Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator or output iterator and sequential execution.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_symmetric_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*

Returns

The *set_symmetric_difference* algorithm returns a *FwdIter3*. The *set_symmetric_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::experimental::reduction_bit_or

Defined in header `hpx/algorithm.hpp`⁶⁹⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_or<T>> hpx::experimental::reduction_bit_or(T
&var)
```

The function template *reduction_bit_or* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::bit_or{ }` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_bit_or* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_or{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of *identity*, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
```

⁶⁹⁴ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_or<T>> hpx::experimental::reduction_bit_or(T
                                                                    &var,
                                                                    T
                                                                    const
                                                                    &iden-
                                                                    tity)
```

hpx::starts_with

Defined in header `hpx/algorithm.hpp`⁶⁹⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename InIter2, typename Pred = hpx::parallel::detail::equal_to>
bool hpx::starts_with(InIter1 first1, InIter1 last1, InIter2 first2, InIter2 last2, Pred &&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear: at most min(N1, N2) applications of the predicate.

Template Parameters

- **InIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The binary predicate that compares the elements. This defaults to *hpx::parallel::detail::equal_to*.

Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

Returns

The *starts_with* algorithm returns *bool*. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename InIter1, typename InIter2, typename Pred = ranges::equal_to>
```

⁶⁹⁵ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::starts_with(ExPolicy &&policy, InIter1
                                                                    first1, InIter1 last1, InIter2
                                                                    first2, InIter2 last2, Pred
                                                                    &&pred = Pred())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2). Executed according to the policy.

The assignments in the parallel *starts_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear: at most min(N1, N2) applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Pred** – The binary predicate that compares the elements. This defaults to *ranges::equal_to*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the two ranges.

Returns

The *starts_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *starts_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

hpx::transform_reduce

Defined in header `hpx/algorithm.hpp`⁶⁹⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy,
                                          FwdIter first, FwdIter last,
                                          T init, Reduce &&red_op,
                                          Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))). Executed according to the policy.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.

⁶⁹⁶ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename InIter, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(InIter first, InIter last, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a_1 when N is 1
- $op(\text{GENERALIZED_SUM}(op, b_1, \dots, b_K), \text{GENERALIZED_SUM}(op, b_M, \dots, b_N))$, where:
 - $b_1, \dots, b_N$ may be any permutation of $a_1, \dots, a_N$ and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy,
                                          FwdIter1 first1, FwdIter1
                                          last1, FwdIter2 first2, T
                                          init)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`. Executed according to the policy.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename InIter1, typename InIter2, typename T>
T hpx::transform_reduce(InIter1 first1, InIter1 last1, InIter2 first2, T init)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`.

Note

Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **InIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as return values (deduced).

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns a *T*.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename T, typename Reduce,
typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy,
                                                                 FwdIter1 first1, FwdIter1
                                                                 last1, FwdIter2 first2, T init,
                                                                 Reduce &&red_op, Convert
                                                                 &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*. Executed according to the policy.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return values (deduced).

- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *red_op*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename InIter1, typename InIter2, typename T, typename Reduce, typename Convert>
T hpx::transform_reduce(ExPolicy &&policy, InIter1 first1, InIter1 last1, InIter2 first2, T init, Reduce
&&red_op, Convert &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note

Complexity: $O(\text{last} - \text{first})$ applications each of *reduce* and *transform*.

Template Parameters

- **InIter1** – The type of the first source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **InIter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an input iterator.

- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the result will be calculated with.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *red_op*.

Returns

The *transform_reduce* algorithm returns a *T*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename T, typename Reduce, typename  
Convert>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Iter  
first, Sent last, T init,  
Reduce &&red_op, Convert  
&&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(Iter first, Sent last, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Iter
                                                                    first, Sent last, Iter2 first2, T
                                                                    init)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename Iter2, typename T>
```

```
T hpx::transform_reduce(Iter first, Sent last, Iter2 first2, T init)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Iter, typename Sent, typename Iter2, typename T, typename Reduce,
        typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Iter
                                                                    first, Sent last, Iter2 first2, T
                                                                    init, Reduce &&red_op,
                                                                    Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for Iter.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename Iter, typename Sent, typename Iter2, typename T, typename Reduce, typename Convert>
T hpx::transform_reduce(Iter first, Sent last, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.

- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Rng
&&rng, T init, Reduce
&&red_op, Convert
&&conv_op)
```

Returns GENERALIZED_SUM(red_op, init, conv_op(*first), ..., conv_op(*(first + (last - first) - 1))).

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *parallel_task_policy* and returns *T* otherwise. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range [*first*, *last*).

```
template<typename Rng, typename T, typename Reduce, typename Convert>
```

```
T hpx::transform_reduce(Rng &&rng, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns GENERALIZED_SUM(*red_op*, *init*, *conv_op*(**first*), ..., *conv_op*((**first* + (*last* - *first*) - 1))).

The difference between *transform_reduce* and *accumulate* is that the behavior of *transform_reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicates *red_op* and *conv_op*.

Note

GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Reduce** – The type of the binary function object used for the reduction operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.
- **red_op** – Specifies the function (or function object) which will be invoked for each of the values returned from the invocation of *conv_op*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The types *Type1*, *Type2*, and *Ret* must be such that an object of a type as returned from *conv_op* can be implicitly converted to any of those types.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

Returns

The *transform_reduce* algorithm returns *T*. The *transform_reduce* algorithm returns the result of the generalized sum over the values returned from *conv_op* when applied to the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Rng
&&rng, Iter2 first2, T init)
```

Returns the result of accumulating `init` with the inner products of the pairs formed by the elements of two ranges starting at `first1` and `first2`.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename Rng, typename Iter2, typename T>
T hpx::transform_reduce(Rng &&rng, Iter2 first2, T init)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.

Returns

The *transform_reduce* algorithm returns *T*.

```
template<typename ExPolicy, typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::transform_reduce(ExPolicy &&policy, Rng
&&rng, Iter2 first2, T init,
Reduce &&red_op, Convert
&&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *transform_reduce* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as return) values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns

The *transform_reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise.

```
template<typename Rng, typename Iter2, typename T, typename Reduce, typename Convert>
T hpx::transform_reduce(Rng &&rng, Iter2 first2, T init, Reduce &&red_op, Convert &&conv_op)
```

Returns the result of accumulating *init* with the inner products of the pairs formed by the elements of two ranges starting at *first1* and *first2*.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op2*.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the second source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **T** – The type of the value to be used as return values (deduced).
- **Reduce** – The type of the binary function object used for the multiplication operation.
- **Convert** – The type of the unary function object used to transform the elements of the input sequence before invoking the reduce function.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the result will be calculated with.
- **init** – The initial value for the sum.
- **red_op** – Specifies the function (or function object) which will be invoked for the initial value and each of the return values of *op2*. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to a type of *T*.

- **conv_op** – Specifies the function (or function object) which will be invoked for each of the input values of the sequence. This is a binary predicate. The signature of this predicate should be equivalent to

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Ret* must be such that it can be implicitly converted to an object for the second argument type of *op1*.

Returns

The *transform_reduce* algorithm returns *T*.

hpx::remove

Defined in header `hpx/algorithm.hpp`⁶⁹⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::remove_if`

```
template<typename FwdIter, typename T = typename std::iterator_traits<FwdIter>::value_type>
FwdIter hpx::remove(FwdIter first, FwdIter last, T const &value)
```

Removes all elements satisfying specific criteria from the range `[first, last)` and returns a past-the-end iterator for the new end of the range. This version removes all elements that are equal to *value*.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator `==()`.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

Returns

The *remove* algorithm returns a *FwdIter*. The *remove* algorithm returns the iterator to the new end of the range.

```
template<typename ExPolicy, typename FwdIter, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::remove(ExPolicy &&policy, FwdIter first,
FwdIter last, T const &value)
```

Removes all elements satisfying specific criteria from the range `[first, last)` and returns a past-the-end iterator for the new end of the range. This version removes all elements that are equal to *value*. Executed according to the policy.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

⁶⁹⁷ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator==().

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.

Returns

The *remove* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove* algorithm returns the iterator to the new end of the range.

hpx::remove_if

Defined in header [hpx/algorithm.hpp](#)⁶⁹⁸.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::remove](#)

```
template<typename FwdIter, typename Pred>
FwdIter hpx::remove_if(FwdIter first, FwdIter last, Pred &&pred)
```

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements for which predicate *pred* returns true.

The assignments in the parallel *remove_if* algorithm execute in sequential order in the calling thread.

⁶⁹⁸ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *Copy-Constructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *remove_if* algorithm returns a *FwdIter*. The *remove_if* algorithm returns the iterator to the new end of the range.

```
template<typename ExPolicy, typename FwdIter, typename Pred>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::remove_if(ExPolicy &&policy, FwdIter
                                                                    first, FwdIter last, Pred
                                                                    &&pred)
```

Removes all elements satisfying specific criteria from the range [first, last) and returns a past-the-end iterator for the new end of the range. This version removes all elements for which predicate *pred* returns true. Executed according to the policy.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove_if* requires *Pred* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *remove_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *remove_if* algorithm returns the iterator to the new end of the range.

hpx::find

Defined in header `hpx/algorithm.hpp`⁶⁹⁹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::find_if*
- *hpx::find_if_not*
- *hpx::find_end*
- *hpx::find_first_of*

```
template<typename ExPolicy, typename FwdIter, typename T>  
util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::find(ExPolicy &&policy, FwdIter first, FwdIter last, T  
                                                             const &val)
```

Returns the first element in the range [first, last) that is equal to value. Executed according to the policy.

⁶⁹⁹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *find* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most last - first applications of the operator==().

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to find (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **val** – the value to compare the elements to

Returns

The *find* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find* algorithm returns the first element in the range [first,last) that is equal to *val*. If no such element in the range of [first,last) is equal to *val*, then the algorithm returns *last*.

```
template<typename InIter, typename T>
InIter hpx::find(InIter first, InIter last, T const &val)
```

Returns the first element in the range [first, last) that is equal to value. Executed according to the policy.

Note

Complexity: At most last - first applications of the operator==().

Template Parameters

- **InIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **T** – The type of the value to find (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **val** – the value to compare the elements to

Returns

The *find* algorithm returns a *InIter*. The *find* algorithm returns the first element in the range [first,last) that is equal to *val*. If no such element in the range of [first,last) is equal to *val*, then the algorithm returns *last*.

hpx::find_if

Defined in header `hpx/algorithm.hpp`⁷⁰⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::find`
- `hpx::find_if_not`
- `hpx::find_end`
- `hpx::find_first_of`

```
template<typename ExPolicy, typename FwdIter, typename F>  
util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::find_if(ExPolicy &&policy, FwdIter first, FwdIter last,  
                                                             F &&f)
```

Returns the first element in the range [first, last) for which predicate *f* returns true. Executed according to the policy.

The comparison operations in the parallel *find_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most last - first applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

⁷⁰⁰ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns true for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_if* algorithm returns the first element in the range `[first,last)` that satisfies the predicate *f*. If no such element exists that satisfies the predicate *f*, the algorithm returns *last*.

```
template<typename InIter, typename F>
InIter hpx::find_if(InIter first, InIter last, F &&f)
```

Returns the first element in the range `[first, last)` for which predicate *f* returns true.

Note

Complexity: At most last - first applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns true for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if* algorithm returns a *InIter*. The *find_if* algorithm returns the first element in the range

[first,last) that satisfies the predicate f . If no such element exists that satisfies the predicate f , the algorithm returns *last*.

hpx::find_if_not

Defined in header `hpx/algorithm.hpp`⁷⁰¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::find`
- `hpx::find_if`
- `hpx::find_end`
- `hpx::find_first_of`

```
template<typename ExPolicy, typename FwdIter, typename F>  
util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::find_if_not(ExPolicy &&policy, FwdIter first, FwdIter  
                                                                    last, F &&f)
```

Returns the first element in the range [first, last) for which predicate f returns false. Executed according to the policy.

The comparison operations in the parallel `find_if_not` algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel `find_if_not` algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most last - first applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires F to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

⁷⁰¹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **f** – The unary predicate which returns false for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if_not* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_if_not* algorithm returns the first element in the range `[first, last)` that does **not** satisfy the predicate *f*. If no such element exists that does not satisfy the predicate *f*, the algorithm returns *last*.

```
template<typename FwdIter, typename F>
FwdIter hpx::find_if_not(FwdIter first, FwdIter last, F &&f)
```

Returns the first element in the range `[first, last)` for which predicate *f* returns false.

Note

Complexity: At most last - first applications of the predicate.

Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **f** – The unary predicate which returns false for the required element. The signature of the predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

Returns

The *find_if_not* algorithm returns a *FwdIter*. The *find_if_not* algorithm returns the first element in the range `[first, last)` that does **not** satisfy the predicate *f*. If no such element exists that does not satisfy the predicate *f*, the algorithm returns *last*.

hpx::find_end

Defined in header `hpx/algorithm.hpp`⁷⁰².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::find`
- `hpx::find_if`
- `hpx::find_if_not`
- `hpx::find_first_of`

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_end(ExPolicy &&policy, FwdIter1 first1,
                                                                FwdIter1 last1, FwdIter2 first2, FwdIter2
                                                                last2, Pred &&op = Pred())
```

Returns the last subsequence of elements [first2, last2) found in the range [first, last) using the given predicate *op* to compare elements. Executed according to the policy.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *find_end* is available if the user decides to provide the algorithm their own predicate *op*.

Note

Complexity: at most $S \cdot (N - S + 1)$ comparisons where S = distance(first2, last2) and N = distance(first1, last1).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *replace* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

⁷⁰² <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_end* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_end* algorithm returns an iterator to the beginning of the last subsequence `[first2, last2)` in range `[first, last)`. If the length of the subsequence `[first2, last2)` is greater than the length of the range `[first1, last1)`, *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_end(ExPolicy &&policy, FwdIter1 first1,
                                                                FwdIter1 last1, FwdIter2 first2, FwdIter2
                                                                last2)
```

Returns the last subsequence of elements `[first2, last2)` found in the range `[first, last)`. Elements are compared using *operator==*. Executed according to the policy.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_end* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.

- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_end* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *find_end* algorithm returns an iterator to the beginning of the last subsequence [first2, last2) in range [first, last). If the length of the subsequence [first2, last2) is greater than the length of the range [first1, last1), *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
FwdIter1 hpx::find_end(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns the last subsequence of elements [first2, last2) found in the range [first, last) using the given predicate *op* to compare elements.

This overload of *find_end* is available if the user decides to provide the algorithm their own predicate *op*.

Note

Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *replace* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.

- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_end* algorithm returns a *FwdIter1*. The *find_end* algorithm returns an iterator to the beginning of the last subsequence `[first2, last2)` in range `[first, last)`. If the length of the subsequence `[first2, last2)` is greater than the length of the range `[first1, last1)`, *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter1 hpx::find_end(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns the last subsequence of elements `[first2, last2)` found in the range `[first, last)`. Elements are compared using *operator==*.

Note

Complexity: at most $S \cdot (N - S + 1)$ comparisons where $S = \text{distance}(\text{first2}, \text{last2})$ and $N = \text{distance}(\text{first1}, \text{last1})$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **last2** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_end* algorithm returns a *FwdIter1*. The *find_end* algorithm returns an iterator to the beginning of the last subsequence `[first2, last2)` in range `[first, last)`. If the length of the subsequence `[first2, last2)` is greater than the length of the range `[first1, last1)`, *last1* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last1* is also returned.

hpx::find_first_of

Defined in header `hpx/algorithm.hpp`⁷⁰³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::find`
- `hpx::find_if`
- `hpx::find_if_not`
- `hpx::find_end`

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_first_of(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 s_first,
                                                                    FwdIter2 s_last, Pred &&op = Pred())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses binary predicate *op* to compare elements. Executed according to the policy.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *find_first_of* is available if the user decides to provide the algorithm their own predicate *op*.

Note

Complexity: at most ($S \cdot N$) comparisons where S = distance(s_first, s_last) and N = distance(first, last).

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

⁷⁰³ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_first_of* algorithm returns a *hpx::future<FwdIter1>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter1* otherwise. The *find_first_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
util::detail::algorithm_result_t<ExPolicy, FwdIter1> hpx::find_first_of(ExPolicy &&policy, FwdIter1 first,
                                                                    FwdIter1 last, FwdIter2 s_first,
                                                                    FwdIter2 s_last)
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Elements are compared using *operator==*. Executed according to the policy.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *find_first_of* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(S \cdot N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.

- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_first_of* algorithm returns a *hpx::future<FwdIter1>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter1* otherwise. The *find_first_of* algorithm returns an iterator to the first element in the range [first, last) that is equal to an element from the range [s_first, s_last). If the length of the subsequence [s_first, s_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
FwdIter1 hpx::find_first_of(FwdIter1 first, FwdIter1 last, FwdIter2 s_first, FwdIter2 s_last, Pred &&op =
    Pred())
```

Searches the range [first, last) for any elements in the range [s_first, s_last). Uses binary predicate *op* to compare elements.

This overload of *find_first_of* is available if the user decides to provide the algorithm their own predicate *op*.

Note

Complexity: at most (S*N) comparisons where *S* = distance(s_first, s_last) and *N* = distance(first, last).

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to<>*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively.

Returns

The *find_first_of* algorithm returns a *FwdIter1*. The *find_first_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

```
template<typename FwdIter1, typename FwdIter2>
```

```
FwdIter1 hpx::find_first_of(FwdIter1 first, FwdIter1 last, FwdIter2 s_first, FwdIter2 s_last)
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Elements are compared using *operator==*.

Note

Complexity: at most $(S \cdot N)$ comparisons where $S = \text{distance}(s_first, s_last)$ and $N = \text{distance}(first, last)$.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.

Returns

The *find_first_of* algorithm returns a *FwdIter1*. The *find_first_of* algorithm returns an iterator to the first element in the range `[first, last)` that is equal to an element from the range `[s_first, s_last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`,

last is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *last* is also returned.

hpx::unique

Defined in header `hpx/algorithm.hpp`⁷⁰⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::unique_copy`

```
template<typename FwdIter, typename Pred = hpx::parallel::detail::equal_to, typename Proj = hpx::identity>
FwdIter hpx::unique(FwdIter first, FwdIter last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique* algorithm returns *FwdIter*. The *unique* algorithm returns the iterator to the new end of the range.

⁷⁰⁴ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename FwdIter, typename Pred = hpx::parallel::detail::equal_to, typename
Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::unique(ExPolicy &&policy, FwdIter first,
FwdIter last, Pred &&pred =
Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range. Executed according to the policy.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *unique* algorithm returns the iterator to the new end of the range.

hpx::unique_copy

Defined in header `hpx/algorithm.hpp`⁷⁰⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::unique*

```
template<typename InIter, typename OutIter, typename Pred = hpx::parallel::detail::equal_to, typename Proj = hpx::identity>
```

```
OutIter hpx::unique_copy(InIter first, InIter last, OutIter dest, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

⁷⁰⁵ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique_copy* algorithm returns a returns *OutIter*. The *unique_copy* algorithm returns the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred =
    hpx::parallel::detail::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type hpx::unique_copy(ExPolicy &&policy,
    FwdIter1 first, FwdIter1
    last, FwdIter2 dest, Pred
    &&pred = Pred(), Proj
    &&proj = Proj())
```

Copies the elements from the range `[first, last)`, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied. Executed according to the policy.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *pred* is invoked.

Returns

The *unique_copy* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *unique_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

hpx::copy

Defined in header `hpx/algorithm.hpp`⁷⁰⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::copy_n`
- `hpx::copy_if`

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::copy(ExPolicy &&policy, FwdIter1 first,
                                                                              FwdIter1 last, FwdIter2 dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Executed according to the policy.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

⁷⁰⁶ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2>
FwdIter2 hpx::copy(FwdIter1 first, FwdIter1 last, FwdIter2 dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy* algorithm returns a *FwdIter2*. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::copy_n

Defined in header [hpx/algorithm.hpp](#)⁷⁰⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::copy](#)
- [hpx::copy_if](#)

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::copy_n(ExPolicy &&policy, FwdIter1
                                                                    first, Size count, FwdIter2 dest)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. Executed according to the policy.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

⁷⁰⁷ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Returns

The *copy_n* algorithm returns a *hpx::future<FwdIter2>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *copy_n* algorithm returns Iterator in the destination range, pointing past the last element copied if count>0 or result otherwise.

```
template<typename FwdIter1, typename Size, typename FwdIter2>
FwdIter2 hpx::copy_n(FwdIter1 first, Size count, FwdIter2 dest)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest.

Note

Complexity: Performs exactly *count* assignments, if count > 0, no assignments otherwise.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *copy_n* algorithm returns a *FwdIter2*. The *copy_n* algorithm returns Iterator in the destination range, pointing past the last element copied if count>0 or result otherwise.

hpx::copy_if

Defined in header [hpx/algorithm.hpp](#)⁷⁰⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

                                                                                   dest, Pred &&pred)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the

⁷⁰⁸ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

elements for which the predicate f returns true. The order of the elements that are not removed is preserved. Executed according to the policy.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate f .

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires F to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

Returns

The *copy_if* algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *copy_if* algorithm returns output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename FwdIter2, typename Pred>
```

FwdIter2 **hpx::copy_if**(*FwdIter1* first, *FwdIter1* last, *FwdIter2* dest, *Pred* &&pred)

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*. Copies only the elements for which the predicate *f* returns true. The order of the elements that are not removed is preserved.

Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

Returns

The *copy_if* algorithm returns a *FwdIter2*. The *copy_if* algorithm returns output iterator to the element in the destination range, one past the last element copied.

hpx::experimental::reduction_bit_xor

Defined in header `hpx/algorithm.hpp`⁷⁰⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_xor<T>> hpx::experimental::reduction_bit_xor(T
&var)
```

The function template *reduction_bit_xor* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::bit_xor{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

⁷⁰⁹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

A parallel algorithm uses the *reduction_bit_xor* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_xor{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_xor<T>> hpx::experimental::reduction_bit_xor(T
                                                                    &var,
                                                                    T
                                                                    const
                                                                    &iden-
                                                                    tity)
```

hpx::experimental::induction

Defined in header [hpx/algorithm.hpp](#)⁷¹⁰.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename T>
constexpr hpx::parallel::detail::induction_stride_helper<T> hpx::experimental::induction(T &&value,
                                                                                          std::size_t stride)
```

The function template returns an induction object of unspecified type having a value type and encapsulating an initial *value* of that type and, optionally, a stride.

For each element in the input range, a looping algorithm over input sequence *S* computes an induction value from an induction variable and ordinal position *p* within *S* by the formula $i + p * \text{stride}$ if a stride was specified or $i + p$ otherwise. This induction value is passed to the element access function.

If the *value* argument to *induction* is a non-const lvalue, then that lvalue becomes the live-out object for the returned induction object. For each induction object that has a live-out object, the looping algorithm assigns the value of $i + n * \text{stride}$ to the live-out object upon return, where *n* is the number of elements in the input range.

Template Parameters

T – The value type to be used by the induction object.

Parameters

- **value** – [in] The initial value to use for the induction object
- **stride** – [in] The (optional) stride to use for the induction object (default: 1)

Returns

This returns an induction object with value type *T*, initial *value*, and (if specified) *stride*. If *T* is a lvalue of non-const type, *value* is used as the live-out object for the induction object; otherwise there is no live-out object.

```
template<typename T>
constexpr hpx::parallel::detail::induction_helper<T> hpx::experimental::induction(T &&value)
```

hpx::experimental::reduction_bit_and

Defined in header [hpx/algorithm.hpp](#)⁷¹¹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_and<T>> hpx::experimental::reduction_bit_and(T
                                                                                                     &var)
```

The function template *reduction_bit_and* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::bit_and{}` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_bit_and* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

⁷¹⁰ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

⁷¹¹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::bit_and{ }` operation until a single value remains, which is then assigned back to the live-out object.

`T` shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The life-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of `var`.

Returns

This returns a reduction object of unspecified type having a value type of `T`. When the return value is used by an algorithm, the reference to `var` is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, std::bit_and<T>> hpx::experimental::reduction_bit_and(T
                                                                                                     &var,
                                                                                                     T
                                                                                                     const
                                                                                                     &iden-
                                                                                                     tity)
```

hpx::equal

Defined in header *hpx/algorithm.hpp*⁷¹².

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
util::detail::algorithm_result_t<ExPolicy, bool> hpx::equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,
                                                                 FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns true if the range `[first1, last1)` is equal to the range `[first2, last2)`, and false otherwise. Executed according to the policy.

⁷¹² <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$ applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range $[\text{first1}, \text{last1})$, **i* equals $*(\text{first2} + (i - \text{first1}))$. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
util::detail::algorithm_result_t<ExPolicy, bool> hpx::equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,
                                                         FwdIter2 first2, FwdIter2 last2)
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise. Executed according to policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$ applications of the predicate *std::equal_to*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
util::detail::algorithm_result_t<ExPolicy, bool> hpx::equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,
                                                         FwdIter2 first2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise. Executed according to policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: $O(\min(\text{last1} - \text{first1}, \text{last2} - \text{first2}))$ applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses operator== to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2>
util::detail::algorithm_result_t<ExPolicy, bool> hpx::equal(ExPolicy &&policy, FwdIter1 first1, FwdIter1 last1,
                                                           FwdIter2 first2)
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise. Executed according to policy.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most *last1 - first1* applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
bool hpx::equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2, Pred &&op = Pred())
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

Note

Complexity: At most min(last1 - first1, last2 - first2) applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range [first1, last1), **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal_to<>*

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *bool*. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range `[first1, last1)` does not equal the length of the range `[first2, last2)`, it returns false.

```
template<typename FwdIter1, typename FwdIter2>
bool hpx::equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, FwdIter2 last2)
```

Returns true if the range `[first1, last1)` is equal to the range `[first2, last2)`, and false otherwise.

Note

Complexity: At most $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$ applications of the predicate *std::equal_to*.

Note

The two ranges are considered equal if, for every iterator *i* in the range `[first1, last1)`, **i* equals **(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.

Returns

The *equal* algorithm returns a *bool*. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range `[first1, last1)` does not equal the length of the range `[first2, last2)`, it returns false.

```
template<typename FwdIter1, typename FwdIter2, typename Pred = detail::equal_to>
bool hpx::equal(FwdIter1 first1, FwdIter1 last1, FwdIter2 first2, Pred &&op = Pred())
```

Returns true if the range `[first1, last1)` is equal to the range `[first2, first2 + (last1 - first1))`, and false otherwise.

Note

Complexity: At most *last1 - first1* applications of the predicate *op*.

Note

The two ranges are considered equal if, for every iterator *i* in the range `[first1,last1)`, `*i` equals `*(first2 + (i - first1))`. This overload of `equal` uses `operator==` to determine if two elements are equal.

Template Parameters

- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

Returns

The *equal* algorithm returns a *bool*. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range `[first1, last1)` does not equal the length of the range `[first2, last2)`, it returns false.

hpx::nth_element

Defined in header `hpx/algorithm.hpp`⁷¹³.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Pred = hpx::parallel::detail::less>
void hpx::nth_element(RandomIt first, RandomIt nth, RandomIt last, Pred &&pred = Pred())
```

`nth_element` is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by `nth` is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new `nth` element are less than or equal to the elements after the new `nth` element. Executed according to the policy.

The comparison operations in the parallel `nth_element` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Linear in `std::distance(first, last)` on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

Template Parameters

- **RandomIt** – The type of the source begin, `nth`, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second. This defaults to `std::less<>`.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type `randomIt` can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

Returns

The `nth_element` algorithms returns nothing.

```
template<typename ExPolicy, typename RandomIt, typename Pred = hpx::parallel::detail::less>
```

⁷¹³ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
void hpx::nth_element(ExPolicy &&policy, RandomIt first, RandomIt nth, RandomIt last, Pred &&pred =
    Pred())
```

`nth_element` is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by `nth` is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new `nth` element are less than or equal to the elements after the new `nth` element.

