloc_bitmap_ptr cpuset_to_nodese(mask_cref_type mask) const
    convert a cpu mask into a numa node mask in hwloc bitmap form

void write_to_log() const

void *allocate(std::size_t len) const
    This is equivalent to malloc(), except that it tries to allocate page-aligned memory from the OS.

void *allocate_membind(std::size_t len, hwloc_bitmap_ptr const &bitmap,
    hpx_hwloc_membind_policy policy, int flags) const
    allocate memory with binding to a numa node set as specified by the policy and flags (see hwloc
    docs)

threads::mask_type get_area_membind_nodese(void const *addr, std::size_t len) const

bool set_area_membind_nodese(void const *addr, std::size_t len, void *nodese) const

int get_numa_domain(void const *addr) const

void deallocate(void *addr, std::size_t len) const noexcept
    Free memory that was previously allocated by allocate.

void print_hwloc(std::ostream&) const

mask_type init_socket_affinity_mask_from_socket(std::size_t num_socket) const

mask_type init_numa_node_affinity_mask_from_numa_node(std::size_t num_numa_node)
    const

mask_type init_core_affinity_mask_from_core(std::size_t num_core, mask_cref_type
    default_mask = empty_mask) const

mask_type init_thread_affinity_mask(std::size_t num_thread) const

mask_type init_thread_affinity_mask(std::size_t num_core, std::size_t num_pu) const

hwloc_bitmap_t mask_to_bitmap(mask_cref_type mask, hwloc_obj_type_t htype, unsigned
    *count = nullptr) const

mask_type bitmap_to_mask(hwloc_bitmap_t bitmap, hwloc_obj_type_t htype) const

```

```

struct **lock_context**

#include <tracing.hpp> Context for annotating lock acquisitions and releases.

This struct is used to provide tracing annotations for synchronization primitives such as spinlocks and mutexes. It registers the creation, acquisition, and release of locks to the active tracing backend.

Public Functions

explicit **lock_context**(char const *name = nullptr, void const *addr = nullptr) noexcept

Constructs a lock context.

Parameters

- **name** – The name or description of the lock.
- **addr** – The memory address of the lock, used to track it uniquely.

explicit **lock_context**(char const *prefix, char const *suffix, void const *addr = nullptr) noexcept

Constructs a lock context with a dynamic name.

Parameters

- **prefix** – The prefix for the lock name.
- **suffix** – The suffix for the lock name.
- **addr** – The memory address of the lock, used to track it uniquely.

bool **before_lock**() const noexcept

Called immediately before attempting to acquire the lock.

Returns

true if the prepare event was recorded and after_lock should be called.

void **after_lock**() const noexcept

Called immediately after the lock is successfully acquired.

void **after_try_lock**(bool success) const noexcept

Called after a try-lock operation completes.

Parameters

success – true if the lock was acquired, false if it failed.

void **before_unlock**() const noexcept

Called immediately before releasing the lock.

void **after_unlock**() const noexcept

Called immediately after releasing the lock.

namespace **util**

namespace **external_timer**

util

See *Public API* for a list of names and headers that are part of the public *HPX* API.

hpx/util/sed_transform.hpp

Defined in header hpx/util/sed_transform.hpp.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

bool **parse_sed_expression**(std::string const &input, std::string &search, std::string &replace)
Parse a sed command.

Note: Currently, only supports search and replace syntax (s/search/replace/)

Parameters

- **input** – [in] The content to parse.
- **search** – [out] If the parsing is successful, this string is set to the search expression.
- **replace** – [out] If the parsing is successful, this string is set to the replace expression.

Returns

true if the parsing was successful, false otherwise.

struct **sed_transform**

#include <sed_transform.hpp> An unary function object which applies a sed command to its subject and returns the resulting string.

Note: Currently, only supports search and replace syntax (s/search/replace/)

Public Functions

sed_transform(std::string const &search, std::string replace)

explicit **sed_transform**(std::string const &expression)

std::string **operator()**(std::string const &input) const

inline explicit **operator bool**() const noexcept

inline bool **operator!**() const noexcept

Private Members

std::shared_ptr<command> **command_**

hpx/util/insert_checked.hpp

Defined in header `hpx/util/insert_checked.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

Functions

```
template<typename Iterator>
constexpr bool insert_checked(std::pair<Iterator, bool> const &r) noexcept
```

Helper function for writing predicates that test whether an `std::map` insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy `std::pair<Iterator, bool>` type.

Parameters

r – [in] The return value of a `std::map` insert operation.

Returns

This function returns **r.second**.

```
template<typename Iterator>
bool insert_checked(std::pair<Iterator, bool> const &r, Iterator &it)
```

Helper function for writing predicates that test whether an `std::map` insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy `std::pair<Iterator, bool>` type.

Parameters

- **r** – [in] The return value of a `std::map` insert operation.
- **r** – [out] A reference to an `Iterator`, which is set to **r.first**.
- **it** – [out] on exit, will hold the iterator referring to the inserted element

Returns

This function returns **r.second**.

2.10 Contributing to HPX

HPX development happens on Github. The following sections are a collection of useful information related to HPX development.

2.10.1 Contributing to HPX

The main source of information to understand the process of how to contribute to HPX can be found in [this document](#)⁸²². This is a living document that is constantly updated with relevant information.

2.10.2 HPX governance model

The HPX project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. [This document](#)⁸²³ describes how that participation takes place and how to set about earning merit within the project community.

⁸²² <https://github.com/TheHPXProject/hpx/blob/master/.github/CONTRIBUTING.md>

⁸²³ <http://hpx.stellar-group.org/documents/governance/>

2.10.3 Release procedure for *HPX*

Below is a step by step procedure for making an *HPX* release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an *HPX* release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.
2. For minor and major releases: create and check out a new branch at an appropriate point on `master` with the name `release-major.minor.X`. `major` and `minor` should be the major and minor versions of the release. For patch releases: check out the corresponding `release-major.minor.X` branch.
3. Write release notes in `docs/sphinx/releases/whats_new_${VERSION}.rst`. Keep adding merged PRs and closed issues to this until just before the release is made. Use `tools/generate_pr_issue_list.sh` to generate the lists. Add the new release notes to the table of contents in `docs/sphinx/releases.rst`.
4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:
 - `$HPX_SOURCE/README.rst`
 - Update grant information
 - `docs/sphinx/releases/whats_new_${VERSION}.rst`
 - `docs/sphinx/about_hpx/people.rst`
 - Update collaborators
 - Update grant information
5. This step does not apply to patch releases. For APEX:
 - Change the release branch to be the most current release tag available in the APEX `git_external` section in the main `CMakeLists.txt`. Please contact the maintainers of the respective packages to generate a new release to synchronize with the *HPX* release (APEX⁸²⁴).
6. Make sure `HPX_VERSION_MAJOR/MINOR/SUBMINOR` in `CMakeLists.txt` contain the correct values. Change them if needed.
7. Change version references in `CITATION.cff`. There are two occurrences. Change year in the copyright file under `/libs/core/version/src/version.cpp`.
8. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main `CMakeLists.txt` and also deleting all related code and tests from the main source tree.

The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:

- a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.
- b. Second release cycle: turn this build option OFF by default.
- c. Third release cycle: completely remove the old code.

The main `CMakeLists.txt` contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don't have a replacement yet, we keep them around in case (like Vc for example).

⁸²⁴ <http://github.com/UO-OACISS/xpress-apex>

9. Update the minimum required versions if necessary (compilers, dependencies, etc.) in `prerequisites.rst`. Update latest tested versions.
10. Verify that the Jenkins setups for the release branch on Rostam are running and do not display any errors.
11. Repeat the following steps until satisfied with the release.
 1. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to `-rcN`, where `N` is the current iteration of this step. Start with `-rc1`.
 2. Create a pre-release on GitHub using the script `tools/roll_release.sh`. This script automatically tag with the corresponding release number. The script requires that you have the STE||AR Group signing key.
 3. This step is not necessary for patch releases. Notify `hpx-users@stellar-group.org` of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.
 4. Allow at least a week for testing of the release candidate.
 - Use `git merge` when possible, and fall back to `git cherry-pick` when needed. For patch releases `git cherry-pick` is most likely your only choice if there have been significant unrelated changes on master since the previous release.
 - Go back to the first step when enough patches have been added.
 - If there are no more patches, continue to make the final release.
12. Update any occurrences of the latest stable release to refer to the version about to be released. For example, `quickstart.rst` contains instructions to check out the latest stable tag. Make sure that refers to the new version.
13. Add a new entry to the RPM changelog (`cmake/packaging/rpm/Changelog.txt`) with the new version number and a link to the corresponding changelog.
14. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to an empty string.
15. Add the release date to the caption of the current “What’s New” section in the docs, and change the value of `HPX_VERSION_DATE` in `CMakeLists.txt`.
16. Create a release on GitHub using the script `tools/roll_release.sh`. This script automatically tag the with the corresponding release number. The script requires that you have the STE||AR Group signing key.
17. Update the websites (hpx.stellar-group.org⁸²⁵ and stellar-group.org <<https://stellar-group.org>>). You can login on wordpress through *this page* <<https://hpx.stellar-group.org/wp-login.php>>. You can update the pages with the following:
 - Update links on the downloads page. Link to the release on GitHub.
 - Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
 - A new blog post announcing the release, which links to downloads and the “What’s New” section in the documentation (see previous releases for examples).
18. Merge release branch into master.
19. Post-release cleanup. Create a new pull request against master with the following changes:
 1. Modify the release procedure if necessary.
 2. Change `HPX_VERSION_TAG` in `CMakeLists.txt` back to `-trunk`.
 3. Increment `HPX_VERSION_MINOR` in `CMakeLists.txt`.
20. Update Vcpkg (<https://github.com/Microsoft/vcpkg>) to pull from latest release.
 - Update version number in `CONTROL`

⁸²⁵ <https://hpx.stellar-group.org>

- Update tag and SHA512 to that of the new release
21. Update spack (<https://github.com/spack/spack>) with the latest HPX package.
 - Update version number in `hpx/package.py` and SHA256 to that of the new release
 22. Announce the release on hpx-users@stellar-group.org, stellar@cct.lsu.edu, allcct@cct.lsu.edu, faculty@csc.lsu.edu, faculty@ece.lsu.edu, the HPX Slack channel, the STELLAR-GROUP Discord channel, our list of external collaborators, isocpp.org, reddit.com, HPC Wire, Inside HPC, Heise Online, and a CCT press release.
 23. Beer and pizza.

2.10.4 Testing HPX

To ensure correctness of HPX, we ship a large variety of unit and regression tests. The tests are driven by the CTest⁸²⁶ tool and are executed automatically on each commit to the HPX Github⁸²⁷ repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our HPX Issues⁸²⁸ tracker with detailed information about the target system.

Running tests manually

Running the tests manually is as easy as typing `make tests` && `make test`. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the `ctest` command. You can list all available test targets using `make help | grep tests`. Please see the CTest Documentation⁸²⁹ for further details.

Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under `tools/perftests_ci/local_run.sh` (to be run in the build directory specifying the HPX source directory as the argument to the script, default is `$HOME/projects/hpx_perftests_ci`).

Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with `hpx::util::perftests_report`, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call `hpx::util::perftests_print_times`. To see an example of use, see `future_overhead_report.cpp`. Finally, you can add the test to the CI report editing the `hpx_targets` variable for the executable name and the `hpx_test_options` variable for the corresponding options to use for the run in the performance test script `.jenkins/cscs-perftests/launch_perftests.sh`. And then run the `tools/perftests_ci/local_run.sh` script to get a reference json run (use the name of the test) to be added in the `tools/perftests_ci/perftest/references/daint_default` directory.

⁸²⁹ <https://www.cmake.org/cmake/help/latest/manual/ctest.1.html>

Issue tracker

If you stumble over a bug or missing feature in *HPX*, please submit an issue to our [HPX Issues](#)⁸³⁰ page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the [Support Website](#)⁸³¹ page.

Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both [github](#)⁸³². You can see the dashboards [CDash HPX dashboard](#)⁸³².

2.10.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, [Docker](#)⁸³³ provides a convenient alternative to quickly get all the dependencies needed to start development of *HPX*. Our testing setup on [github](#)⁸³⁴ uses a docker image to run all tests.

To get started you need to install [Docker](#)⁸³⁴ using whatever means is most convenient on your system. Once you have [Docker](#)⁸³⁵ installed, you can pull or directly run the docker image. The image is based on Debian and Clang, and can be found on [Docker Hub](#)⁸³⁶. To start a container using the *HPX* build environment, run:

```
$ docker run --interactive --tty stellargroup/build_env:latest bash
```

You are now in an environment where all the *HPX* build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the [Docker Documentation](#)⁸³⁷ for more information on using [Docker](#)⁸³⁸.

Warning: All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the *HPX* source tree) after closing the container, you can bind directories from the host system into the container (see [Docker Documentation \(Bind mounts\)](#)⁸³⁹).

2.10.6 Documentation

This documentation is built using [Sphinx](#)⁸⁴⁰, and an automatically generated API reference using [Doxygen](#)⁸⁴¹ and [Breathe](#)⁸⁴².

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

⁸³⁰ <https://github.com/TheHPXProject/hpx/issues>
⁸³¹ <https://stellar.cct.lsu.edu/support/>
⁸³² <https://cdash.rostam.cct.lsu.edu/index.php?project=HPX>
⁸³³ <https://www.docker.com>
⁸³⁴ <https://www.docker.com>
⁸³⁵ <https://www.docker.com>
⁸³⁶ https://hub.docker.com/r/stellargroup/build_env/
⁸³⁷ <https://docs.docker.com/>
⁸³⁸ <https://www.docker.com>
⁸³⁹ <https://docs.docker.com/storage/bind-mounts/>
⁸⁴⁰ <http://www.sphinx-doc.org>
⁸⁴¹ <https://www.doxygen.org>
⁸⁴² <https://breathe.readthedocs.io/en/latest>

Prerequisites

To build the *HPX* documentation, you need recent versions of the following packages:

- python3
- sphinx 4.5.0 (Python package)
- sphinx-book-theme (Python package)
- breathe 4.33.1 (Python package)
- doxygen
- sphinxcontrib-bibtex
- sphinx-copybutton

If the [Python](https://www.python.org)⁸⁴³ dependencies are not available through your system package manager, you can install them using the Python package manager `pip`:

```
pip install --user "sphinx<5" sphinx-book-theme breathe sphinxcontrib-bibtex sphinx-  
↪copybutton
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

Doxygen_ROOT:PATH

Specifies where to look for the installation of the [Doxygen](https://www.doxygen.org)⁸⁴⁴ tool.

Sphinx_ROOT:PATH

Specifies where to look for the installation of the [Sphinx](http://www.sphinx-doc.org)⁸⁴⁵ tool.

Breathe_APIDOC_ROOT:PATH

Specifies where to look for the installation of the [Breathe](https://breathe.readthedocs.io/en/latest)⁸⁴⁶ tool.

Building documentation

Enable building of the documentation by setting `HPX_WITH_DOCUMENTATION=ON` during [CMake](https://www.cmake.org)⁸⁴⁷ configuration. To build the documentation, build the `docs` target using your build tool. The default output format is HTML documentation. You can choose alternative output formats (single-page HTML, PDF, and man) with the `HPX_WITH_DOCUMENTATION_OUTPUT_FORMATS` CMake option.

Note: If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

⁸⁴³ <https://www.python.org>

⁸⁴⁴ <https://www.doxygen.org>

⁸⁴⁵ <http://www.sphinx-doc.org>

⁸⁴⁶ <https://breathe.readthedocs.io/en/latest>

⁸⁴⁷ <https://www.cmake.org>

Style guide

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with =.
- Sub-headings use only underlines with characters in decreasing level of importance: =, - and ..
- Use sentence case in headings.
- Refer to common terminology using `:term: `Component``.
- Indent content of directives (`.. directive::`) by three spaces.
- For C++ code samples at the end of paragraphs, use `::` and indent the code sample by 4 spaces.
 - For other languages (or if you don't want a colon at the end of the paragraph), use `.. code-block:: language` and indent by three spaces as with other directives.
- Use `.. list-table::` to wrap tables with a lot of text in cells.

API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the `doxygen_dependencies` variable in `docs/CMakeLists.txt`.

Adding new API documentation

When you add new public APIs to *HPX*, follow these guidelines to ensure the documentation is correctly generated and easy to use.

Documenting headers

At the top of a new header file, include the standard Doxygen documentation block. For example, if the new feature is called *my_new_feature*, you should:

- List the name of the new file under `\file`.
- Specify the page name with `\page` (e.g., `hpx:my_new_feature`).
- Reference the existing header that will include your new file under `\headerfile`.

```
/// \file my_new_feature.hpp
/// \page hpx:my_new_feature
/// \headerfile hpx/existing_header_of_new_feature.hpp
```

Adding to the public API reference

For the documentation to appear in the generated API reference, add your new API to `docs/sphinx/api/public_api.rst` under the appropriate table (usually “Functions”) for the relevant header (for example, `hpx/existing_header_of_new_feature.hpp`).

Including examples

Do **not** inline examples in the API reference. If you want to provide an example of how to use the new API, there are two recommended options:

1. **Documentation page option** Edit an existing relevant manual page to explain the new functionality and include a code example. Use this option if you want to provide additional context about how the API works.
2. **Standalone examples option** Create a separate example under `docs/sphinx/examples/`. Examples in this directory are typically more comprehensive and executable, making them suitable for richer or more complex scenarios.

2.10.7 Module structure

This section explains the structure of an *HPX* module.

The tool `create_library_skeleton.py`⁸⁴⁸ can be used to generate a basic skeleton. To create a library skeleton, run the tool in the `libs` subdirectory with the module name as an argument:

```
$ ./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an *HPX* module. It will not create any actual source files. The structure of this skeleton is as follows:

- `<lib_name>/`
 - `README.rst`
 - `CMakeLists.txt`
 - `cmake`
 - `docs/`
 - * `index.rst`
 - `examples/`
 - * `CMakeLists.txt`
 - `include/`
 - * `hpx/`
 - `<lib_name>`
 - `src/`
 - * `CMakeLists.txt`
 - `tests/`
 - * `CMakeLists.txt`

⁸⁴⁸ https://github.com/TheHPXProject/hpx/blob/master/libs/create_module_skeleton.py

```

* unit/
  · CMakeLists.txt
* regressions/
  · CMakeLists.txt
* performance/
  · CMakeLists.txt

```

A `README.rst` should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main `CMakeLists.txt` is created in the root directory of the module. By default it contains a call to `add_hpx_module` which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

`add_hpx_module` requires a module name. Optional flags are:

Optional single-value arguments are:

- `INSTALL_BINARIES`: Install the resulting library.

Optional multi-value arguments-are:

- `SOURCES`: List of source files.
- `HEADERS`: List of header files.
- `COMPAT_HEADERS`: List of compatibility header files.
- `DEPENDENCIES`: Libraries that this module depends on, such as other modules.
- `CMAKE_SUBDIRS`: List of subdirectories to add to the module.

The `include` directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the `src` directory. This allows for clear separation. The `cmake` subdirectory may include additional [CMake](https://www.cmake.org)⁸⁴⁹ scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an `include_compatibility` directory. This directory is not created by default.

Documentation is placed in the `docs` folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the `include` directory will automatically be processed by Doxygen and included into the documentation.

Tests are placed in suitable subdirectories of `tests`.

When in doubt, consult existing modules for examples on how to structure the module.

⁸⁴⁹ <https://www.cmake.org>

Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it's not clear what is causing the circular dependency, running the `cpp-dependencies`⁸⁵⁰ tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the `cpp-dependencies` tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See *Using docker for development* for details on how to use the docker image.

To produce the graph produced by CI run the following command (HPX_SOURCE is assumed to hold the path to the HPX source directory):

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a dot file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have `graphviz` installed:

```
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an svg file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on `config`, the following should give you a long list of paths from `algorithms` to `config`:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest algorithms config
```

The following should report that it can't find a path between the two modules:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest config algorithms
```

2.11 Releases

2.11.1 List of supported releases

HPX V2.0.0 (TBD)

General changes

Breaking changes

⁸⁵⁰ <https://github.com/tomtom-international/cpp-dependencies>

HPX V1.11.0 (Jun 30, 2025)

This release is the last version of HPX that supports C++17. Future versions of HPX will require compilation using C++20 or above.

General changes

- Added synchronous versions of all collective operations. Added global predefined communicator objects that are accessible through new APIs: `hpx::collectives::get_world_communicator()` refers to all localities and `hpx::collectives::get_local_communicator()` refers to all threads on the calling locality. We unified the interfaces of the different communicator objects.
- Added `hpx::experimental::run_on_all` allowing to run a given function (possibly concurrently) using a given execution policy.
- Added a helper object `hpx::runtime_manager` that simplifies the initialization of HPX without needing to modify the main function of the application.
- We improved the compatibility with various accelerator frameworks (SYCL, OneAPI).
- Applied build system changes that allow building HPX without any prerequisites. This requires to pass `-DHPX_WITH_FETCH_HWLOC=On` and `-DHPX_WITH_FETCH_BOOST=On` to the [CMake](https://cmake.org)⁸⁵¹ configuration.
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- Added the `hpx::contains` and `hpx::contains_subrange` parallel algorithms.
- Adapted many of HPX' parallel algorithms to be usable with senders/receivers.

Breaking changes

- We have moved most of the APIs that were defined in the namespace `hpx::parallel::execution` to the namespace `hpx::execution::experimental`. It was not possible to add compatibility facilities that will allow to continue using the old APIs, applications will have to be changed in order to continue functioning correctly.
- The CMake configuration parameter `HPX_WITH_RUN_MAIN_EVERYWHERE` is now deprecated and will be removed in the future. Use the preprocessor macro `HPX_HAVE_RUN_MAIN_EVERYWHERE` on a target-by-target case instead.
- Removed the dysfunctional `libfabric` `parcelport`.
- Removed features that were long deprecated (starting V1.8):
 - `hpx::flush`, `hpx::endl`, `hpx::async_flush`, `hpx::async_endl` - Various enumerator types are now only available as `class enum` requiring explicit scoped use of the enumerator values
 - Various non-conforming overloads of parallel algorithms
 - `hpx::for_loop` and friends (now only available as

`hpx::experimental::for_loop)`

- `hpx::parallel::induction` is now only available as `hpx::experimental::induction`
- `hpx::parallel::reduction` and friends are now only available as `hpx::experimental::reduction`
- `hpx::assertion::source_location` is now only available as `hpx::source_location`
- `hpx::lcos::split_future` is now only available as `hpx::split_future`
- `hpx::lcos::wait` and friends have been removed altogether

⁸⁵¹ <https://www.cmake.org>

- `hpx::lcos::wait_any` and friends are now only available as `hpx::wait_any`
- `hpx::lcos::wait_some` and friends are now only available as `hpx::wait_some`
- `hpx::lcos::wait_each` and friends are now only available as `hpx::wait_each`
- `hpx::lcos::wait_all` and friends are now only available as `hpx::wait_all`
- `hpx::lcos::when_all` and friends are now only available as `hpx::when_all`
- `hpx::lcos::when_any` and friends are now only available as `hpx::when_any`
- `hpx::lcos::when_each` and friends are now only available as `hpx::when_each`
- `hpx::lcos::when_some` and friends are now only available as `hpx::when_some`
- `hpx::util::optional` and related facilities are now only available as `hpx::optional`
- `hpx::util::bind` and related facilities are now only available as `hpx::bind`
- `hpx::util::function` and friends are now only available as `hpx::function`
- `hpx::traits::is_bound_action` and related facilities are now only available as `hpx::is_bound_action`
- `hpx::traits::is_bind_expression` and related facilities are now only available as `hpx::is_bind_expression`
- `hpx::traits::is_placeholder` and related facilities are now only available as `hpx::is_placeholder`
- `hpx::lcos::future` and related facilities are now only available as `hpx::future`
- `hpx::memory::intrusive_ptr` is now only available as `hpx::intrusive_ptr`
- `hpx::lcos::local::barrier` is now only available as `hpx::barrier`
- `hpx::lcos::barrier` is now only available as `hpx::distributed::barrier`
- `hpx::lcos::local::cpp20_binary_semaphore` is now only available as `hpx::detail::binary_semaphore`
- `hpx::lcos::local::condition_variable` and friends are now only available as `hpx::condition_variable`
- `hpx::lcos::local::counting_semaphore` and friends are now only available as `hpx::counting_semaphore`
- `hpx::lcos::local::cpp20_latch` and is now only available as `hpx::latch`
- `hpx::lcos::latch` and is now only available as `hpx::distributed::latch`
- `hpx::lcos::local::upgrade_lock` and friends are now only available as `hpx::upgrade_lock`
- `hpx::lcos::local::mutex` and friends are now only available as `hpx::mutex`
- `hpx::lcos::local::spinlock` and friends are now only available as `hpx::spinlock`
- `hpx::lcos::local::call_once` and friends are now only available as `hpx::call_once`
- `hpx::util::annotated_function` and is now only available as `hpx::annotated_function`
- `hpx::components::abstract_simple_component_base` and is now only available as `hpx::components::abstract_component_base`
- `hpx::naming::id_type` and is now only available as `hpx::id_type`

- PR #6507⁹⁸⁵ - Update LSU Jenkins libraries to match Rostam 3.0 with RHEL9
- PR #6503⁹⁸⁶ - Fix 2 tests on FreeBSD by initializing freebsd_environ
- PR #6499⁹⁸⁷ - Fix crash in get_executable_filename on FreeBSD
- PR #6498⁹⁸⁸ - Avoid rewriting defines.hpp
- PR #6497⁹⁸⁹ - Contains and contains_subrange parallel algorithm implementation GSOC 2024
- PR #6496⁹⁹⁰ - Prevent usage of CMake try_run on crosscompiling
- PR #6494⁹⁹¹ - Add unit test cases and fixes for the S/R versions of the parallel algorithms
- PR #6487⁹⁹² - Fixing security vulnerabilities reported by MSVC security checks
- PR #6486⁹⁹³ - Create codeql.yml
- PR #6474⁹⁹⁴ - Remove remnants of libfabric parcellport
- PR #6473⁹⁹⁵ - Add documentation for distributed implementations of post, async, sync and dataflow
- PR #6471⁹⁹⁶ - Add distance.cpp test in CMake
- PR #6468⁹⁹⁷ - Small vector relocation
- PR #6448⁹⁹⁸ - Standardising Benchmarks, with support for nanobench as an option for its backend
- PR #6365⁹⁹⁹ - Release V1.10.0
- PR #6089¹⁰⁰⁰ - Implementing p2079

2.11.2 List of older releases

HPX V1.10.0 (May 29, 2024)

General changes

- The HPX documentation has seen a major overhaul for this release. We finished documenting the public local HPX API, we have added migration guides from widely used parallelization platforms to HPX (OpenMP, TBB, and MPI).
- We have added facilities enabling optimizations for trivially-relocatable types (see P1144¹⁰⁰¹ for more details).

⁹⁸⁴ <https://github.com/TheHPXProject/hpx/pull/6508>

⁹⁸⁵ <https://github.com/TheHPXProject/hpx/pull/6507>

⁹⁸⁶ <https://github.com/TheHPXProject/hpx/pull/6503>

⁹⁸⁹ <https://github.com/TheHPXProject/hpx/pull/6497>

⁹⁹⁰ <https://github.com/TheHPXProject/hpx/pull/6496>

⁹⁹¹ <https://github.com/TheHPXProject/hpx/pull/6494>

⁹⁹² <https://github.com/TheHPXProject/hpx/pull/6487>

⁹⁹³ <https://github.com/TheHPXProject/hpx/pull/6486>

⁹⁹⁴ <https://github.com/TheHPXProject/hpx/pull/6474>

⁹⁹⁵ <https://github.com/TheHPXProject/hpx/pull/6473>

⁹⁹⁶ <https://github.com/TheHPXProject/hpx/pull/6471>

⁹⁹⁷ <https://github.com/TheHPXProject/hpx/pull/6468>

⁹⁹⁸ <https://github.com/TheHPXProject/hpx/pull/6448>

⁹⁹⁹ <https://github.com/TheHPXProject/hpx/pull/6365>

¹⁰⁰⁰ <https://github.com/TheHPXProject/hpx/pull/6089>

¹⁰⁰¹ <https://wg21.link/p1144>

- We have added (and use) the `scope_xxx` helper facilities as specified by the C++ library fundamentals TS v3 (see: [N4948](http://wg21.link/n4948)¹⁰⁰²).
- We have added configuration options that allow to build HPX without pre-installing any prerequisites. Use `HPX_WITH_FETCH_HWLOC=On` to have [Portable Hardware Locality \(HWLOC\)](https://www.open-mpi.org/projects/hwloc/)¹⁰⁰³ installed for you. Similarly, setting `HPX_WITH_FETCH_BOOST=On` during configuration time will install the necessary [Boost](https://www.boost.org/)¹⁰⁰⁴ libraries (currently V1.84.0).
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- The collective operations APIs have seen an unification, we have fixed issues and performance problems for the collectives.
- The HPX executors have seen a streamlining and some consistency changes. We have applied many performance improvements to the executor implementations that directly positively impact the performance of our parallel algorithms.
- We have added a new parcelport allowing to use Gasnet as a communication platform.
- We have added optimizations to various parcelports improving overall communication performance. This includes - amongst other things - send immediate optimizations and receiver-side zero-copy optimizations.
- Futures will now execute the associated task eagerly and inline on any wait operation if the task has not started running yet. This feature can be enabled using the `HPX_COROUTINES_WITH_THREAD_SCHEDULE_HINT_RUNS_AS_CHILD=On` configuration setting (which is *Off* by default).
- We have enabled using json files to supply configuration information through the command line. This feature can be enabled with the configuration option `HPX_COMMAND_LINE_HANDLING_WITH_JSON_CONFIGURATION_FILES=On`. This functionality depends on the external [JSON library](https://github.com/nlohmann/json)¹⁰⁰⁵, which can be built at configuration time by supplying `HPX_WITH_FETCH_JSON=On` to [CMake](https://www.cmake.org/)¹⁰⁰⁶.
- We have applied many fixes to our CUDA, ROCm, and SYCL build environments.

Breaking changes

- The [CMake](https://www.cmake.org/)¹⁰⁰⁷ configuration keys `SOMELIB_ROOT` (e.g., `BOOST_ROOT`) have been renamed to `Somelib_ROOT` (e.g., `Boost_ROOT`) to avoid warnings when using newer versions of [CMake](https://www.cmake.org/)¹⁰⁰⁸. Please update your scripts accordingly. For now, the old variable names are re-assigned to the new names and unset in the [CMake](https://www.cmake.org/)¹⁰⁰⁹ cache.

HPX V1.9.1 (August 4, 2023)

General changes

This point release fixes a couple of problems reported for the V1.9.0 release. Most importantly, we fixed various occasional hanging during startup and shutdown in distributed scenarios. We also added support for zero-copy serialization on the receiving side to the TCP, MPI, and LCI parcellports. Last but not least, we have added support for Visual Studio 2019 and gcc using MINGW on Windows, and also support for gcc V13 and clang V15.

HPX headers are now made consistently named the same as their standard library counterparts, e.g. `#include <thread>` now corresponds to `#include <hpx/thread.hpp>`. This significantly simplifies porting existing standards conforming codes to HPX.

A lot of work has been done to improve and optimize our network communication layers. Primary focus of this work was on the LCI parcellport, but we have also cleaned up and improved the MPI parcellport.

Additionally, we have continued working on our documentation. The main focus here was on completing the API documentation of the most important API functions. We have started adding migration guides for people interested in moving their codes away from other, commonplace parallelization frameworks like OpenMP.

HPX V1.9.0 (May 2, 2023)

General changes

- Added RISC-V 64bit support. HPX is now compatible with RISC-V architectures which have revolutionized the HPC world.
- LCI parcelport has been optimized to transfer parcels with fewer messages and use the HPX resource partitioner for its progress thread allocation. It should generally provide better performance than before. It also removes its dependency on the MPI library.
- HPX dependency on Boost was further relaxed by replacing headers from Boost.Range, Boost.Tokenizer and Boost.Lockfree.

¹²³⁹ <https://github.com/TheHPXProject/hpx/pull/6281>

¹²⁴⁰ <https://github.com/TheHPXProject/hpx/pull/6283>

- Improvements took place on our parallel algorithms implementation.
- Our Senders/Receivers (P2300) integration was extended:
 - Coroutines were integrated with senders/receivers.

`get_completion_signatures` now works with awaitable senders. - `with_awaitable_senders` allows the passed senders to retrieve the value i.e. senders are transparently awaitable from within a coroutine. - `when_all_vector` was added.

- `sync_wait` and `sync_wait_with_variant` sender consumers were added. The user can now initiate the execution of their asynchronous pipeline by blocking the current thread that executes the `main()` function until the result is retrieved.
- The combinators for futures (a.k.a. `async_combinators`) `when_*`, `wait_*`, `wait_*_nothrow` were turned into CPOs allowing for end-user customization. For more information on the `async_combinators` refer to the documentation, https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators.
- The new datapar backend SVE allows `simd` and `par_simd` execution policies to exploit dataparallelism in the processors that have SVE vector registers like A64FX and Neoverse V1.
- The documentation for parallel algorithms, container algorithms was further improved. The Public API page was vastly enriched.
- Copy button shortcut was added at the top-right of code-blocks.
- Pragma directive that reports warnings as errors on MSVC was fixed.
- Command line argument `--hpx:loopback_network` was added to facilitate debugging with networks.
- We added an HPX-SYCL integration, allowing users to obtain HPX futures for SYCL events. This effectively enables the integration of arbitrary asynchronous SYCL operations into the HPX task graph. Bolted on top of this integration, we further added an HPX-SYCL executor for ease of use.

Breaking changes

- Stopped supporting Clang V8, the minimal version supported is now Clang V10.
- Stopped supporting gcc V8, the minimal version supported is now gcc V9.
- Stopped supporting Visual Studio 2015, the minimal version supported is now Visual Studio 2019.
- `tag_policy_tag` et.al. were re-added after HPX V1.8.1 deprecation.
- `get_chunk_size` and `processing_units_count` API is now expecting the time for one iteration as an argument.
- The list of all the namespace changes can be found here: *HPX V1.9.0 Namespace changes*.

HPX V1.8.1 (Aug 5, 2022)

This is a bugfix release with a few minor additions and resolved problems.

General changes

This patch release adds a number of small new features and fixes a handful of problems discovered since the last release, in particular:

- A lot of work has been done to improve vectorization support for our parallel algorithms. HPX now supports using EVE - the Expressive Vector Engine as a vectorization backend.
- Added a simple average power consumption performance counter.
- Added performance counters related to the use of zero-copy chunks in the networking layer.

¹⁴⁶⁴ <https://github.com/TheHPXProject/hpx/pull/5872>

¹⁴⁶⁵ <https://github.com/TheHPXProject/hpx/pull/5855>

- More work was done towards full compatibility with the sender/receivers proposal P2300.
- Fixing `sync_wait` to decay the result types
- Fixed collective operations to properly avoid overalapping consecutive operations on the same communicator.
- Simplified the implementation of our execution policies and added mapping functions between those.
- Fixed performance issues with our implementation of *small_vector*.
- Serialization now works with buffers of unsigned characters.
- Fixing dangling reference in serialization of non-default constructible types
- Fixed static linking on Windows.
- Fixed support for M1/MacOS based architectures.
- Fixed support for gentoo/musl.
- Fixed *hpx::counting_semaphore_var*.
- Properly check start and end bounds for *hpx::for_loop*
- A lot of changes and fixes to the documentation (see <https://hpx-docs.stellar-group.org>).

Breaking changes

- No breaking changes have been introduced.

- PR #5879¹⁵³⁰ - New performance counters related to zero-copy chunks.

HPX V1.8.0 (May 18, 2022)

With HPX parallel algorithms been fully adapted to C++20 the new release achieves full conformance with C++20 concurrency and parallelism facilities. HPX now supports all of the algorithms as specified by C++20. We have added support for vectorization to more of our algorithms. Much work has been done towards implementing P2300 (“std::execution”) and implementing the underlying senders/receivers facilities. Finally, The new release comes with a brand new documentation interface!

General changes

- The new documentation can now be found on our webpage: <https://hpx-docs.stellar-group.org>. This includes a completely new and user-friendly interface environment along with restructuring of certain components. The content in the “Quick start”, “Manual” and “Examples” was improved, while the “Build system” page was adapted to include necessary information for newcomers.
- With the vectorization support available in modern hardware architectures HPX now provides new data-parallel vector execution policies `hpx::execution::simd` and `hpx::execution::par_simd` that enable significant speed-up of our parallel algorithm implementations. The following algorithms now support SIMD execution:
 - `copy`, `copy_n`
 - `generate`
 - `adjacent_difference`, `adjacent_find`
 - `all_of`, `any_of`, `none_of`
 - `equal`, `mismatch`,
 - `inner_product`
 - `count`, `count_if`
 - `fill`, `fill_n`

¹⁵²² <https://github.com/TheHPXProject/hpx/pull/5897>

¹⁵²³ <https://github.com/TheHPXProject/hpx/pull/5896>

¹⁵²⁴ <https://github.com/TheHPXProject/hpx/pull/5895>

¹⁵²⁵ <https://github.com/TheHPXProject/hpx/pull/5894>

¹⁵²⁶ <https://github.com/TheHPXProject/hpx/pull/5890>

¹⁵²⁷ <https://github.com/TheHPXProject/hpx/pull/5889>

¹⁵²⁸ <https://github.com/TheHPXProject/hpx/pull/5888>

¹⁵²⁹ <https://github.com/TheHPXProject/hpx/pull/5887>

¹⁵³⁰ <https://github.com/TheHPXProject/hpx/pull/5879>

- `find`, `find_end`, `find_first_of`, `find_if`, `find_if_not`
 - `for_each`, `for_each_n`
 - `generate`, `generate_n`.
- Based on top of P2300 the HPX parallel algorithms now support the pipeline syntax towards an effort to unify their usage along with senders/receivers. The HPX parallel algorithms can now bind with senders/receivers using the pipeline operator.
- Several changes took place on the executors provided by HPX:
- The executors now support the `num_cores` options in order for the user to be able to specify the desired number of cores to be used in the corresponding execution.
- The `scheduler` executor was implemented on top of senders/receivers and can be used with all HPX facilities that schedule new work, such as parallel algorithms, `hpx::async`, `hpx::dataflow`, etc.
- The performance of `fork_join_executor` was improved.
- The following algorithms have been added/adapted to be C++20 conformant:
 - `min_element`
 - `max_element`
 - `minmax_element`
 - `starts_with`
 - `ends_with`
 - `swap_ranges`
 - `unique`
 - `unique_copy`
 - `rotate`
 - `rotate_copy`
 - `sort`
 - `shift_left`
 - `shift_right`
 - `stable_sort`
 - `partition`
 - `partition_copy`
 - `stable_partition`
 - `adjacent_difference`
 - `nth_element`
 - `partial_sort`
 - `partial_sort_copy`.
- `HPX_FORWARD`/`HPX_MOVE` macros were introduced that replaced the `std::move` and `std::forward` facilities that in the library code.
- Hangs on distributed barrier were fixed.
- The performance of `scan_partitioner` was improved.

- Support was added for `thread_priority` to the `parallel_execution_policy`
- Regarding senders/receivers and the P2300 proposal various actions took place. `stop_token` was adapted to the recent proposal version (`in_place_stop_token` was introduced). Also hint, annotation, priority and stacksize properties were added to the scheduler executor. Stop support was added to `when_all`. Support for completion signatures was added. The following schedulers and algorithms were added:
 - `get_completion_scheduler`
 - `any_sender` and `unique_any_sender`
 - `split` sender
 - `transform_mpi` sender
 - `transfer` sender
 - `let_error`, `let_stopped`
 - `get_env` and related environment queries
 - `schedule`, `set_value`, `set_error`, `set_done`, `start` and `connect` are now proper customization points as defined in P2300.
- Several namespaces were altered towards conformance with C++20. Compatibility layers have been added and the old versions will be removed in next releases. The namespace changes are the following:
 - `hpx::parallel::induction/reduction` were moved into namespace `hpx::experimental`
 - `for_loop` and friends were moved into namespace `hpx::experimental`.
 - `hpx::util::optional` and friends were moved into namespace `hpx`.
 - `hpx::lcos::barrier` has been moved into the `hpx::distributed` namespace and `hpx::lcos::local::cpp20_barrier` has been renamed to `barrier` and moved into the `hpx` namespace.
 - `hpx::lcos::latch` has been moved into the `hpx::distributed` namespace and `lcos::local::latch` has been moved into the `hpx` namespace. The `count_down_and_wait()` functionality of `latch` has been renamed to `arrive_and_wait()`.
 - `hpx::util::unique_function_nonsr` has been renamed to `hpx::move_only_function`.
 - `hpx::util::unique_function` has been renamed to `hpx::distributed::move_only_function`.
 - `hpx::util::function` has been renamed to `hpx::distributed::function`.
 - `hpx::util::function_nonsr` has been renamed to `hpx::function`.
 - `hpx::util::function_ref` have been moved to namespace `hpx`.
 - `hpx::lcos::split_future` changed namespace and is now used as `hpx::split_future`.
 - `hpx::lcos::local::counting_semaphore` has been deprecated and `hpx::lcos::local::cpp20_counting_semaphore` has been renamed to `hpx::counting_semaphore`.
 - `hpx::lcos::local::cpp20_binary_semaphore` has been renamed to `hpx::binary_semaphore`.
 - `hpx::lcos::local::sliding_semaphore` has been renamed to `hpx::sliding_semaphore` and
 - `hpx::lcos::local::sliding_semaphore_var` has been renamed to `hpx::sliding_semaphore_var`.
 - `hpx::lcos::local::spinlock` has been renamed to `hpx::spinlock`.
 - `hpx::lcos::local::mutex` has been renamed to `hpx::mutex`.

- `hpx::lcos::local::timed_mutex` has been renamed to `hpx::timed_mutex`.
- `hpx::lcos::local::no_mutex` has been renamed to `hpx::no_mutex`.
- `hpx::lcos::local::recursive_mutex` has been renamed to `hpx::recursive_mutex`.
- `hpx::lcos::local::shared_mutex` has been renamed to `hpx::shared_mutex`.
- `hpx::lcos::local::upgrade_lock` has been renamed to `hpx::upgrade_lock`.
- `hpx::lcos::local::upgrade_to_unique_lock` has been renamed to `hpx::upgrade_to_unique_lock`.
- `hpx::lcos::local::condition_variable` has been renamed to `hpx::condition_variable`.
`hpx::lcos::local::condition_variable_var` has been renamed to `hpx::condition_variable_var`.
- `hpx::lcos::local::once_flag` has been renamed to `hpx::once_flag`, and `hpx::lcos::local::call_once` has been renamed to `hpx::call_once`.
- The new LCI (Lightweight Communication Interface) `parcelpport` was added that supports irregular and asynchronous applications like graph analysis, sparse linear algebra, modern parallel architectures etc. Major features include:
 - Support for advanced communication primitives like two sided send/rcv and one sided remote put.
 - Better multi-threaded performance.
 - Explicit user control of communication resource.
 - Flexible signaling mechanisms (synchronizer, completion queue, active message handler).
- The following CMake flags were added, mostly to support using HPX as a backend for SHAD (<https://github.com/pnnl/SHAD>). Please note that these options enable questionable functionalities, partially they even enable undefined behavior. Please only use any of them if you know what you're doing:
 - `HPX_SERIALIZATION_WITH_ALLOW_RAW_POINTER_SERIALIZATION`
 - `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`
 - `HPX_SERIALIZATION_WITH_ALLOW_CONST_TUPLE_MEMBERS`

Breaking changes

- Minimum required C++ standard library is C++17.
- Support for GCC 7 and Clang 8.0.0 and below has been removed.
- CUDA version required updated to 11.4.
- CMake version required updated to 3.18.
- The default version of Asio used was updated to 1.20.0.
- The default version of APEX used was updated to 2.5.1.
- APEX version was updated to 2.5.1.
- `tagged_pair` and `tagged_tuple` were removed.
- `tag_dispatch` was renamed to `tag_invoke`.
- `hpx.max_backgroud_threads` was renamed to `hpx.parcel.max_background_threads`.
- The following CMake flags were removed after being deprecated for at least two releases:

- HPX_SCHEDULER_MAX_TERMINATED_THREADS
 - HPX_WITH_GOOGLE_PERFTOOLS
 - HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY
 - HPX_HAVE_{COROUTINE,PLUGIN}_GCC_HIDDEN_VISIBILITY
 - HPX_TOP_LEVEL
 - HPX_WITH_COMPUTE_CUDA
 - HPX_WITH_ASYNC_CUDA
- `annotate_function` was renamed to `scoped_annotation`.
 - `execution::transform` was renamed to `execution::then`.
 - `execution::detach` was renamed to `execution::start_detached`.
 - `execution::on_sender` was renamed to `execution::schedule_on`.
 - `execution::just_on` was renamed to `execution::just_transfer`.
 - `execution::set_done` was renamed to `execution::set_stopped`.

- PR #5793¹⁶⁵⁸ - Remove features that are deprecated since V1.6
- PR #5792¹⁶⁵⁹ - Making sure num_cores is properly handled by parallel_executor
- PR #5791¹⁶⁶⁰ - Moving bind, bind_front, bind_back to namespace hpx
- PR #5790¹⁶⁶¹ - Moving serializable function/move_only_function into namespace hpx::distributed
- PR #5787¹⁶⁶² - Remove unneeded (and commented) tests
- PR #5786¹⁶⁶³ - Attempting to fix hangs in distributed barrier
- PR #5785¹⁶⁶⁴ - add cmake code to detect arm64 on macOS
- PR #5783¹⁶⁶⁵ - Moving function and function_ref into namespace hpx
- PR #5781¹⁶⁶⁶ - Updating used version of Visual Studio
- PR #5780¹⁶⁶⁷ - Update Piz Daint Jenkins configurations from gcc/clang 7 to 8
- PR #5778¹⁶⁶⁸ - Updated for_loop.hpp
- PR #5777¹⁶⁶⁹ - Update reference for foreach benchmark
- PR #5775¹⁶⁷⁰ - Move optional into namespace hpx
- PR #5773¹⁶⁷¹ - Moving barrier to consolidated namespaces
- PR #5772¹⁶⁷² - Adding missing docs for ranges::find_if and find_if_not algorithms
- PR #5771¹⁶⁷³ - Moving for_loop into namespace hpx::experimental
- PR #5770¹⁶⁷⁴ - Fixing HIP issues
- PR #5769¹⁶⁷⁵ - Slight improvement of small_vector performance
- PR #5766¹⁶⁷⁶ - Fixing a integral conversion warning
- PR #5765¹⁶⁷⁷ - Adding a sphinx role allowing to link to a file directly in github
- PR #5763¹⁶⁷⁸ - add num_cores facility
- PR #5762¹⁶⁷⁹ - Fix Public API main page
- PR #5761¹⁶⁸⁰ - Add missing inline to mpi_exception.hpp error_message function

- PR #5699¹⁷²⁷ - Update CI to use Boost 1.78.0
- PR #5697¹⁷²⁸ - Adding `fork_join_executor` to `foreach_benchmark`
- PR #5696¹⁷²⁹ - Modernize `when_all` and `friends` (`when_any`, `when_some`, `when_each`)
- PR #5693¹⁷³⁰ - Fix test errors with `_GLIBCXX_DEBUG` defined
- PR #5691¹⁷³¹ - Rename `annotate_function` to `scoped_annotation`
- PR #5690¹⁷³² - Replace `tag_dispatch` with `tag_invoke` in `minmax` segmented
- PR #5688¹⁷³³ - Remove more deprecated macros
- PR #5687¹⁷³⁴ - Add most important CMake options
- PR #5685¹⁷³⁵ - Fix future API
- PR #5684¹⁷³⁶ - Move lock registration to separate module and remove global lock registration
- PR #5683¹⁷³⁷ - Make `hpx::wait_all` etc. throw exceptions when waited futures hold exceptions and deprecate `hpx::lcos::wait_all[_n]` in favor of `hpx::wait_all[_n]`
- PR #5682¹⁷³⁸ - Fix macOS test exceptions
- PR #5681¹⁷³⁹ - docs: add links to hpx recepies
- PR #5680¹⁷⁴⁰ - Embed base execution policies to datapar execution policies
- PR #5679¹⁷⁴¹ - Fix `fork_join_executor` with dynamic schedule
- PR #5678¹⁷⁴² - Fix compilation of service executors with `nvcc`
- PR #5677¹⁷⁴³ - Remove `compute_cuda` module
- PR #5676¹⁷⁴⁴ - Don't require up-to-date approvals for bors
- PR #5675¹⁷⁴⁵ - Add default template type parameters for algorithms
- PR #5674¹⁷⁴⁶ - Allow using `any_sender` in global variables
- PR #5671¹⁷⁴⁷ - Making sure `task_group` can be reused