The comparison operations in the parallel `nth_element` invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel `nth_element` algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in `std::distance(first, last)` on average. $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source begin, `nth`, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second. This defaults to `std::less<>`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

Returns

The `nth_element` algorithms returns nothing.

hpx::transform_exclusive_scan

Defined in header `hpx/algorithm.hpp`⁷¹⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename OutIter, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<InIter>::value_type>
OutIter hpx::transform_exclusive_scan(InIter first, InIter last, OutIter dest, T init, BinOp &&binary_op,
                                     UnOp &&unary_op)
```

Transforms each element in the range `[first, last)` with *unary_op*, then computes an exclusive prefix sum operation using *binary_op* over the resulting range, with *init* as the initial value, and writes the results to the range beginning at *dest*. “exclusive” means that the *i*-th input element is not included in the *i*-th sum. Formally, assigns through each iterator *i* in `[dest, d_first + (last - first))` the value of the generalized noncommutative sum of *init*, *unary_op*(**j*)... for every *j* in `[first, first + (i - d_first))` over *binary_op*, where generalized noncommutative sum *GNSUM*(*op*, *a*₁, ..., *a*_N) is defined as follows:

- if *N*=1, *a*₁
- if *N* > 1, *op*(*GNSUM*(*op*, *a*₁, ..., *a*_K), *GNSUM*(*op*, *a*_M, ..., *a*_N)) for any *K* where $1 < K+1 = M \leq N$. In other words, the summation operations may be performed in arbitrary order, and the behavior is nondeterministic if *binary_op* is not associative.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *unary_op* nor *binary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of *transform_exclusive_scan* may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of each of *binary_op* and *unary_op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_N) is defined as:

- *a*₁ when *N* is 1
- *op*(*GENERALIZED_NONCOMMUTATIVE_SUM*(*op*, *a*₁, ..., *a*_K), *GENERALIZED_NONCOMMUTATIVE_SUM*(*op*, *a*_M, ..., *a*_N)) where $1 < K+1 = M \leq N$.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

⁷¹⁴ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Binary *FunctionObject* that will be applied to the result of *unary_op*, the results of other *binary_op*, and *init*.
- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.

Returns

The *transform_exclusive_scan* algorithm returns a returns *OutIter*. The *transform_exclusive_scan* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename FwdIter2, typename BinOp, typename UnOp,
typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter2>::type hpx::transform_exclusive_scan(ExPolicy
&&policy,
FwdIter1
first,
FwdIter1
last,
FwdIter2
dest, T init,
BinOp
&&binary_op,
UnOp
&&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))). Executed according to the policy.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform_exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *unary_op* nor *binary_op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of `transform_exclusive_scan` may be non-deterministic for a non-associative predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of each of *binary_op* and *unary_op*.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$ when N is 1
- $op(\text{GENERALIZED_NONCOMMUTATIVE_SUM}(op, a1, \dots, aK), \text{GENERALIZED_NONCOMMUTATIVE_SUM}(op, aM, \dots, aN))$ where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of *binary_op*.
- **UnOp** – The type of *unary_op*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary_op** – Binary *FunctionObject* that will be applied in to the result of *unary_op*, the results of other *binary_op*, and *init*.
- **unary_op** – Unary *FunctionObject* that will be applied to each element of the input range. The return type must be acceptable as input to *binary_op*.

Returns

The `transform_exclusive_scan` algorithm returns a `hpx::future<FwdIter2>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter2` otherwise. The `transform_exclusive_scan` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::uninitialized_move

Defined in header `hpx/algorithm.hpp`⁷¹⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::uninitialized_move_n`

template<typename **InIter**, typename **FwdIter**>

FwdIter **hpx::uninitialized_move**(*InIter* first, *InIter* last, *FwdIter* dest)

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move* algorithm returns *FwdIter*. The *uninitialized_move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

template<typename **ExPolicy**, typename **FwdIter1**, typename **FwdIter2**>

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> **hpx::uninitialized_move**(*ExPolicy* &&policy, *FwdIter1* first, *FwdIter1* last, *FwdIter2* dest)

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state. Executed according to the policy.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

⁷¹⁵ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move* algorithm returns a `hpx::future<FwdIter2>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter2* otherwise. The *uninitialized_move* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

hpx::uninitialized_move_n

Defined in header `hpx/algorithm.hpp`⁷¹⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::uninitialized_move`

```
template<typename InIter, typename Size, typename FwdIter>
std::pair<InIter, FwdIter> hpx::uninitialized_move_n(InIter first, Size count, FwdIter dest)
```

Moves the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1`, to another range beginning at `dest`. If an exception is thrown during the initialization, some objects in `[first, first + count)` are left in a valid but unspecified state.

Note

Complexity: Performs exactly *count* movements, if *count* > 0, no move operations otherwise.

Template Parameters

⁷¹⁶ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply f to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move_n* algorithm returns a `std::pair<InIter,FwdIter>`. The *uninitialized_move_n* algorithm returns A pair whose first element is an iterator to the element past the last element moved in the source range, and whose second element is an iterator to the element past the last element moved in the destination range.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2>
parallel::util::detail::algorithm_result<ExPolicy, std::pair<FwdIter1, FwdIter2>>::type hpx::uninitialized_move_n(ExPolicy
&&pol-
icy,
FwdIter1
first,
Size
count,
FwdIter2
dest)
```

Moves the elements in the range $[first, first + count)$, starting from *first* and proceeding to $first + count - 1$., to another range beginning at *dest*. If an exception is thrown during the initialization, some objects in $[first, first + count)$ are left in a valid but unspecified state. Executed according to the policy.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_move_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* movements, if $count > 0$, no move operations otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *uninitialized_move_n* algorithm returns a `hpx::future<std::pair<FwdIter1,FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::pair<FwdIter1,FwdIter2>` otherwise. The *uninitialized_move_n* algorithm returns A pair whose first element is an iterator to the element past the last element moved in the source range, and whose second element is an iterator to the element past the last element moved in the destination range.

hpx::experimental::reduction_min

Defined in header `hpx/algorithm.hpp`⁷¹⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename T>

constexpr `hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::min_of<T>>` `hpx::experimental::reduction_min(T &va`

The function template *reduction_min* returns a reduction object of unspecified type having a value type and encapsulating an identity value for the reduction, it uses `std::min_of{ }` as its combiner function, and a live-out object from which the initial value is obtained and into which the final value is stored.

A parallel algorithm uses the *reduction_min* object by allocating an unspecified number of instances, called views, of the reduction's value type. Each view is initialized with the reduction object's identity value, except that the live-out object (which was initialized by the caller) comprises one of the views. The algorithm passes a reference to a view to each application of an element-access function, ensuring that no two concurrently-executing invocations share the same view. A view can be shared between two applications that do not execute concurrently, but initialization is performed only once per view.

Modifications to the view by the application of element access functions accumulate as partial results. At some point before the algorithm returns, the partial results are combined, two at a time, using the `std::min_of{ }` operation until a single value remains, which is then assigned back to the live-out object.

T shall meet the requirements of *CopyConstructible* and *MoveAssignable*.

Note

In order to produce useful results, modifications to the view should be limited to commutative operations closely related to the combiner operation.

⁷¹⁷ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Template Parameters

- **T** – The value type to be used by the induction object.
- **Op** – The type of the binary function (object) used to perform the reduction operation.

Parameters

- **var** – [in,out] The live-out value to use for the reduction object. This will hold the reduced value after the algorithm is finished executing.
- **identity** – [in] The identity value to use for the reduction operation. This argument is optional and defaults to a copy of *var*.

Returns

This returns a reduction object of unspecified type having a value type of *T*. When the return value is used by an algorithm, the reference to *var* is used as the live-out object, new views are initialized to a copy of identity, and views are combined by invoking the copy of combiner, passing it the two views to be combined.

```
template<typename T>
constexpr hpx::parallel::detail::reduction_helper<T, hpx::parallel::detail::min_of<T>> hpx::experimental::reduction_min(T
&va
T
cons
&ide
tity)
```

hpx::ranges::uninitialized_fill

Defined in header *hpx/algorithm.hpp*⁷¹⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::uninitialized_fill_n*

```
template<typename FwdIter, typename Sent, typename T>
FwdIter hpx::ranges::uninitialized_fill(FwdIter first, Sent last, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the ranges *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

⁷¹⁸ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_fill(ExPolicy
                                                                                               &&pol-
                                                                                               icy,
                                                                                               FwdIter
                                                                                               first,
                                                                                               Sent
                                                                                               last, T
                                                                                               const
                                                                                               &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a returns *FwdIter*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename Rng, typename T>
```

```
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::uninitialized_fill(Rng &&rng, T const &value)
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a returns *hpx::traits::range_traits<Rng>::iterator_type*. The *uninitialized_fill* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename T>
```

```
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng1>::iterator_type>::type hpx::ranges::unin
```

Copies the given *value* to an uninitialized memory area, defined by the range [first, last). If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be filled
- **value** – The value to be assigned.

Returns

The *uninitialized_fill* algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *typename hpx::traits::range_traits<Rng>::iterator_type* otherwise. The *uninitialized_fill* algorithm returns the iterator to one past the last element filled in the range.

`hpx::ranges::uninitialized_fill_n`

Defined in header `hpx/algorithm.hpp`⁷¹⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_fill`

template<typename **FwdIter**, typename **Size**, typename **T**>

FwdIter `hpx::ranges::uninitialized_fill_n`(*FwdIter* first, *Size* count, *T* const &value)

Copies the given *value* value to the first count elements in an uninitialized memory area beginning at first. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

⁷¹⁹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill_n* algorithm returns a returns *FwdIter*. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_fill_n(ExPolicy
                                                                                                     &&pol-
                                                                                                     icy,
                                                                                                     FwdIter
                                                                                                     first,
                                                                                                     Size
                                                                                                     count,
                                                                                                     T
                                                                                                     const
                                                                                                     &value)
```

Copies the given *value* value to the first *count* elements in an uninitialized memory area beginning at *first*. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_fill_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

Returns

The *uninitialized_fill_n* algorithm returns a `hpx::future<FwdIter>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `FwdIter` otherwise. The *uninitialized_fill_n* algorithm returns the output iterator to the element in the range, one past the last element copied.

hpx::ranges::shift_right

Defined in header `hpx/algorithm.hpp`⁷²⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter, typename Sent, typename Size>
FwdIter hpx::ranges::shift_right(FwdIter first, Sent last, Size n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the end of the range. For every integer `i` in `[0, last - first - n)`, moves the element originally at position `first + i` to position `first`

- `n + i`.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: At most $(last - first) - n$ assignments.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

⁷²⁰ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns *FwdIter*. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::shift_right(ExPolicy
                                                                    &&policy,
                                                                    FwdIter first,
                                                                    Sent last, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the end of the range. For every integer i in [0, last - first - n), moves the element originally at position first + i to position first

- n + i.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most (last - first) - n assignments.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `FwdIter` otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename Rng, typename Size>  
std::ranges::iterator_t<Rng> hpx::ranges::shift_right(Rng &&rng, Size n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the end of the range. For every integer `i` in `[0, last - first - n)`, moves the element originally at position `first + i` to position `first`

- `n + i`.

The assignment operations in the parallel *shift_right* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: At most $(last - first) - n$ assignments.

Note

The type of dereferenced `std::ranges::iterator_t<Rng>` must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns `std::ranges::iterator_t<Rng>`. The *shift_right* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename Rng, typename Size>
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::shift_right(ExPolicy
                                                                                                     &&pol-
                                                                                                     icy,
                                                                                                     Rng
                                                                                                     &&rng,
                                                                                                     Size
                                                                                                     n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the end of the range. For every integer `i` in `[0, last - first - n)`, moves the element originally at position `first + i` to position `first`

- `n + i`.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_right* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $(last - first) - n$ assignments.

Note

The type of dereferenced *std::ranges::iterator_t<Rng>* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_right* algorithm returns a *hpx::future<std::ranges::iterator_t<Rng>>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *std::ranges::iterator_t<Rng>* otherwise. The *shift_right* algorithm returns an iterator to the end of the resulting range.

hpx::ranges::shift_left

Defined in header `hpx/algorithm.hpp`⁷²¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter, typename Sent, typename Size>
FwdIter hpx::ranges::shift_left(FwdIter first, Sent last, Size n)
```

Shifts the elements in the range [first, last) by n positions towards the beginning of the range. For every integer i in [0, last - first

- n), moves the element originally at position first + n + i to position first + i.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: At most (last - first) - n assignments.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns *FwdIter*. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Size>
FwdIter hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::shift_left(ExPolicy
                                                                                               &&policy, FwdIter
                                                                                               first, Sent last, Size
                                                                                               n)
```

⁷²¹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Shifts the elements in the range `[first, last)` by `n` positions towards the beginning of the range. For every integer `i` in `[0, last - first`

- `n`), moves the element originally at position `first + n + i` to position `first + i`.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $(last - first) - n$ assignments.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename Rng, typename Size>
std::ranges::iterator_t<Rng> hpx::ranges::shift_left(Rng &&rng, Size n)
```

Shifts the elements in the range `[first, last)` by `n` positions towards the beginning of the range. For every integer `i` in `[0, last - first`

- n), moves the element originally at position $\text{first} + n + i$ to position $\text{first} + i$.

The assignment operations in the parallel *shift_left* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: At most $(\text{last} - \text{first}) - n$ assignments.

Note

The type of dereferenced `std::ranges::iterator_t<Rng>` must meet the requirements of *MoveAssignable*.

Template Parameters

- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns `std::ranges::iterator_t<Rng>`. The *shift_left* algorithm returns an iterator to the end of the resulting range.

```
template<typename ExPolicy, typename Rng, typename Size>
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::shift_left(ExPolicy
                                                                                                     &&pol-
                                                                                                     icy,
                                                                                                     Rng
                                                                                                     &&rng,
                                                                                                     Size
                                                                                                     n)
```

Shifts the elements in the range $[\text{first}, \text{last})$ by n positions towards the beginning of the range. For every integer i in $[0, \text{last} - \text{first})$

- n), moves the element originally at position $\text{first} + n + i$ to position $\text{first} + i$.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignment operations in the parallel *shift_left* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most (last - first) - n assignments.