- PR #5670¹⁷⁴⁸ - Relax constraints on `execution::when_all`
- PR #5669¹⁷⁴⁹ - Use `HPX_WITH_CXX_STANDARD` for controlling C++ version

HPX V1.7.1 (Aug 12, 2021)

This is a bugfix release with a few minor fixes.

General changes

- Added a CMake option to assume that all types are bitwise serializable by default: `HPX_SERIALIZATION_WITH_ALL_TYPES_ARE_BITWISE_SERIALIZABLE`. The default value `OFF` corresponds to the old behaviour.
- Added a version check for Asio. The minimum Asio version supported by *HPX* is 1.12.0.
- Fixed a bug affecting usage of actions, where the internals of *HPX* relied on function addresses being unique. This was fixed by relying on variable addresses being unique instead.
- Made `hpx::util::bind` more strict in checking the validity of placeholders.
- Small performance improvement to spinlocks.
- Adapted the following parallel algorithms to C++20: `inclusive_scan`, `exclusive_scan`, `transform_inclusive_scan`, `transform_exclusive_scan`.

Breaking changes

- The experimental `hpx::execution::simdpair` execution policy (introduced in 1.7.0) was renamed to `hpx::execution::par_simd` for consistency with the other parallel policies.

HPX V1.7.0 (Jul 14, 2021)

This release is again focused on C++20 conformance of algorithms. Additionally, many new experimental sender-based algorithms have been added based on the latest proposals.

¹⁹³² <https://github.com/TheHPXProject/hpx/pull/5439>

¹⁹³³ <https://github.com/TheHPXProject/hpx/pull/5436>

General changes

- The following algorithms have been adapted to be C++20 conformant:
 - `remove`,
 - `remove_if`,
 - `remove_copy`,
 - `remove_copy_if`,
 - `replace`,
 - `replace_if`,
 - `reverse`, and
 - `lexicographical_compare`.
- When the compiler and standard library support the standard execution policies `std::execution::seq`, `std::execution::par`, and `std::execution::par_unseq` they can now be used in all *HPX* parallel algorithms with equivalent behaviour to the non-task policies `hpx::execution::seq`, `hpx::execution::par`, and `hpx::execution::par_unseq`.
- Vc support has been fixed, after being broken in 1.6.0. In addition, *HPX* now experimentally supports GCC's SIMD implementation, when available. The implementation can be used through the `hpx::execution::simd` and `hpx::execution::simdpair` execution policies.
- The customization points `sync_execute`, `async_execute`, `then_execute`, `post`, `bulk_sync_execute`, `bulk_async_execute`, and `bulk_then_execute` are now implemented using `tag_dispatch` (previously `tag_invoke`). Executors can still be implemented by providing the aforementioned functions as member functions of an executor.
- New functionality, enhancements, and fixes based on P0443r14 (executors proposal) and P1897 (sender-based algorithms) have been added to the `hpx::execution::experimental` namespace. These can be accessed through the `hpx/execution.hpp` and `hpx/local/execution.hpp` headers. In particular, the following sender-based algorithms have been added:
 - `detach`,
 - `ensure_started`,
 - `just`,
 - `just_on`,
 - `let_error`,
 - `let_value`,
 - `on`,
 - `transform`, and
 - `when_all`.

Additionally, futures now implement the sender concept. `make_future` can be used to turn a sender into a future. All functionality is experimental and can change without notice.

- All `hpx::init` and `hpx::start` overloads now take `std::functions` instead of `hpx::util::function_nonsr`. No changes should be required in user code to accommodate this change.

- `hpx::util::unwrapping` and other related unwrapping functionality has been moved up into the `hpx` namespace. Names in `hpx::util` are still usable with a deprecation warning. This functionality can now be accessed through the `hpx/unwrap.hpp` and `hpx/local/unwrap.hpp` headers.
- The default tag for APEX has been update from 2.3.1 to 2.4.0. In particular, this fixes a bug which could lead to hangs in distributed runs.
- The dependency on Boost.Asio has been replaced with the standalone Asio available at <https://github.com/chriskohlhoff/asio>. By default, a system-installed Asio will be used. `ASIO_ROOT` can be given as a hint to tell CMake where to find Asio. Alternatively, Asio can be fetched automatically using CMake's `fetchcontent` by setting `HPX_WITH_FETCH_ASIO=ON`. In general, dependencies on Boost have again been reduced.
- Modularization of the library has continued. In this release almost all functionality has been moved into modules. These changes do not generally affect user code. Warnings are still issued for headers that have moved.
- `hipBLAS` is now optional when compiling with `hipcc`. A warning instead of an error will be printed if `hipBLAS` is not found during configuration.
- Previously `HPX_COMPUTE_HOST_CODE` was defined in host code only if HPX was configured with CUDA or HIP. In this release `HPX_COMPUTE_HOST_CODE` is always defined in host code.
- An experimental `HPX_WITH_PRECOMPILED_HEADERS` CMake option has been added to use precompiled headers when building *HPX*. This option should not be used on Windows.
- Numerous bug fixes.

Breaking changes

- The minimum required CMake version is now 3.17.
- The minimum required Boost version is now 1.71.0.
- The customization mechanism used to implement and extend sender functionality and algorithms has been renamed from `tag_invoke` to `tag_dispatch`. All customization of sender functionality should be done by overloading `tag_dispatch`.
- The following compatibility options have been removed, along with their compatibility implementations:
 - `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`
 - `HPX_WITH_ACTION_BASE_COMPATIBILITY`
 - `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`
 - `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`
 - `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`
 - `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`
 - `HPX_WITH_REGISTER_THREAD_OVERLOADS_COMPATIBILITY`
 - `HPX_WITH_THREAD_AWARE_TIMER_COMPATIBILITY`
 - `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`
 - `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`
- The `HPX_WITH_THREAD_SCHEDULERS` CMake option has been removed. All schedulers are now enabled when possible.
- `HPX_WITH_INIT_START_OVERLOADS_COMPATIBILITY` has been turned off by default.

- PR #5348²⁰²³ - Rename `tag_invoke` and related facilities to `tag_dispatch`
- PR #5347²⁰²⁴ - Remove `make_` prefix for executor properties
- PR #5346²⁰²⁵ - Remove and disable compatibility options for 1.7.0
- PR #5343²⁰²⁶ - Fix `timed_executor` static cast conversion
- PR #5342²⁰²⁷ - Refactor CUDA event polling
- PR #5341²⁰²⁸ - Adding `make_with_annotation` and `get_annotation` properties
- PR #5339²⁰²⁹ - Making sure `hpx::util::hardware::timestamp()` is always defined
- PR #5338²⁰³⁰ - Fixing `timed_executor` specializations of customization points
- PR #5335²⁰³¹ - Make `partial_algorithm` work with any number of arguments
- PR #5334²⁰³² - Follow up `iter_sent` include on #5225
- PR #5332²⁰³³ - Simplify `tag_invoke` and friends
- PR #5331²⁰³⁴ - More work on cleaning up executor CPOs
- PR #5330²⁰³⁵ - Add option to disable `pkgconfig` generation
- PR #5328²⁰³⁶ - Adapt data parallel support using `std-simd`
- PR #5327²⁰³⁷ - Fix missing `ifdef HPX_SMT_PAUSE`
- PR #5326²⁰³⁸ - Adding `resize()` to `serialize_buffer` allowing to shrink its size
- PR #5324²⁰³⁹ - Add get member functions to `async_rw_mutex` proxy objects for explicitly getting the wrapped value
- PR #5323²⁰⁴⁰ - Add `keep_future` algorithm
- PR #5322²⁰⁴¹ - Replace executor customization point implementations with `tag_invoke`
- PR #5321²⁰⁴² - Seperate segmented algorithms for reduce
- PR #5320²⁰⁴³ - Fix `is_sender` trait and other small fixes to p0443 traits
- PR #5319²⁰⁴⁴ - gcc 11.1 c++20 build fixes
- PR #5318²⁰⁴⁵ - Make `hipblas` dependency optional as not always available

HPX V1.6.0 (Feb 17, 2021)

General changes

This release continues the focus on C++20 conformance with multiple new algorithms adapted to be C++20 conformant and becoming customization point objects (CPOs). We have also added experimental support for HIP, allowing previous CUDA features to now be compiled with `hipcc` and run on AMD GPUs.

- The following algorithms have been adapted to be C++20 conformant: `adjacent_find`, `includes`, `inplace_merge`, `is_heap`, `is_heap_until`, `is_partitioned`, `is_sorted`, `is_sorted_until`, `merge`, `set_difference`, `set_intersection`, `set_symmetric_difference`, `set_union`.
- Experimental HIP support can be enabled by compiling *HPX* with `hipcc`. All CUDA functionality in *HPX* can now be used with HIP. The HIP functionality is for the time being exposed through the same API as the CUDA functionality, i.e. no changes are required in user code. The CUDA, and now HIP, functionality is in the `hpx::cuda` namespace.
- We have added `partial_sort` based on Francisco Tapia's implementation.
- `hpx::init` and `hpx::start` gained new overloads taking an `hpx::init_params` struct in 1.5.0. All overloads not taking an `hpx::init_params` are now deprecated.
- We have added an experimental `fork_join_executor`. This executor can be used for OpenMP-style fork-join parallelism, where the latency of a parallel region is important for performance.
- The `parallel_executor` now uses a hierarchical spawning scheme for bulk execution, which improves data locality and performance.
- `hpx::dataflow` can now be used with executors that inject additional parameters into the call of the user-provided function.
- We have added experimental support for properties as proposed in P2220²¹⁸⁰. Currently the only supported property is the scheduling hint on `parallel_executor`.
- `hpx::util::annotated_function` can now be passed a dynamically generated `std::string`.
- In moving functionality to new namespaces, old names have been deprecated. A deprecation warning will be issued if you are using deprecated functionality, with instructions on how to correct or ignore the warning.
- We have removed all support for C and Fortran from our build system.
- We have further reduced the use of Boost types within *HPX* (`boost::system::error_code` and `boost::detail::spinlock`).
- We have enabled more warnings in our CI builds (unused variables and unused typedefs).

Breaking changes

- `hpxMP` support has been completely removed.
- The `verbs` `parcelpoint` has been removed.
- The following compatibility options have been disabled by default: `HPX_WITH_ACTION_BASE_COMPATIBILITY`, `HPX_WITH_REGISTER_THREAD_COMPATIBILITY`, `HPX_WITH_PROMISE_ALIAS_COMPATIBILITY`, `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`, `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY`, `HPX_WITH_EMBEDDED_THREAD_POOLS_COMPATIBILITY`, `HPX_WITH_THREAD_POOL_OS_EXECUTOR_COMPATIBILITY`, `HPX_WITH_THREAD_EXECUTORS_COMPATIBILITY`, `HPX_THREAD_AWARE_TIMER_COMPATIBILITY`, `HPX_WITH_POOL_EXECUTOR_COMPATIBILITY`. Unless noted here, the above functionalities do not come

²¹⁸⁰ <https://wg21.link/p2220>

with replacements. Unscoped enumerations have been replaced by scoped enumerations. Previously deprecated unscoped enumerations are disabled by `HPX_WITH_UNSCOPED_ENUM_COMPATIBILITY`. Newly deprecated unscoped enumerations have been given deprecation warnings and replaced by scoped enumerations. `hpx::promise` has been replaced with `hpx::distributed::promise`. `hpx::program_options` is a drop-in replacement for `boost::program_options`. `hpx::execution::parallel_executor` now has constructors which take a thread pool, covering the use case of `hpx::threads::executors::pool_executor`. A pool can be supplied with `hpx::resource::get_thread_pool`.

Closed issues

HPX V1.5.1 (Sep 30, 2020)

General changes

This is a patch release. It contains the following changes:

- Remove restriction on suspending runtime with multiple localities, users are now responsible for synchronizing work between localities before suspending.
- Fixes several compilation problems and warnings.
- Adds notes in the documentation explaining how to cite HPX.

Closed issues

- [Issue #4971²³⁵⁵](#) - Parallel sort fails to compile with C++20
- [Issue #4950²³⁵⁶](#) - Build with `HPX_WITH_PARCELPORT_ACTION_COUNTERS_ON` fails
- [Issue #4940²³⁵⁷](#) - Codespell report for “HPX” (on fossies.org)
- [Issue #4937²³⁵⁸](#) - Allow suspension of runtime for multiple localities

HPX V1.5.0 (Sep 02, 2020)

General changes

The main focus of this release is on APIs and C++20 conformance. We have added many new C++20 features and adapted multiple algorithms to be fully C++20 conformant. As part of the modularization we have begun specifying the public API of *HPX* in terms of headers and functionality, and aligning it more closely to the C++ standard. All non-distributed modules are now in place, along with an experimental option to completely disable distributed features in *HPX*. We have also added experimental asynchronous MPI and CUDA executors. Lastly this release introduces CMake targets for depending projects, performance improvements, and many bug fixes.

- We have added the C++20 features `hpx::jthread` and `hpx::stop_token`. `hpx::condition_variable_any` now exposes new functions supporting `hpx::stop_token`.
- We have added `hpx::stable_sort` based on Francisco Tapia's implementation.
- We have adapted existing synchronization primitives to be fully conformant C++20: `hpx::barrier`, `hpx::latch`, `hpx::counting_semaphore`, and `hpx::binary_semaphore`.
- We have started using customization point objects (CPOs) to make the corresponding algorithms fully conformant to C++20 as well as to make algorithm extension easier for the user. `all_of/any_of/none_of`, `copy`, `count`, `destroy`, `equal`, `fill`, `find`, `for_each`, `generate`, `mismatch`, `move`, `reduce`, `transform_reduce` are using those CPOs (all in namespace `hpx`). We also have adapted their corresponding `hpx::ranges` versions to be conforming to C++20 in this release.
- We have adapted support for `co_await` to C++20, in addition to `hpx::future` it now also supports `hpx::shared_future`. We have also added allocator support for futures returned by `co_return`. It is no longer in the `experimental` namespace.
- We added serialization support for `std::variant` and `std::tuple`.
- `result_of` and `is_callable` are now deprecated and replaced by `invoke_result` and `is_invocable` to conform to C++20.
- We continued with the modularization, making it easier for us to add the new experimental `HPX_WITH_DISTRIBUTED_RUNTIME` CMake option (see below) . A significant amount of headers have been deprecated. We adapted the namespaces and headers we could to be closer to the standard ones (*Public API*). Depending code should still compile, however warnings are now generated instructing to change the include statements accordingly.
- It is now possible to have a basic CUDA support including a helper function to get a future from a CUDA stream and target handling. They are available under the `hpx::cuda::experimental` namespace and they can be enabled with the `-DHPX_WITH_ASYNC_CUDA=ON` CMake option.
- We added a new `hpx::mpi::experimental` namespace for getting futures from an asynchronous MPI call and a new minimal MPI executor `hpx::mpi::experimental::executor`. These can be enabled with the `-DHPX_WITH_ASYNC_MPI=On` CMake option.
- A polymorphic executor has been implemented to reduce compile times as a function accepting executors can potentially be instantiated only once instead of multiple times with different executors. It accepts the function signature as a template argument. It needs to be constructed from any other executor. Please note, that the function signatures that can be scheduled using `then_execute`, `bulk_sync_execute`, `bulk_async_execute` and `bulk_then_execute` are slightly different (See the comment in [PR #4514](https://github.com/TheHPXProject/hpx/pull/4514)²³⁶⁹ for more details).
- The underlying executor of `block_executor` has been updated to a newer one.
- We have added a parameter to `auto_chunk_size` to control the amount of iterations to measure.

²³⁶⁹ <https://github.com/TheHPXProject/hpx/pull/4514>

- All executor parameter hooks can now be exposed through the executor itself. This will allow to deprecate the `.with()` functionality on execution policies in the future. This is also a first step towards simplifying our executor APIs in preparation for the upcoming C++23 executors (senders/receivers).
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`. Please note this is a breaking change without backwards-compatibility option. We have converted all of those APIs to be based on customization point objects. Two new executors have been added to enable easy integration of the existing resiliency features with other facilities (like the parallel algorithms): `replay_executor` and `replicate_executor`.
- We have added performance counters type information (aggregating, monotonically increasing, average count, average timer, etc.).
- HPX threads are now re-scheduled on the same worker thread they were suspended on to avoid cache misses from moving from one thread to the other. This behavior doesn't prevent the thread from being stolen, however.
- We have added a new configuration option `hpx.exception_verbosity` to allow to control the level of verbosity of the exceptions (3 levels available).
- `broadcast_to`, `broadcast_from`, `scatter_to` and `scatter_from` have been added to the collectives, modernization of `gather_here` and `gather_there` with futures taken by rvalue references. See the breaking change on `all_to_all` in the next section. None of the collectives need supporting macros anymore (e.g. specifying the data types used for a collective operation using `HPX_REGISTER_ALLGATHER` and similar is not needed anymore).
- New API functions have been added: a) to get the number of cores which are idle (`hpx::get_idle_core_count`) and b) returning a bitmask representing the currently idle cores (`hpx::get_idle_core_mask`).
- We have added an experimental option to only enable the local runtime, you can disable the distributed runtime with `HPX_WITH_DISTRIBUTED_RUNTIME=OFF`. You can also enable the local runtime by using the `--hpx:local` runtime option.
- We fixed task annotations for actions.
- The alias `hpx::promise` to `hpx::lcos::promise` is now deprecated. You can use `hpx::lcos::promise` directly instead. `hpx::promise` will refer to the local-only promise in the future.
- We have added a `prepare_checkpoint` API function that calculates the amount of necessary buffer space for a particular set of arguments checkpointed.
- We have added `hpx::upgrade_lock` and `hpx::upgrade_to_unique_lock`, which make `hpx::shared_mutex` (and similar) usable in more flexible ways.
- We have changed the CMake targets exposed to the user, it now includes `HPX:hpx`, `HPX:wrap_main` (int main as the first *HPX* thread of the application, see *Starting the HPX runtime*), `HPX:plugin`, `HPX:component`. The CMake variables `HPX_INCLUDE_DIRS` and `HPX_LIBRARIES` are deprecated and will be removed in a future release, you should now link directly to the `HPX:hpx` CMake target.
- A new example is demonstrating how to create and use a wrapping executor (`quickstart/executor_with_thread_hooks.cpp`)
- A new example is demonstrating how to disable thread stealing during the execution of parallel algorithms (`quickstart/disable_thread_stealing_executor.cpp`)
- We now require for our CMake build system configuration files to be formatted using `cmake-format`.
- We have removed more dependencies on various Boost libraries.
- We have added an experimental option enabling unity builds of HPX using the `-DHPX_WITH_UNITY_BUILD=On` CMake option.
- Many bug fixes.

Breaking changes

- *HPX* now requires a C++14 capable compiler. We have set the *HPX* C++ standard automatically to C++14 and if it needs to be set explicitly, it should be specified through the `CMAKE_CXX_STANDARD` setting as mandated by CMake. The `HPX_WITH_CXX*` variables are now deprecated and will be removed in the future.
- Building and using *HPX* is now supported only when using CMake V3.13 or later, Boost V1.64 or newer, and when compiling with clang V5, gcc V7, or VS2019, or later. Other compilers might still work but have not been tested thoroughly.
- We have added a `hpx::init_params` struct to pass parameters for *HPX* initialization e.g. the resource partitioner callback to initialize thread pools (*Using the resource partitioner*).
- The `all_to_all` algorithm is renamed to `all_gather`, and the new `all_to_all` algorithm is not compatible with the old one.
- We have moved all of the existing APIs related to resiliency into the namespace `hpx::resiliency::experimental`.

- Issue #4662²⁴⁰⁷ - MPI initialization broken when networking off
- Issue #4652²⁴⁰⁸ - How to fix distributed action annotation
- Issue #4650²⁴⁰⁹ - thread descriptions are broken... again
- Issue #4648²⁴¹⁰ - Thread stacksize not properly set
- Issue #4647²⁴¹¹ - Rename generated collective headers in modules
- Issue #4639²⁴¹² - Update deprecation warnings in compatibility headers to point to collective headers
- Issue #4628²⁴¹³ - mpi parcelport totally broken
- Issue #4619²⁴¹⁴ - Fully document hpx_wrap behaviour and targets
- Issue #4612²⁴¹⁵ - Compilation issue with HPX 1.4.1 and 1.4.0
- Issue #4594²⁴¹⁶ - Rename modules
- Issue #4578²⁴¹⁷ - Default value for HPX_WITH_THREAD_BACKTRACE_DEPTH
- Issue #4572²⁴¹⁸ - Thread manager should be given a runtime_configuration
- Issue #4571²⁴¹⁹ - Add high-level documentation to new modules
- Issue #4569²⁴²⁰ - Annoying warning when compiling - pls suppress or fix it.
- Issue #4555²⁴²¹ - HPX_HAVE_THREAD_BACKTRACE_ON_SUSPENSION compilation error
- Issue #4543²⁴²² - Segfaults in Release builds using *sleep_for*
- Issue #4539²⁴²³ - Compilation Error when HPX_MPI_WITH_FUTURES=ON
- Issue #4537²⁴²⁴ - Linking issue with libhpx_initd.a
- Issue #4535²⁴²⁵ - API for checking if pool with a given name exists
- Issue #4523²⁴²⁶ - Build of PR #4311 (git tag 9955e8e) fails
- Issue #4519²⁴²⁷ - Documentation problem
- Issue #4513²⁴²⁸ - HPXConfig.cmake contains ill-formed paths when library paths use backslashes

- [PR #4821²⁵⁴²](#) - Implement customization point for `hpx::copy` and `hpx::ranges::copy`
- [PR #4819²⁵⁴³](#) - Allow finding Boost components before finding HPX
- [PR #4817²⁵⁴⁴](#) - Adding range version of stable sort
- [PR #4815²⁵⁴⁵](#) - Fix a wrong `#ifdef` for IO/TIMER pools causing build errors
- [PR #4814²⁵⁴⁶](#) - Replace `hpx::function_nonsr` with `std::function` in error module
- [PR #4809²⁵⁴⁷](#) - Foreach adapt
- [PR #4808²⁵⁴⁸](#) - Make internal algorithms functions const
- [PR #4807²⁵⁴⁹](#) - Add Jenkins configuration for running on Piz Daint
- [PR #4806²⁵⁵⁰](#) - Update documentation links to new domain name
- [PR #4805²⁵⁵¹](#) - Applying changes that resolve time complexity issues in sort
- [PR #4803²⁵⁵²](#) - Adding implementation of `stable_sort`
- [PR #4802²⁵⁵³](#) - Fix datapar header paths
- [PR #4801²⁵⁵⁴](#) - Replace `boost::shared_array<T>` with `std::shared_ptr<T[]>` if supported
- [PR #4799²⁵⁵⁵](#) - Fixing `#include` paths in compatibility headers
- [PR #4798²⁵⁵⁶](#) - Include the main module header (fixes partially #4488)
- [PR #4797²⁵⁵⁷](#) - Change cmake targets
- [PR #4794²⁵⁵⁸](#) - Removing 128bit integer emulation
- [PR #4793²⁵⁵⁹](#) - Make sure global variable is handled properly
- [PR #4792²⁵⁶⁰](#) - Replace `enable_if` with **HPX_CONCEPT_REQUIRES_** and add `is_sentinel_for` constraint
- [PR #4790²⁵⁶¹](#) - Move deprecation warnings from base template to template specializations for `result_of` etc. structs
- [PR #4789²⁵⁶²](#) - Fix hangs during assertion handling and distributed runtime construction
- [PR #4788²⁵⁶³](#) - Fixing inclusive transform scan algorithm to properly handle initial value
- [PR #4785²⁵⁶⁴](#) - Fixing barrier test

- PR #4784²⁵⁶⁵ - Fixing deleter argument bindings in `serialize_buffer`
- PR #4783²⁵⁶⁶ - Add coveralls badge
- PR #4782²⁵⁶⁷ - Make header tests parallel again
- PR #4780²⁵⁶⁸ - Remove outdated comment about `hpx::stop` in documentation
- PR #4776²⁵⁶⁹ - debug print improvements
- PR #4775²⁵⁷⁰ - Checkpoint cleanup
- PR #4771²⁵⁷¹ - Fix compilation with `HPX_WITH_NETWORKING=OFF`
- PR #4767²⁵⁷² - Remove all force linking leftovers
- PR #4765²⁵⁷³ - Fix 1d stencil index calculation
- PR #4764²⁵⁷⁴ - Force some tests to run serially
- PR #4762²⁵⁷⁵ - Update pointees in compatibility headers
- PR #4761²⁵⁷⁶ - Fix running and building of execution module tests on CircleCI
- PR #4760²⁵⁷⁷ - Storing `hpx_options` in global property to speed up summary report
- PR #4759²⁵⁷⁸ - Reduce memory requirements for our main shared state
- PR #4757²⁵⁷⁹ - Fix `mimalloc` linking on Windows
- PR #4756²⁵⁸⁰ - Fix compilation issues
- PR #4753²⁵⁸¹ - Re-adding API functions that were lost during merges
- PR #4751²⁵⁸² - Revert “Create coverage reports and upload them to codecov.io”
- PR #4750²⁵⁸³ - Fixing possible race condition during termination detection
- PR #4749²⁵⁸⁴ - Deprecate `result_of` and friends
- PR #4748²⁵⁸⁵ - Create coverage reports and upload them to codecov.io
- PR #4747²⁵⁸⁶ - Changing `#include` for MPI `parcelport`
- PR #4745²⁵⁸⁷ - Add `is_sentinel_for` trait implementation and test

HPX V1.4.1 (Feb 12, 2020)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation issues on Windows, macOS, FreeBSD, and with gcc 10
- Install missing pdb files on Windows
- Allow running tests using an installed version of *HPX*
- Skip MPI finalization if HPX has not initialized MPI
- Give a hard error when attempting to use IO counters on Windows

Closed issues

- [Issue #4320](#)²⁸⁶⁸ - HPX 1.4.0 does not compile with gcc 10
- [Issue #4336](#)²⁸⁶⁹ - Building HPX 1.4.0 with IO Counters breaks (Windows)
- [Issue #4334](#)²⁸⁷⁰ - HPX Debug and RelWithDebinfo builds on Windows not installing .pdb files
- [Issue #4322](#)²⁸⁷¹ - Undefine VT1 and VT2 after boost includes
- [Issue #4314](#)²⁸⁷² - Compile error on 1.4.0
- [Issue #4307](#)²⁸⁷³ - `ld: error: duplicate symbol: freebsd_environ`

Closed pull requests

HPX V1.4.0 (January 15, 2020)

General changes

- We have added the collectives `all_to_all` and `all_reduce`.
- We have added APIs for resiliency, which allows replication and replay for failed tasks. See the *documentation* for more details.
- Components can now be checkpointed.
- Performance improvements to schedulers and coroutines. A significant change is the addition of stackless coroutines. These are to be used for tasks that do not need to be suspended and can reduce overheads noticeably in applications with short tasks. A stackless coroutine can be created with the new stack size `thread_stacksize_nostack`.
- We have added an implementation of `unique_any`, which is a non-copyable version of `any`.
- The `shared_priority_queue_scheduler` has been improved. It now has lower overheads than the default scheduler in many situations. Unlike the default scheduler it fully supports NUMA scheduling hints. Enable it with the command line option `--hpx:queuing=shared-priority`. This scheduler should still be considered experimental, but its use is encouraged in real applications to help us make it production ready.
- We have added the performance counters `background-receive-duration` and `background-receive-overhead` for inspecting the time and overhead spent on receiving parcels in the background.
- Compilation time has been further improved when `HPX_WITH_NETWORKING=OFF`.
- We no longer require compiled Boost dependencies in certain configurations. This requires at least Boost 1.70, compiling on x86 with GCC 9, clang (libc++) 9, or VS2019 in C++17 mode. The dependency on `Boost.Filesystem` can explicitly be turned on with `HPX_FILESYSTEM_WITH_BOOST_FILESYSTEM_COMPATIBILITY=ON` (it is off by default if the standard library supports `std::filesystem`). `Boost.ProgramOptions` has been copied into the HPX repository. We have a compatibility layer for users who must explicitly use `Boost.ProgramOptions` instead of the `ProgramOptions` provided by HPX. To remove the dependency `HPX_PROGRAM_OPTIONS_WITH_BOOST_PROGRAM_OPTIONS_COMPATIBILITY` must be explicitly set to `OFF`. This option will be removed in a future release. We have also removed several other header-only dependencies on Boost.
- It is now possible to use the process affinity mask set by tools like `numactl` and various batch environments with the command line option `--hpx:use-process-mask`. Enabling this option implies `--hpx:ignore-batch-env`.
- It is now possible to create standalone thread pools without starting the runtime. See the `standalone_thread_pool_executor.cpp` test in the `execution` module for an example.

²⁸⁷⁸ <https://github.com/TheHPXProject/hpx/pull/4337>

²⁸⁷⁹ <https://github.com/TheHPXProject/hpx/pull/4335>

²⁸⁸⁰ <https://github.com/TheHPXProject/hpx/pull/4315>

²⁸⁸¹ <https://github.com/TheHPXProject/hpx/pull/4310>

- Tasks annotated with `hpx::util::annotated_function` now have their correct name when using APEX to generate OTF2 files.
- Cloning of APEX was defective in previous releases (it required manual intervention to check out the correct tag or branch). This has been fixed.
- The option `HPX_WITH_MORE_THAN_64_THREADS` is now ignored and will be removed in a future release. The value is instead derived directly from `HPX_WITH_MAX_CPU_COUNT` option.
- We have deprecated compiling in C++11 mode. The next release will require a C++14 capable compiler.
- We have deprecated support for the Vc library. This option will be replaced with SIMD support from the standard library in a future release.
- We have significantly refactored our CMake setup. This is intended to be a non-breaking change and will allow for using HPX through CMake targets in the future.
- We have continued modularizing the HPX library. In the process we have rearranged many header files into module-specific directories. All moved headers have compatibility headers which forward from the old location to the new location, together with a deprecation warning. The compatibility headers will eventually be removed.
- We now enforce formatting with `clang-format` on the majority of our source files.
- We have added SPDX license tags to all files.
- Many bugfixes.

Breaking changes

- The `HPX_WITH_THREAD_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY` option and the associated compatibility layer has been removed.
- The `HPX_WITH_UNWRAPPED_COMPATIBILITY` option and the associated compatibility layer has been removed.

- PR #3159³²⁴⁸ - Support Checkpointing Components

HPX V1.3.0 (May 23, 2019)

General changes

- Performance improvements: the schedulers have significantly reduced overheads from removing false sharing and the parallel executor has been updated to create fewer futures.
- HPX now defaults to not turning on networking when running on one locality. This means that you can run multiple instances on the same system without adding command line options.
- Multiple issues reported by Clang sanitizers have been fixed.
- We have added (back) single-page HTML documentation and PDF documentation.
- We have started modularizing the HPX library. This is useful both for developers and users. In the long term users will be able to consume only parts of the HPX libraries if they do not require all the functionality that HPX currently provides.
- We have added an implementation of `function_ref`.

³²⁴⁵ <https://github.com/TheHPXProject/hpx/pull/3701>

³²⁴⁶ <https://github.com/TheHPXProject/hpx/pull/3496>

³²⁴⁷ <https://github.com/TheHPXProject/hpx/pull/3192>

³²⁴⁸ <https://github.com/TheHPXProject/hpx/pull/3159>

- The barrier and latch classes have gained a few additional member functions.

Breaking changes

- Executable and library targets are now created without the `_exe` and `_lib` suffix respectively. For example, the target `1d_stencil_1_exe` is now simply called `1d_stencil_1`.
- We have removed the following deprecated functionality: `queue`, `scoped_unlock`, and support for input iterators in algorithms.
- We have turned off the compatibility layer for `unwrapped` by default. The functionality will be removed in the next release. The option can still be turned on using the [CMake](#)³²⁴⁹ option `HPX_WITH_UNWRAPPED_SUPPORT`. Likewise, `inclusive_scan` compatibility overloads have been turned off by default. They can still be turned on with `HPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY`.
- The minimum compiler and dependency versions have been updated. We now support GCC from version 5 onwards, Clang from version 4 onwards, and Boost from version 1.61.0 onwards.
- The headers for preprocessor macros have moved as a result of the functionality being moved to a separate module. The old headers are deprecated and will be removed in a future version of HPX. You can turn off the warnings by setting `HPX_PREPROCESSOR_WITH_DEPRECATION_WARNINGS=OFF` or turn off the compatibility headers completely with `HPX_PREPROCESSOR_WITH_COMPATIBILITY_HEADERS=OFF`.

- Issue #3442³³⁰⁹ - HPX set_difference, set_intersection failure cases
- Issue #3437³³¹⁰ - Ensure parent_task pointer when child task is created and child/parent are on same locality
- Issue #3255³³¹¹ - Suspension with lock for --hpx:list-component-types
- Issue #3034³³¹² - Use C++17 structured bindings for serialization
- Issue #2999³³¹³ - Change thread scheduling use of size_t for thread indexing

Closed pull requests

- PR #3865³³¹⁴ - adds hpx_target_compile_option_if_available
- PR #3864³³¹⁵ - Helper functions that are useful in numa binding and testing of allocator
- PR #3862³³¹⁶ - Temporary fix to local_dataflow_boost_small_vector test
- PR #3860³³¹⁷ - Add cache line padding to intermediate results in for loop reduction
- PR #3859³³¹⁸ - Remove HPX_TLL_PUBLIC and HPX_TLL_PRIVATE from CMake files
- PR #3858³³¹⁹ - Add compile flags and definitions to modules
- PR #3851³³²⁰ - update hpxmp release tag to v0.2.0
- PR #3849³³²¹ - Correct BOOST_ROOT variable name in quick start guide
- PR #3847³³²² - Fix attach_debugger configuration option
- PR #3846³³²³ - Add tests for libs header tests
- PR #3844³³²⁴ - Fixing source_groups in preprocessor module to properly handle compatibility headers
- PR #3843³³²⁵ - This fixes the launch_process/launched_process pair of tests
- PR #3842³³²⁶ - Fix macro call with ITTNOTIFY enabled
- PR #3840³³²⁷ - Fixing SLURM environment parsing
- PR #3837³³²⁸ - Fixing misplaced #endif

- PR #3835³³²⁹ - make all latch members protected for consistency
- PR #3834³³³⁰ - Disable transpose_block_numa example on CircleCI
- PR #3833³³³¹ - make latch **counter_** protected for deriving latch in hpxmp
- PR #3831³³³² - Fix CircleCI config for modules
- PR #3830³³³³ - minor fix: option HPX_WITH_TEST was not working correctly
- PR #3828³³³⁴ - Avoid for binaries that depend on HPX to directly link against internal modules
- PR #3827³³³⁵ - Adding shortcut for `hpx::get_ptr<>(sync, id)` for a local, non-migratable objects
- PR #3826³³³⁶ - Fix and update modules documentation
- PR #3825³³³⁷ - Updating default APEX version to 2.1.3 with HPX
- PR #3823³³³⁸ - Fix pkgconfig libs handling
- PR #3822³³³⁹ - Change includes in `hpx_wrap.cpp` to more specific includes
- PR #3821³³⁴⁰ - Disable barrier_3792 test when networking is disabled
- PR #3820³³⁴¹ - Assorted CMake fixes
- PR #3815³³⁴² - Removing left-over debug output
- PR #3814³³⁴³ - Allow setting default scheduler mode via the configuration database
- PR #3813³³⁴⁴ - Make the deprecation warnings issued by the old pp headers optional
- PR #3812³³⁴⁵ - Windows requires to handle symlinks to directories differently from those linking files
- PR #3811³³⁴⁶ - Clean up PP module and library skeleton
- PR #3806³³⁴⁷ - Moving include path configuration to before APEX
- PR #3804³³⁴⁸ - Fix latch
- PR #3803³³⁴⁹ - Update `hpxcxx` to look at `lib64` and use `python3`
- PR #3802³³⁵⁰ - Numa binding allocator
- PR #3801³³⁵¹ - Remove duplicated includes

- PR #3800³³⁵² - Attempt to fix Posix context switching after lazy init changes
- PR #3798³³⁵³ - count and count_if accepts different iterator types
- PR #3797³³⁵⁴ - Adding a couple of `override` keywords to overloaded virtual functions
- PR #3796³³⁵⁵ - Re-enable testing all schedulers in `shutdown_suspended_test`
- PR #3795³³⁵⁶ - Change `std::terminate` to `std::abort` in SIGSEGV handler
- PR #3794³³⁵⁷ - Fixing #3792
- PR #3793³³⁵⁸ - Extending `migrate_polymorphic_component` unit test
- PR #3791³³⁵⁹ - Change `throw()` to `noexcept`
- PR #3790³³⁶⁰ - Remove deprecated options for 1.3.0 release
- PR #3789³³⁶¹ - Remove Boost filesystem compatibility header
- PR #3788³³⁶² - Disabled even more spots that should not execute if networking is disabled
- PR #3787³³⁶³ - Bump minimal boost supported version to 1.61.0
- PR #3786³³⁶⁴ - Bump minimum required versions for 1.3.0 release
- PR #3785³³⁶⁵ - Explicitly set number of jobs for all ninja invocations on CircleCI
- PR #3784³³⁶⁶ - Fix leak and address sanitizer problems
- PR #3783³³⁶⁷ - Disabled even more spots that should not execute is networking is disabled
- PR #3782³³⁶⁸ - Cherry-picked tuple and `thread_init_data` fixes from #3701
- PR #3781³³⁶⁹ - Fix generic context coroutines after lazy stack allocation changes
- PR #3780³³⁷⁰ - Rename hello world examples
- PR #3776³³⁷¹ - Sort algorithms now use the supplied chunker to determine the required minimal chunk size
- PR #3775³³⁷² - Disable Boost auto-linking
- PR #3774³³⁷³ - Tag and push stable builds
- PR #3773³³⁷⁴ - Enable migration of polymorphic components

- PR #3771³³⁷⁵ - Fix link to stackoverflow in documentation
- PR #3770³³⁷⁶ - Replacing constexpr if in brace-serialization code
- PR #3769³³⁷⁷ - Fix SIGSEGV handler
- PR #3768³³⁷⁸ - Adding flags to scheduler allowing to control thread stealing and idle back-off
- PR #3767³³⁷⁹ - Fix help formatting in hpxrun.py
- PR #3765³³⁸⁰ - Fix a couple of bugs in the thread test
- PR #3764³³⁸¹ - Workaround for SFINAE regression in msvc14.2
- PR #3762³³⁸² - Prevent MSVC from prematurely instantiating things
- PR #3761³³⁸³ - Update python scripts to work with python 3
- PR #3760³³⁸⁴ - Fix callable vtable for GCC4.9
- PR #3759³³⁸⁵ - Rename PAGE_SIZE to PAGE_SIZE_ because AppleClang
- PR #3755³³⁸⁶ - Making sure locks are not held during suspension
- PR #3754³³⁸⁷ - Disable more code if networking is not available/not enabled
- PR #3752³³⁸⁸ - Move util::format implementation to source file
- PR #3751³³⁸⁹ - Fixing problems with lcos::barrier and iostreams
- PR #3750³³⁹⁰ - Change error message to take into account use_guard_page setting
- PR #3749³³⁹¹ - Fix lifetime problem in run_as_hpx_thread
- PR #3748³³⁹² - Fixed unusable behavior of the clang code analyzer.
- PR #3747³³⁹³ - Added PMIX_RANK to the defaults of HPX_WITH_PARCELPOR MPI_ENV.
- PR #3745³³⁹⁴ - Introduced cache_aligned_data and cache_line_data helper structure
- PR #3742³³⁹⁵ - Remove more unused functionality from util/logging
- PR #3740³³⁹⁶ - Fix includes in partitioned vector tests
- PR #3739³³⁹⁷ - More fixes to make sure that std::flush really flushes all output

- PR #3737³³⁹⁸ - Fix potential shutdown problems
- PR #3736³³⁹⁹ - Fix `guided_pool_executor` after dataflow changes caused compilation fail
- PR #3734³⁴⁰⁰ - Limiting executor
- PR #3732³⁴⁰¹ - More constrained bound constructors
- PR #3730³⁴⁰² - Attempt to fix deadlocks during component loading
- PR #3729³⁴⁰³ - Add latch member function `count_up` and `reset`, requested by `hpxMP`
- PR #3728³⁴⁰⁴ - Send even empty buffers on `hpx::endl` and `hpx::flush`
- PR #3727³⁴⁰⁵ - Adding example demonstrating how to customize the memory management for a component
- PR #3726³⁴⁰⁶ - Adding support for passing command line options through the `HPX_COMMANDLINE_OPTIONS` environment variable
- PR #3722³⁴⁰⁷ - Document known broken OpenMPI builds
- PR #3716³⁴⁰⁸ - Add barrier reset function, requested by `hpxMP` for reusing barrier
- PR #3715³⁴⁰⁹ - More work on functions and vttables
- PR #3714³⁴¹⁰ - Generate single-page HTML, PDF, manpage from documentation
- PR #3713³⁴¹¹ - Updating default APEX version to 2.1.2
- PR #3712³⁴¹² - Update release procedure
- PR #3710³⁴¹³ - Fix the C++11 build, after #3704
- PR #3709³⁴¹⁴ - Move some component_registry functionality to source file
- PR #3708³⁴¹⁵ - Ignore all locks while handling assertions
- PR #3707³⁴¹⁶ - Remove obsolete `hpx` runtime executable
- PR #3705³⁴¹⁷ - Fix and simplify `make_ready_future` overload sets
- PR #3704³⁴¹⁸ - Reduce use of binders
- PR #3703³⁴¹⁹ - Ini
- PR #3702³⁴²⁰ - Fixing CUDA compiler errors

- PR #3700³⁴²¹ - Added `barrier::increment` function to increase total number of thread
- PR #3697³⁴²² - One more attempt to fix migration...
- PR #3694³⁴²³ - Fixing component migration
- PR #3693³⁴²⁴ - Print thread state when getting disallowed value in `set_thread_state`
- PR #3692³⁴²⁵ - Only disable `constexpr` with clang-cuda, not nvcc+gcc
- PR #3691³⁴²⁶ - Link with `libsupc++` if needed for `thread_local`
- PR #3690³⁴²⁷ - Remove thousands separators in `set_operations_3442` to comply with C++11
- PR #3688³⁴²⁸ - Decouple serialization from function vtables
- PR #3687³⁴²⁹ - Fix a couple of test failures
- PR #3686³⁴³⁰ - Make sure `tests.unit.build` are run after install on CircleCI
- PR #3685³⁴³¹ - Revise quickstart CMakeLists.txt explanation
- PR #3684³⁴³² - Provide concept emulation for Ranges-TS concepts
- PR #3683³⁴³³ - Ignore uninitialized chunks
- PR #3682³⁴³⁴ - Ignore uninitialized chunks. Check proper indices.
- PR #3680³⁴³⁵ - Ignore uninitialized chunks. Check proper range indices
- PR #3679³⁴³⁶ - Simplify basic action implementations
- PR #3678³⁴³⁷ - Making sure `HPX_HAVE_LIBATOMIC` is unset before checking
- PR #3677³⁴³⁸ - Fix generated full version number to be usable in expressions
- PR #3674³⁴³⁹ - Reduce functional utilities call depth
- PR #3672³⁴⁴⁰ - Change new build system to use existing macros related to pseudo dependencies
- PR #3669³⁴⁴¹ - Remove indirection in `function_ref` when thread description is disabled
- PR #3668³⁴⁴² - Unbreaking `async_*cb*` tests
- PR #3667³⁴⁴³ - Generate `version.hpp`

- PR #3665³⁴⁴⁴ - Enabling MPI parcelport for gitlab runners
- PR #3664³⁴⁴⁵ - making clang-tidy work properly again
- PR #3662³⁴⁴⁶ - Attempt to fix exception handling
- PR #3661³⁴⁴⁷ - Move `lcos::latch` to source file
- PR #3660³⁴⁴⁸ - Fix accidentally explicit `gid_type` default constructor
- PR #3659³⁴⁴⁹ - Parallel executor latch
- PR #3658³⁴⁵⁰ - Fixing `execution_parameters`
- PR #3657³⁴⁵¹ - Avoid dangling references in `wait_all`
- PR #3656³⁴⁵² - Avoiding lifetime problems with `sync_put_parcel`
- PR #3655³⁴⁵³ - Fixing `nullptr` dereference inside of function
- PR #3652³⁴⁵⁴ - Attempt to fix `thread_map_type` definition with C++11
- PR #3650³⁴⁵⁵ - Allowing for end iterator being different from begin iterator
- PR #3649³⁴⁵⁶ - Added architecture identification to `cmake` to be able to detect timestamp support
- PR #3645³⁴⁵⁷ - Enabling sanitizers on gitlab runner
- PR #3644³⁴⁵⁸ - Attempt to tackle timeouts during startup
- PR #3642³⁴⁵⁹ - Cleanup parallel partitioners
- PR #3640³⁴⁶⁰ - Dataflow now works with functions that return a reference
- PR #3637³⁴⁶¹ - Merging the executor-enabled overloads of `shared_future<>::then`
- PR #3633³⁴⁶² - Replace deprecated boost endian macros
- PR #3632³⁴⁶³ - Add instructions on getting HPX to documentation
- PR #3631³⁴⁶⁴ - Simplify parcel creation
- PR #3630³⁴⁶⁵ - Small additions and fixes to release procedure
- PR #3629³⁴⁶⁶ - Modular pp

HPX V1.2.1 (Feb 19, 2019)

General changes

This is a bugfix release. It contains the following changes:

- Fix compilation on ARM, s390x and 32-bit architectures.
- Fix a critical bug in the `future` implementation.
- Fix several problems in the CMake configuration which affects external projects.
- Add support for Boost 1.69.0.

Closed issues

- Issue #3638³⁵²⁵ - Build HPX 1.2 with boost 1.69
- Issue #3635³⁵²⁶ - Non-deterministic crashing on Stampede2

HPX V1.2.0 (Nov 12, 2018)

General changes

Here are some of the main highlights and changes for this release:

- Thanks to the work of our Google Summer of Code student, Nikunj Gupta, we now have a new implementation of `hpx_main.hpp` on supported platforms (Linux, BSD and MacOS). This is intended to be a less fragile drop-in replacement for the old implementation relying on preprocessor macros. The new implementation does not require changes if you are using the [CMake](#)³⁵⁴³ or `pkg-config`. The old behaviour can be restored by setting `HPX_WITH_DYNAMIC_HPX_MAIN=OFF` during [CMake](#)³⁵⁴⁴ configuration. The implementation on Windows is unchanged.

³⁵⁴³ <https://www.cmake.org>

³⁵⁴⁴ <https://www.cmake.org>

- We have added functionality to allow passing scheduling hints to our schedulers. These will allow us to create executors that for example target a specific NUMA domain or allow for *HPX* threads to be pinned to a particular worker thread.
- We have significantly improved the performance of our futures implementation by making the shared state atomic.
- We have replaced Boostbook by Sphinx for our documentation. This means the documentation is easier to navigate with built-in search and table of contents. We have also added a quick start section and restructured the documentation to be easier to follow for new users.
- We have added a new option to the `--hpx:threads` command line option. It is now possible to use `cores` to tell *HPX* to only use one worker thread per core, unlike the existing option `all` which uses one worker thread per processing unit (processing unit can be a hyperthread if hyperthreads are available). The default value of `--hpx:threads` has also been changed to `cores` as this leads to better performance in most cases.
- All command line options can now be passed alongside configuration options when initializing *HPX*. This means that some options that were previously only available on the command line can now be set as configuration options.
- HPXMP is a portable, scalable, and flexible application programming interface using the OpenMP specification that supports multi-platform shared memory multiprocessing programming in C and C++. HPXMP can be enabled within *HPX* by setting `DHPX_WITH_HPXM=ON` during [CMake](https://www.cmake.org)³⁵⁴⁵ configuration.
- Two new performance counters were added for measuring the time spent doing background work. `/threads/time/background-work-duration` returns the time spent doing background on a given thread or locality, while `/threads/time/background-overhead` returns the fraction of time spent doing background work with respect to the overall time spent running the scheduler. The new performance counters are disabled by default and can be turned on by setting `HPX_WITH_BACKGROUND_THREAD_COUNTERS=ON` during [CMake](https://www.cmake.org)³⁵⁴⁶ configuration.
- The idling behaviour of *HPX* has been tweaked to allow for faster idling. This is useful in interactive applications where the *HPX* worker threads may not have work all the time. This behaviour can be tweaked and turned off as before with `HPX_WITH_THREAD_MANAGER_IDLE_BACKOFF=OFF` during [CMake](https://www.cmake.org)³⁵⁴⁷ configuration.
- It is now possible to register callback functions for *HPX* worker thread events. Callbacks can be registered for starting and stopping worker threads, and for when errors occur.

Breaking changes

- The implementation of `hpx_main.hpp` has changed. If you are using custom Makefiles you will need to make changes. Please see the documentation on *using Makefiles* for more details.
- The default value of `--hpx:threads` has changed from `all` to `cores`. The new option `cores` only starts one worker thread per core.
- We have dropped support for Boost 1.56 and 1.57. The minimal version of Boost we now test is 1.58.
- Our `boost::format`-based formatting implementation has been revised and replaced with a custom implementation. This changes the formatting syntax and requires changes if you are relying on `hpx::util::format` or `hpx::util::format_to`. The pull request for this change contains more information: [PR #3266](https://github.com/HPXProject/hpx/pull/3266)³⁵⁴⁸.
- The following deprecated options have now been completely removed: `HPX_WITH_ASYNC_FUNCTION_COMPATIBILITY`, `HPX_WITH_LOCAL_DATAFLOW`, `HPX_WITH_GENERIC_EXECUTION_POLICY`, `HPX_WITH_BOOST_CHRONO_COMPATIBILITY`, `HPX_WITH_EXECUTOR_COMPATIBILITY`, `HPX_WITH_EXECUTION_POLICY_COMPATIBILITY`, and `HPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY`.

Closed pull requests

- [PR #3542³⁵⁹⁷](#) - Fix numa lookup from pu when using hwloc 2.x
- [PR #3541³⁵⁹⁸](#) - Fixing the build system of the MPI parcelport
- [PR #3540³⁵⁹⁹](#) - Updating HPX people section
- [PR #3539³⁶⁰⁰](#) - Splitting test to avoid OOM on CircleCI
- [PR #3537³⁶⁰¹](#) - Fix guided exec
- [PR #3536³⁶⁰²](#) - Updating grants which support the LSU team
- [PR #3535³⁶⁰³](#) - Fix hiding of docker credentials
- [PR #3534³⁶⁰⁴](#) - Fixing #3533
- [PR #3532³⁶⁰⁵](#) - fixing minor doc typo `-hpx:print-counter-at` arg
- [PR #3530³⁶⁰⁶](#) - Changing APEX default tag to v2.1.0
- [PR #3529³⁶⁰⁷](#) - Remove leftover security options and documentation
- [PR #3528³⁶⁰⁸](#) - Fix hwloc version check
- [PR #3524³⁶⁰⁹](#) - Do not build guided pool examples with older GCC compilers
- [PR #3523³⁶¹⁰](#) - Fix logging regression
- [PR #3522³⁶¹¹](#) - Fix more warnings
- [PR #3521³⁶¹²](#) - Fixing argument handling in induction and reduction clauses for `parallel::for_loop`
- [PR #3520³⁶¹³](#) - Remove docs symlink and versioned docs folders
- [PR #3519³⁶¹⁴](#) - hpxMP release
- [PR #3518³⁶¹⁵](#) - Change all steps to use new docker image on CircleCI

- PR #3516³⁶¹⁶ - Drop usage of deprecated facilities removed in C++17
- PR #3515³⁶¹⁷ - Remove remaining uses of Boost.TypeTraits
- PR #3513³⁶¹⁸ - Fixing a CMake problem when trying to use libfabric
- PR #3508³⁶¹⁹ - Remove memory_block component
- PR #3507³⁶²⁰ - Propagating the MPI compile definitions to all relevant targets
- PR #3503³⁶²¹ - Update documentation colors and logo
- PR #3502³⁶²² - Fix bogus `throws` bindings in scheduled_thread_pool_impl
- PR #3501³⁶²³ - Split parallel::remove_if tests to avoid OOM on CircleCI
- PR #3500³⁶²⁴ - Support NONAMEPREFIX in add_hpx_library()
- PR #3497³⁶²⁵ - Note that cuda support requires cmake 3.9
- PR #3495³⁶²⁶ - Fixing dataflow
- PR #3493³⁶²⁷ - Remove deprecated options for 1.2.0 part 2
- PR #3492³⁶²⁸ - Add CUDA_LINK_LIBRARIES_KEYWORD to allow PRIVATE keyword in linkage t...
- PR #3491³⁶²⁹ - Changing Base docker image
- PR #3490³⁶³⁰ - Don't create tasks immediately with hpx::apply
- PR #3489³⁶³¹ - Remove deprecated options for 1.2.0
- PR #3488³⁶³² - Revert "Use BUILD_INTERFACE generator expression to fix cmake flag exports"
- PR #3487³⁶³³ - Revert "Fixing type attribute warning for transfer_action"
- PR #3485³⁶³⁴ - Use BUILD_INTERFACE generator expression to fix cmake flag exports
- PR #3483³⁶³⁵ - Fixing type attribute warning for transfer_action
- PR #3481³⁶³⁶ - Remove unused variables
- PR #3480³⁶³⁷ - Towards a more lightweight transfer action
- PR #3479³⁶³⁸ - Fix FLAGS - Use correct version of target_compile_options

- PR #3478³⁶³⁹ - Making sure the application's exit code is properly propagated back to the OS
- PR #3476³⁶⁴⁰ - Don't print docker credentials as part of the environment.
- PR #3473³⁶⁴¹ - Fixing invalid cmake code if no jemalloc prefix was given
- PR #3472³⁶⁴² - Attempting to work around recent clang test compilation failures
- PR #3471³⁶⁴³ - Enable jemalloc on windows
- PR #3470³⁶⁴⁴ - Updates readme
- PR #3468³⁶⁴⁵ - Avoid hang if there is an exception thrown during startup
- PR #3467³⁶⁴⁶ - Add compiler specific fallback attributes if C++17 attribute is not available
- PR #3466³⁶⁴⁷ - - bugfix : fix compilation with llvm-7.0
- PR #3465³⁶⁴⁸ - This patch adds various optimizations extracted from the thread_local_allocator work
- PR #3464³⁶⁴⁹ - Check for forked repos in CircleCI docker push step
- PR #3463³⁶⁵⁰ - - cmake : create the parent directory before symlinking
- PR #3459³⁶⁵¹ - Remove unused/incomplete functionality from util/logging
- PR #3458³⁶⁵² - Fix a problem with scope of CMAKE_CXX_FLAGS and hpx_add_compile_flag
- PR #3457³⁶⁵³ - Fixing more size_t -> int16_t (and similar) warnings
- PR #3456³⁶⁵⁴ - Add #ifdefs to topology.cpp to support old hwloc versions again
- PR #3454³⁶⁵⁵ - Fixing warnings related to silent conversion of size_t -> int16_t
- PR #3451³⁶⁵⁶ - Add examples as unit tests
- PR #3450³⁶⁵⁷ - Constexpr-fying bind and other functional facilities
- PR #3446³⁶⁵⁸ - Fix some thread suspension timeouts
- PR #3445³⁶⁵⁹ - Fix various warnings
- PR #3443³⁶⁶⁰ - Only enable service pool config options if pools are enabled
- PR #3441³⁶⁶¹ - Fix missing closing brackets in documentation

- PR #3439³⁶⁶² - Use correct MPI CXX libraries for MPI parcelport
- PR #3436³⁶⁶³ - Add projection function to find_* (and fix very bad bug)
- PR #3435³⁶⁶⁴ - Fixing 1205
- PR #3434³⁶⁶⁵ - Fix threads cores
- PR #3433³⁶⁶⁶ - Add Heise Online to release announcement list
- PR #3432³⁶⁶⁷ - Don't track task dependencies for distributed runs
- PR #3431³⁶⁶⁸ - Circle CI setting changes for hpxMP
- PR #3430³⁶⁶⁹ - Fix unused params warning
- PR #3429³⁶⁷⁰ - One thread per core
- PR #3428³⁶⁷¹ - This suppresses a deprecation warning that is being issued by MSVC 19.15.26726
- PR #3427³⁶⁷² - Fixes #3426
- PR #3425³⁶⁷³ - Use source cache and workspace between job steps on CircleCI
- PR #3421³⁶⁷⁴ - Add CDash timing output to future overhead test (for graphs)
- PR #3420³⁶⁷⁵ - Add guided_pool_executor
- PR #3419³⁶⁷⁶ - Fix typo in CircleCI config
- PR #3418³⁶⁷⁷ - Add sphinx documentation
- PR #3415³⁶⁷⁸ - Scheduler NUMA hint and shared priority scheduler
- PR #3414³⁶⁷⁹ - Adding step to synchronize the APEX release
- PR #3413³⁶⁸⁰ - Fixing multiple defines of APEX_HAVE_HPX
- PR #3412³⁶⁸¹ - Fixes linking with libhpx_wrap error with BSD and Windows based systems
- PR #3410³⁶⁸² - Fix typo in CMakeLists.txt
- PR #3409³⁶⁸³ - Fix brackets and indentation in existing_performance_counters.qbk
- PR #3407³⁶⁸⁴ - Fix unused param and extra ; warnings emitted by gcc 8.x

³⁶⁸⁴ <https://github.com/TheHPXProject/hpx/pull/3407>

- PR #3406³⁶⁸⁵ - Adding thread local allocator and use it for future shared states
- PR #3405³⁶⁸⁶ - Adding DHPX_HAVE_THREAD_LOCAL_STORAGE=ON to builds
- PR #3404³⁶⁸⁷ - fixing multiple definition of main() in linux
- PR #3402³⁶⁸⁸ - Allow debug option to be enabled only for Linux systems with dynamic main on
- PR #3401³⁶⁸⁹ - Fix cuda_future_helper.h when compiling with C++11
- PR #3400³⁶⁹⁰ - Fix floating point exception scheduler_base idle backoff
- PR #3398³⁶⁹¹ - Atomic future state
- PR #3397³⁶⁹² - Fixing code for older gcc versions
- PR #3396³⁶⁹³ - Allowing to register thread event functions (start/stop/error)
- PR #3394³⁶⁹⁴ - Fix small mistake in primary_namespace_server.cpp
- PR #3393³⁶⁹⁵ - Explicitly instantiate configured schedulers
- PR #3392³⁶⁹⁶ - Add performance counters background overhead and background work duration
- PR #3391³⁶⁹⁷ - Adapt integration of HPXMP to latest build system changes
- PR #3390³⁶⁹⁸ - Make AGAS measurements optional
- PR #3389³⁶⁹⁹ - Fix deadlock during shutdown
- PR #3388³⁷⁰⁰ - Add several functionalities allowing to optimize synchronous action invocation
- PR #3387³⁷⁰¹ - Add cmake option to opt out of fail-compile tests
- PR #3386³⁷⁰² - Adding support for boost::container::small_vector to dataflow
- PR #3385³⁷⁰³ - Adds Debug option for hpx initializing from main
- PR #3384³⁷⁰⁴ - This hopefully fixes two tests that occasionally fail
- PR #3383³⁷⁰⁵ - Making sure thread local storage is enable for hpxMP
- PR #3382³⁷⁰⁶ - Fix usage of HPX_CAPTURE together with default value capture [=]
- PR #3381³⁷⁰⁷ - Replace undefined instantiations of uniform_int_distribution

³⁷⁰⁷ <https://github.com/TheHPXProject/hpx/pull/3381>

- PR #3380³⁷⁰⁸ - Add missing semicolons to uses of HPX_COMPILER_FENCE
- PR #3379³⁷⁰⁹ - Fixing #3378
- PR #3377³⁷¹⁰ - Adding build system support to integrate hpxmp into hpx at the user's machine
- PR #3375³⁷¹¹ - Replacing wrapper for `__libc_start_main` with `main`
- PR #3374³⁷¹² - Adds `hpx_wrap` to `HPX_LINK_LIBRARIES` which links only when specified.
- PR #3373³⁷¹³ - Forcing cache settings in `HPXConfig.cmake` to guarantee updated values
- PR #3372³⁷¹⁴ - Fix some more c++11 build problems
- PR #3371³⁷¹⁵ - Adds `HPX_LINKER_FLAGS` to HPX applications without editing their source codes
- PR #3370³⁷¹⁶ - `util::format`: add `type_specifier<>` specializations for `%!s(MISSING)` and `%!l(MISSING)s`
- PR #3369³⁷¹⁷ - Adding configuration option to allow explicit disable of the new `hpx_main` feature on Linux
- PR #3368³⁷¹⁸ - Updates doc with recent `hpx_wrap` implementation
- PR #3367³⁷¹⁹ - Adds Mac OS implementation to `hpx_main.hpp`
- PR #3365³⁷²⁰ - Fix order of hpx libs in `HPX_CONF_LIBRARIES`.