Note

The type of dereferenced `std::ranges::iterator_t<Rng>` must meet the requirements of *MoveAssignable*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of positions to shift by.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range in which the elements will be shifted.
- **n** – Refers to the number of positions to shift.

Returns

The *shift_left* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. The *shift_left* algorithm returns an iterator to the end of the resulting range.

hpx/parallel/container_algorithms/iota.hpp

Defined in header `hpx/parallel/container_algorithms/iota.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **ranges**

Functions

```
template<typename FwdIter, typename Sent, typename T>
iota_result<FwdIter, T> iota(FwdIter first, Sent last, T value)
```

Fills the range [first, last) with sequentially increasing values, starting with *value* and repetitively evaluating ++*value*.

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Exactly *std::distance(first, last)* assignments and increments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input or output iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a *hpx::ranges::iota_result* containing the final iterator and the final value.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, iota_result<FwdIter, T>> iota(ExPolicy
&&policy,
FwdIter first,
Sent last, T
value)
```

Fills the range [first, last) with sequentially increasing values, starting with *value* and repetitively evaluating ++*value*.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly *std::distance(first, last)* assignments and increments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a *hpx::future<iota_result>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *iota_result* otherwise.

```
template<typename Range, typename T>
iota_result<typename hpx::traits::range_traits<Range>::iterator_type, T> iota(Range &&r, T value)
    Fills the range r with sequentially increasing values, starting with value and repetitively evaluating ++value.
```

The assignments in the *iota* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Exactly *std::ranges::distance(r)* assignments and increments.

Template Parameters

- **Range** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input or output iterator
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **r** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a *hpx::ranges::iota_result* containing the final iterator and the final value.

```
template<typename ExPolicy, typename Range, typename T>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, iota_result<typename hpx::traits::range_traits<Range>::iterator_type, T>>
```

Fills the range *r* with sequentially increasing values, starting with *value* and repetitively evaluating ++value.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *iota* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly *std::ranges::distance(r)* assignments and increments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Range** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T** – The type of the target value. This type must meet the requirements of weakly incrementable.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **r** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be stored in the first element.

Returns

The *iota* algorithm returns a *hpx::future<iota_result>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *iota_result* otherwise.

hpx::ranges::generate

Defined in header [hpx/algorithm.hpp](#)⁷²².

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::generate_n](#)

```
template<typename ExPolicy, typename Rng, typename F>
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::generate(ExPolicy
&&pol-
icy,
Rng
&&rng,
F
&&f)
```

Assign each element in range [first, last) a value generated by the given function object f

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

⁷²² <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::generate(ExPolicy &&policy, Iter
                                                                    first, Sent last, F &&f)
```

Assign each element in range [first, last) a value generated by the given function object *f*

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source end iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

```
template<typename Rng, typename F>
std::ranges::iterator_t<Rng> hpx::ranges::generate(Rng &&rng, F &&f)
```

Assign each element in range [first, last) a value generated by the given function object *f*

Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns *last*.

```
template<typename Iter, typename Sent, typename F>
Iter hpx::ranges::generate(Iter first, Sent last, F &&f)
```

Assign each element in range [first, last) a value generated by the given function object *f*

Note

Complexity: Exactly *distance(first, last)* invocations of *f* and assignments.

Template Parameters

- **Iter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source end iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – generator function that will be called. signature of function should be equivalent to the following:

```
Ret fun();
```

The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns *last*.

hpx::ranges::generate_n

Defined in header `hpx/algorithm.hpp`⁷²³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::generate*

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F>
```

⁷²³ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::generate_n(ExPolicy
                                                                    &&policy, FwdIter
                                                                    first, Size count, F
                                                                    &&f)
```

Assigns each element in range [first, first+count) a value generated by the given function object g.

The assignments in the parallel *generate_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *generate_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly *count* invocations of *f* and assignments, for count > 0.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

```
Ret fun();
```

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

```
template<typename FwdIter, typename Size, typename F>
FwdIter hpx::ranges::generate_n(FwdIter first, Size count, F &&f)
```

Assigns each element in range [first, first+count) a value generated by the given function object g.

Note

Complexity: Exactly *count* invocations of *f* and assignments, for *count* > 0.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements in the sequence the algorithm will be applied to.
- **f** – Refers to the generator function object that will be called. The signature of the function should be equivalent to

```
Ret fun();
```

The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

Returns

The *replace_if* algorithm returns *last*.

hpx::ranges::rotate

Defined in header [hpx/algorithm.hpp](#)⁷²⁴.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::rotate_copy](#)

```
template<typename FwdIter, typename Sent>
```

```
subrange_t<FwdIter, Sent> hpx::ranges::rotate(FwdIter first, FwdIter middle, Sent last)
```

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [first, last) in such a way that the element middle becomes the first element of the new range and middle - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*.

⁷²⁴ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a *subrange_t<FwdIter, Sent>*. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

```
template<typename ExPolicy, typename FwdIter, typename Sent>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::rotate(ExPolicy
&&pol-
icy,
FwdIter
first,
FwdIter
mid-
dle,
Sent
last)
```

Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range `[first, last)` in such a way that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *rotate* algorithm returns a `hpx::future<subrange_t<FwdIter, Sent>>` if the execution policy is of type *parallel_task_policy* and returns a `subrange_t<FwdIter, Sent>` otherwise. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

```
template<typename Rng>
subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>> hpx::ranges::rotate(Rng &&rng,
                                                                                          std::ranges::iterator_t<Rng>
                                                                                          middle)
```

Uses *rng* as the source range, as if using `util::begin(rng)` as *first* and `ranges::end(rng)` as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range `[first, last)` in such a way that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm execute in sequential order in the calling thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

Returns

The *rotate* algorithm returns a *subrange_t*<*std::ranges::iterator_t*<*Rng*>, *std::ranges::iterator_t*<*Rng*>>. The *rotate* algorithm returns the iterator equal to *pair*(*first* + (*last* - *middle*), *last*).

```
template<typename ExPolicy, typename Rng>  
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> hpx::range
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Performs a left rotation on a range of elements. Specifically, *rotate* swaps the elements in the range [*first*, *last*) in such a way that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Linear in the distance between *first* and *last*.

Note

The type of dereferenced *FwdIter* must meet the requirements of *MoveAssignable* and *MoveConstructible*.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.

Returns

The *rotate* algorithm returns a `hpx::future` `<subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>*. otherwise. The *rotate* algorithm returns the iterator equal to `pair(first + (last - middle), last)`.

hpx::ranges::rotate_copy

Defined in header `hpx/algorithm.hpp`⁷²⁵.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::rotate*

```
template<typename FwdIter, typename Sent, typename OutIter>
rotate_copy_result<FwdIter, OutIter> hpx::ranges::rotate_copy(FwdIter first, FwdIter middle, Sent last,
                                                             OutIter dest_first)
```

Copies the elements from the range `[first, last)`, to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range `[first,last)`.

Returns

The *rotate_copy* algorithm returns a *rotate_copy_result<FwdIter, OutIter>*. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

⁷²⁵ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2>
parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<FwdIter1, FwdIter2>>::type hpx::ranges::rotate_copy(ExP
&&
icy,
Fwd
first,
Fwd
mid-
dle,
Sent
last,
Fwd
dest,
```

Copies the elements from the range `[first, last)`, to another range beginning at `dest_first` in such a way, that the element `middle` becomes the first element of the new range and `middle - 1` becomes the last element.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range `[first,last)`.

Returns

The `rotate_copy` algorithm returns `hpx::future< rotate_copy_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `rotate_copy_result<FwdIter1, FwdIter2>` otherwise. The `rotate_copy` algorithm returns the output iterator to the element past the last element copied.

```
template<typename Rng, typename OutIter>
rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::rotate_copy(Rng &&rng,
                                                                    std::ranges::iterator_t<Rng>
                                                                    middle, OutIter
                                                                    dest_first)
```

Uses *rng* as the source range, as if using `util::begin(rng)` as *first* and `ranges::end(rng)` as *last*. Copies the elements from the range `[first, last)`, to another range beginning at *dest_first* in such a way, that the element *middle* becomes the first element of the new range and *middle* - 1 becomes the last element.

The assignments in the parallel `rotate_copy` algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range `[first,last)`.

Returns

The `rotate` algorithm returns a `rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>`. The `rotate_copy` algorithm returns the output iterator to the element past the last element copied.

```
template<typename ExPolicy, typename Rng, typename OutIter>
parallel::util::detail::algorithm_result<ExPolicy, rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>> hpx::ranges::rotate_
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range *[first, last)*, to another range beginning at *dest_first* in such a way, that the element *new_first* becomes the first element of the new range and *new_first* - 1 becomes the last element.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *rotate_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last* - *first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the element that should appear at the beginning of the rotated range.
- **dest_first** – Output iterator to the initial position of the range where the reversed range is stored. The pointed type shall support being assigned the value of an element in the range *[first,last)*.

Returns

The *rotate_copy* algorithm returns a `hpx::future<rotate_copy_result<std::ranges::iterator_t<Rng>, OutIter>>` if the execution policy is of type *parallel_task_policy* and returns *rotate_copy_result< std::ranges::iterator_t<Rng>, OutIter>* otherwise. The *rotate_copy* algorithm returns the output iterator to the element past the last element copied.

hpx::ranges::for_each

Defined in header `hpx/algorithm.hpp`⁷²⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::for_each_n*

⁷²⁶ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename InIter, typename Sent, typename F, typename Proj = hpx::identity>
for_each_result<InIter, F> hpx::ranges::for_each(InIter first, Sent last, F &&f, Proj &&proj = Proj())
```

Applies *f* to the result of dereferencing every iterator in the range [first, last).

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Note

Complexity: Applies *f* exactly *last - first* times.

Template Parameters

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

{last, HPX_MOVE(f)} where last is the iterator corresponding to the input sentinel last.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
for_each_result<std::ranges::iterator_t<Rng>, F> hpx::ranges::for_each(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Applies *f* to the result of dereferencing every iterator in the given range *rng*.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Note

Complexity: Applies f exactly $size(rng)$ times.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires F to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

{std::end(rng), HPX_MOVE(f)}

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::for_each(ExPolicy &&policy,
                                                                                      FwdIter first, Sent
                                                                                      last, F &&f, Proj
                                                                                      &&proj = Proj())
```

Applies f to the result of dereferencing every iterator in the range [first, last).

If f returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Applies f exactly *last - first* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires F to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *for_each* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::for_each(ExPolicy
&&pol-
icy,
Rng
&&rng,
F
&&f,
Proj
&&proj
=
Proj())
```

Applies *f* to the result of dereferencing every iterator in the given range *rng*.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Applies *f* exactly *size(rng)* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *for_each* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

hpx::ranges::for_each_n

Defined in header `hpx/algorithm.hpp`⁷²⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::for_each`

```
template<typename InIter, typename Size, typename F, typename Proj = hpx::identity>
for_each_n_result<InIter, F> hpx::ranges::for_each_n(InIter first, Size count, F &&f, Proj &&proj = Proj())
```

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

Note

Complexity: Applies *f* exactly *count* times.

Template Parameters

- **InIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

⁷²⁷ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Returns

It returns *last*.

```
template<typename ExPolicy, typename FwdIter, typename Size, typename F, typename Proj = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::for_each_n(ExPolicy  
                                                                                      &&policy,  
                                                                                      FwdIter first,  
                                                                                      Size count, F  
                                                                                      &&f, Proj  
                                                                                      &&proj =  
                                                                                      Proj())
```

Applies *f* to the result of dereferencing every iterator in the range [first, first + count), starting from first and proceeding to first + count - 1.

If *f* returns a result, the result is ignored.

If the type of *first* satisfies the requirements of a mutable iterator, *f* may apply non-constant functions through the dereferenced iterator.

Unlike its sequential form, the parallel overload of *for_each* does not return a copy of its *Function* parameter, since parallelization may not permit efficient state accumulation.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Applies *f* exactly *count* times.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *for_each* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
<ignored> pred(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *for_each* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. It returns *last*.

hpx::ranges::count

Defined in header [hpx/algorithm.hpp](#)⁷²⁸.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::count_if](#)

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator\_t<Rng>, Proj>::value\_type>
hpx::parallel::util::detail::algorithm\_result<ExPolicy, typename std::iterator\\_traits<typename hpx::traits::range\\\_traits<Rng>::iterator\\\_t
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* comparisons.

⁷²⁸ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Note

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns a *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Proj = hpx::identity, typename T =  
typename hpx::parallel::traits::projected<Iter, Proj>::value_type>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<Iter>::difference_type>::type hpx::ranges::count
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* comparisons.

Note

The comparisons in the parallel *count* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns a `hpx::future<difference_type>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by `std::iterator_traits<FwdIter>::difference_type`). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
```

```

std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::difference_type hpx::ranges::count(Rng
&&rng,
T
const
&value,
Proj
&&proj
=
Proj())

```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

Note

Complexity: Performs exactly *last - first* comparisons.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to search for (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

```

template<typename Iter, typename Sent, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<Iter, Proj>::value_type>
std::iterator_traits<Iter>::difference_type hpx::ranges::count(Iter first, Sent last, T const &value, Proj &&proj
= Proj())

```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts the elements that are equal to the given *value*.

Note

Complexity: Performs exactly *last - first* comparisons.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **T** – The type of the value to search for (deduced).

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – The value to search for.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

hpx::ranges::count_if

Defined in header [hpx/algorithm.hpp](#)⁷²⁹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::count](#)

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_t
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

Note

Complexity: Performs exactly *last - first* applications of the predicate.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

⁷²⁹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count_if* algorithm returns *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<Iter>::difference_type>::type hpx::ranges::count
```

Returns the number of elements in the range `[first, last)` satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

Note

Complexity: Performs exactly *last - first* applications of the predicate.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

The assignments in the parallel *count_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the comparisons.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is a unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count_if* algorithm returns *hpx::future<difference_type>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *difference_type* otherwise (where *difference_type* is defined by *std::iterator_traits<FwdIter>::difference_type*). The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::difference_type hpx::ranges::count_if(Rng
&&rng,
F
&&f,
Proj
&&proj
=
Proj())
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

Note

Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
std::iterator_traits<Iter>::difference_type hpx::ranges::count_if(Iter first, Sent last, F &&f, Proj &&proj =
Proj())
```

Returns the number of elements in the range [first, last) satisfying a specific criteria. This version counts elements for which predicate *f* returns true.

Note

Complexity: Performs exactly *last - first* applications of the predicate.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *count_if* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *count* algorithm returns the number of elements satisfying the given criteria.

hpx::ranges::destroy

Defined in header `hpx/algorithm.hpp`⁷³⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::destroy_n*

template<typename **ExPolicy**, typename **Rng**>

hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> **hpx::ranges::destroy**(*ExPolicy* &&policy, *Rng* &&rng)

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range [first, last).

⁷³⁰ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* operations.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

```
template<typename ExPolicy, typename Iter, typename Sent>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::destroy(ExPolicy &&policy, Iter
                                                                    first, Sent last)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* operations.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns a *hpx::future<void>*, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *void* otherwise.

```
template<typename Rng>
hpx::traits::range_iterator<Rng>::type hpx::ranges::destroy(Rng &&rng)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

Note

Complexity: Performs exactly *last - first* operations.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns *void*.