- PR #3363³⁷²¹ - Apex fixing null wrapper
- PR #3361³⁷²² - Making sure all parcels get destroyed on an HPX thread (TCP pp)
- PR #3359³⁷²³ - Feature/improve error for compiler
- PR #3357³⁷²⁴ - Static/dynamic executable implementation
- PR #3355³⁷²⁵ - Reverting changes introduced by #3283 as those make applications hang
- PR #3354³⁷²⁶ - Add external dependencies to `HPX_LIBRARY_DIR`
- PR #3353³⁷²⁷ - Fix `libfabric tcp`
- PR #3351³⁷²⁸ - Move obsolete header to tests directory.
- PR #3350³⁷²⁹ - Renaming two functions to avoid problem described in #3285
- PR #3349³⁷³⁰ - Make idle backoff exponential with maximum sleep time

³⁷³⁰ <https://github.com/TheHPXProject/hpx/pull/3349>

- PR #3347³⁷³¹ - Replace *simple_component** with *component** in the Documentation
- PR #3346³⁷³² - Fix CMakeLists.txt example in quick start
- PR #3345³⁷³³ - Fix automatic setting of HPX_MORE_THAN_64_THREADS
- PR #3344³⁷³⁴ - Reduce amount of information printed for unknown command line options
- PR #3343³⁷³⁵ - Safeguard HPX against destruction in global contexts
- PR #3341³⁷³⁶ - Allowing for all command line options to be used as configuration settings
- PR #3340³⁷³⁷ - Always convert inspect results to JUnit XML
- PR #3336³⁷³⁸ - Only run docker push on master on CircleCI
- PR #3335³⁷³⁹ - Update description of hpx.os_threads config parameter.
- PR #3334³⁷⁴⁰ - Making sure early logging settings don't get mixed with others
- PR #3333³⁷⁴¹ - Update CMake links and versions in documentation
- PR #3332³⁷⁴² - Add notes on target suffixes to CMake documentation
- PR #3331³⁷⁴³ - Add quickstart section to documentation
- PR #3330³⁷⁴⁴ - Rename resource_partitioner test to avoid conflicts with pseudodependencies
- PR #3328³⁷⁴⁵ - Making sure object is pinned while executing actions, even if action returns a future
- PR #3327³⁷⁴⁶ - Add missing std::forward to tuple.hpp
- PR #3326³⁷⁴⁷ - Make sure logging is up and running while modules are being discovered.
- PR #3324³⁷⁴⁸ - Replace C++14 overload of std::equal with C++11 code.
- PR #3323³⁷⁴⁹ - Fix a missing apex thread data (wrapper) initialization
- PR #3320³⁷⁵⁰ - Adding support for -std=c++2a (define *HPX_WITH_CXX2A=On*)
- PR #3319³⁷⁵¹ - Replacing C++14 feature with equivalent C++11 code
- PR #3317³⁷⁵² - Fix compilation with VS 15.7.1 and /std:c++latest
- PR #3316³⁷⁵³ - Fix includes for 1d_stencil_*_omp examples

- [PR #3232³⁸⁰⁰](#) - Clean up suspension tests
- [PR #3230³⁸⁰¹](#) - Add optional scheduler mode parameter to `create_thread_pool` function
- [PR #3228³⁸⁰²](#) - Allow suspension also on static schedulers
- [PR #3163³⁸⁰³](#) - libfabric parcelport w/o `HPX_PARCELPORT_LIBFABRIC_ENDPOINT_RDM`
- [PR #3036³⁸⁰⁴](#) - Switching to CircleCI 2.0

HPX V1.1.0 (Mar 24, 2018)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- We have changed the way *HPX* manages the processing units on a node. We do not longer implicitly bind all available cores to a single thread pool. The user has now full control over what processing units are bound to what thread pool, each with a separate scheduler. It is now also possible to create your own scheduler implementation and control what processing units this scheduler should use. We added the `hpx::resource::partitioner` that manages all available processing units and assigns resources to the used thread pools. Thread pools can be now be suspended/resumed independently. This functionality helps in running *HPX* concurrently to code that is directly relying on [OpenMP³⁸⁰⁵](#) and/or [MPI³⁸⁰⁶](#).
- We have continued to implement various parallel algorithms. *HPX* now almost completely implements all of the parallel algorithms as specified by the [C++17 Standard³⁸⁰⁷](#). We have also continued to implement these algorithms for the distributed use case (for segmented data structures, such as `hpx::partitioned_vector`).
- Added a compatibility layer for `std::thread`, `std::mutex`, and `std::condition_variable` allowing for the code to use those facilities where available and to fall back to the corresponding Boost facilities otherwise. The [CMake³⁸⁰⁸](#) configuration option `-DHPX_WITH_THREAD_COMPATIBILITY=On` can be used to force using the Boost equivalents.
- The parameter sequence for the `hpx::parallel::transform_inclusive_scan` overload taking one iterator range has changed (again) to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to [CMake³⁸⁰⁹](#).
- The parameter sequence for the `hpx::parallel::inclusive_scan` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overloads can be still enabled at configure time by passing `-DHPX_WITH_INCLUSIVE_SCAN_COMPATIBILITY=On` to CMake.
- Added a helper facility `hpx::local_new` which is equivalent to `hpx::new_` except that it creates components locally only. As a consequence, the used component constructor may accept non-serializable argument types and/or non-const references or pointers.
- Removed the (broken) component type `hpx::lcos::queue<T>`. The old type is still available at configure time by passing `-DHPX_WITH_QUEUE_COMPATIBILITY=On` to CMake.

³⁸⁰⁷ <http://www.open-std.org/jtc1/sc22/wg21>

³⁸⁰⁸ <https://www.cmake.org>

³⁸⁰⁹ <https://www.cmake.org>

- The parallel algorithms adopted for C++17 restrict the iterator categories usable with those to at least forward iterators. Our implementation of the parallel algorithms was supporting input iterators (and output iterators) as well by simply falling back to sequential execution. We have now made our implementations conforming by requiring at least forward iterators. In order to enable the old behavior use the compatibility option `-DHPX_WITH_ALGORITHM_INPUT_ITERATOR_SUPPORT=On` on the `CMake`³⁸¹⁰ command line.
- We have added the functionalities allowing for LCOs being implemented using (simple) components. Before LCOs had to always be implemented using managed components.
- User defined components don't have to be default-constructible anymore. Return types from actions don't have to be default-constructible anymore either. Our serialization layer now in general supports non-default-constructible types.
- We have added a new launch policy `hpx::launch::lazy` that allows one to defer the decision on what launch policy to use to the point of execution. This policy is initialized with a function (object) that – when invoked – is expected to produce the desired launch policy.

Breaking changes

- We have dropped support for the gcc compiler version V4.8. The minimal gcc version we now test on is gcc V4.9. The minimally required version of `CMake`³⁸¹¹ is now V3.3.2.
- We have dropped support for the Visual Studio 2013 compiler version. The minimal Visual Studio version we now test on is Visual Studio 2015.5.
- We have dropped support for the Boost V1.51-V1.54. The minimal version of Boost we now test is Boost V1.55.
- We have dropped support for the `hpx::util::unwrapped` API. `hpx::util::unwrapped` will stay functional to some degree, until it finally gets removed in a later version of HPX. The functional usage of `hpx::util::unwrapped` should be changed to the new `hpx::util::unwrapping` function whereas the immediate usage should be replaced to `hpx::util::unwrap`.
- The performance counter names referring to properties as exposed by the threading subsystem have changes as those now additionally have to specify the thread-pool. See the corresponding documentation for more details.
- The overloads of `hpx::async` that invoke an action do not perform implicit unwrapping of the returned future anymore in case the invoked function does return a future in the first place. In this case `hpx::async` now returns a `hpx::future<future<T>>` making its behavior conforming to its local counterpart.
- We have replaced the use of `boost::exception_ptr` in our APIs with the equivalent `std::exception_ptr`. Please change your codes accordingly. No compatibility settings are provided.
- We have removed the compatibility settings for `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` as their life-cycle has reached its end.
- We have removed the experimental thread schedulers `hierarchy_scheduler`, `periodic_priority_scheduler` and `throttling_scheduler` in an effort to clean up and consolidate our thread schedulers.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- PR #3250³⁸¹² - Apex refactoring with guides
- PR #3249³⁸¹³ - Updating People.qbk
- PR #3246³⁸¹⁴ - Assorted fixes for CUDA
- PR #3245³⁸¹⁵ - Apex refactoring with guides
- PR #3242³⁸¹⁶ - Modify task counting in thread_queue.hpp
- PR #3240³⁸¹⁷ - Fixed typos
- PR #3238³⁸¹⁸ - Readding accidentally removed std::abort
- PR #3237³⁸¹⁹ - Adding Pipeline example
- PR #3236³⁸²⁰ - Fixing memory_block
- PR #3233³⁸²¹ - Make schedule_thread take suspended threads into account
- Issue #3226³⁸²² - memory_block is breaking, signaling SIGSEGV on a thread on creation and freeing
- PR #3225³⁸²³ - Applying quick fix for hwloc-2.0
- Issue #3224³⁸²⁴ - HPX counters crashing the application
- PR #3223³⁸²⁵ - Fix returns when setting config entries
- Issue #3222³⁸²⁶ - Errors linking libhpx.so
- Issue #3221³⁸²⁷ - HPX on Mac OS X with HWLoc 2.0.0 fails to run
- PR #3216³⁸²⁸ - Reorder a variadic array to satisfy VS 2017 15.6
- PR #3214³⁸²⁹ - Changed prerequisites.qbk to avoid confusion while building boost
- PR #3213³⁸³⁰ - Relax locks for thread suspension to avoid holding locks when yielding
- PR #3212³⁸³¹ - Fix check in sequenced_executor test
- PR #3211³⁸³² - Use preinit_array to set argc/argv in init_globally example

- PR #2973⁴⁰⁴⁰ - Fix small typos
- PR #2972⁴⁰⁴¹ - Adding uintstd.h header
- PR #2971⁴⁰⁴² - Fall back to creating local components using local_new
- PR #2970⁴⁰⁴³ - Improve is_tuple_like trait
- PR #2969⁴⁰⁴⁴ - Fix HPX_WITH_MORE_THAN_64_THREADS default value
- PR #2968⁴⁰⁴⁵ - Cleaning up dataflow overload set
- PR #2967⁴⁰⁴⁶ - Make parallel::merge is stable. (Fix #2964.)
- PR #2966⁴⁰⁴⁷ - Fixing a couple of held locks during exception handling
- PR #2965⁴⁰⁴⁸ - Adding missing #include
- Issue #2964⁴⁰⁴⁹ - parallel merge is not stable
- PR #2963⁴⁰⁵⁰ - Making sure any function object passed to dataflow is released after being invoked
- PR #2962⁴⁰⁵¹ - Partially reverting #2891
- PR #2961⁴⁰⁵² - Attempt to fix the gcc 4.9 problem with the async pack traversal
- Issue #2959⁴⁰⁵³ - Program terminates during error handling
- Issue #2958⁴⁰⁵⁴ - HPX_PLAIN_ACTION breaks due to missing include
- PR #2957⁴⁰⁵⁵ - Fixing errors generated by mixing different attribute syntaxes
- Issue #2956⁴⁰⁵⁶ - Mixing attribute syntaxes leads to compiler errors
- Issue #2955⁴⁰⁵⁷ - Fix OS-Thread throttling
- PR #2953⁴⁰⁵⁸ - Making sure any hpx.os_threads=N supplied through a -hpx::config file is taken into account
- PR #2952⁴⁰⁵⁹ - Removing wrong call to cleanup_terminated_locked
- PR #2951⁴⁰⁶⁰ - Revert “Make sure the function vtables are initialized before use”
- PR #2950⁴⁰⁶¹ - Fix a namespace compilation error when some schedulers are disabled
- Issue #2949⁴⁰⁶² - master branch giving lockups on shutdown

HPX V1.0.0 (Apr 24, 2017)

General changes

Here are some of the main highlights and changes for this release (in no particular order):

- Added the facility `hpx::split_future` which allows one to convert a `future<tuple<Ts...>>` into a `tuple<future<Ts>...>`. This functionality is not available when compiling *HPX* with VS2012.
- Added a new type of performance counter which allows one to return a list of values for each invocation. We also added a first counter of this type which collects a histogram of the times between parcels being created.
- Added new LCOs: `hpx::lcos::channel` and `hpx::lcos::local::channel` which are very similar to the well known channel constructs used in the Go language.
- Added new performance counters reporting the amount of data handled by the networking layer on a action-by-action basis (please see [PR #2289](#)⁴⁴²¹ for more details).
- Added a new facility `hpx::lcos::barrier`, replacing the equally named older one. The new facility has a slightly changed API and is much more efficient. Most notable, the new facility exposes a (global) function `hpx::lcos::barrier::synchronize()` which represents a global barrier across all localities.

⁴⁴²⁰ <https://github.com/TheHPXProject/hpx/issues/528>

⁴⁴²¹ <https://github.com/TheHPXProject/hpx/pull/2289>

- We have started to add support for vectorization to our parallel algorithm implementations. This support depends on using an external library, currently either Vc Library or `boost_simd`. Please see [Issue #2333](#)⁴⁴²² for a list of currently supported algorithms. This is an experimental feature and its implementation and/or API might change in the future. Please see this [blog-post](#)⁴⁴²³ for more information.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17. The old overload can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17. The old `inner_product` names can be still enabled at configure time by specifying `-DHPX_WITH_TRANSFORM_REDUCE_COMPATIBILITY=On` to CMake.
- Added versions of `hpx::get_ptr` taking client side representations for component instances as their parameter (instead of a global id).
- Added the helper utility `hpx::performance_counters::performance_counter_set` helping to encapsulate a set of performance counters to be managed concurrently.
- All execution policies and related classes have been renamed to be consistent with the naming changes applied for C++17. All policies now live in the namespace `hpx::parallel::execution`. The old names can be still enabled at configure time by specifying `-DHPX_WITH_EXECUTION_POLICY_COMPATIBILITY=On` to CMake.
- The thread scheduling subsystem has undergone a major refactoring which results in significant performance improvements. We have also improved the performance of creating `hpx::future` and of various facilities handling those.
- We have consolidated all of the code in `HPX.Compute` related to the integration of CUDA. `hpx::partitioned_vector` has been enabled to be usable with `hpx::compute::vector` which allows one to place the partitions on one or more GPU devices.
- Added new performance counters exposing various internals of the thread scheduling subsystem, such as the current idle- and busy-loop counters and instantaneous scheduler utilization.
- Extended and improved the use of the ITTNotify hooks allowing to collect performance counter data and function annotation information from within the Intel Amplifier tool.

Breaking changes

- We have dropped support for the gcc compiler versions V4.6 and 4.7. The minimal gcc version we now test on is gcc V4.8.
- We have removed (default) support for `boost::chrono` in interfaces, uses of it have been replaced with `std::chrono`. This facility can be still enabled at configure time by specifying `-DHPX_WITH_BOOST_CHRONO_COMPATIBILITY=On` to CMake.
- The parameter sequence for the `hpx::parallel::transform_reduce` overload taking one iterator range has changed to match the changes this algorithm has undergone while being moved to C++17.
- The algorithm `hpx::parallel::inner_product` has been renamed to `hpx::parallel::transform_reduce` to match the changes this algorithm has undergone while being moved to C++17.

⁴⁴²² <https://github.com/TheHPXProject/hpx/issues/2333>

⁴⁴²³ <http://stellar-group.org/2016/09/vectorized-cpp-parallel-algorithms-with-hpx/>

- the build options `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` and `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY` are now disabled by default. Please change your code still depending on the deprecated interfaces.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #2596](#)⁴⁴²⁴ - Adding apex data
- [PR #2595](#)⁴⁴²⁵ - Remove obsolete file
- [Issue #2594](#)⁴⁴²⁶ - FindOpenCL.cmake mismatch with the official cmake module
- [PR #2592](#)⁴⁴²⁷ - First attempt to introduce `spmd_block` in `hpx`
- [Issue #2591](#)⁴⁴²⁸ - Feature request: continuation (then) which does not require the callable object to take a future<R> as parameter
- [PR #2588](#)⁴⁴²⁹ - Daint fixes
- [PR #2587](#)⁴⁴³⁰ - Fixing `transfer_(continuation)_action::schedule`
- [PR #2585](#)⁴⁴³¹ - Work around MSVC having an ICE when compiling with `-Ob2`
- [PR #2583](#)⁴⁴³² - changing 7zip command to 7za in `roll_release.sh`
- [PR #2582](#)⁴⁴³³ - First attempt to introduce `spmd_block` in `hpx`
- [PR #2581](#)⁴⁴³⁴ - Enable annotated function for parallel algorithms
- [PR #2580](#)⁴⁴³⁵ - First attempt to introduce `spmd_block` in `hpx`
- [PR #2579](#)⁴⁴³⁶ - Make thread NICE level setting an option
- [PR #2578](#)⁴⁴³⁷ - Implementing enqueue instead of busy wait when no sender is available
- [PR #2577](#)⁴⁴³⁸ - Retrieve `-std=c++11` consistent nvcc flag
- [PR #2576](#)⁴⁴³⁹ - Add missing dependencies of cuda based tests
- [PR #2575](#)⁴⁴⁴⁰ - Remove warnings due to some captured variables
- [PR #2573](#)⁴⁴⁴¹ - Attempt to resolve `resolve_locality`
- [PR #2572](#)⁴⁴⁴² - Adding APEX hooks to background thread

HPX V0.9.99 (Jul 15, 2016)

General changes

As the version number of this release hints, we consider this release to be a preview for the upcoming *HPX* V1.0. All of the functionalities we set out to implement for V1.0 are in place; all of the features we wanted to have exposed are ready. We are very happy with the stability and performance of *HPX* and we would like to present this release to the community in order for us to gather broad feedback before releasing V1.0. We still expect for some minor details to change, but on the whole this release represents what we would like to have in a V1.0.

Overall, since the last release we have had almost 1600 commits while closing almost 400 tickets. These numbers reflect the incredible development activity we have seen over the last couple of months. We would like to express a big ‘Thank you!’ to all contributors and those who helped to make this release happen.

The most notable addition in terms of new functionality available with this release is the full implementation of object migration (i.e. the ability to transparently move *HPX* components to a different compute node). Additionally, this release of *HPX* cleans up many minor issues and some API inconsistencies.

Here are some of the main highlights and changes for this release (in no particular order):

- We have fixed a couple of issues in AGAS and the parcell layer which have caused hangs, segmentation faults at exit, and a slowdown of applications over time. Fixing those has significantly increased the overall stability and performance of distributed runs.
- We have started to add parallel algorithm overloads based on the C++ Extensions for Ranges ([N4560](#)⁴⁷⁴⁷) proposal. This also includes the addition of projections to the existing algorithms. Please see [Issue #1668](#)⁴⁷⁴⁸ for a list of algorithms which have been adapted to [N4560](#)⁴⁷⁴⁹.
- We have implemented index-based parallel for-loops based on a corresponding standardization proposal ([P0075R1](#)⁴⁷⁵⁰). Please see [Issue #2016](#)⁴⁷⁵¹ for a list of available algorithms.
- We have added implementations for more parallel algorithms as proposed for the upcoming C++ 17 Standard. See [Issue #1141](#)⁴⁷⁵² for an overview of which algorithms are available by now.
- We have started to implement a new prototypical functionality with *HPX.Compute* which uniformly exposes some of the higher level APIs to heterogeneous architectures (currently CUDA). This functionality is an early preview and should not be considered stable. It may change considerably in the future.
- We have pervasively added (optional) executor arguments to all API functions which schedule new work. Executors are now used throughout the code base as the main means of executing tasks.

⁴⁷⁴⁹ <http://wg21.link/n4560>

⁴⁷⁵⁰ <http://wg21.link/p0075r1>

⁴⁷⁵¹ <https://github.com/TheHPXProject/hpx/issues/2016>

⁴⁷⁵² <https://github.com/TheHPXProject/hpx/issues/1141>

- Added `hpx::make_future<R>(future<T> &&)` allowing to convert a future of any type `T` into a future of any other type `R`, either based on default conversion rules of the embedded types or using a given explicit conversion function.
- We finally finished the implementation of transparent migration of components to another locality. It is now possible to trigger a migration operation without ‘stopping the world’ for the object to migrate. *HPX* will make sure that no work is being performed on an object before it is migrated and that all subsequently scheduled work for the migrated object will be transparently forwarded to the new locality. Please note that the global id of the migrated object does not change, thus the application will not have to be changed in any way to support this new functionality. Please note that this feature is currently considered experimental. See [Issue #559](#)⁴⁷⁵³ and [PR #1966](#)⁴⁷⁵⁴ for more details.
- The `hpx::dataflow` facility is now usable with actions. Similarly to `hpx::async`, actions can be specified as an explicit template argument (`hpx::dataflow<Action>(target, ...)`) or as the first argument (`hpx::dataflow(Action(), target, ...)`). We have also enabled the use of distribution policies as the target for dataflow invocations. Please see [Issue #1265](#)⁴⁷⁵⁵ and [PR #1912](#)⁴⁷⁵⁶ for more information.
- Adding overloads of `gather_here` and `gather_there` to accept the plain values of the data to gather (in addition to the existing overloads expecting futures).
- We have cleaned up and refactored large parts of the code base. This helped reducing compile and link times of *HPX* itself and also of applications depending on it. We have further decreased the dependency of *HPX* on the Boost libraries by replacing part of those with facilities available from the standard libraries.
- Wherever possible we have removed dependencies of our API on Boost by replacing those with the equivalent facility from the C++11 standard library.
- We have added new performance counters for parcel coalescing, file-IO, the AGAS cache, and overall scheduler time. Resetting performance counters has been overhauled and fixed.
- We have introduced a generic client type `hpx::components::client<>` and added support for using it with `hpx::async`. This removes the necessity to implement specific client types for every component type without losing type safety. This deemphasizes the need for using the low level `hpx::id_type` for referencing (possibly remote) component instances. The plan is to deprecate the direct use of `hpx::id_type` in user code in the future.
- We have added a special iterator which supports automatic prefetching of one or more arrays for speeding up loop-like code (see `hpx::parallel::util::make_prefetcher_context()`).
- We have extended the interfaces exposed from executors (as proposed by [N4406](#)⁴⁷⁵⁷) to accept an arbitrary number of arguments.

Breaking changes

- In order to move the dataflow facility to namespace `hpx` we added a definition of `hpx::dataflow` which might create ambiguities in existing codes. The previous definition of this facility (`hpx::lcos::local::dataflow`) has been deprecated and is available only if the constant `-DHPX_WITH_LOCAL_DATAFLOW_COMPATIBILITY=On` to `CMake`⁴⁷⁵⁸ is defined at configuration time. Please explicitly qualify all uses of the dataflow facility if you enable this compatibility setting and encounter ambiguities.
- The adaptation of the C++ Extensions for Ranges ([N4560](#)⁴⁷⁵⁹) proposal imposes some breaking changes related

⁴⁷⁵³ <https://github.com/TheHPXProject/hpx/issues/559>

⁴⁷⁵⁴ <https://github.com/TheHPXProject/hpx/pull/1966>

⁴⁷⁵⁵ <https://github.com/TheHPXProject/hpx/issues/1265>

⁴⁷⁵⁶ <https://github.com/TheHPXProject/hpx/pull/1912>

⁴⁷⁵⁷ <http://wg21.link/n4406>

⁴⁷⁵⁸ <https://www.cmake.org>

⁴⁷⁵⁹ <http://wg21.link/n4560>

to the return types of some of the parallel algorithms. Please see [Issue #1668](#)⁴⁷⁶⁰ for a list of algorithms which have already been adapted.

- The facility `hpx::lcos::make_future_void()` has been replaced by `hpx::make_future<void>()`.
- We have removed support for Intel V13 and gcc 4.4.x.
- We have removed (default) support for the generic `hpx::parallel::execution_policy` because it was removed from the Parallelism TS (`__cpp11_n4104__`) while it was being added to the upcoming C++17 Standard. This facility can be still enabled at configure time by specifying `-DHPX_WITH_GENERIC_EXECUTION_POLICY=On` to CMake.
- Uses of `boost::shared_ptr` and related facilities have been replaced with `std::shared_ptr` and friends. Uses of `boost::unique_lock`, `boost::lock_guard` etc. have also been replaced by the equivalent (and equally named) tools available from the C++11 standard library.
- Facilities that used to expect an explicit `boost::unique_lock` now take an `std::unique_lock`. Additionally, `condition_variable` no longer aliases `condition_variable_any`; its interface now only works with `std::unique_lock<local::mutex>`.
- Uses of `boost::function`, `boost::bind`, `boost::tuple` have been replaced by the corresponding facilities in HPX (`hpx::util::function`, `hpx::util::bind`, and `hpx::util::tuple`, respectively).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #2250](#)⁴⁷⁶¹ - change default chunker of parallel executor to static one
- [PR #2247](#)⁴⁷⁶² - HPX on ppc64le
- [PR #2244](#)⁴⁷⁶³ - Fixing MSVC problems
- [PR #2238](#)⁴⁷⁶⁴ - Fixing small typos
- [PR #2237](#)⁴⁷⁶⁵ - Fixing small typos
- [PR #2234](#)⁴⁷⁶⁶ - Fix broken add test macro when extra args are passed in
- [PR #2231](#)⁴⁷⁶⁷ - Fixing possible race during future awaiting in serialization
- [PR #2230](#)⁴⁷⁶⁸ - Fix stream nvcc
- [PR #2229](#)⁴⁷⁶⁹ - Fixed `run_as_hpx_thread`
- [PR #2228](#)⁴⁷⁷⁰ - On `prefetching_test` branch : adding `prefetching_iterator` and related tests used for prefetching containers within lambda functions
- [PR #2227](#)⁴⁷⁷¹ - Support for HPXCL's `opencl::event`
- [PR #2226](#)⁴⁷⁷² - Preparing for release of V0.9.99

HPX V0.9.11 (Nov 11, 2015)

Our main focus for this release was the design and development of a coherent set of higher-level APIs exposing various types of parallelism to the application programmer. We introduced the concepts of an `executor`, which can be used to customize the `where` and `when` of execution of tasks in the context of parallelizing codes. We extended all APIs related to managing parallel tasks to support executors which gives the user the choice of either using one of the predefined executor types or to provide its own, possibly application specific, executor. We paid very close attention to align all of these changes with the existing C++ Standards documents or with the ongoing proposals for standardization.

This release is the first after our change to a new development policy. We switched all development to be strictly performed on branches only, all direct commits to our main branch (`master`) are prohibited. Any change has to go through a peer review before it will be merged to `master`. As a result the overall stability of our code base has significantly increased, the development process itself has been simplified. This change manifests itself in a large number of pull-requests which have been merged (please see below for a full list of closed issues and pull-requests). All in all for this release, we closed almost 100 issues and merged over 290 pull-requests. There have been over 1600 commits to the master branch since the last release.

⁵¹⁵⁴ <https://github.com/TheHPXProject/hpx/issues/55>

General changes

- We are moving into the direction of unifying managed and simple components. As such, the classes `hpx::components::component` and `hpx::components::component_base` have been added which currently just forward to the currently existing simple component facilities. The examples have been converted to only use those two classes.
- Added integration with the [CircleCI](https://circleci.com/gh/TheHPXProject/hpx)⁵¹⁵⁵ hosted continuous integration service. This gives us constant and immediate feedback on the health of our master branch.
- The compiler configuration subsystem in the build system has been reimplemented. Instead of using Boost.Config we now use our own lightweight set of cmake scripts to determine the available language and library features supported by the used compiler.
- The API for creating instances of components has been consolidated. All component instances should be created using the `hpx::new_` only. It allows one to instantiate both, single component instances and multiple component instances. The placement of the created components can be controlled by special distribution policies. Please see the corresponding documentation outlining the use of `hpx::new_`.
- Introduced four new distribution policies which can be used with many API functions which traditionally expected to be used with a locality id. The new distribution policies are:
 - `hpx::components::default_distribution_policy` which tries to place multiple component instances as evenly as possible.
 - `hpx::components::colocating_distribution_policy` which will refer to the locality where a given component instance is currently placed.
 - `hpx::components::binpacking_distribution_policy` which will place multiple component instances as evenly as possible based on any performance counter.
 - `hpx::components::target_distribution_policy` which allows one to represent a given locality in the context of a distribution policy.
- The new distribution policies can now be also used with `hpx::async`. This change also deprecates `hpx::async_colocated(id, ...)` which now is replaced by a distribution policy: `hpx::async(hpx::colocated(id), ...)`.
- The `hpx::vector` and `hpx::unordered_map` data structures can now be used with the new distribution policies as well.
- The parallel facility `hpx::parallel::task_region` has been renamed to `hpx::parallel::task_block` based on the changes in the corresponding standardization proposal [N4411](http://wg21.link/n4411)⁵¹⁵⁶.
- Added extensions to the parallel facility `hpx::parallel::task_block` allowing to combine a `task_block` with an execution policy. This implies a minor breaking change as the `hpx::parallel::task_block` is now a template.
- Added new LCOs: `hpx::lcos::latch` and `hpx::lcos::local::latch` which semantically conform to the proposed `std::latch` (see [N4399](http://wg21.link/n4399)⁵¹⁵⁷).
- Added performance counters exposing data related to data transferred by input/output (filesystem) operations (thanks to Maciej Brodowicz).
- Added performance counters allowing to track the number of action invocations (local and remote invocations).
- Added new command line options `-hpx:print-counter-at` and `-hpx:reset-counters`.

⁵¹⁵⁵ <https://circleci.com/gh/TheHPXProject/hpx>

⁵¹⁵⁶ <http://wg21.link/n4411>

⁵¹⁵⁷ <http://wg21.link/n4399>

- The `hpx::vector` component has been renamed to `hpx::partitioned_vector` to make it explicit that the underlying memory is not contiguous.
- Introduced a completely new and uniform higher-level parallelism API which is based on executors. All existing parallelism APIs have been adapted to this. We have added a large number of different executor types, such as a numa-aware executor, a this-thread executor, etc.
- Added support for the MingW toolchain on Windows (thanks to Eric Lemanissier).
- HPX now includes support for APEX, (Autonomic Performance Environment for eXascale). APEX is an instrumentation and software adaptation library that provides an interface to TAU profiling / tracing as well as runtime adaptation of HPX applications through policy definitions. For more information and documentation, please see <https://github.com/UO-OACISS/xpress-apex>. To enable APEX at configuration time, specify `-DHPX_WITH_APEX=On`. To also include support for TAU profiling, specify `-DHPX_WITH_TAU=On` and specify the `-DTAU_ROOT`, `-DTAU_ARCH` and `-DTAU_OPTIONS` cmake parameters.
- We have implemented many more of the *Using parallel algorithms*. Please see [Issue #1141](#)⁵¹⁵⁸ for the list of all available parallel algorithms (thanks to Daniel Bourgeois and John Biddiscombe for contributing their work).

Breaking changes

- We are moving into the direction of unifying managed and simple components. In order to stop exposing the old facilities, all examples have been converted to use the new classes. The breaking change in this release is that performance counters are now a `hpx::components::component_base` instead of `hpx::components::managed_component_base`.
- We removed the support for stackless threads. It turned out that there was no performance benefit when using stackless threads. As such, we decided to clean up our codebase. This feature was not documented.
- The CMake project name has changed from 'hpx' to 'HPX' for consistency and compatibility with naming conventions and other CMake projects. Generated config files go into `<prefix>/lib/cmake/HPX` and not `<prefix>/lib/cmake/hpx`.
- The macro `HPX_REGISTER_MINIMAL_COMPONENT_FACTORY` has been deprecated. Please use `HPX_REGISTER_COMPONENT` instead. The old macro will be removed in the next release.
- The obsolete `distributing_factory` and `binpacking_factory` components have been removed. The corresponding functionality is now provided by the `hpx::new_` API function in conjunction with the `hpx::default_layout` and `hpx::binpacking` distribution policies (`hpx::components::default_distribution_policy` and `hpx::components::binpacking_distribution_policy`).
- The API function `hpx::new_colocated` has been deprecated. Please use the consolidated API `hpx::new_` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of HPX if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The API function `hpx::async_colocated` has been deprecated. Please use the consolidated API `hpx::async` in conjunction with the new `hpx::colocated` distribution policy (`hpx::components::colocating_distribution_policy`) instead. The old API function will still be available for at least one release of HPX if the configuration variable `HPX_WITH_COLOCATED_BACKWARDS_COMPATIBILITY` is enabled.
- The obsolete `remote_object` component has been removed.

⁵¹⁵⁸ <https://github.com/TheHPXProject/hpx/issues/1141>

- Replaced the use of Boost.Serialization with our own solution. While the new version is mostly compatible with Boost.Serialization, this change requires some minor code modifications in user code. For more information, please see the corresponding [announcement](#)⁵¹⁵⁹ on the hpx-users@stellar.cct.lsu.edu mailing list.
- The names used by cmake to influence various configuration options have been unified. The new naming scheme relies on all configuration constants to start with `HPX_WITH_...`, while the preprocessor constant which is used at build time starts with `HPX_HAVE_...`. For instance, the former cmake command line `-DHPX_MALLOC=...` now has to be specified as `-DHPX_WITH_MALLOC=...` and will cause the preprocessor constant `HPX_HAVE_MALLOC` to be defined. The actual name of the constant (i.e. `MALLOC`) has not changed. Please see the corresponding documentation for more details (*CMake options*).
- The `get_gid()` functions exposed by the component base classes `hpx::components::server::simple_component_base`, `hpx::components::server::managed_component_base`, and `hpx::components::server::fixed_component_base` have been replaced by two new functions: `get_unmanaged_id()` and `get_id()`. To enable the old function name for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.
- All functions which were named `get_gid()` but were returning `hpx::id_type` have been renamed to `get_id()`. To enable the old function names for backwards compatibility, use the cmake configuration option `HPX_WITH_COMPONENT_GET_GID_COMPATIBILITY=On`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [PR #1855](#)⁵¹⁶⁰ - Completely removing external/endian
- [PR #1854](#)⁵¹⁶¹ - Don't pollute `CMAKE_CXX_FLAGS` through `find_package()`
- [PR #1853](#)⁵¹⁶² - Updating CMake configuration to get correct version of TAU library
- [PR #1852](#)⁵¹⁶³ - Fixing Performance Problems with MPI Parcelport
- [PR #1851](#)⁵¹⁶⁴ - Fixing `hpx_add_link_flag()` and `hpx_remove_link_flag()`
- [PR #1850](#)⁵¹⁶⁵ - Fixing 1836, adding `parallel::sort`
- [PR #1849](#)⁵¹⁶⁶ - Fixing configuration for use of more than 64 cores
- [PR #1848](#)⁵¹⁶⁷ - Change default APEX version for release
- [PR #1847](#)⁵¹⁶⁸ - Fix `client_base::then` on release
- [PR #1846](#)⁵¹⁶⁹ - Removing broken `lcos::local::channel` from release
- [PR #1845](#)⁵¹⁷⁰ - Adding example demonstrating a possible safe-object implementation to release
- [PR #1844](#)⁵¹⁷¹ - Removing stubs from accumulator examples

- PR #1814⁵¹⁹⁵ - Fix async to dispatch to the correct locality in all cases
- Issue #1813⁵¹⁹⁶ - `async(launch::..., action(), ...)` always invokes locally
- PR #1812⁵¹⁹⁷ - fixed syntax error in CMakeLists.txt
- PR #1811⁵¹⁹⁸ - Agas optimizations
- PR #1810⁵¹⁹⁹ - drop superfluous typedefs
- PR #1809⁵²⁰⁰ - Allow HPX to be used as an optional package in 3rd party code
- PR #1808⁵²⁰¹ - Fixing #1723
- PR #1807⁵²⁰² - Making sure `resolve_localities` does not hang during normal operation
- Issue #1806⁵²⁰³ - Spinlock no longer movable and deletes operator '=', breaks MiniGhost
- Issue #1804⁵²⁰⁴ - `register_with_basename` causes hangs
- PR #1801⁵²⁰⁵ - Enhanced the inspect tool to take user directly to the problem with hyperlinks
- Issue #1800⁵²⁰⁶ - Problems compiling application on smic
- PR #1799⁵²⁰⁷ - Fixing cv exceptions
- PR #1798⁵²⁰⁸ - Documentation refactoring & updating
- PR #1797⁵²⁰⁹ - Updating the activeharmony CMake module
- PR #1795⁵²¹⁰ - Fixing cv
- PR #1794⁵²¹¹ - Fix connect with `hpx::runtime_mode_connect`
- PR #1793⁵²¹² - fix a wrong use of `HPX_MAX_CPU_COUNT` instead of `HPX_HAVE_MAX_CPU_COUNT`
- PR #1792⁵²¹³ - Allow for default constructed parcel instances to be moved
- PR #1791⁵²¹⁴ - Fix connect with `hpx::runtime_mode_connect`
- Issue #1790⁵²¹⁵ - assertion `action_.get()` failed: `HPX(assertion_failure)` when running Octotiger with pull request 1786
- PR #1789⁵²¹⁶ - Fixing `discover_counter_types` API function
- Issue #1788⁵²¹⁷ - connect with `hpx::runtime_mode_connect`

- Issue #1787⁵²¹⁸ - discover_counter_types not working
- PR #1786⁵²¹⁹ - Changing addressing_service to use std::unordered_map instead of std::map
- PR #1785⁵²²⁰ - Fix is_iterator for container algorithms
- PR #1784⁵²²¹ - Adding new command line options:
- PR #1783⁵²²² - Minor changes for APEX support
- PR #1782⁵²²³ - Drop legacy forwarding action traits
- PR #1781⁵²²⁴ - Attempt to resolve the race between cv::wait_xxx and cv::notify_all
- PR #1780⁵²²⁵ - Removing serialize_sequence
- PR #1779⁵²²⁶ - Fixed #1501: hwloc configuration options are wrong for MIC
- PR #1778⁵²²⁷ - Removing ability to enable/disable parcel handling
- PR #1777⁵²²⁸ - Completely removing stackless threads
- PR #1776⁵²²⁹ - Cleaning up util/plugin
- PR #1775⁵²³⁰ - Agas fixes
- PR #1774⁵²³¹ - Action invocation count
- PR #1773⁵²³² - replaced MSVC variable with WIN32
- PR #1772⁵²³³ - Fixing Problems in MPI parcelport and future serialization.
- PR #1771⁵²³⁴ - Fixing intel 13 compiler errors related to variadic template template parameters for lcos::when_tests
- PR #1770⁵²³⁵ - Forwarding decay to std:::
- PR #1769⁵²³⁶ - Add more characters with special regex meaning to the existing patch
- PR #1768⁵²³⁷ - Adding test for receive_buffer
- PR #1767⁵²³⁸ - Making sure that uptime counter throws exception on any attempt to be reset
- PR #1766⁵²³⁹ - Cleaning up code related to throttling scheduler
- PR #1765⁵²⁴⁰ - Restricting thread_data to creating only with intrusive_pointers

⁵³⁰⁷ <https://github.com/TheHPXProject/hpx/pull/1693>
⁵³⁰⁸ <https://github.com/TheHPXProject/hpx/pull/1692>
⁵³⁰⁹ <https://github.com/TheHPXProject/hpx/issues/1691>

- PR #1690⁵³¹⁰ - added macro for non-intrusive serialization of classes without a default c-tor
- PR #1689⁵³¹¹ - Replace value_or_error with custom storage, unify future_data state
- Issue #1688⁵³¹² - Add timer counters for tfunc_total and exec_total
- PR #1687⁵³¹³ - Fixed interval timer
- PR #1686⁵³¹⁴ - Fixing cmake warnings about not existing pseudo target dependencies
- PR #1685⁵³¹⁵ - Converting partitioners to use bulk async execute
- PR #1683⁵³¹⁶ - Adds a tool for inspect that checks for character limits
- PR #1682⁵³¹⁷ - Change project name to (uppercase) HPX
- PR #1681⁵³¹⁸ - Counter shortnames
- PR #1680⁵³¹⁹ - Extended Non-intrusive Serialization to Ease Usage for Library Developers
- PR #1679⁵³²⁰ - Working on 1544: More executor changes
- PR #1678⁵³²¹ - Transpose fixes
- PR #1677⁵³²² - Improve Boost compatibility check
- PR #1676⁵³²³ - 1d stencil fix
- Issue #1675⁵³²⁴ - hpx project name is not HPX
- PR #1674⁵³²⁵ - Fixing the MPI parcellport
- PR #1673⁵³²⁶ - added move semantics to map/vector deserialization
- PR #1672⁵³²⁷ - Vs2015 await
- PR #1671⁵³²⁸ - Adapt transform for #1668
- PR #1670⁵³²⁹ - Started to work on #1668
- PR #1669⁵³³⁰ - Add this_thread_executors
- Issue #1667⁵³³¹ - Apple build instructions in docs are out of date
- PR #1666⁵³³² - Apex integration

⁵³³² <https://github.com/TheHPXProject/hpx/pull/1666>

- PR #1665⁵³³³ - Fixes an error with the whitespace check that showed the incorrect location of the error
- Issue #1664⁵³³⁴ - Inspect tool found incorrect endline whitespace
- PR #1663⁵³³⁵ - Improve use of locks
- Issue #1662⁵³³⁶ - Possible exception source in coalescing_message_handler
- PR #1661⁵³³⁷ - Added support for 128bit number serialization
- PR #1660⁵³³⁸ - Serialization 128bits
- PR #1659⁵³³⁹ - Implemented inner_product and adjacent_diff algos
- PR #1658⁵³⁴⁰ - Add serialization for std::set (as there is for std::vector and std::map)
- PR #1657⁵³⁴¹ - Use of shared_ptr in io_service_pool changed to unique_ptr
- Issue #1656⁵³⁴² - 1d_stencil codes all have wrong factor
- PR #1654⁵³⁴³ - When using runtime_mode_connect, find the correct localhost public ip address
- PR #1653⁵³⁴⁴ - Fixing 1617
- PR #1652⁵³⁴⁵ - Remove traits::action_may_require_id_splitting
- PR #1651⁵³⁴⁶ - Fixed performance counters related to AGAS cache timings
- PR #1650⁵³⁴⁷ - Remove leftovers of traits::type_size
- PR #1649⁵³⁴⁸ - Shorten target names on Windows to shorten used path names
- PR #1648⁵³⁴⁹ - Fixing problems introduced by merging #1623 for older compilers
- PR #1647⁵³⁵⁰ - Simplify running automatic builds on Windows
- Issue #1646⁵³⁵¹ - Cache insert and update performance counters are broken
- Issue #1644⁵³⁵² - Remove leftovers of traits::type_size
- Issue #1643⁵³⁵³ - Remove traits::action_may_require_id_splitting
- PR #1642⁵³⁵⁴ - Adds spell checker to the inspect tool for qbk and doxygen comments
- PR #1640⁵³⁵⁵ - First step towards fixing 688

- [PR #1639](#)⁵³⁵⁶ - Re-apply remaining changes from `limit_dataflow_recursion` branch
- [PR #1638](#)⁵³⁵⁷ - This fixes possible deadlock in the test `ignore_while_locked_1485`
- [PR #1637](#)⁵³⁵⁸ - Fixing `hpx::wait_all()` invoked with two `vector<future<T>>`
- [PR #1636](#)⁵³⁵⁹ - Partially re-apply changes from `limit_dataflow_recursion` branch
- [PR #1635](#)⁵³⁶⁰ - Adding missing test for #1572
- [PR #1634](#)⁵³⁶¹ - Revert “Limit recursion-depth in dataflow to a configurable constant”
- [PR #1633](#)⁵³⁶² - Add command line option to ignore batch environment
- [PR #1631](#)⁵³⁶³ - `hpx::lcos::queue` exhibits strange behavior
- [PR #1630](#)⁵³⁶⁴ - Fixed `endline_whitespace_check.cpp` to detect lines with only whitespace
- [Issue #1629](#)⁵³⁶⁵ - Inspect trailing whitespace checker problem
- [PR #1628](#)⁵³⁶⁶ - Removed meaningless `const` qualifiers. Minor `icpc` fix.
- [PR #1627](#)⁵³⁶⁷ - Fixing the queue LCO and add example demonstrating its use
- [PR #1626](#)⁵³⁶⁸ - Deprecating `get_gid()`, add `get_id()` and `get_unmanaged_id()`
- [PR #1625](#)⁵³⁶⁹ - Allowing to specify whether to send credits along with message
- [Issue #1624](#)⁵³⁷⁰ - Lifetime issue
- [Issue #1623](#)⁵³⁷¹ - `hpx::wait_all()` invoked with two `vector<future<T>>` fails
- [PR #1622](#)⁵³⁷² - Executor partitioners
- [PR #1621](#)⁵³⁷³ - Clean up coroutines implementation
- [Issue #1620](#)⁵³⁷⁴ - Revert #1535
- [PR #1619](#)⁵³⁷⁵ - Fix result type calculation for `hpx::make_continuation`
- [PR #1618](#)⁵³⁷⁶ - Fixing RDTSC on Xeon/Phi
- [Issue #1617](#)⁵³⁷⁷ - `hpx` `cmake` not working when run as a subproject
- [Issue #1616](#)⁵³⁷⁸ - `cmake` problem resulting in RDTSC not working correctly for Xeon Phi creates very strange results for duration counters

- [Issue #524](#)⁵⁵⁶³ - Extend scheduler to support threads which can't be stolen

HPX V0.9.10 (Mar 24, 2015)

General changes

This is the 12th official release of *HPX*. It coincides with the 7th anniversary of the first commit to our source code repository. Since then, we have seen over 12300 commits amounting to more than 220000 lines of C++ code.

The major focus of this release was to improve the reliability of large scale runs. We believe to have achieved this goal as we now can reliably run *HPX* applications on up to ~24k cores. We have also shown that *HPX* can be used with success for symmetric runs (applications using both, host cores and Intel Xeon/Phi coprocessors). This is a huge step forward in terms of the usability of *HPX*. The main focus of this work involved isolating the causes of the segmentation faults at start up and shut down. Many of these issues were discovered to be the result of the suspension of threads which hold locks.

A very important improvement introduced with this release is the refactoring of the code representing our parcel-port implementation. Parcel-ports can now be implemented by 3rd parties as independent plugins which are dynamically loaded at runtime (static linking of parcel-ports is also supported). This refactoring also includes a massive improvement of the performance of our existing parcel-ports. We were able to significantly reduce the networking latencies and to improve the available networking bandwidth. Please note that in this release we disabled the `ibverbs` and `ipc` parcel ports as those have not been ported to the new plugin system yet (see [Issue #839](#)⁵⁵⁶⁴).

Another corner stone of this release is our work towards a complete implementation of `__cpp11_n4104__` (Working Draft, Technical Specification for C++ Extensions for Parallelism). This document defines a set of parallel algorithms to be added to the C++ standard library. We now have implemented about 75% of all specified parallel algorithms (see [\[link hpx.manual.parallel.parallel_algorithms Parallel Algorithms\]](#) for more details). We also implemented some extensions to `__cpp11_n4104__` allowing to invoke all of the algorithms asynchronously.

This release adds a first implementation of `hpx::vector` which is a distributed data structure closely aligned to the functionality of `std::vector`. The difference is that `hpx::vector` stores the data in partitions where the partitions can be distributed over different localities. We started to work on allowing to use the parallel algorithms with `hpx::vector`. At this point we have implemented only a few of the parallel algorithms to support distributed data structures (like `hpx::vector`) for testing purposes (see [Issue #1338](#)⁵⁵⁶⁵ for a documentation of our progress).

Breaking changes

With this release we put a lot of effort into changing the code base to be more compatible to C++11. These changes have caused the following issues for backward compatibility:

- Move to Variadics- All of the API now uses variadic templates. However, this change required to modify the argument sequence for some of the exiting API functions (`hpx::async_continue`, `hpx::apply_continue`, `hpx::when_each`, `hpx::wait_each`, synchronous invocation of actions).
- Changes to Macros- We also removed the macros `HPX_STD_FUNCTION` and `HPX_STD_TUPLE`. This shouldn't affect any user code as we replaced `HPX_STD_FUNCTION` with `hpx::util::function_nonser` which was the default expansion used for this macro. All *HPX* API functions which expect a `hpx::util::function_nonser` (or a `hpx::util::unique_function_nonser`) can now be transparently called with a compatible `std::function` instead. Similarly, `HPX_STD_TUPLE` was replaced by its default expansion as well: `hpx::util::tuple`.

⁵⁵⁶³ <https://github.com/TheHPXProject/hpx/issues/524>

⁵⁵⁶⁴ <https://github.com/TheHPXProject/hpx/issues/839>

⁵⁵⁶⁵ <https://github.com/TheHPXProject/hpx/issues/1338>

- Changes to `hpx::unique_future`- `hpx::unique_future`, which was deprecated in the previous release for `hpx::future` is now completely removed from HPX. This completes the transition to a completely standards conforming implementation of `hpx::future`.
- Changes to Supported Compilers. Finally, in order to utilize more C++11 semantics, we have officially dropped support for GCC 4.4 and MSVC 2012. Please see our *Prerequisites* page for more details.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1402⁵⁵⁶⁶](#) - Internal shared_future serialization copies
- [Issue #1399⁵⁵⁶⁷](#) - Build takes unusually long time...
- [Issue #1398⁵⁵⁶⁸](#) - Tests using the scan partitioner are broken on at least gcc 4.7 and intel compiler
- [Issue #1397⁵⁵⁶⁹](#) - Completely remove `hpx::unique_future`
- [Issue #1396⁵⁵⁷⁰](#) - Parallel scan algorithms with different initial values
- [Issue #1395⁵⁵⁷¹](#) - Race Condition - `1d_stencil_8` - SuperMIC
- [Issue #1394⁵⁵⁷²](#) - “suspending thread while at least one lock is being held” - `1d_stencil_8` - SuperMIC
- [Issue #1393⁵⁵⁷³](#) - SEGVFAULT in `1d_stencil_8` on SuperMIC
- [Issue #1392⁵⁵⁷⁴](#) - Fixing #1168
- [Issue #1391⁵⁵⁷⁵](#) - Parallel Algorithms for scan partitioner for small number of elements
- [Issue #1387⁵⁵⁷⁶](#) - Failure with more than 4 localities
- [Issue #1386⁵⁵⁷⁷](#) - Dispatching unhandled exceptions to outer user code
- [Issue #1385⁵⁵⁷⁸](#) - Adding Copy algorithms, fixing `parallel::copy_if`
- [Issue #1384⁵⁵⁷⁹](#) - Fixing 1325
- [Issue #1383⁵⁵⁸⁰](#) - Fixed #504: Refactor Dataflow LCO to work with futures, this removes the dataflow component as it is obsolete
- [Issue #1382⁵⁵⁸¹](#) - `is_sorted`, `is_sorted_until` and `is_partitioned` algorithms
- [Issue #1381⁵⁵⁸²](#) - fix for CMake versions prior to 3.1
- [Issue #1380⁵⁵⁸³](#) - resolved warning in CMake 3.1 and newer

HPX V0.9.9 (Oct 31, 2014, codename Spooky)

General changes

We have had over 1500 commits since the last release and we have closed over 200 tickets (bugs, feature requests, pull requests, etc.). These are by far the largest numbers of commits and resolved issues for any of the *HPX* releases so far. We are especially happy about the large number of people who contributed for the first time to *HPX*.

- We completed the transition from the older (non-conforming) implementation of `hpx::future` to the new and fully conforming version by removing the old code and by renaming the type `hpx::unique_future` to `hpx::future`. In order to maintain backwards compatibility with existing code which uses the type `hpx::unique_future` we support the configuration variable `HPX_UNIQUE_FUTURE_ALIAS`. If this variable is set to ON while running `cmake` it will additionally define a template alias for this type.
- We rewrote and significantly changed our build system. Please have a look at the new (now generated) documentation here: *Building HPX*. Please revisit your build scripts to adapt to the changes. The most notable changes are:
 - `HPX_NO_INSTALL` is no longer necessary.
 - For external builds, you need to set `HPX_DIR` instead of `HPX_ROOT` as described here: *Using HPX with CMake-based projects*.
 - IDEs that support multiple configurations (Visual Studio and XCode) can now be used as intended. that means no build dir.
 - Building HPX statically (without dynamic libraries) is now supported (`-DHPX_STATIC_LINKING=On`).
 - Please note that many variables used to configure the build process have been renamed to unify the naming conventions (see the section *CMake options* for more information).
 - This also fixes a long list of issues, for more information see [Issue #1204](#)⁵⁶⁷⁹.
- We started to implement various proposals to the C++ Standardization committee related to parallelism and concurrency, most notably [N4409](#)⁵⁶⁸⁰ (Working Draft, Technical Specification for C++ Extensions for Parallelism), [N4411](#)⁵⁶⁸¹ (Task Region Rev. 3), and [N4313](#)⁵⁶⁸² (Working Draft, Technical Specification for C++ Extensions for Concurrency).
- We completely remodeled our automatic build system to run builds and unit tests on various systems and compilers. This allows us to find most bugs right as they were introduced and helps to maintain a high level of quality and compatibility. The newest build logs can be found at [HPX Buildbot Website](#)⁵⁶⁸³.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1296](#)⁵⁶⁸⁴ - Rename `make_error_future` to `make_exceptional_future`, adjust to N4123
- [Issue #1295](#)⁵⁶⁸⁵ - building issue
- [Issue #1293](#)⁵⁶⁸⁶ - Transpose example
- [Issue #1292](#)⁵⁶⁸⁷ - Wrong `abs()` function used in example
- [Issue #1291](#)⁵⁶⁸⁸ - non-synchronized shift operators have been removed
- [Issue #1290](#)⁵⁶⁸⁹ - RDTSCP is defined as true for Xeon Phi build
- [Issue #1289](#)⁵⁶⁹⁰ - Fixing 1288
- [Issue #1288](#)⁵⁶⁹¹ - Add new performance counters
- [Issue #1287](#)⁵⁶⁹² - Hierarchy scheduler broken performance counters
- [Issue #1286](#)⁵⁶⁹³ - Algorithm cleanup
- [Issue #1285](#)⁵⁶⁹⁴ - Broken Links in Documentation
- [Issue #1284](#)⁵⁶⁹⁵ - Uninitialized copy
- [Issue #1283](#)⁵⁶⁹⁶ - missing `boost::scoped_ptr` includes
- [Issue #1282](#)⁵⁶⁹⁷ - Update documentation of build options for schedulers
- [Issue #1281](#)⁵⁶⁹⁸ - reset idle rate counter
- [Issue #1280](#)⁵⁶⁹⁹ - Bug when executing on Intel MIC
- [Issue #1279](#)⁵⁷⁰⁰ - Add improved `when_all/wait_all`
- [Issue #1278](#)⁵⁷⁰¹ - Implement improved `when_all/wait_all`
- [Issue #1277](#)⁵⁷⁰² - feature request: get access to `argc argv` and `variables_map`
- [Issue #1276](#)⁵⁷⁰³ - Remove merging map
- [Issue #1274](#)⁵⁷⁰⁴ - Weird (wrong) string code in `papi.cpp`

- Issue #1273⁵⁷⁰⁵ - Sequential task execution policy
- Issue #1272⁵⁷⁰⁶ - Avoid CMake name clash for Boost.Thread library
- Issue #1271⁵⁷⁰⁷ - Updates on HPX Test Units
- Issue #1270⁵⁷⁰⁸ - `hpx/util/safe_lexical_cast.hpp` is added
- Issue #1269⁵⁷⁰⁹ - Added default value for “LIB” cmake variable
- Issue #1268⁵⁷¹⁰ - Memory Counters not working
- Issue #1266⁵⁷¹¹ - FindHPX.cmake is not installed
- Issue #1263⁵⁷¹² - `apply_remote` test takes too long
- Issue #1262⁵⁷¹³ - Chrono cleanup
- Issue #1261⁵⁷¹⁴ - Need make install for papi counters and this builds all the examples
- Issue #1260⁵⁷¹⁵ - Documentation of Stencil example claims
- Issue #1259⁵⁷¹⁶ - Avoid double-linking Boost on Windows
- Issue #1257⁵⁷¹⁷ - Adding additional parameter to `create_thread`
- Issue #1256⁵⁷¹⁸ - added buildbot changes to release notes
- Issue #1255⁵⁷¹⁹ - Cannot build MiniGhost
- Issue #1253⁵⁷²⁰ - `hpx::thread` defects
- Issue #1252⁵⁷²¹ - `HPX_PREFIX` is too fragile
- Issue #1250⁵⁷²² - `switch_to_fiber_emulation` does not work properly
- Issue #1249⁵⁷²³ - Documentation is generated under Release folder
- Issue #1248⁵⁷²⁴ - Fix usage of `hpx_generic_coroutine_context` and get tests passing on powerpc
- Issue #1247⁵⁷²⁵ - Dynamic linking error
- Issue #1246⁵⁷²⁶ - Make `cpuid.cpp` C++11 compliant
- Issue #1245⁵⁷²⁷ - HPX fails on startup (setting thread affinity mask)

- Issue #1216⁵⁷⁵¹ - Fixing using futures (clients) as arguments to actions
- Issue #1215⁵⁷⁵² - Error compiling simple component
- Issue #1214⁵⁷⁵³ - Stencil docs
- Issue #1213⁵⁷⁵⁴ - Using more than a few dozen MPI processes on SuperMike results in a seg fault before getting to `hpx_main`
- Issue #1212⁵⁷⁵⁵ - Parallel rotate
- Issue #1211⁵⁷⁵⁶ - Direct actions cause the future's `shared_state` to be leaked
- Issue #1210⁵⁷⁵⁷ - Refactored `local::promise` to be standard conformant
- Issue #1209⁵⁷⁵⁸ - Improve command line handling
- Issue #1208⁵⁷⁵⁹ - Adding `parallel::reverse` and `parallel::reverse_copy`
- Issue #1207⁵⁷⁶⁰ - Add `copy_backward` and `move_backward`
- Issue #1206⁵⁷⁶¹ - N4071 additional algorithms implemented
- Issue #1204⁵⁷⁶² - Cmake simplification and various other minor changes
- Issue #1203⁵⁷⁶³ - Implementing new launch policy for (local) `async`: `hpx::launch::fork`.
- Issue #1202⁵⁷⁶⁴ - Failed assertion in `connection_cache.hpp`
- Issue #1201⁵⁷⁶⁵ - `pkg-config` doesn't add `mpi` link directories
- Issue #1200⁵⁷⁶⁶ - Error when querying time performance counters
- Issue #1199⁵⁷⁶⁷ - library path is now configurable (again)
- Issue #1198⁵⁷⁶⁸ - Error when querying performance counters
- Issue #1197⁵⁷⁶⁹ - tests fail with intel compiler
- Issue #1196⁵⁷⁷⁰ - Silence several warnings
- Issue #1195⁵⁷⁷¹ - Rephrase initializers to work with VC++ 2012
- Issue #1194⁵⁷⁷² - Simplify parallel algorithms
- Issue #1193⁵⁷⁷³ - Adding `parallel::equal`

⁵⁸⁶⁵ <https://github.com/TheHPXProject/hpx/issues/1093>