```
template<typename Iter, typename Sent>
Iter hpx::ranges::destroy(Iter first, Sent last)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, last)`.

Note

Complexity: Performs exactly *last - first* operations.

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *destroy* algorithm returns *void*.

hpx::ranges::destroy_n

Defined in header [hpx/algorithm.hpp](#)⁷³¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::destroy](#)

```
template<typename ExPolicy, typename FwdIter, typename Size>  
hpx::parallel::util::detail::algorithm\_result<ExPolicy, FwdIter>::type hpx::ranges::destroy\_n(ExPolicy  
                                                    &&policy,  
                                                    FwdIter first,  
                                                    Size count)
```

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, first + count)`.

The operations in the parallel *destroy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The operations in the parallel *destroy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *destroy_n* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *FwdIter* otherwise. The *destroy_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename FwdIter, typename Size>
```

⁷³¹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

FwdIter `hpx::ranges::destroy_n(FwdIter first, Size count)`

Destroys objects of type `typename iterator_traits<ForwardIt>::value_type` in the range `[first, first + count)`.

Note

Complexity: Performs exactly *count* operations, if *count* > 0, no assignments otherwise.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply this algorithm to.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

Returns

The *destroy_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

`hpx::ranges::experimental::for_loop`

Defined in header `hpx/algorithm.hpp`⁷³².

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::experimental::for_loop_strided`
- `hpx::ranges::experimental::for_loop_n`
- `hpx::ranges::experimental::for_loop_n_strided`

template<typename **ExPolicy**, typename **Iter**, typename **Sent**, typename ...**Args**>

`hpx::parallel::util::detail::algorithm_result<ExPolicy>::type` `hpx::ranges::experimental::for_loop(ExPolicy`
`&&pol-`
`icy, Iter`
`first,`
`Sent last,`
`Args&&...`
`args)`

The `for_loop` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Iter* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of Move-Constructible.

⁷³² <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Effects: Applies f to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding f , an additional argument is passed to each application of f as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of f in the input sequence.

Complexity: Applies f exactly once for each element of the input sequence.

Remarks: If f returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of f , even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the iteration variable (forward iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *Iter*.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Iter const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop* algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Iter, typename Sent, typename ...Args>
void hpx::ranges::experimental::for_loop(Iter first, Sent last, Args&&... args)
```

The *for_loop* implements loop functionality over a range specified by iterator bounds. These algorithms resemble *for_each* from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of *for_loop* without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Iter* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of Move-Constructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using *advance* and *distance*.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **Iter** – The type of the iteration variable (input iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Iter const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

```
template<typename ExPolicy, typename R, typename ...Args>
hpx::parallel::util::detail::algorithm_result<ExPolicy>::type hpx::ranges::experimental::for_loop(ExPolicy
&&pol-
icy, R
&&rng,
Args&&...
args)
```

The `for_loop` implements loop functionality over a range specified by a range. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Rng::iterator* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of MoveConstructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies f exactly once for each element of the input sequence.

Remarks: If f returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of f , even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **R** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to theof the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop* algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Rng, typename ...Args>
void hpx::ranges::experimental::for_loop(Rng &&rng, Args&&... args)
```

The *for_loop* implements loop functionality over a range specified by a range. These algorithms resemble *for_each* from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of *for_loop* without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Rng::iterator* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of *MoveConstructible*.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have *const&*. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

hpx::ranges::experimental::for_loop_strided

Defined in header `hpx/algorithm.hpp`⁷³³.

- `hpx::ranges::experimental::for_loop_n_strided`

```
template<typename ExPolicy, typename Iter, typename Sent, typename S, typename ...Args>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy> hpx::ranges::experimental::for_loop_strided(ExPolicy
&&pol-
icy,
Iter
first,
Sent
last,
S
stride,
Args&&...
args)
```

The `for_loop_strided` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

Requires: *Iter* shall meet the requirements of a forward iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of Move-Constructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

⁷³³ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of f , even though the applications themselves may be unordered.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the iteration variable (forward iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for Iter.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if Iter meets the requirements a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Iter const& a, ...);
```

The signature does not need to have const&. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop_strided* algorithm returns a *hpx::future<void>* if the execution policy is of type *hpx::execution::sequenced_task_policy* or *hpx::execution::parallel_task_policy* and returns *void* otherwise.

```
template<typename Iter, typename Sent, typename S, typename ...Args>
```

void `hpx::ranges::experimental::for_loop_strided`(*Iter* first, *Sent* last, *S* stride, *Args*&&... args)

The `for_loop_strided` implements loop functionality over a range specified by iterator bounds. These algorithms resemble `for_each` from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of `for_loop_strided` without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Iter* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of Move-Constructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is `last - first`.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using `advance` and `distance`.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **Iter** – The type of the iteration variable (input iterator).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *Iter*.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if `Rng::iterator` meets the requirements a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

Returns

The *for_loop_strided* algorithm returns a `hpx::future<void>` if the execution policy is of type `hpx::execution::sequenced_task_policy` or `hpx::execution::parallel_task_policy` and returns `void` otherwise.

```
template<typename Rng, typename S, typename ...Args>
void hpx::ranges::experimental::for_loop_strided(Rng &&rng, S stride, Args&&... args)
```

The *for_loop_strided* implements loop functionality over a range specified by a range. These algorithms resemble *for_each* from the Parallelism TS, but leave to the programmer when and if to dereference the iterator.

The execution of *for_loop_strided* without specifying an execution policy is equivalent to specifying `hpx::execution::seq` as the execution policy.

Requires: *Rng::iterator* shall meet the requirements of an input iterator type. The *args* parameter pack shall have at least one element, comprising objects returned by invocations of *reduction* and/or *induction* function templates followed by exactly one element invocable element-access function, *f*. *f* shall meet the requirements of MoveConstructible.

Effects: Applies *f* to each element in the input sequence, with additional arguments corresponding to the reductions and inductions in the *args* parameter pack. The length of the input sequence is last - first.

The first element in the input sequence is specified by *first*. Each subsequent element is generated by incrementing the previous element.

Along with an element from the input sequence, for each member of the *args* parameter pack excluding *f*, an additional argument is passed to each application of *f* as follows:

If the pack member is an object returned by a call to a reduction function listed in section, then the additional argument is a reference to a view of that reduction object. If the pack member is an object returned by a call to induction, then the additional argument is the induction value for that induction object corresponding to the position of the application of *f* in the input sequence.

Complexity: Applies *f* exactly once for each element of the input sequence.

Remarks: If *f* returns a result, the result is ignored.

Note

As described in the C++ standard, arithmetic on non-random-access iterators is performed using advance and distance.

Note

The order of the elements of the input sequence is important for determining ordinal position of an application of *f*, even though the applications themselves may be unordered.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **S** – The type of the stride variable. This should be an integral type.
- **Args** – A parameter pack, it's last element is a function object to be invoked for each iteration, the others have to be either conforming to the induction or reduction concept.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **stride** – Refers to the stride of the iteration steps. This shall have non-zero value and shall be negative only if *Rng::iterator* meets the requirements a bidirectional iterator.
- **args** – The last element of this parameter pack is the function (object) to invoke, while the remaining elements of the parameter pack are instances of either induction or reduction objects. The function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last) should expose a signature equivalent to:

```
<ignored> pred(Rng::iterator const& a, ...);
```

The signature does not need to have `const&`. It will receive the current value of the iteration variable and one argument for each of the induction or reduction objects passed to the algorithms, representing their current values.

- `hpx::ranges::is_sorted_until`

⁷³⁴ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

⁷³⁵ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

⁷³⁶ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_sorted(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Determines if the range [first, last) is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is_sorted* algorithm executes in sequential order in the calling thread.

Note

Complexity: at most $(N+S-1)$ comparisons where N = distance(first, last). S = number of partitions

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const &, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a *bool*. The *is_sorted* algorithm returns true if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less,  
typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_sorted(ExPolicy &&policy,  
                                          FwdIter first, Sent last,  
                                          Pred &&pred = Pred(),  
                                          Proj &&proj = Proj())
```

Determines if the range [first, last) is sorted. Uses pred to compare elements.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(N+S-1)$ comparisons where $N = \text{distance}(\text{first}, \text{last})$. $S = \text{number of partitions}$

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a `hpx::future<bool>` if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_sorted* algorithm returns a *bool* if each element in the sequence [first, last) satisfies the predicate passed. If the range [first, last) contains less than two elements, the function always returns true.

```
template<typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_sorted(Rng &&rng, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Determines if the range *rng* is sorted. Uses *pred* to compare elements.

The comparison operations in the parallel *is_sorted* algorithm executes in sequential order in the calling thread.

Note

Complexity: at most $(N+S-1)$ comparisons where $N = \text{size}(\text{rng})$. $S = \text{number of partitions}$

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a *bool*. The *is_sorted* algorithm returns true if each element in the *rng* satisfies the predicate passed. If the range *rng* contains less than two elements, the function always returns true.

```
template<typename ExPolicy, typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_sorted(ExPolicy &&policy,  
                                             Rng &&rng, Pred  
                                             &&pred = Pred(), Proj  
                                             &&proj = Proj())
```

Determines if the range *rng* is sorted. Uses *pred* to compare elements.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(N+S-1)$ comparisons where $N = \text{size}(\text{rng})$. S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted* algorithm returns a `hpx::future<bool>` if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_sorted* algorithm returns a *bool* if each element in the range *rng* satisfies the predicate passed. If the range *rng* contains less than two elements, the function always returns true.

hpx::ranges::is_sorted_until

Defined in header `hpx/algorithm.hpp`⁷³⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::is_sorted`

```
template<typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

⁷³⁷ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

FwdIter `hpx::ranges::is_sorted_until`(*FwdIter* first, *Sent* last, *Pred* &&pred = *Pred*(), *Proj* &&proj = *Proj*())

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm execute in sequential order in the calling thread.

Note

Complexity: at most $(N+S-1)$ comparisons where N = distance(first, last). S = number of partitions

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* algorithm returns a *FwdIter*. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = hpx::parallel::detail::less,
typename Proj = hpx::identity>
```

```

hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::is_sorted_until(ExPolicy
&&policy,
FwdIter
first,
Sent last,
Pred
&&pred
=
Pred(),
Proj
&&proj
=
Proj())

```

Returns the first element in the range [first, last) that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most (N+S-1) comparisons where N = distance(first, last). S = number of partitions

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.

- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> hpx::ranges::is_sorted_until(Rng &&rng, Pred &&pred = Pred(), Proj
&&proj = Proj())
```

Returns the first element in the range *rng* that is not sorted. Uses a predicate to compare elements or the less than operator.

Note

Complexity: at most $(N+S-1)$ comparisons where $N = \text{size}(\text{rng})$. $S = \text{number of partitions}$

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* returns *FwdIter*. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

```
template<typename ExPolicy, typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj =  

hpx::identity>  

hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::is_sorted_until(ExPolicy  

&&pol-  

icy,  

Rng  

&&rng,  

Pred  

&&pred  

=  

Pred(),  

Proj  

&&proj  

=  

Proj())
```

Returns the first element in the range *rng* that is not sorted. Uses a predicate to compare elements or the less than operator.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_sorted_until* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most $(N+S-1)$ comparisons where $N = \text{size}(\text{rng})$. $S = \text{number of partitions}$

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *is_sorted_until* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::less*<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second argument. The signature of the function should be equivalent to

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_sorted_until* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task_execution_policy* and returns *FwdIter* otherwise. The *is_sorted_until* algorithm returns the first unsorted element. If the sequence has less than two elements or the sequence is sorted, last is returned.

hpx::ranges::set_difference

Defined in header [hpx/algorithm.hpp](#)⁷³⁸.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename  
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =  
hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<Iter1, Iter3>>::type hpx::ranges::set_difference(Ex  
&  
ic;  
Iter1  
fin  
Se  
las  
Iter  
fin  
Se  
las  
Iter  
de  
Pr  
&  
=  
Pr  
Pr  
&  
=  
Pr  
Pr  
&  
=  
Pr
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range [*first1*, *last1*) and not present in the range [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

⁷³⁸ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Equivalent elements are treated individually, that is, if some element is found m times in $[first1, last1)$ and n times in $[first2, last2)$, it will be copied to *dest* exactly $\text{std::max}(m-n, 0)$ times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns a `hpx::future<ranges::set_difference_result<Iter1, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_difference_result<Iter1, Iter3>` otherwise. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =  
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_difference_result<std::ranges::iterator_t<Rng1>, Iter3>> hpx::ranges::se
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range [*first1*, *last1*) and not present in the range [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found m times in $[first1, last1)$ and n times in $[first2, last2)$, it will be copied to *dest* exactly $\text{std::max}(m-n, 0)$ times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns a `hpx::future<ranges::set_difference_result<Iter1, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_difference_result<Iter1, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred
= hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_difference_result<Iter1, Iter3> hpx::ranges::set_difference(Iter1 first1, Sent1 last1, Iter2 first2, Sent2
                                                                last2, Iter3 dest, Pred &&op = Pred(), Proj1
                                                                &&proj1 = Proj1(), Proj2 &&proj2 =
                                                                Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range `[first1, last1)` and not present in the range `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in `[first1, last1)` and *n* times in `[first2, last2)`, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for *Iter2*.

- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns `ranges::set_difference_result<Iter1, Iter3>`. The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_difference_result<std::ranges::iterator_t<Rng1>, Iter3> hpx::ranges::set_difference(Rng1 &&rng1,
                                                                                      Rng2 &&rng2, Iter3
dest, Pred &&op =
Pred(), Proj1
&&proj1 = Proj1(),
Proj2 &&proj2 =
Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in the range *[first1, last1)* and not present in the range *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

Equivalent elements are treated individually, that is, if some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly `std::max(m-n, 0)` times. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_difference* algorithm returns *ranges::set_difference_result<Iter1, Iter3>*. where *Iter1* is *range_iterator_t<Rng1>* and *Iter2* is *range_iterator_t<Rng2>* The *set_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::reduce

Defined in header [hpx/algorithm.hpp](#)⁷³⁹.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, FwdIter
first, Sent last, T init, F &&f)
```

Returns GENERALIZED_SUM(*f*, *init*, **first*, ..., *(*first* + (*last* - *first*) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *f*.

Note

GENERALIZED_SUM(*op*, *a1*, ..., *aN*) is defined as follows:

- *a1* when *N* is 1
- *op*(GENERALIZED_SUM(*op*, *b1*, ..., *bK*), GENERALIZED_SUM(*op*, *bM*, ..., *bN*)), where:
 - *b1*, ..., *bN* may be any permutation of *a1*, ..., *aN* and
 - $1 < K+1 = M \leq N$.

Template Parameters

⁷³⁹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename F, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, Rng
&&rng, T init, F &&f)
```

Returns GENERALIZED_SUM(f, init, *first, ..., *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate f .

Note

GENERALIZED_SUM(op , a1 , ..., aN) is defined as follows:

- a1 when N is 1
- $\text{op}(\text{GENERALIZED_SUM}(\text{op}, \text{b1}, \dots, \text{bK}), \text{GENERALIZED_SUM}(\text{op}, \text{bM}, \dots, \text{bN}))$, where:
 - $\text{b1}, \dots, \text{bN}$ may be any permutation of $\text{a1}, \dots, \text{aN}$ and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires F to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns T otherwise. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, FwdIter
first, Sent last, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename Rng, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, T> hpx::ranges::reduce(ExPolicy &&policy, Rng
&&rng, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns a *hpx::future<T>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *T* otherwise. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename ExPolicy, typename FwdIter, typename Sent>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<FwdIter>::value_type>::type hpx::ranges::redu
```

Returns GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1)).

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

The type of the initial value (and the result type) *T* is determined from the value_type of the used *FwdIterB*.

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `T` otherwise (where `T` is the `value_type` of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator`+`()) over the elements given by the input range `[first, last)`.

```
template<typename ExPolicy, typename Rng>
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_t
```

Returns `GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1))`.

The reduce operations in the parallel *reduce* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator`+`).

Note

The type of the initial value (and the result type) *T* is determined from the `value_type` of the used *FwdIterB*.

Note

`GENERALIZED_SUM(+, a1, ..., aN)` is defined as follows:

- `a1` when `N` is 1
- `op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN))`, where:
 - `b1, ..., bN` may be any permutation of `a1, ..., aN` and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns a `hpx::future<T>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `T` otherwise (where `T` is the `value_type` of `FwdIterB`). The *reduce* algorithm returns the result of the generalized sum (applying operator`+`()) over the elements given by the input range `[first, last)`.

```
template<typename FwdIter, typename Sent, typename F, typename T = typename
std::iterator_traits<FwdIter>::value_type>
```

```
T hpx::ranges::reduce(FwdIter first, Sent last, T init, F &&f)
```

Returns GENERALIZED_SUM(`f`, `init`, `*first`, ..., `*(first + (last - first) - 1)`).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *f*.

Note

GENERALIZED_SUM(`op`, `a1`, ..., `aN`) is defined as follows:

- `a1` when `N` is 1
- `op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN))`, where:
 - `b1`, ..., `bN` may be any permutation of `a1`, ..., `aN` and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename Rng, typename F, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
T hpx::ranges::reduce(Rng &&rng, T init, F &&f)
```

Returns GENERALIZED_SUM(f, init, *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *f*.

Note

GENERALIZED_SUM(op, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(op, b1, ..., bK), GENERALIZED_SUM(op, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *copy_if* requires *F* to meet the requirements of *CopyConstructible*.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&. The types *Type1* *Ret* must be such that an object of type *FwdIterB* can be dereferenced and then implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum over the elements given by the input range [first, last).

```
template<typename FwdIter, typename Sent, typename T = typename std::iterator_traits<FwdIter>::value_type>
T hpx::ranges::reduce(FwdIter first, Sent last, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename Rng, typename T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
T hpx::ranges::reduce(Rng &&rng, T init)
```

Returns GENERALIZED_SUM(+, init, *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the generalized sum.

Returns

The *reduce* algorithm returns *T*. The *reduce* algorithm returns the result of the generalized sum (applying operator+()) over the elements given by the input range [first, last).

```
template<typename FwdIter, typename Sent>
std::iterator_traits<FwdIter>::value_type hpx::ranges::reduce(FwdIter first, Sent last)
```

Returns GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of reduce may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the operator+().

Note

The type of the initial value (and the result type) T is determined from the `value_type` of the used *FwdIterB*.

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - $1 < K+1 = M \leq N$.

Template Parameters

- **FwdIter** – The type of the source begin iterator used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns T (where T is the `value_type` of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying `operator+()`) over the elements given by the input range `[first, last)`.

```
template<typename Rng>
std::iterator_traits<typename hpx::traits::range_traits<Rng>::iterator_type>::value_type hpx::ranges::reduce(Rng
&&rng)
```

Returns GENERALIZED_SUM(+, T(), *first, ..., *(first + (last - first) - 1)).

The difference between *reduce* and *accumulate* is that the behavior of *reduce* may be non-deterministic for non-associative or non-commutative binary predicate.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the `operator+()`.

Note

The type of the initial value (and the result type) T is determined from the `value_type` of the used *FwdIterB*.

Note

GENERALIZED_SUM(+, a1, ..., aN) is defined as follows:

- a1 when N is 1
- op(GENERALIZED_SUM(+, b1, ..., bK), GENERALIZED_SUM(+, bM, ..., bN)), where:
 - b1, ..., bN may be any permutation of a1, ..., aN and
 - 1 < K+1 = M <= N.

Template Parameters

Rng – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

Parameters

rng – Refers to the sequence of elements the algorithm will be applied to.

Returns

The *reduce* algorithm returns *T* (where *T* is the `value_type` of *FwdIterB*). The *reduce* algorithm returns the result of the generalized sum (applying operator`+`()) over the elements given by the input range `[first, last)`.

hpx::ranges::move

Defined in header `hpx/algorithm.hpp`⁷⁴⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2>
hpx::parallel::util::detail::algorithm_result<ExPolicy, move_result<Iter1, Iter2>>::type hpx::ranges::move(ExPolicy
&&pol-
icy,
Iter1
first,
Sent1
last,
Iter2
dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

⁷⁴⁰ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a `hpx::future<ranges::move_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::move_result<iterator_t<Rng>, FwdIter2>` otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename Rng, typename Iter2>
hpx::parallel::util::detail::algorithm_result<ExPolicy, move_result<std::ranges::iterator_t<Rng>, Iter2>>::type hpx::ranges::move(
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a `hpx::future<ranges::move_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::move_result<iterator_t<Rng>, FwdIter2>` otherwise. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Iter1, typename Sent1, typename Iter2>
move_result<Iter1, Iter2> hpx::ranges::move(Iter1 first, Sent1 last, Iter2 dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns `ranges::move_result<iterator_t<Rng>, FwdIter2>`. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Rng, typename Iter2>  
move_result<std::ranges::iterator_t<Rng>, Iter2> hpx::ranges::move(Rng &&rng, Iter2 dest)
```

Moves the elements in the range *rng* to another range beginning at *dest*. After this operation the elements in the moved-from range will still contain valid values of the appropriate type, but not necessarily the same values as before the move.

Note

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

Returns

The *move* algorithm returns a `ranges::move_result<iterator_t<Rng>, FwdIter2>`. The *move* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element moved.

`hpx::ranges::transform`

Defined in header `hpx/algorithm.hpp`⁷⁴¹.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename F, typename  
Proj = hpx::identity>
```

⁷⁴¹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

`parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<FwdIter1, FwdIter2>>::type hpx::ranges::transf`

Applies the given function f to the given range rng and stores the result in another range, beginning at $dest$.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly $\text{size}(rng)$ applications of f

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of f .
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires F to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have const&. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns a `hpx::future<ranges::unary_transform_result<FwdIter1, FwdIter2>>` if the execution policy is of type *parallel_task_policy* and returns `ranges::unary_transform_result<FwdIter1, FwdIter2>` otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, ranges::unary_transform_result<std::ranges::iterator_t<Rng>, FwdIter>> hpx::rang
```

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at *dest*.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of *f* in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly `size(rng)` applications of *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *range_iterator<Rng>::type* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns a `hpx::future<ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>>` if the execution policy is of type *parallel_task_policy* and returns `ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>` otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename FwdIter3, typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

parallel::util::detail::algorithm_result<ExPolicy, ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>::type *hpx::range*

Applies the given function f to pairs of elements from two ranges: one defined by rng and the other beginning at $first2$, and stores the result in another range, beginning at $dest$.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The invocations of f in the parallel *transform* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Exactly $\text{size}(rng)$ applications of f

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of f .
- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.

- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns A `hpx::future<ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>>` if the execution policy is of type *parallel_task_policy* and returns `ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>` otherwise. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename F, typename Proj = hpx::identity>
ranges::unary_transform_result<FwdIter1, FwdIter2> hpx::ranges::transform(FwdIter1 first, Sent1 last,
                                                                    FwdIter2 dest, F &&f, Proj
                                                                    &&proj = Proj())
```

Applies the given function *f* to the given range *rng* and stores the result in another range, beginning at *dest*.

Note

Complexity: Exactly $\text{size}(\text{rng})$ applications of f

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires F to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *FwdIter2* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate f is invoked.

Returns

The *transform* algorithm returns *ranges::unary_transform_result<FwdIter1, FwdIter2>*. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter, typename F, typename Proj = hpx::identity>
ranges::unary_transform_result<std::ranges::iterator_t<Rng>, FwdIter> hpx::ranges::transform(Rng &&rng,
                                                                                          FwdIter dest,
                                                                                          F &&f, Proj
                                                                                          &&proj =
                                                                                          Proj())
```

Applies the given function f to the given range rng and stores the result in another range, beginning at dest .

Note

Complexity: Exactly `size(rng)` applications of f

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires F to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an unary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type `range_iterator<Rng>::type` can be dereferenced and then implicitly converted to *Type*. The type *Ret* must be such that an object of type *OutIter* can be dereferenced and assigned a value of type *Ret*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate f is invoked.

Returns

The *transform* algorithm returns `ranges::unary_transform_result<range_iterator<Rng>::type, FwdIter>`. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2, typename FwdIter3,
typename F, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3> hpx::ranges::transform(FwdIter1 first1,
Sent1 last1,
FwdIter2 first2,
Sent2 last2,
FwdIter3 dest, F
&&f, Proj1
&&proj1 = Proj1(),
Proj2 &&proj2 =
Proj2())
```

Applies the given function f to pairs of elements from two ranges: one defined by *rng* and the other beginning at *first2*, and stores the result in another range, beginning at *dest*.

Note

Complexity: Exactly $\text{size}(\text{rng})$ applications of f

Template Parameters

- **FwdIter1** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for FwdIter2.
- **FwdIter3** – The type of the source iterators for the first range used (deduced). This iterator type must meet the requirements of a forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires F to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to *hpx::identity*

Parameters

- **first1** – Refers to the beginning of the first sequence of elements the algorithm will be applied to.
- **last1** – Refers to the end of the first sequence of elements the algorithm will be applied to.
- **first2** – Refers to the beginning of the second sequence of elements the algorithm will be applied to.
- **last2** – Refers to the end of the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter3* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate f is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate f is invoked.

Returns

The *transform* algorithm returns `ranges::binary_transform_result<FwdIter1, FwdIter2, FwdIter3>`. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename FwdIter, typename F, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
ranges::binary_transform_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, FwdIter> hpx::ranges::transform(
```

Applies the given function *f* to pairs of elements from two ranges: one defined by [first1, last1) and the other beginning at first2, and stores the result in another range, beginning at dest.

Note

Complexity: Exactly min(last2-first2, last1-first1) applications of *f*

Note

The algorithm will invoke the binary predicate until it reaches the end of the shorter of the two given input sequences

Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *transform* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj1** – The type of an optional projection function to be used for elements of the first sequence. This defaults to *hpx::identity*

- **Proj2** – The type of an optional projection function to be used for elements of the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`. The types *Type1* and *Type2* must be such that objects of types `range_iterator<Rng1>::type` and `range_iterator<Rng2>::type` can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively. The type *Ret* must be such that an object of type *FwdIter* can be dereferenced and assigned a value of type *Ret*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *f* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *f* is invoked.

Returns

The *transform* algorithm returns `ranges::binary_transform_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, FwdIter>`. The *transform* algorithm returns a tuple holding an iterator referring to the first element after the first input sequence, an iterator referring to the first element after the second input sequence, and the output iterator referring to the element in the destination range, one past the last element copied.

hpx::ranges::includes

Defined in header `hpx/algorithm.hpp`⁷⁴².