- Issue #1092⁵⁸⁶⁶ - Rename `unique_future<>` back to `future<>`
- Issue #1091⁵⁸⁶⁷ - Inconsistent error message
- Issue #1090⁵⁸⁶⁸ - On windows 8.1 the examples crashed if using more than one os thread
- Issue #1089⁵⁸⁶⁹ - Components should be allowed to have their own executor
- Issue #1088⁵⁸⁷⁰ - Add possibility to select a network interface for the `ibverbs` `parcelport`
- Issue #1087⁵⁸⁷¹ - `ibverbs` and `ipc` `parcelport` uses zero copy optimization
- Issue #1083⁵⁸⁷² - Make shell examples copyable in docs
- Issue #1082⁵⁸⁷³ - Implement proper termination detection during shutdown
- Issue #1081⁵⁸⁷⁴ - Implement `thread_specific_ptr` for `hpx::threads`
- Issue #1072⁵⁸⁷⁵ - make install not working properly
- Issue #1070⁵⁸⁷⁶ - Complete quoting for parameters of some CMake commands
- Issue #1059⁵⁸⁷⁷ - Fix more unused variable warnings
- Issue #1051⁵⁸⁷⁸ - Implement `when_each`
- Issue #973⁵⁸⁷⁹ - Would like option to report `hwloc` bindings
- Issue #970⁵⁸⁸⁰ - Bad flags for Fortran compiler
- Issue #941⁵⁸⁸¹ - Create a proper user level context switching class for BG/Q
- Issue #935⁵⁸⁸² - Build error with gcc 4.6 and Boost 1.54.0 on `hpx` trunk and 0.9.6
- Issue #934⁵⁸⁸³ - Want to build HPX without dynamic libraries
- Issue #927⁵⁸⁸⁴ - Make `hpx/lcos/reduce.hpp` accept futures of `id_type`
- Issue #926⁵⁸⁸⁵ - All unit tests that are run with more than one thread with `CTest/hpx_run_test` should configure `hpx.os_threads`
- Issue #925⁵⁸⁸⁶ - `regression_dataflow_791` needs to be brought in line with HPX standards
- Issue #899⁵⁸⁸⁷ - Fix race conditions in regression tests
- Issue #879⁵⁸⁸⁸ - Hung test leads to cascading test failure; make tests should support the MPI `parcelport`

HPX V0.9.8 (Mar 24, 2014)

We have had over 800 commits since the last release and we have closed over 65 tickets (bugs, feature requests, etc.).

With the changes below, *HPX* is once again leading the charge of a whole new era of computation. By intrinsically breaking down and synchronizing the work to be done, *HPX* insures that application developers will no longer have to fret about where a segment of code executes. That allows coders to focus their time and energy to understanding the data dependencies of their algorithms and thereby the core obstacles to an efficient code. Here are some of the advantages of using *HPX*:

- *HPX* is solidly rooted in a sophisticated theoretical execution model – ParalleX
- *HPX* exposes an API fully conforming to the C++11 and the draft C++14 standards, extended and applied to distributed computing. Everything programmers know about the concurrency primitives of the standard C++ library is still valid in the context of *HPX*.
- It provides a competitive, high performance implementation of modern, future-proof ideas which gives an smooth migration path from today's mainstream techniques
- There is no need for the programmer to worry about lower level parallelization paradigms like threads or message passing; no need to understand pthreads, MPI, OpenMP, or Windows threads, etc.
- There is no need to think about different types of parallelism such as tasks, pipelines, or fork-join, task or data parallelism.
- The same source of your program compiles and runs on Linux, BlueGene/Q, Mac OS X, Windows, and Android.
- The same code runs on shared memory multi-core systems and supercomputers, on handheld devices and Intel® Xeon Phi™ accelerators, or a heterogeneous mix of those.

General changes

- A major API breaking change for this release was introduced by implementing `hpx::future` and `hpx::shared_future` fully in conformance with the [C++11 Standard](#)⁵⁹⁰⁸. While `hpx::shared_future` is new and will not create any compatibility problems, we revised the interface and implementation of the existing `hpx::future`. For more details please see the [mailing list archive](#)⁵⁹⁰⁹. To avoid any incompatibilities for existing code we named the type which implements the `std::future` interface as `hpx::unique_future`. For the next release this will be renamed to `hpx::future`, making it full conforming to [C++11 Standard](#)⁵⁹¹⁰.
- A large part of the code base of *HPX* has been refactored and partially re-implemented. The main changes were related to
 - The threading subsystem: these changes significantly reduce the amount of overheads caused by the schedulers, improve the modularity of the code base, and extend the variety of available scheduling algorithms.
 - The parcel subsystem: these changes improve the performance of the *HPX* networking layer, modularize the structure of the parcelports, and simplify the creation of new parcelports for other underlying networking libraries.
 - The API subsystem: these changes improved the conformance of the API to C++11 Standard, extend and unify the available API functionality, and decrease the overheads created by various elements of the API.
 - The robustness of the component loading subsystem has been improved significantly, allowing to more portably and more reliably register the components needed by an application as startup. This additionally speeds up general application initialization.

⁵⁹⁰⁸ <http://www.open-std.org/jtc1/sc22/wg21>

⁵⁹⁰⁹ <http://mail.cct.lsu.edu/pipermail/hpx-users/2014-January/000141.html>

⁵⁹¹⁰ <http://www.open-std.org/jtc1/sc22/wg21>

- We added new API functionality like `hpx::migrate` and `hpx::copy_component` which are the basic building blocks necessary for implementing higher level abstractions for system-wide load balancing, runtime-adaptive resource management, and object-oriented checkpointing and state-management.
- We removed the use of C++11 move emulation (using `Boost.Move`), replacing it with C++11 rvalue references. This is the first step towards using more and more native C++11 facilities which we plan to introduce in the future.
- We improved the reference counting scheme used by *HPX* which helps managing distributed objects and memory. This improves the overall stability of *HPX* and further simplifies writing real world applications.
- The minimal Boost version required to use *HPX* is now V1.49.0.
- This release coincides with the first release of HPXPI (V0.1.0), the first implementation of the [XPI specification](#)⁵⁹¹¹.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1086](#)⁵⁹¹² - Expose internal `boost::shared_array` to allow user management of array lifetime
- [Issue #1083](#)⁵⁹¹³ - Make shell examples copyable in docs
- [Issue #1080](#)⁵⁹¹⁴ - `/threads{locality#*/total}/count/cumulative` broken
- [Issue #1079](#)⁵⁹¹⁵ - Build problems on OS X
- [Issue #1078](#)⁵⁹¹⁶ - Improve robustness of component loading
- [Issue #1077](#)⁵⁹¹⁷ - Fix a missing enum definition for 'take' mode
- [Issue #1076](#)⁵⁹¹⁸ - Merge Jb master
- [Issue #1075](#)⁵⁹¹⁹ - Unknown CMake command "add_hpx_pseudo_target"
- [Issue #1074](#)⁵⁹²⁰ - Implement `apply_continue_callback` and `apply_colocated_callback`
- [Issue #1073](#)⁵⁹²¹ - The new `apply_colocated` and `async_colocated` functions lead to automatic registered functions
- [Issue #1071](#)⁵⁹²² - Remove `deferred_packaged_task`
- [Issue #1069](#)⁵⁹²³ - `serialize_buffer` with allocator fails at destruction
- [Issue #1068](#)⁵⁹²⁴ - Coroutine include and forward declarations missing
- [Issue #1067](#)⁵⁹²⁵ - Add allocator support to `util::serialize_buffer`

HPX V0.9.7 (Nov 13, 2013)

We have had over 1000 commits since the last release and we have closed over 180 tickets (bugs, feature requests, etc.).

General changes

- Ported HPX to BlueGene/Q
- Improved HPX support for Xeon/Phi accelerators
- Reimplemented `hpx::bind`, `hpx::tuple`, and `hpx::function` for better performance and better compliance with the C++11 Standard. Added `hpx::mem_fn`.
- Reworked `hpx::when_all` and `hpx::when_any` for better compliance with the ongoing C++ standardization effort, added heterogeneous version for those functions. Added `hpx::when_any_swapped`.
- Added `hpx::copy` as a precursor for a migrate functionality
- Added `hpx::get_ptr` allowing to directly access the memory underlying a given component
- Added the `hpx::lcos::broadcast`, `hpx::lcos::reduce`, and `hpx::lcos::fold` collective operations

⁵⁹⁷² <https://github.com/TheHPXProject/hpx/issues/1013>

⁵⁹⁷³ <https://github.com/TheHPXProject/hpx/issues/1012>

⁵⁹⁷⁹ <https://github.com/TheHPXProject/hpx/issues/1003>

⁵⁹⁸⁰ <https://github.com/TheHPXProject/hpx/issues/982>

⁵⁹⁸¹ <https://github.com/TheHPXProject/hpx/issues/912>

⁵⁹⁸² <https://github.com/TheHPXProject/hpx/issues/663>

⁵⁹⁸³ <https://github.com/TheHPXProject/hpx/issues/636>

⁵⁹⁸⁴ <https://github.com/TheHPXProject/hpx/issues/197>

⁵⁹⁸⁵ <https://github.com/TheHPXProject/hpx/issues/175>

- Added `hpx::get_locality_name` allowing to retrieve the name of any of the localities for the application.
- Added support for more flexible thread affinity control from the HPX command line, such as new modes for `--hpx:bind` (balanced, scattered, compact), improved default settings when running multiple localities on the same node.
- Added experimental executors for simpler thread pooling and scheduling. This API may change in the future as it will stay aligned with the ongoing C++ standardization efforts.
- Massively improved the performance of the HPX serialization code. Added partial support for zero copy serialization of array and bitwise-copyable types.
- General performance improvements of the code related to threads and futures.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release.

- [Issue #1005⁵⁹⁸⁶](#) - Allow one to disable array optimizations and zero copy optimizations for each parcelport
- [Issue #1004⁵⁹⁸⁷](#) - Generate new HPX logo image for the docs
- [Issue #1002⁵⁹⁸⁸](#) - If MPI parcelport is not available, running HPX under mpirun should fail
- [Issue #1001⁵⁹⁸⁹](#) - Zero copy serialization raises assert
- [Issue #1000⁵⁹⁹⁰](#) - Can't connect to a HPX application running with the MPI parcelport from a non MPI parcelport locality
- [Issue #999⁵⁹⁹¹](#) - Optimize `hpx::when_n`
- [Issue #998⁵⁹⁹²](#) - Fixed const-correctness
- [Issue #997⁵⁹⁹³](#) - Making `serialize_buffer::data()` type save
- [Issue #996⁵⁹⁹⁴](#) - Memory leak in `hpx::lcos::promise`
- [Issue #995⁵⁹⁹⁵](#) - Race while registering pre-shutdown functions
- [Issue #994⁵⁹⁹⁶](#) - `thread_rescheduling` regression test does not compile
- [Issue #992⁵⁹⁹⁷](#) - Correct comments and messages
- [Issue #991⁵⁹⁹⁸](#) - `setcap cap_sys_rawio=ep` for power profiling causes an HPX application to abort
- [Issue #989⁵⁹⁹⁹](#) - Jacobi hangs during execution
- [Issue #988⁶⁰⁰⁰](#) - `multiple_init` test is failing

HPX V0.9.6 (Jul 30, 2013)

We have had over 1200 commits since the last release and we have closed roughly 140 tickets (bugs, feature requests, etc.).

General changes

The major new features in this release are:

- We further consolidated the API exposed by *HPX*. We aligned our APIs as much as possible with the existing C++11 Standard⁶¹⁷² and related proposals to the C++ standardization committee (such as [N3632](#)⁶¹⁷³ and [N3857](#)⁶¹⁷⁴).
- We implemented a first version of a distributed AGAS service which essentially eliminates all explicit AGAS network traffic.
- We created a native ibverbs parcelport allowing to take advantage of the superior latency and bandwidth characteristics of Infiniband networks.
- We successfully ported *HPX* to the Xeon Phi platform.
- Support for the SLURM scheduling system was implemented.
- Major efforts have been dedicated to improving the performance counter framework, numerous new counters were implemented and new APIs were added.
- We added a modular parcel compression system allowing to improve bandwidth utilization (by reducing the overall size of the transferred data).

⁶¹⁷³ <http://wg21.link/n3632>

⁶¹⁷⁴ <http://wg21.link/n3857>

- We added a modular parcel coalescing system allowing to combine several parcels into larger messages. This reduces latencies introduced by the communication layer.
- Added an experimental executors API allowing to use different scheduling policies for different parts of the code. This API has been modelled after the Standards proposal [N3562](#)⁶¹⁷⁵. This API is bound to change in the future, though.
- Added minimal security support for localities which is enforced on the parcelport level. This support is preliminary and experimental and might change in the future.
- We created a parcelport using low level MPI functions. This is in support of legacy applications which are to be gradually ported and to support platforms where MPI is the only available portable networking layer.
- We added a preliminary and experimental implementation of a tuple-space object which exposes an interface similar to such systems described in the literature (see for instance [The Linda Coordination Language](#)⁶¹⁷⁶).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is again a very long list of newly implemented features and fixed issues.

- [Issue #806](#)⁶¹⁷⁷ - make (all) in examples folder does nothing
- [Issue #805](#)⁶¹⁷⁸ - Adding the introduction and fixing DOCBOOK dependencies for Windows use
- [Issue #804](#)⁶¹⁷⁹ - Add stackless (non-suspendable) thread type
- [Issue #803](#)⁶¹⁸⁰ - Create proper serialization support functions for util::tuple
- [Issue #800](#)⁶¹⁸¹ - Add possibility to disable array optimizations during serialization
- [Issue #798](#)⁶¹⁸² - HPX_LIMIT does not work for local dataflow
- [Issue #797](#)⁶¹⁸³ - Create a parcelport which uses MPI
- [Issue #796](#)⁶¹⁸⁴ - Problem with Large Numbers of Threads
- [Issue #793](#)⁶¹⁸⁵ - Changing dataflow test case to hang consistently
- [Issue #792](#)⁶¹⁸⁶ - CMake Error
- [Issue #791](#)⁶¹⁸⁷ - Problems with local::dataflow
- [Issue #790](#)⁶¹⁸⁸ - wait_for() doesn't compile
- [Issue #789](#)⁶¹⁸⁹ - HPX with Intel compiler segfaults
- [Issue #788](#)⁶¹⁹⁰ - Intel compiler support

⁶¹⁹⁰ <https://github.com/TheHPXProject/hpx/issues/788>

- Issue #787⁶¹⁹¹ - Fixed SFINAEd specializations
- Issue #786⁶¹⁹² - Memory issues during benchmarking.
- Issue #785⁶¹⁹³ - Create an API allowing to register external threads with HPX
- Issue #784⁶¹⁹⁴ - util::plugin is throwing an error when a symbol is not found
- Issue #783⁶¹⁹⁵ - How does hpx::bind work?
- Issue #782⁶¹⁹⁶ - Added quotes around STRING REPLACE potentially empty arguments
- Issue #781⁶¹⁹⁷ - Make sure no exceptions propagate into the thread manager
- Issue #780⁶¹⁹⁸ - Allow arithmetics performance counters to expand its parameters
- Issue #779⁶¹⁹⁹ - Test case for 778
- Issue #778⁶²⁰⁰ - Swapping futures segfaults
- Issue #777⁶²⁰¹ - hpx::lcos::details::when_xxx don't restore completion handlers
- Issue #776⁶²⁰² - Compiler chokes on dataflow overload with launch policy
- Issue #775⁶²⁰³ - Runtime error with local dataflow (copying futures?)
- Issue #774⁶²⁰⁴ - Using local dataflow without explicit namespace
- Issue #773⁶²⁰⁵ - Local dataflow with unwrap: functor operators need to be const
- Issue #772⁶²⁰⁶ - Allow (remote) actions to return a future
- Issue #771⁶²⁰⁷ - Setting HPX_LIMIT gives huge boost MPL errors
- Issue #770⁶²⁰⁸ - Add launch policy to (local) dataflow
- Issue #769⁶²⁰⁹ - Make compile time configuration information available
- Issue #768⁶²¹⁰ - Const correctness problem in local dataflow
- Issue #767⁶²¹¹ - Add launch policies to async
- Issue #766⁶²¹² - Mark data structures for optimized (array based) serialization
- Issue #765⁶²¹³ - Align hpx::any with N3508: Any Library Proposal (Revision 2)

- Issue #736⁶²³⁷ - Performance counter wildcards do not always work
- Issue #735⁶²³⁸ - Create native ibverbs parcelport based on rdma operations
- Issue #734⁶²³⁹ - Threads stolen performance counter total is incorrect
- Issue #733⁶²⁴⁰ - Test benchmarks need to be checked and fixed
- Issue #732⁶²⁴¹ - Build fails with Mac, using mac ports clang-3.3 on latest git branch
- Issue #731⁶²⁴² - Add global start/stop API for performance counters
- Issue #730⁶²⁴³ - Performance counter values are apparently incorrect
- Issue #729⁶²⁴⁴ - Unhandled switch
- Issue #728⁶²⁴⁵ - Serialization of `hpx::util::function` between two localities causes seg faults
- Issue #727⁶²⁴⁶ - Memory counters on Mac OS X
- Issue #725⁶²⁴⁷ - Restore original thread priority on resume
- Issue #724⁶²⁴⁸ - Performance benchmarks do not depend on main HPX libraries
- Issue #723⁶²⁴⁹ - [teletype]-`hpx:nodes=`cat $PBS_NODEFILE`` works; `-hpx:nodefile=$PBS_NODEFILE` does not.[c++]
- Issue #722⁶²⁵⁰ - Fix binding const member functions as actions
- Issue #719⁶²⁵¹ - Create performance counter exposing compression ratio
- Issue #718⁶²⁵² - Add possibility to compress parcel data
- Issue #717⁶²⁵³ - `strip_credit_from_gid` has misleading semantics
- Issue #716⁶²⁵⁴ - Non-option arguments to programs run using `pbsdsh` must be before `--hpx:nodes`, contrary to directions
- Issue #715⁶²⁵⁵ - Re-thrown exceptions should retain the original call site
- Issue #714⁶²⁵⁶ - failed assertion in debug mode
- Issue #713⁶²⁵⁷ - Add performance counters monitoring connection caches
- Issue #712⁶²⁵⁸ - Adjust parcel related performance counters to be connection type specific

⁶²⁵⁸ <https://github.com/TheHPXProject/hpx/issues/712>

- Issue #711⁶²⁵⁹ - configuration failure
- Issue #710⁶²⁶⁰ - Error “timed out while trying to find room in the connection cache” when trying to start multiple localities on a single computer
- Issue #709⁶²⁶¹ - Add new thread state ‘staged’ referring to task descriptions
- Issue #708⁶²⁶² - Detect/mitigate bad non-system installs of GCC on Redhat systems
- Issue #707⁶²⁶³ - Many examples do not link with Git HEAD version
- Issue #706⁶²⁶⁴ - `hpx::init` removes portions of non-option command line arguments before last = sign
- Issue #705⁶²⁶⁵ - Create rolling average and median aggregating performance counters
- Issue #704⁶²⁶⁶ - Create performance counter to expose thread queue waiting time
- Issue #703⁶²⁶⁷ - Add support to HPX build system to find `libcrtool.a` and related headers
- Issue #699⁶²⁶⁸ - Generalize instrumentation support
- Issue #698⁶²⁶⁹ - compilation failure with `hwloc` absent
- Issue #697⁶²⁷⁰ - Performance counter counts should be zero indexed
- Issue #696⁶²⁷¹ - Distributed problem
- Issue #695⁶²⁷² - Bad perf counter time printed
- Issue #693⁶²⁷³ - `--help` doesn’t print component specific command line options
- Issue #692⁶²⁷⁴ - SLURM support broken
- Issue #691⁶²⁷⁵ - exception while executing any application linked with `hwloc`
- Issue #690⁶²⁷⁶ - `thread_id_test` and `thread_launcher_test` failing
- Issue #689⁶²⁷⁷ - Make the buildbots use `hwloc`
- Issue #687⁶²⁷⁸ - compilation error fix (`hwloc_topology`)
- Issue #686⁶²⁷⁹ - Linker Error for Applications
- Issue #684⁶²⁸⁰ - Pinning of service thread fails when number of worker threads equals the number of cores
- Issue #682⁶²⁸¹ - Add performance counters exposing number of stolen threads

- Issue #177⁶³¹⁵ - Implement distributed AGAS
- Issue #43⁶³¹⁶ - Support for Darwin (Xcode + Clang)

HPX V0.9.5 (Jan 16, 2013)

We have had over 1000 commits since the last release and we have closed roughly 150 tickets (bugs, feature requests, etc.).

General changes

This release is continuing along the lines of code and API consolidation, and overall usability improvements. We dedicated much attention to performance and we were able to significantly improve the threading and networking subsystems.

We successfully ported *HPX* to the Android platform. *HPX* applications now not only can run on mobile devices, but we support heterogeneous applications running across architecture boundaries. At the Supercomputing Conference 2012 we demonstrated connecting Android tablets to simulations running on a Linux cluster. The Android tablet was used to query performance counters from the Linux simulation and to steer its parameters.

We successfully ported *HPX* to Mac OSX (using the Clang compiler). Thanks to Pyry Jahkola for contributing the corresponding patches. Please see the section `macos_installation` for more details.

We made a special effort to make *HPX* usable in highly concurrent use cases. Many of the *HPX* API functions which possibly take longer than 100 microseconds to execute now can be invoked asynchronously. We added uniform support for composing futures which simplifies to write asynchronous code. *HPX* actions (function objects encapsulating possibly concurrent remote function invocations) are now well integrated with all other API facilities such like `hpx::bind`.

⁶³⁰⁵ <https://github.com/TheHPXProject/hpx/issues/601>

⁶³⁰⁶ <https://github.com/TheHPXProject/hpx/issues/557>

⁶³⁰⁷ <https://github.com/TheHPXProject/hpx/issues/531>

⁶³⁰⁸ <https://github.com/TheHPXProject/hpx/issues/529>

⁶³⁰⁹ <https://github.com/TheHPXProject/hpx/issues/526>

⁶³¹⁰ <https://github.com/TheHPXProject/hpx/issues/518>

⁶³¹¹ <https://github.com/TheHPXProject/hpx/issues/473>

⁶³¹² <https://github.com/TheHPXProject/hpx/issues/383>

⁶³¹³ <https://github.com/TheHPXProject/hpx/issues/341>

⁶³¹⁴ <https://github.com/TheHPXProject/hpx/issues/219>

⁶³¹⁵ <https://github.com/TheHPXProject/hpx/issues/177>

⁶³¹⁶ <https://github.com/TheHPXProject/hpx/issues/43>

All of the API has been aligned as much as possible with established paradigms. HPX now mirrors many of the facilities as defined in the C++11 Standard, such as `hpx::thread`, `hpx::function`, `hpx::future`, etc.

A lot of work has been put into improving the documentation. Many of the API functions are documented now, concepts are explained in detail, and examples are better described than before. The new documentation index enables finding information with lesser effort.

This is the first release of HPX we perform after the move to [Github](https://github.com/TheHPXProject/hpx/)⁶³¹⁷. This step has enabled a wider participation from the community and further encourages us in our decision to release HPX as a true open source library (HPX is licensed under the very liberal [Boost Software License](https://www.boost.org/LICENSE_1_0.txt)⁶³¹⁸).

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release. This is by far the longest list of newly implemented features and fixed issues for any of HPX' releases so far.

- [Issue #666](https://github.com/TheHPXProject/hpx/issues/666)⁶³¹⁹ - Segfault on calling `hpx::finalize` twice
- [Issue #665](https://github.com/TheHPXProject/hpx/issues/665)⁶³²⁰ - Adding declaration `num_of_cores`
- [Issue #662](https://github.com/TheHPXProject/hpx/issues/662)⁶³²¹ - `pkgconfig` is building wrong
- [Issue #660](https://github.com/TheHPXProject/hpx/issues/660)⁶³²² - Need `uninterrupt` function
- [Issue #659](https://github.com/TheHPXProject/hpx/issues/659)⁶³²³ - Move our logging library into a different namespace
- [Issue #658](https://github.com/TheHPXProject/hpx/issues/658)⁶³²⁴ - Dynamic performance counter types are broken
- [Issue #657](https://github.com/TheHPXProject/hpx/issues/657)⁶³²⁵ - HPX v0.9.5 (RC1) `hello_world` example segfaulting
- [Issue #656](https://github.com/TheHPXProject/hpx/issues/656)⁶³²⁶ - Define the affinity of `parcel-pool`, `io-pool`, and `timer-pool` threads
- [Issue #654](https://github.com/TheHPXProject/hpx/issues/654)⁶³²⁷ - Integrate the Boost `auto_index` tool with documentation
- [Issue #653](https://github.com/TheHPXProject/hpx/issues/653)⁶³²⁸ - Make HPX build on OS X + Clang + `libc++`
- [Issue #651](https://github.com/TheHPXProject/hpx/issues/651)⁶³²⁹ - Add fine-grained control for thread pinning
- [Issue #650](https://github.com/TheHPXProject/hpx/issues/650)⁶³³⁰ - Command line no error message when using `-hpx:(anything)`
- [Issue #645](https://github.com/TheHPXProject/hpx/issues/645)⁶³³¹ - Command line aliases don't work in `[teletype]`@file`[c++]`
- [Issue #644](https://github.com/TheHPXProject/hpx/issues/644)⁶³³² - Terminated threads are not always properly cleaned up
- [Issue #640](https://github.com/TheHPXProject/hpx/issues/640)⁶³³³ - `future_data<T>::set_on_completed_` used without locks
- [Issue #638](https://github.com/TheHPXProject/hpx/issues/638)⁶³³⁴ - `hpx` build with intel compilers fails on linux

⁶³³⁴ <https://github.com/TheHPXProject/hpx/issues/638>

- Issue #637⁶³³⁵ - `--copy-dt-needed-entries` breaks with gold
- Issue #635⁶³³⁶ - Boost V1.53 will add `Boost.Lockfree` and `Boost.Atomic`
- Issue #633⁶³³⁷ - Re-add examples to final 0.9.5 release
- Issue #632⁶³³⁸ - Example `thread_aware_timer` is broken
- Issue #631⁶³³⁹ - FFT application throws error in `parcellayer`
- Issue #630⁶³⁴⁰ - Event synchronization example is broken
- Issue #629⁶³⁴¹ - Waiting on futures hangs
- Issue #628⁶³⁴² - Add an `HPX_ALWAYS_ASSERT` macro
- Issue #625⁶³⁴³ - Port coroutines context switch benchmark
- Issue #621⁶³⁴⁴ - New INI section for stack sizes
- Issue #618⁶³⁴⁵ - `pkg_config` support does not work with a HPX debug build
- Issue #617⁶³⁴⁶ - `hpx/external/logging/boost/logging/detail/cache_before_init.hpp:139:67: error: 'get_thread_id' was not declared in this scope`
- Issue #616⁶³⁴⁷ - Change `wait_xxx` not to use locking
- Issue #615⁶³⁴⁸ - Revert visibility 'fix' (fb0b6b8245dad1127b0c25ebafd9386b3945cca9)
- Issue #614⁶³⁴⁹ - Fix Dataflow linker error
- Issue #613⁶³⁵⁰ - `find_here` should throw an exception on failure
- Issue #612⁶³⁵¹ - Thread phase doesn't show up in debug mode
- Issue #611⁶³⁵² - Make stack guard pages configurable at runtime (initialization time)
- Issue #610⁶³⁵³ - Co-Locate Components
- Issue #609⁶³⁵⁴ - `future_overhead`
- Issue #608⁶³⁵⁵ - `--hpx:list-counter-infos` problem
- Issue #607⁶³⁵⁶ - Update `Boost.Context` based backend for coroutines
- Issue #606⁶³⁵⁷ - `1d_wave_equation` is not working

HPX V0.9.0 (Jul 5, 2012)

We have had roughly 800 commits since the last release and we have closed approximately 80 tickets (bugs, feature requests, etc.).

General changes

- Significant improvements made to the usability of *HPX* in large-scale, distributed environments.
- Renamed `hpx::lcos::packaged_task` to `hpx::lcos::packaged_action` to reflect the semantic differences to a `packaged_task` as defined by the [C++11 Standard](#)⁶⁴⁷⁵.
- *HPX* now exposes `hpx::thread` which is compliant to the C++11 `std::thread` type except that it (purely locally) represents an *HPX* thread. This new type does not expose any of the remote capabilities of the underlying *HPX*-thread implementation.
- The type `hpx::lcos::future` is now compliant to the C++11 `std::future<>` type. This type can be used to synchronize both, local and remote operations. In both cases the control flow will ‘return’ to the future in order to trigger any continuation.
- The types `hpx::lcos::local::promise` and `hpx::lcos::local::packaged_task` are now compliant to the C++11 `std::promise<>` and `std::packaged_task<>` types. These can be used to create a future representing local work only. Use the types `hpx::lcos::promise` and `hpx::lcos::packaged_action` to wrap any (possibly remote) action into a future.
- `hpx::thread` and `hpx::lcos::future` are now cancelable.
- Added support for sequential and logic composition of `hpx::lcos::futures`. The member function `hpx::lcos::future::when` permits futures to be sequentially composed. The helper functions `hpx::wait_all`, `hpx::wait_any`, and `hpx::wait_n` can be used to wait for more than one future at a time.
- *HPX* now exposes `hpx::apply` and `hpx::async` as the preferred way of creating (or invoking) any deferred work. These functions are usable with various types of functions, function objects, and actions and provide a uniform way to spawn deferred tasks.
- *HPX* now utilizes `hpx::util::bind` to (partially) bind local functions and function objects, and also actions. Remote bound actions can have placeholders as well.
- *HPX* continuations are now fully polymorphic. The class `hpx::actions::forwarding_continuation` is an example of how the user can write its own types of continuations. It can be used to execute any function as an continuation of a particular action.
- Reworked the action invocation API to be fully conformant to normal functions. Actions can now be invoked using `hpx::apply`, `hpx::async`, or using the `operator()` implemented on actions. Actions themselves can now be cheaply instantiated as they do not have any members anymore.
- Reworked the lazy action invocation API. Actions can now be directly bound using `hpx::util::bind` by passing an action instance as the first argument.
- A minimal *HPX* program now looks like this:

⁶⁴⁷³ <https://github.com/TheHPXProject/hpx/issues/48>

⁶⁴⁷⁴ <https://github.com/TheHPXProject/hpx/issues/21>

⁶⁴⁷⁵ <http://www.open-std.org/jtc1/sc22/wg21>