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::includes(ExPolicy &&policy, Iter1
first1, Sent1 last1, Iter2
first2, Sent2 last2, Pred
&&op = Pred(), Proj1
&&proj1 = Proj1(),
Proj2 &&proj2 =
Proj2())
```

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

⁷⁴² <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

At most $2*(N1+N2-1)$ comparisons, where $N1 = \text{std::distance}(\text{first1}, \text{last1})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range `[first2, last2)` is found within the sorted range `[first1, last1)`. Also returns true if `[first2, last2)` is empty.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::includes(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Returns true if every element from the sorted range `[first2, last2)` is found within the sorted range `[first1, last1)`. Also returns true if `[first2, last2)` is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

Note

At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1 = \text{std::distance}(\text{first1}, \text{last1})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns true every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::parallel::detail::less,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::includes(ExPolicy &&policy,
                                           Rng1 &&rng1, Rng2
                                           &&rng2, Pred &&op =
                                           Pred(), Proj1 &&proj1 =
                                           Proj1(), Proj2 &&proj2
                                           = Proj2())
```

Returns true if every element from the sorted range [first2, last2) is found within the sorted range [first1, last1). Also returns true if [first2, last2) is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *includes* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1 = \text{std::distance}(\text{first1}, \text{last1})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *includes* algorithm returns true every element from the sorted range `[first2, last2)` is found within the sorted range `[first1, last1)`. Also returns true if `[first2, last2)` is empty.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::parallel::detail::less, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::includes(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(),
                          Proj2 &&proj2 = Proj2())
```

Returns true if every element from the sorted range `[first2, last2)` is found within the sorted range `[first1, last1)`. Also returns true if `[first2, last2)` is empty. The version expects both ranges to be sorted with the user supplied binary predicate *f*.

Note

At most $2*(N1+N2-1)$ comparisons, where $N1 = \text{std::distance}(\text{first1}, \text{last1})$ and $N2 = \text{std::distance}(\text{first2}, \text{last2})$.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *includes* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as includes. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *includes* algorithm returns true every element from the sorted range `[first2, last2)` is found within the sorted range `[first1, last1)`. Also returns true if `[first2, last2)` is empty.

hpx::ranges::uninitialized_copy

Defined in header `hpx/algorithm.hpp`⁷⁴³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_copy_n`

```
template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_copy(InIter first1, Sent1 last1,
                                                                                   FwdIter first2, Sent2
                                                                                   last2)
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy* algorithm returns an *in_out_result<InIter, FwdIter>*. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

⁷⁴³ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

`parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type hpx::ranges::uninitial`

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *in_out_result<InIter, FwdIter>* otherwise. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2>
hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::it
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns

The *uninitialized_copy* algorithm returns an *in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type>*. The *uninitialized_copy* algorithm returns an input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_t
```

Copies the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be copied from
- **rng2** – Refers to the range to which the elements will be copied to

Returns

The *uninitialized_copy* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `in_out_result< typename hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The *uninitialized_copy* algorithm returns the input iterator to one past the last element copied from and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::uninitialized_copy_n

Defined in header `hpx/algorithm.hpp`⁷⁴⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_copy`

```
template<typename InIter, typename Size, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_copy_n(InIter first1, Size
count, FwdIter first2,
Sent2 last2)
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

⁷⁴⁴ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The *uninitialized_copy_n* algorithm returns *in_out_result<InIter, FwdIter>*. The *uninitialized_copy_n* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>  
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type hpx::ranges::uninitial
```

Copies the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the copy operation, the function has no effects.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized_copy_n* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter2`.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be copied from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

Returns

The `uninitialized_copy_n` algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `FwdIter2` otherwise. The `uninitialized_copy_n` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::replace

Defined in header `hpx/algorithm.hpp`⁷⁴⁵.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace_if`
- `hpx::ranges::replace_copy`
- `hpx::ranges::replace_copy_if`

```
template<typename Iter, typename Sent, typename Proj = hpx::identity, typename T1 = typename
hpx::parallel::traits::projected<Iter, Proj>::value_type, typename T2 = T1>
```

⁷⁴⁵ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
Iter hpx::ranges::replace(Iter first, Sent sent, T1 const &old_value, T2 const &new_value, Proj &&proj =
    Proj())
```

Replaces all elements satisfying specific criteria with *new_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator it in the range [first,last) with *new_value*, when the following corresponding conditions hold: INVOKE(proj, *i) == *old_value*

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace* algorithm returns an *Iter*.

```
template<typename Rng, typename Proj = hpx::identity, typename T1 = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
std::ranges::iterator_t<Rng> hpx::ranges::replace(Rng &&rng, T1 const &old_value, T2 const &new_value,
    Proj &&proj = Proj())
```

Replaces all elements satisfying specific criteria with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator it in the range *rng* with *new_value*, when the following corresponding conditions hold: INVOKE(proj, *i) == *old_value*

The assignments in the parallel *replace* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly $util::end(rng) - util::begin(rng)$ assignments.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace* algorithm returns an `hpx::traits::range_iterator<Rng>::type`.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Proj = hpx::identity, typename T1 =
typename hpx::parallel::traits::projected<Iter, Proj>::value_type, typename T2 = T1>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::replace(ExPolicy &&policy, Iter
first, Sent sent, T1 const
&old_value, T2 const
&new_value, Proj &&proj
= Proj())
```

Replaces all elements satisfying specific criteria with *new_value* in the range [first, last).

Effects: Substitutes elements referred by the iterator it in the range [first,last) with *new_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *last - first* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *Iter* otherwise.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename T1 = typename  
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>  
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::replace(ExPolicy  
                                                    &&pol-  
                                                    icy, Rng  
                                                    &&rng,  
                                                    T1 const  
                                                    &old_value,  
                                                    T2 const  
                                                    &new_value,  
                                                    Proj  
                                                    &&proj =  
                                                    Proj())
```

Replaces all elements satisfying specific criteria with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new_value*, when the following corresponding conditions hold: `INVOKE(proj, *i) == old_value`

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* assignments.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

Returns

The *replace* algorithm returns an `hpx::future<hpx::traits::range_iterator<Rng>::type>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `hpx::traits::range_iterator<Rng>::type` otherwise.

hpx::ranges::replace_if

Defined in header `hpx/algorithm.hpp`⁷⁴⁶.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace`
- `hpx::ranges::replace_copy`
- `hpx::ranges::replace_copy_if`

template<typename **Iter**, typename **Sent**, typename **Pred**, typename **Proj** = *hpx::identity*, typename **T** = typename *hpx::parallel::traits::projected<Iter, Proj>::value_type>*

Iter **hpx::ranges::replace_if**(*Iter* first, *Sent* sent, *Pred* &&pred, *T* const &new_value, *Proj* &&proj = *Proj*())

Replaces all elements satisfying specific criteria (for which predicate *f* returns true) with *new_value* in the range [first, sent).

⁷⁴⁶ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Effects: Substitutes elements referred by the iterator *it* in the range `[first, sent)` with *new_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

The assignments in the parallel *replace_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *Iter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns *Iter*. It returns *last*.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
std::ranges::iterator_t<Rng> hpx::ranges::replace_if(Rng &&rng, Pred &&pred, T const &new_value, Proj
&&proj = Proj())
```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by *rng*. This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns an `hpx::traits::range_iterator<Rng>::type`. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Pred, typename Proj = hpx::identity,
typename T = typename hpx::parallel::traits::projected<Iter, Proj>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::replace_if(ExPolicy &&policy,
                                          Iter first, Sent sent,
                                          Pred &&pred, T const
                                          &new_value, Proj
                                          &&proj = Proj())
```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator *it* in the range *rng* with *new_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

The assignments in the parallel *replace_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy*. It returns *last*.

```

template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity, typename T =
typename hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::replace_if(ExPolicy
&&pol-
icy,
Rng
&&rng,
Pred
&&pred,
T
const
&new_value,
Proj
&&proj
=
Proj())

```

Replaces all elements satisfying specific criteria (for which predicate *pred* returns true) with *new_value* in the range *rng*.

Effects: Substitutes elements referred by the iterator it in the range *rng* with *new_value*, when the following corresponding conditions hold: `INVOKE(f, INVOKE(proj, *it)) != false`

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *F* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by *rng*. This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_if* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy*. It returns *last*.

hpx::ranges::replace_copy

Defined in header `hpx/algorithm.hpp`⁷⁴⁷.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace`
- `hpx::ranges::replace_if`
- `hpx::ranges::replace_copy_if`

```
template<typename InIter, typename Sent, typename OutIter, typename Proj = hpx::identity, typename T1 =
typename hpx::parallel::traits::projected<InIter, Proj>::value_type, typename T2 = T1>
replace_copy_result<InIter, OutIter> hpx::ranges::replace_copy(InIter first, Sent sent, OutIter dest, T1 const
&old_value, T2 const &new_value, Proj
&&proj = Proj())
```

Copies the all elements from the range `[first, sent)` to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator *it* in the range `[result, result + (sent - first))` either *new_value* or `*(first + (it - result))` depending on whether the following corresponding condition holds: `INVOKE(proj, *(first + (i - result))) == old_value`

The assignments in the parallel *replace_copy* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

⁷⁴⁷ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **InIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns an *in_out_result<InIter, OutIter>*. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename OutIter, typename Proj = hpx::identity, typename T1 = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
replace_copy_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::replace_copy(Rng &&rng, OutIter
dest, T1 const
&old_value, T2 const
&new_value, Proj
&&proj = Proj())
```

Copies the all elements from the range *rbg* to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator *it* in the range $[\text{result}, \text{result} + (\text{util::end}(\text{rng}) - \text{util::begin}(\text{rng}))]$ either *new_value* or $*(\text{first} + (\text{it} - \text{result}))$ depending on whether the following corresponding condition holds: `INVOKE(proj, *(first + (i - result))) == old_value`

The assignments in the parallel *replace_copy* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly $\text{util::end}(\text{rng}) - \text{util::begin}(\text{rng})$ applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The `replace_copy` algorithm returns an `in_out_result<std::ranges::iterator_t<Rng>, OutIter>`. The `copy` algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Proj =  
hpx::identity, typename T1 = typename hpx::parallel::traits::projected<FwdIter1, Proj>::value_type, typename T2 =  
T1>  
parallel::util::detail::algorithm_result<ExPolicy, replace_copy_result<FwdIter1, FwdIter2>>::type hpx::ranges::replace_copy(E
```

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either *new_value* or `*(first + (it - result))` depending on whether the following corresponding condition holds: `INVOKE(proj, *(first + (i - result))) == old_value`

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `in_out_result<FwdIter1, FwdIter2>` otherwise. The *copy* algorithm returns the pair of the forward iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename Proj = hpx::identity, typename T1 =  
typename hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type, typename T2 = T1>
```

`parallel::util::detail::algorithm_result<ExPolicy, replace_copy_result<std::ranges::iterator_t<Rng>, FwdIter>>::type hpx::ranges::r`

Copies the all elements from the range `rbg` to another range beginning at `dest` replacing all elements satisfying a specific criteria with `new_value`.

Effects: Assigns to every iterator `it` in the range `[result, result + (util::end(rng) - util::begin(rng))]` either `new_value` or `*(first + (it - result))` depending on whether the following corresponding condition holds: `INVOKE(proj, *(first + (i - result))) == old_value`

The assignments in the parallel `replace_copy` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `replace_copy` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly `util::end(rng) - util::begin(rng)` applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T1** – The type of the old value to replace (deduced).
- **T2** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **old_value** – Refers to the old value of the elements to replace.
- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy* algorithm returns a `hpx::future<in_out_result< std::ranges::iterator_t<Rng>, FwdIter>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `in_out_result< std::ranges::iterator_t<Rng>, FwdIter>>` The *copy* algorithm returns the pair of the input iterator *last* and the forward iterator to the element in the destination range, one past the last element copied.

hpx::ranges::replace_copy_if

Defined in header `hpx/algorithm.hpp`⁷⁴⁸.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::replace`
- `hpx::ranges::replace_if`
- `hpx::ranges::replace_copy`

```
template<typename InIter, typename Sent, typename OutIter, typename Pred, typename T = typename
std::iterator_traits<OutIter>::value_type, typename Proj = hpx::identity>
replace_copy_if_result<InIter, OutIter> hpx::ranges::replace_copy_if(InIter first, Sent sent, OutIter dest,
                                                                    Pred &&pred, T const &new_value,
                                                                    Proj &&proj = Proj())
```

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either *new_value* or **(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false`

The assignments in the parallel *replace_copy_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

- **InIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.

⁷⁴⁸ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `InIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns a *in_out_result<InIter, OutIter>*. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename OutIter, typename Pred, typename T = typename
std::iterator_traits<OutIter>::value_type, typename Proj = hpx::identity>
replace_copy_if_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::replace_copy_if(Rng &&rng,
                                                                                          OutIter dest,
                                                                                          Pred &&pred,
                                                                                          T const
                                                                                          &new_value,
                                                                                          Proj &&proj =
                                                                                          Proj())
```

Copies the all elements from the range *rng* to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator *it* in the range [result, result + (util::end(rng) - util::begin(rng))) either *new_value* or **(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false`

The assignments in the parallel *replace_copy_if* algorithm execute in sequential order in the calling thread.

Note

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns an *in_out_result<std::ranges::iterator_t<Rng>, OutIter>*. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Pred,
typename T = typename std::iterator_traits<FwdIter2>::value_type, typename Proj = hpx::identity>
```

parallel::util::detail::algorithm_result<ExPolicy, replace_copy_if_result<FwdIter1, FwdIter2>>::type *hpx::ranges::replace_copy*

Copies the all elements from the range [first, sent) to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator it in the range [result, result + (sent - first)) either *new_value* or $*(first + (it - result))$ depending on whether the following corresponding condition holds: $INVOKE(f, INVOKE(proj, *(first + (i - result)))) \neq false$

The assignments in the parallel *replace_copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *sent - first* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterator used (deduced). The iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).

- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns an *hpx::future<FwdIter1, FwdIter2>*. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename Pred, typename T = typename
std::iterator_traits<FwdIter>::value_type, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, replace_copy_if_result<std::ranges::iterator_t<Rng>, FwdIter>>::type hpx::ranges::
```

Copies the all elements from the range *rng* to another range beginning at *dest* replacing all elements satisfying a specific criteria with *new_value*.