```
#include <hpx/hpx_init.hpp>

int hpx_main()
{
    return hpx::finalize();
}

int main()
{
    return hpx::init();
}
```

This removes the immediate dependency on the `Boost.Program_options`⁶⁴⁷⁶ library.

Note: This minimal version of an *HPX* program does not support any of the default command line arguments (such as `-help`, or command line options related to PBS). It is suggested to always pass `argc` and `argv` to *HPX* as shown in the example below.

- In order to support those, but still not to depend on `Boost.Program_options`⁶⁴⁷⁷, the minimal program can be written as:

```
#include <hpx/hpx_init.hpp>

// The arguments for hpx_main can be left off, which very similar to the
// behavior of ``main()`` as defined by C++.
int hpx_main(int argc, char* argv[])
{
    return hpx::finalize();
}

int main(int argc, char* argv[])
{
    return hpx::init(argc, argv);
}
```

- Added performance counters exposing the number of component instances which are alive on a given locality.
- Added performance counters exposing then number of messages sent and received, the number of parcels sent and received, the number of bytes sent and received, the overall time required to send and receive data, and the overall time required to serialize and deserialize the data.
- Added a new component: `hpx::components::binpacking_factory` which is equivalent to the existing `hpx::components::distributing_factory` component, except that it equalizes the overall population of the components to create. It exposes two factory methods, one based on the number of existing instances of the component type to create, and one based on an arbitrary performance counter which will be queried for all relevant localities.
- Added API functions allowing to access elements of the diagnostic information embedded in the given exception: `hpx::get_locality_id`, `hpx::get_host_name`, `hpx::get_process_id`, `hpx::get_function_name`, `hpx::get_file_name`, `hpx::get_line_number`, `hpx::get_os_thread`, `hpx::get_thread_id`, and `hpx::get_thread_description`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- [Issue #71](#)⁶⁴⁷⁸ - GIDs that are not serialized via `handle_gid<>` should raise an exception
- [Issue #105](#)⁶⁴⁷⁹ - Allow for `hpx::util::functions` to be registered in the AGAS symbolic namespace
- [Issue #107](#)⁶⁴⁸⁰ - Nasty threadmanger race condition (reproducible in `sheneos_test`)
- [Issue #108](#)⁶⁴⁸¹ - Add millisecond resolution to *HPX* logs on Linux
- [Issue #110](#)⁶⁴⁸² - Shutdown hang in distributed with release build
- [Issue #116](#)⁶⁴⁸³ - Don't use TSS for the applier and runtime pointers
- [Issue #162](#)⁶⁴⁸⁴ - Move local synchronous execution shortcut from `hpx::function` to the applier
- [Issue #172](#)⁶⁴⁸⁵ - Cache sources in CMake and check if they change manually
- [Issue #178](#)⁶⁴⁸⁶ - Add an INI option to turn off ranged-based AGAS caching
- [Issue #187](#)⁶⁴⁸⁷ - Support for disabling performance counter deployment
- [Issue #202](#)⁶⁴⁸⁸ - Support for sending performance counter data to a specific file
- [Issue #218](#)⁶⁴⁸⁹ - `boost.coroutines` allows different stack sizes, but stack pool is unaware of this
- [Issue #231](#)⁶⁴⁹⁰ - Implement movable `boost::bind`
- [Issue #232](#)⁶⁴⁹¹ - Implement movable `boost::function`
- [Issue #236](#)⁶⁴⁹² - Allow binding `hpx::util::function` to actions
- [Issue #239](#)⁶⁴⁹³ - Replace `hpx::function` with `hpx::util::function`
- [Issue #240](#)⁶⁴⁹⁴ - Can't specify `RemoteResult` with `lcos::async`
- [Issue #242](#)⁶⁴⁹⁵ - `REGISTER_TEMPLATE` support for plain actions
- [Issue #243](#)⁶⁴⁹⁶ - `handle_gid<>` support for `hpx::util::function`
- [Issue #245](#)⁶⁴⁹⁷ - `*_c_cache` code throws an exception if the queried GID is not in the local cache
- [Issue #246](#)⁶⁴⁹⁸ - Undefined references in `dataflow/adaptive1d` example

- ⁶⁵³⁸ <https://github.com/TheHPXProject/hpx/issues/425>
- ⁶⁵³⁹ <https://github.com/TheHPXProject/hpx/issues/426>

General changes

- *HPX* does not need to be installed anymore to be functional.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this point release:

- [Issue #295](https://github.com/TheHPXProject/hpx/issues/295)⁶⁵⁴⁰ - Don't require install path to be known at compile time.
- [Issue #371](https://github.com/TheHPXProject/hpx/issues/371)⁶⁵⁴¹ - Add `hpx::iostreams` to standard build.
- [Issue #384](https://github.com/TheHPXProject/hpx/issues/384)⁶⁵⁴² - Fix compilation with GCC 4.7.
- [Issue #390](https://github.com/TheHPXProject/hpx/issues/390)⁶⁵⁴³ - Remove `keep_factory_alive` startup call from ShenEOS; add shutdown call to `H5close`.
- [Issue #393](https://github.com/TheHPXProject/hpx/issues/393)⁶⁵⁴⁴ - Thread affinity control is broken.

Bug fixes (commits)

Here is a list of the important commits included in this point release:

- `r7642` - External: Fix backtrace memory violation.
- **`r7775` - Components: Fix symbol visibility bug with component startup providers.** This prevents one components providers from overriding another components.
- `r7778` - Components: Fix startup/shutdown provider shadowing issues.

HPX V0.8.0 (Mar 23, 2012)

We have had roughly 1000 commits since the last release and we have closed approximately 70 tickets (bugs, feature requests, etc.).

General changes

- Improved PBS support, allowing for arbitrary naming schemes of node-hostnames.
- Finished verification of the reference counting framework.
- Implemented decrement merging logic to optimize the distributed reference counting system.
- Restructured the LCO framework. Renamed `hpx::lcos::eager_future<>` and `hpx::lcos::lazy_future<>` into `hpx::lcos::packaged_task` and `hpx::lcos::deferred_packaged_task`. Split `hpx::lcos::promise` into `hpx::lcos::packaged_task` and `hpx::lcos::future`. Added 'local' futures (in namespace `hpx::lcos::local`).
- Improved the general performance of local and remote action invocations. This (under certain circumstances) drastically reduces the number of copies created for each of the parameters and return values.

⁶⁵⁴⁰ <https://github.com/TheHPXProject/hpx/issues/295>

⁶⁵⁴¹ <https://github.com/TheHPXProject/hpx/issues/371>

⁶⁵⁴² <https://github.com/TheHPXProject/hpx/issues/384>

⁶⁵⁴³ <https://github.com/TheHPXProject/hpx/issues/390>

⁶⁵⁴⁴ <https://github.com/TheHPXProject/hpx/issues/393>

- Reworked the performance counter framework. Performance counters are now created only when needed, which reduces the overall resource requirements. The new framework allows for much more flexible creation and management of performance counters. The new sine example application demonstrates some of the capabilities of the new infrastructure.
- Added a buildbot-based continuous build system which gives instant, automated feedback on each commit to SVN.
- Added more automated tests to verify proper functioning of *HPX*.
- Started to create documentation for *HPX* and its API.
- Added documentation toolchain to the build system.
- Added dataflow LCO.
- Changed default *HPX* command line options to have `hpx:` prefix. For instance, the former option `--threads` is now `--hpx:threads`. This has been done to make ambiguities with possible application specific command line options as unlikely as possible. See the section *HPX Command Line Options* for a full list of available options.
- Added the possibility to define command line aliases. The former short (one-letter) command line options have been predefined as aliases for backwards compatibility. See the section *HPX Command Line Options* for a detailed description of command line option aliasing.
- Network connections are now cached based on the connected host. The number of simultaneous connections to a particular host is now limited. Parcels are buffered and bundled if all connections are in use.
- Added more refined thread affinity control. This is based on the external library Portable Hardware Locality (HWLOC).
- Improved support for Windows builds with CMake.
- Added support for components to register their own command line options.
- Added the possibility to register custom startup/shutdown functions for any component. These functions are guaranteed to be executed by an *HPX* thread.
- Added two new experimental thread schedulers: `hierarchy_scheduler` and `periodic_priority_scheduler`. These can be activated by using the command line options `--hpx:queuing=hierarchy` or `--hpx:queuing=periodic`.

Example applications

- [Graph500 performance benchmark](http://www.graph500.org/)⁶⁵⁴⁵ (thanks to Matthew Anderson for contributing this application).
- [GTC \(Gyrokinetic Toroidal Code\)](http://www.nersc.gov/research-and-development/benchmarking-and-workload-characterization/nersc-6-benchmarks/gtc/)⁶⁵⁴⁶: a skeleton for particle in cell type codes.
- Random Memory Access: an example demonstrating random memory accesses in a large array
- [ShenEOS example](http://stellarcollapse.org/equationofstate)⁶⁵⁴⁷, demonstrating partitioning of large read-only data structures and exposing an interpolation API.
- Sine performance counter demo.
- Accumulator examples demonstrating how to write and use *HPX* components.
- Quickstart examples (like `hello_world`, `fibonacci`, `quicksort`, `factorial`, etc.) demonstrating simple *HPX* concepts which introduce some of the concepts in *HPX*.
- Load balancing and work stealing demos.

⁶⁵⁴⁵ <http://www.graph500.org/>

⁶⁵⁴⁶ <http://www.nersc.gov/research-and-development/benchmarking-and-workload-characterization/nersc-6-benchmarks/gtc/>

⁶⁵⁴⁷ <http://stellarcollapse.org/equationofstate>

API changes

- Moved all local LCOs into a separate namespace `hpx::lcos::local` (for instance, `hpx::lcos::local_mutex` is now `hpx::lcos::local::mutex`).
- Replaced `hpx::actions::function` with `hpx::util::function`. Cleaned up related code.
- Removed `hpx::traits::handle_gid` and moved handling of global reference counts into the corresponding serialization code.
- Changed terminology: `prefix` is now called `locality_id`, renamed the corresponding API functions (such as `hpx::get_prefix`, which is now called `hpx::get_locality_id`).
- Adding `hpx::find_remote_localities`, and `hpx::get_num_localities`.
- Changed performance counter naming scheme to make it more bash friendly. The new performance counter naming scheme is now

```
/object{parentname#parentindex/instance#index}/counter#parameters
```

- Added `hpx::get_worker_thread_num` replacing `hpx::threadmanager_base::get_thread_num`.
- Renamed `hpx::get_num_os_threads` to `hpx::get_os_threads_count`.
- Added `hpx::threads::get_thread_count`.
- Restructured the Futures sub-system, renaming types in accordance with the terminology used by the C++11 ISO standard.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- [Issue #31](#)⁶⁵⁴⁸ - Specialize `handle_gid<>` for examples and tests
- [Issue #72](#)⁶⁵⁴⁹ - Fix AGAS reference counting
- [Issue #104](#)⁶⁵⁵⁰ - heartbeat throws an exception when decrefing the performance counter it's watching
- [Issue #111](#)⁶⁵⁵¹ - throttle causes an exception on the target application
- [Issue #142](#)⁶⁵⁵² - One failed component loading causes an unrelated component to fail
- [Issue #165](#)⁶⁵⁵³ - Remote exception propagation bug in AGAS reference counting test
- [Issue #186](#)⁶⁵⁵⁴ - Test credit exhaustion/splitting (e.g. `prepare_gid` and symbol NS)
- [Issue #188](#)⁶⁵⁵⁵ - Implement remaining AGAS reference counting test cases

⁶⁵⁹¹ <https://github.com/TheHPXProject/hpx/issues/353>
⁶⁵⁹² <https://github.com/TheHPXProject/hpx/issues/355>
⁶⁵⁹³ <https://github.com/TheHPXProject/hpx/issues/356>
⁶⁵⁹⁴ <https://github.com/TheHPXProject/hpx/issues/359>
⁶⁵⁹⁵ <https://github.com/TheHPXProject/hpx/issues/361>
⁶⁵⁹⁶ <https://github.com/TheHPXProject/hpx/issues/364>

General changes

- Completely removed code related to deprecated AGAS V1, started to work on AGAS V2.1.
- Started to clean up and streamline the exposed APIs (see ‘API changes’ below for more details).
- Revamped and unified performance counter framework, added a lot of new performance counter instances for monitoring of a diverse set of internal *HPX* parameters (queue lengths, access statistics, etc.).
- Improved general error handling and logging support.
- Fixed several race conditions, improved overall stability, decreased memory footprint, improved overall performance (major optimizations include native TLS support and ranged-based AGAS caching).
- Added support for running *HPX* applications with PBS.
- Many updates to the build system, added support for gcc 4.5.x and 4.6.x, added C++11 support.
- Many updates to default command line options.
- Added many tests, set up buildbot for continuous integration testing.
- Better shutdown handling of distributed applications.

Example applications

- quickstart/factorial and quickstart/fibonacci, future-recursive parallel algorithms.
- quickstart/hello_world, distributed hello world example.
- quickstart/rma, simple remote memory access example
- quickstart/quicksort, parallel quicksort implementation.
- gtc, gyrokinetic torodial code.
- bfs, breadth-first-search, example code for a graph application.
- sheneos, partitioning of large data sets.
- accumulator, simple component example.
- balancing/os_thread_num, balancing/px_thread_phase, examples demonstrating load balancing and work stealing.

API changes

- Added `hpx::find_all_localities`.
- Added `hpx::terminate` for non-graceful termination of applications.
- Added `hpx::lcos::async` functions for simpler asynchronous programming.
- Added new AGAS interface for handling of symbolic namespace (`hpx::agas::*`).
- Renamed `hpx::components::wait` to `hpx::lcos::wait`.
- Renamed `hpx::lcos::future_value` to `hpx::lcos::promise`.
- Renamed `hpx::lcos::recursive_mutex` to `hpx::lcos::local_recursive_mutex`, `hpx::lcos::mutex` to `hpx::lcos::local_mutex`
- Removed support for Boost versions older than V1.38, recommended Boost version is now V1.47 and newer.

- Removed `hpx::process` (this will be replaced by a real process implementation in the future).
- Removed non-functional LCO code (`hpx::lcos::dataflow`, `hpx::lcos::thunk`, `hpx::lcos::dataflow_variable`).
- Removed deprecated `hpx::naming::full_address`.

Bug fixes (closed tickets)

Here is a list of the important tickets we closed for this release:

- [Issue #28⁶⁵⁹⁷](#) - Integrate Windows/Linux CMake code for *HPX* core
- [Issue #32⁶⁵⁹⁸](#) - `hpx::cout()` should be `hpx::cout`
- [Issue #33⁶⁵⁹⁹](#) - AGAS V2 legacy client does not properly handle `error_code`
- [Issue #60⁶⁶⁰⁰](#) - AGAS: allow for `registerid` to optionally take ownership of the `gid`
- [Issue #62⁶⁶⁰¹](#) - `adaptive1d` compilation failure in Fusion
- [Issue #64⁶⁶⁰²](#) - Parcel subsystem doesn't resolve domain names
- [Issue #83⁶⁶⁰³](#) - No error handling if no console is available
- [Issue #84⁶⁶⁰⁴](#) - No error handling if a hosted locality is treated as the bootstrap server
- [Issue #90⁶⁶⁰⁵](#) - Add general commandline option `-N`
- [Issue #91⁶⁶⁰⁶](#) - Add possibility to read command line arguments from file
- [Issue #92⁶⁶⁰⁷](#) - Always log exceptions/errors to the log file
- [Issue #93⁶⁶⁰⁸](#) - Log the command line/program name
- [Issue #95⁶⁶⁰⁹](#) - Support for distributed launches
- [Issue #97⁶⁶¹⁰](#) - Attempt to create a bad component type in AMR examples
- [Issue #100⁶⁶¹¹](#) - `factorial` and `factorial_get` examples trigger AGAS component type assertions
- [Issue #101⁶⁶¹²](#) - Segfault when `hpx::process::here()` is called in `fibonacci2`
- [Issue #102⁶⁶¹³](#) - `unknown_component_address` in `int_object_semaphore_client`
- [Issue #114⁶⁶¹⁴](#) - `marduk` raises assertion with default parameters

2.11.3 Namespace changes

HPX V1.9.0 Namespace changes

The latest release includes amongst others changes in the namespaces so that *HPX* facilities correspond to the C++ Standard Library. The old namespaces are deprecated. Below is a comprehensive list of the namespace changes.

Table 2.189: Namespace changes in V1.9.0

Old namespace	New namespace
<code>hpx::util::mem_fn</code>	<code>hpx::mem_fn</code>
<code>hpx::util::invoke</code>	<code>hpx::invoke</code>
<code>hpx::util::invoke_r</code>	<code>hpx::invoke_r</code>
<code>hpx::util::invoke_fused</code>	<code>hpx::invoke_fused</code>
<code>hpx::util::invoke_fused_r</code>	<code>hpx::invoke_fused_r</code>
<code>hpx::util::unlock_guard</code>	<code>hpx::unlock_guard</code>
<code>hpx::parallel::v1::reduce_by_key</code>	<code>hpx::experimental::reduce_by_key</code>

2.12 Citing HPX

Please cite *HPX* whenever you use it for publications. Use our paper in The Journal of Open Source Software as the main citation for *HPX*: ⁶⁶⁷³. Use the Zenodo entry for referring to the latest version of *HPX*: ⁶⁶⁷⁴. Entries for citing specific versions of *HPX* can also be found at ⁶⁶⁷⁵.

2.13 HPX users

A list of institutions and projects using *HPX* can be found on the *HPX Users*⁶⁶⁷⁶ page.

2.14 About HPX

2.14.1 History

The development of High Performance ParalleX (*HPX*) began in 2007. At that time, Hartmut Kaiser became interested in the work done by the ParalleX group at the [Center for Computation and Technology \(CCT\)](https://www.cct.lsu.edu)⁶⁶⁷⁷, a multi-disciplinary research institute at [Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁶⁷⁸. The ParalleX group was working to develop a new and experimental execution model for future high performance computing architectures. This model was christened ParalleX. The first implementations of ParalleX were crude, and many of those designs had to be discarded entirely. However, over time the team learned quite a bit about how to design a parallel, distributed runtime system which implements the concepts of ParalleX.

From the very beginning, this endeavour has been a group effort. In addition to a handful of interested researchers, there have always been graduate and undergraduate students participating in the discussions, design, and implementation of *HPX*. In 2011 we decided to formalize our collective research efforts by creating the [STE||AR](https://stellar-group.org)⁶⁶⁷⁹ group (Systems Technology, Emergent Parallelism, and Algorithm Research). Over time, the team grew to include researchers around the country and the world. In 2014, the [STE||AR](https://stellar-group.org)⁶⁶⁸⁰ Group was reorganized to become the international community it is today. This consortium of researchers aims to develop stable, sustainable, and scalable tools which will enable application developers to exploit the parallelism latent in the machines of today and tomorrow. Our goal of the *HPX* project is to create a high quality, freely available, open source implementation of ParalleX concepts for conventional and future systems by building a modular and standards conforming runtime system for SMP and distributed application environments. The API exposed by *HPX* is conformant to the interfaces defined by the C++ ISO Standard and adheres to the programming guidelines used by the [Boost](https://www.boost.org/)⁶⁶⁸¹ collection of C++ libraries. We steer the development of *HPX* with real world applications and aim to provide a smooth migration path for domain scientists.

To learn more about [STE||AR](https://stellar-group.org)⁶⁶⁸² and ParalleX, see *People* and *Why HPX?*.

2.14.2 People

The [STE||AR](https://stellar-group.org)⁶⁶⁸³ Group (pronounced as stellar) stands for “Systems Technology, Emergent Parallelism, and Algorithm Research”. We are an international group of faculty, researchers, and students working at various institutions around the world. The goal of the [STE||AR](https://stellar-group.org)⁶⁶⁸⁴ Group is to promote the development of scalable parallel applications by providing a community for ideas, a framework for collaboration, and a platform for communicating these concepts to the broader community.

Our work is focused on building technologies for scalable parallel applications. *HPX*, our general purpose C++ runtime system for parallel and distributed applications, is no exception. We use *HPX* for a broad range of scientific applications, helping scientists and developers to write code which scales better and shows better performance compared to more conventional programming models such as MPI.

HPX is based on *ParalleX* which is a new (and still experimental) parallel execution model aiming to overcome the limitations imposed by the current hardware and the techniques we use to write applications today. Our group focuses on two types of applications - those requiring excellent strong scaling, allowing for a dramatic reduction of execution time for fixed workloads and those needing highest level of sustained performance through massive parallelism. These applications are presently unable (through conventional practices) to effectively exploit a relatively small number of cores in a multi-core system. By extension, these application will not be able to exploit high-end exascale computing systems which are likely to employ hundreds of millions of such cores by the end of this decade.

Critical bottlenecks to the effective use of new generation high performance computing (HPC) systems include:

- *Starvation*: due to lack of usable application parallelism and means of managing it,
- *Overhead*: reduction to permit strong scalability, improve efficiency, and enable dynamic resource management,
- *Latency*: from remote access across system or to local memories,
- *Contention*: due to multicore chip I/O pins, memory banks, and system interconnects.

The *ParalleX* model has been devised to address these challenges by enabling a new computing dynamic through the application of message-driven computation in a global address space context with lightweight synchronization. The work on *HPX* is centered around implementing the concepts as defined by the *ParalleX* model. *HPX* is currently targeted at conventional machines, such as classical Linux based Beowulf clusters and SMP nodes.

We fully understand that the success of *HPX* (and *ParalleX*) is very much the result of the work of many people. To see a list of who is contributing see our tables below.

Acknowledgements

Thanks also to the following people who contributed directly or indirectly to the project through discussions, pull requests, documentation patches, etc.

- Panos Syskakis for benchmarking and optimizing our parallel algorithms.
- Shreyas Atre, for contributing fixes to our implementation of senders/receivers and extending our coroutines integration with senders/receivers.
- Alexander Neumann, for contributing fixes to the cmake build system.
- Dimitra Karatza, for her work on refactoring the documentation and providing a new user-friendly environment during and after Google Season of Docs 2021.

⁶⁷¹³ <https://www.tudelft.nl/en/>

- Srinivas Yadav, for his work on SIMD support in algorithms before and during Google Summer of Code 2021.
- Akhil Nair, for his work on adapting algorithms to C++20 before and during Google Summer of Code 2021.
- Alexander Toktarev, for updating the parallel algorithm customization points to use `tag_fallback_invoke` for the default implementations.
- Brice Goglin, for reporting and helping fix issues related to the integration of `hwloc` in *HPX*.
- Giannis Gonidelis, for his work on the ranges adaptation during the Google Summer of Code 2020.
- Auriane Reverdell ([Swiss National Supercomputing Centre](https://www.cscs.ch)⁶⁷¹⁴), for her tireless work on refactoring our CMake setup and modularizing *HPX*.
- Christopher Hinz, for his work on refactoring our CMake setup.
- Weile Wei, for fixing *HPX* builds with CUDA on Summit.
- Severin Strobl, for fixing our CMake setup related to linking and adding new entry points to the *HPX* runtime.
- Rebecca Stobaugh, for her major documentation review and contributions during and after the 2019 Google Season of Documentation.
- Jan Melech, for adding automatic serialization of simple structs.
- Austin McCartney, for adding concept emulation of the Ranges TS bidirectional and random access iterator concepts.
- Marco Diers, reporting and fixing issues related PMIx.
- Maximilian Bremer, for reporting multiple issues and extending the component migration tests.
- Piotr Mikolajczyk, for his improvements and fixes to the set and count algorithms.
- Grant Rostig, for reporting several deficiencies on our web pages.
- Jakub Golinowski, for implementing an *HPX* backend for OpenCV and in the process improving documentation and reporting issues.
- Mikael Simberg ([Swiss National Supercomputing Centre](https://www.cscs.ch)⁶⁷¹⁵), for his tireless help cleaning up and maintaining *HPX*.
- Tianyi Zhang, for his work on HPXMP.
- Shahrzad Shirzad, for her contributions related to Phylanx.
- Christopher Ogle, for his contributions to the parallel algorithms.
- Surya Priy, for his work with statistic performance counters.
- Anushi Maheshwari, for her work on random number generation.
- Bruno Pitrus, for his work with parallel algorithms.
- Nikunj Gupta, for rewriting the implementation of `hpx_main.hpp` and for his fixes for tests.
- Christopher Taylor, for his interest in *HPX* and the fixes he provided. Chris also contributed support for RISC-V architectures.
- Shoshana Jakobovits, for her work on the resource partitioner.
- Denis Blank, who re-wrote our unwrapped function to accept plain values arbitrary containers, and properly deal with nested futures.
- Ajai V. George, who implemented several of the parallel algorithms.

⁶⁷¹⁴ <https://www.cscs.ch>

⁶⁷¹⁵ <https://www.cscs.ch>

- Taeguk Kwon, who worked on implementing parallel algorithms as well as adapting the parallel algorithms to the Ranges TS.
- Zach Byerly ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁷¹⁶), who in his work developing applications on top of *HPX* opened tickets and contributed to the *HPX* examples.
- Daniel Estermann, for his work porting *HPX* to the Raspberry Pi.
- Alireza Kheirkhahan ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁷¹⁷), who built and administered our local cluster as well as his work in distributed IO.
- Abhimanyu Rawat, who worked on stack overflow detection.
- David Pfander, who improved signal handling in *HPX*, provided his optimization expertise, and worked on incorporating the Vc vectorization into *HPX*.
- Denis Demidov, who contributed his insights with VexCL.
- Khalid Hasanov, who contributed changes which allowed to run *HPX* on 64Bit power-pc architectures.
- Zahra Khatami ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁷¹⁸), who contributed the prefetching iterators and the persistent auto chunking executor parameters implementation.
- Marcin Copik, who worked on implementing GPU support for C++AMP and HCC. He also worked on implementing a HCC backend for *HPX.Compute*.
- Minh-Khanh Do, who contributed the implementation of several segmented algorithms.
- Bibek Wagle ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁷¹⁹), who worked on fixing and analyzing the performance of the *parcel* coalescing plugin in *HPX*.
- Lukas Troska, who reported several problems and contributed various test cases allowing to reproduce the corresponding issues.
- Andreas Schaefer, who worked on integrating his library ([LibGeoDecomp](https://www.libgeodecomp.org/)⁶⁷²⁰) with *HPX*. He reported various problems and submitted several patches to fix issues allowing for a better integration with [LibGeoDecomp](https://www.libgeodecomp.org/)⁶⁷²¹.
- Satyaki Upadhyay, who contributed several examples to *HPX*.
- Brandon Cordes, who contributed several improvements to the inspect tool.
- Harris Brakmic, who contributed an extensive build system description for building *HPX* with Visual Studio.
- Parsa Amini ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁷²²), who refactored and simplified the implementation of AGAS in *HPX* and who works on its implementation and optimization.
- Luis Martinez de Bartolome who implemented a build system extension for *HPX* integrating it with the [Conan](https://www.conan.io/)⁶⁷²³ C/C++ package manager.
- Vinay C Amatya ([Louisiana State University \(LSU\)](https://www.lsu.edu)⁶⁷²⁴), who contributed to the documentation and provided some of the *HPX* examples.
- Kevin Huck and Nick Chaimov ([University of Oregon](https://uoregon.edu/)⁶⁷²⁵), who contributed the integration of APEX (Autonomic Performance Environment for eXascale) with *HPX*.
- Francisco Jose Tapia, who helped with implementing the parallel sort algorithm for *HPX*.

⁶⁷²⁵ <https://uoregon.edu/>

- Patrick Diehl, who worked on implementing CUDA support for our companion library targeting GPGPUs (HPXCL⁶⁷²⁶).
- Eric Lemanissier contributed fixes to allow compilation using the MingW toolchain.
- Nidhi Makhijani who helped cleaning up some enum consistencies in *HPX* and contributed to the resource manager used in the thread scheduling subsystem. She also worked on *HPX* in the context of the Google Summer of Code 2015.
- Larry Xiao, Devang Bacharwar, Marcin Copik, and Konstantin Kronfeldner who worked on *HPX* in the context of the Google Summer of Code program 2015.
- Daniel Bourgeois (Center for Computation and Technology (CCT)⁶⁷²⁷) who contributed to *HPX* the implementation of several parallel algorithms (as proposed by N4313⁶⁷²⁸).
- Anuj Sharma and Christopher Bross (Department of Computer Science 3 - Computer Architecture⁶⁷²⁹), who worked on *HPX* in the context of the Google Summer of Code⁶⁷³⁰ program 2014.
- Martin Stumpf (Department of Computer Science 3 - Computer Architecture⁶⁷³¹), who rebuilt our contiguous testing infrastructure (see the *HPX* Buildbot Website⁶⁷³²). Martin is also working on HPXCL⁶⁷³³ (mainly all work related to OpenCL⁶⁷³⁴) and implementing an *HPX* backend for POCL⁶⁷³⁵, a portable computing language solution based on OpenCL⁶⁷³⁶.
- Grant Mercer (University of Nevada, Las Vegas⁶⁷³⁷), who helped creating many of the parallel algorithms (as proposed by N4313⁶⁷³⁸).
- Damond Howard (Louisiana State University (LSU)⁶⁷³⁹), who works on HPXCL⁶⁷⁴⁰ (mainly all work related to CUDA⁶⁷⁴¹).
- Christoph Junghans (Los Alamos National Lab), who helped making our buildsystem more portable.
- Antoine Tran Tan (Laboratoire de Recherche en Informatique, Paris), who worked on integrating *HPX* as a backend for NT2⁶⁷⁴². He also contributed an implementation of an API similar to Fortran co-arrays on top of *HPX*.
- John Biddiscombe (Swiss National Supercomputing Centre⁶⁷⁴³), who helped with the BlueGene/Q port of *HPX*, implemented the parallel sort algorithm, and made several other contributions.
- Erik Schnetter (Perimeter Institute for Theoretical Physics), who greatly helped to make *HPX* more robust by submitting a large amount of problem reports, feature requests, and made several direct contributions.
- Mathias Gaunard (Metascale), who contributed several patches to reduce compile time warnings generated while compiling *HPX*.
- Andreas Buhr, who helped with improving our documentation, especially by suggesting some fixes for inconsistencies.

- Patricia Grubel ([New Mexico State University](https://www.nmsu.edu)⁶⁷⁴⁴), who contributed the description of the different *HPX* thread scheduler policies and is working on the performance analysis of our thread scheduling subsystem.
- Lars Viklund, whose wit, passion for testing, and love of odd architectures has been an amazing contribution to our team. He has also contributed platform specific patches for FreeBSD and MSVC12.
- Agustin Berge, who contributed patches fixing some very nasty hidden template meta-programming issues. He rewrote large parts of the API elements ensuring strict conformance with the C++ ISO Standard.
- Anton Bikineev for contributing changes to make using `boost::lexical_cast` safer, he also contributed a thread safety fix to the `iostreams` module. He also contributed a complete rewrite of the serialization infrastructure replacing `Boost.Serialization` inside *HPX*.
- Pyry Jähkola, who contributed the Mac OS build system and build documentation on how to build *HPX* using Clang and `libc++`.
- Mario Mulansky, who created an *HPX* backend for his `Boost.Odeint` library, and who submitted several test cases allowing us to reproduce and fix problems in *HPX*.
- Rekha Raj, who contributed changes to the description of the Windows build instructions.
- Jeremy Kemp how worked on an *HPX* OpenMP backend and added regression tests.
- Alex Nagelberg for his work on implementing a C wrapper API for *HPX*.
- Chen Guo, helvihartmann, Nicholas Pezolano, and John West who added and improved examples in *HPX*.
- Joseph Kleinhenz, Markus Elfring, Kirill Kropivnyansky, Alexander Neundorf, Bryant Lam, and Alex Hirsch who improved our CMake.
- Tapasweni Pathak, Praveen Velliengiri, Jean-Loup Tastet, Michael Levine, Aalekh Nigam, HadrienG2, Prayag Verma, Islada, Alex Myczko, and Avyav Kumar who improved the documentation.
- Jayesh Badwaik, J. F. Bastien, Christoph Garth, Christopher Hinz, Brandon Kohn, Mario Lang, Maikel Nadolski, pierrele, hendrx, Dekken, woodmeister123, xaguilar, Andrew Kemp, Dylan Stark, Matthew Anderson, Jeremy Wilke, Jiazheng Yuan, CyberDrudge, david8dixon, Maxwell Reeser, Raffaele Solca, Marco Ippolito, Jules Penuchot, Weile Wei, Severin Strobl, Kor de Jong, albestro, Jeff Trull, Yuri Victorovich, and Gregor Daiss who contributed to the general improvement of *HPX*.