Effects: Assigns to every iterator *it* in the range [*result*, *result* + (*util::end(rng)* - *util::begin(rng)*)) either *new_value* or **(first + (it - result))* depending on whether the following corresponding condition holds: `INVOKE(f, INVOKE(proj, *(first + (i - result)))) != false`

The assignments in the parallel *replace_copy_if* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *replace_copy_if* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs exactly *util::end(rng) - util::begin(rng)* applications of the predicate.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. (deduced).
- **T** – The type of the new values to replace (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the elements which need to be replaced. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have *const&*, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **new_value** – Refers to the new value to use as the replacement.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *replace_copy_if* algorithm returns an `hpx::future<in_out_result<std::ranges::iterator_t<Rng>, OutIter>>`. The *replace_copy_if* algorithm returns the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::is_heap

Defined in header `hpx/algorithm.hpp`⁷⁴⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::is_heap_until`

```
template<typename ExPolicy, typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_heap(ExPolicy &&policy, Rng  
&&rng, Comp &&comp =  
Comp(), Proj &&proj =  
Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

⁷⁴⁹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less,
        typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_heap(ExPolicy &&policy, Iter
                                                                                   first, Sent last, Comp
                                                                                   &&comp = Comp(), Proj
                                                                                   &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
bool hpx::ranges::is_heap(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

comp has to induce a strict weak ordering on the values.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to *bool*, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap* algorithm returns *bool*. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

```
template<typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
bool hpx::ranges::is_heap(Iter first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns whether the range is max heap. That is, true if the range is max heap, false otherwise. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

comp has to induce a strict weak ordering on the values.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most 2 * N applications of the projection *proj*, where N = last - first.

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_heap* algorithm returns *bool*. The *is_heap* algorithm returns whether the range is max heap. That is, true if the range is max heap, false otherwise.

hpx::ranges::is_heap_until

Defined in header `hpx/algorithm.hpp`⁷⁵⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::is_heap`

```
template<typename ExPolicy, typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj =  
hpx::identity>  
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::is_heap_until(ExPolicy  
    &&pol-  
    icy,  
    Rng  
    &&rng,  
    Comp  
    &&comp  
    =  
    Comp(),  
    Proj  
    &&proj  
    =  
    Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it*

⁷⁵⁰ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using operator<()).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most $2 * N$ applications of the projection *proj*, where $N = \text{last} - \text{first}$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less,
        typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::is_heap_until(ExPolicy
                                                                                          &&policy, Iter
                                                                                          first, Sent last,
                                                                                          Comp &&comp =
                                                                                          Comp(), Proj
                                                                                          &&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it*

for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

comp has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most $2 * N$ applications of the projection *proj*, where $N = \text{last} - \text{first}$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter1*.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap_until* algorithm returns a *hpx::future<RandIter>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *RandIter* otherwise. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename Rng, typename Comp = hpx::parallel::detail::less, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> hpx::ranges::is_heap_until(Rng &&rng, Comp &&comp = Comp(), Proj
&&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

comp has to induce a strict weak ordering on the values.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most $2 * N$ applications of the projection *proj*, where $N = \text{last} - \text{first}$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* is invoked.

Returns

The *is_heap_until* algorithm returns *RandIter*. The *is_heap_until* algorithm returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap.

```
template<typename Iter, typename Sent, typename Comp = hpx::parallel::detail::less, typename Proj =
hpx::identity>
Iter hpx::ranges::is_heap_until(Iter first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Returns the upper bound of the largest range beginning at *first* which is a max heap. That is, the last iterator *it* for which range [first, it) is a max heap. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

comp has to induce a strict weak ordering on the values.

Note

Complexity: Performs at most N applications of the comparison *comp*, at most $2 * N$ applications of the projection *proj*, where $N = \text{last} - \text{first}$.

Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.

- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter1`.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The `is_heap_until` algorithm returns `RandIter`. The `is_heap_until` algorithm returns the upper bound of the largest range beginning at `first` which is a max heap. That is, the last iterator *it* for which range `[first, it)` is a max heap.

`hpx::ranges::is_partitioned`

Defined in header `hpx/algorithm.hpp`⁷⁵¹.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter, typename Sent, typename Pred, typename Proj = hpx::identity>
bool hpx::ranges::is_partitioned(FwdIter first, Sent last, Pred &&pred, Proj &&proj = Proj())
```

Determines if the range `[first, last)` is partitioned.

Note

Complexity: at most (N) predicate evaluations where $N = \text{distance}(\text{first}, \text{last})$.

Template Parameters

- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`.

Parameters

- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.

⁷⁵¹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns *bool*. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range `[first, last)` contains less than two elements, the function is always true.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_partitioned(ExPolicy
&&policy,
FwdIter first,
Sent last, Pred
&&pred, Proj
&&proj =
Proj())
```

Determines if the range `[first, last)` is partitioned.

The predicate operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most (*N*) predicate evaluations where *N* = `distance(first, last)`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *CopyConstructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of that the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of that the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns a *hpx::future<bool>* if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range [*first*, *last*) contains less than two elements, the function is always true.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
bool hpx::ranges::is_partitioned(Rng &&rng, Pred &&pred, Proj &&proj = Proj())
```

Determines if the range *rng* is partitioned.

Note

Complexity: at most (*N*) predicate evaluations where *N* = `std::size(rng)`.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns *bool*. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range *rng* contains less than two elements, the function is always true.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::is_partitioned(ExPolicy
                                                                                               &&policy, Rng
                                                                                               &&rng, Pred
                                                                                               &&pred, Proj
                                                                                               &&proj =
                                                                                               Proj())
```

Determines if the range [first, last) is partitioned.

The predicate operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *is_partitioned* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: at most (N) predicate evaluations where *N* = `std::size(rng)`.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). *Pred* must be *CopyConstructible* when using a parallel policy.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the unary predicate which returns true for elements expected to be found in the beginning of the range. The signature of the function should be equivalent to

```
bool pred(const Type &a);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *is_partitioned* algorithm returns a `hpx::future<bool>` if the execution policy is of type *task_execution_policy* and returns *bool* otherwise. The *is_partitioned* algorithm returns true if each element in the sequence for which *pred* returns true precedes those for which *pred* returns false. Otherwise *is_partitioned* returns false. If the range *rng* contains less than two elements, the function is always true.

hpx::ranges::exclusive_scan

Defined in header `hpx/algorithm.hpp`⁷⁵².

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename T = typename
std::iterator_traits<InIter>::value_type, typename Op = std::plus<T>>
exclusive_scan_result<InIter, OutIter> hpx::ranges::exclusive_scan(InIter first, Sent last, OutIter dest, T init,
                                                                    Op &&op = Op())
```

Assigns through each iterator *i* in $[result, result + (last - first))$ the value of GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, ..., *(first + (i - result) - 1)).

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: $O(last - first)$ applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_N) is defined as:

- *a*₁ when *N* is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*₁, ..., *a*_K), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*_M, ..., *a*_N)) where $1 < K+1 = M \leq N$.

Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.

⁷⁵² <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter1`.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename T = typename
std::iterator_traits<FwdIter1>::value_type, typename Op = std::plus<T>>
parallel::util::detail::algorithm_result<ExPolicy, exclusive_scan_result<FwdIter1, FwdIter2>>::type hpx::ranges::exclusive_sca
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, *first, ..., *(first + (i - result) - 1))`.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive_scan* may be non-deterministic.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate *op*.

Note

GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*1, ..., *a*N) is defined as:

- *a*1 when *N* is 1
- *op*(GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*1, ..., *a*K), GENERALIZED_NONCOMMUTATIVE_SUM(*op*, *a*M, ..., *a*N)) where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter1*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns a `hpx::future<util::in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `util::in_out_result<FwdIter1, FwdIter2>` otherwise. The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type, typename Op = std::plus<T>>
exclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::exclusive_scan(Rng &&rng, O dest, T
init, Op &&op = Op())
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, ..., *(first + (i - result) - 1))`

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate `std::plus<T>`.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
- `GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)`
 - `GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN)` where $1 < K+1 = M \leq N$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type, typename Op = std::plus<T>>
parallel::util::detail::algorithm_result<ExPolicy, exclusive_scan_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::exclusive
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(+, init, *first, ..., *(first + (i - result) - 1))`

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *exclusive_scan* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive_scan* and *inclusive_scan* is that *inclusive_scan* includes the *i*th input element in the *i*th sum.

Note

Complexity: $O(\text{last} - \text{first})$ applications of the predicate `std::plus<T>`.

Note

`GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- a_1 when N is 1
- `GENERALIZED_NONCOMMUTATIVE_SUM(+,  $a_1, \dots, a_K$ )`
 - `GENERALIZED_NONCOMMUTATIVE_SUM(+,  $a_M, \dots, a_N$ )` where $1 < K+1 = M \leq N$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **Op** – The type of the binary function object used for the reduction operation.

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

Returns

The *exclusive_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *exclusive_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::all_of

Defined in header `hpx/algorithm.hpp`⁷⁵³.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::any_of`
- `hpx::ranges::none_of`

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::all_of(ExPolicy &&policy, Rng
&&rng, F &&f, Proj
&&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

⁷⁵³ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::all_of(ExPolicy &&policy, Iter
                                                                    first, Sent last, F &&f, Proj
                                                                    &&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.

- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
bool hpx::ranges::all_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
bool hpx::ranges::all_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for all elements in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *all_of* algorithm returns true if the unary predicate *f* returns true for all elements in the range, false otherwise. It returns true if the range is empty.

hpx::ranges::any_of

Defined in header `hpx/algorithm.hpp`⁷⁵⁴.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::all_of*
- *hpx::ranges::none_of*

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
```

⁷⁵⁴ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::any_of(ExPolicy &&policy, Rng
&&rng, F &&f, Proj
&&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
```

`hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::any_of(ExPolicy &&policy, Iter first, Sent last, F &&f, Proj &&proj = Proj())`

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *any_of* algorithm

returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
bool hpx::ranges::any_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
bool hpx::ranges::any_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for at least one element in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.

- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *any_of* algorithm returns true if the unary predicate *f* returns true for at least one element in the range, false otherwise. It returns false if the range is empty.

hpx::ranges::none_of

Defined in header `hpx/algorithm.hpp`⁷⁵⁵.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::all_of*
- *hpx::ranges::any_of*

```
template<typename ExPolicy, typename Rng, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::none_of(ExPolicy &&policy, Rng
&&rng, F &&f, Proj
&&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range *rng*.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

⁷⁵⁵ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename ExPolicy, typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::none_of(ExPolicy &&policy, Iter
                                                                    first, Sent last, F &&f,
                                                                    Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns *bool* otherwise. The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Rng, typename F, typename Proj = hpx::identity>
bool hpx::ranges::none_of(Rng &&rng, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range *rng*.

Note

Complexity: At most `std::distance(begin(rng), end(rng))` applications of the predicate *f*

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

```
template<typename Iter, typename Sent, typename F, typename Proj = hpx::identity>
bool hpx::ranges::none_of(Iter first, Sent last, F &&f, Proj &&proj = Proj())
```

Checks if unary predicate *f* returns true for no elements in the range [first, last).

Note

Complexity: At most *last - first* applications of the predicate *f*

Template Parameters

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *none_of* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **f** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *none_of* algorithm returns true if the unary predicate *f* returns true for no elements in the range, false otherwise. It returns true if the range is empty.

hpx::ranges::set_intersection

Defined in header [hpx/algorithm.hpp](#)⁷⁵⁶.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_intersection_result<Iter1, Iter2, Iter3>>::type hpx::ranges::set_interse
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

⁷⁵⁶ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

If some element is found m times in $[first1, last1)$ and n times in $[first2, last2)$, the first $\text{std::min}(m, n)$ elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns a `hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>` otherwise. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_intersection_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, std::ranges::iterator_t<Rng3>>>
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found m times in $[first1, last1)$ and n times in $[first2, last2)$, the first $\text{std::min}(m, n)$ elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced_policy*) or in a single new thread spawned from the current thread (for *sequenced_task_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns a `hpx::future<ranges::set_intersection_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced_task_policy* or *parallel_task_policy* and returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred
= hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_intersection_result<Iter1, Iter2, Iter3> hpx::ranges::set_intersection(Iter1 first1, Sent1 last1, Iter2 first2,
                                                                    Sent2 last2, Iter3 dest, Pred &&op
                                                                    = Pred(), Proj1 &&proj1 =
                                                                    Proj1(), Proj2 &&proj2 = Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for *Iter2*.

- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set_intersection* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The *set_intersection* algorithm returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>`. The *set_intersection* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```

set_intersection_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::set_intersection(Rng1, Rng2, Iter3, dest, Pred, Proj1, Proj2)
    &&
    Rng1
    &&
    Iter3
    dest
    Pred
    &&
    =
    Pred
    Proj1
    Proj2
    &&
    =
    Proj1
    Proj2
    &&
    =
    Proj1

```

Constructs a sorted range beginning at `dest` consisting of all elements present in both sorted ranges `[first1, last1)` and `[first2, last2)`. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

If some element is found m times in `[first1, last1)` and n times in `[first2, last2)`, the first `std::min(m, n)` elements will be copied from the first range to the destination range. The order of equivalent elements is preserved. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

Note

Complexity: At most $2 \cdot (N1 + N2 - 1)$ comparisons, where $N1$ is the length of the first sequence and $N2$ is the length of the second sequence.

Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `set_intersection` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.

- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*.

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

Returns

The `set_intersection` algorithm returns `ranges::set_intersection_result<Iter1, Iter2, Iter3>`, where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>`. The `set_intersection` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

hpx::ranges::partition

Defined in header `hpx/algorithm.hpp`⁷⁵⁹.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::stable_partition`
- `hpx::ranges::partition_copy`

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::partition(Rng &&rng, Pred &&pred, Proj &&proj =
    Proj())
```

Reorders the elements in the range *rng* in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: Performs at most $2 * N$ swaps, exactly N applications of the predicate and projection, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

⁷⁵⁹ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns `subrange_t<std::ranges::iterator_t<Rng>>`. The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::partition(ExPolicy
&&pol-
icy,
Rng
&&rng,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Reorders the elements in the range *rng* in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: Performs at most $2 * N$ swaps, exactly N applications of the predicate and projection, where $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns a `hpx::future<subrange_t<std::ranges::iterator_t<Rng>>>` if the execution policy is of type *parallel_task_policy* and returns *subrange_t<std::ranges::iterator_t<Rng>>* The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

```
template<typename FwdIter, typename Sent, typename Pred, typename Proj = hpx::identity>
subrange_t<FwdIter> hpx::ranges::partition(FwdIter first, Sent last, Pred &&pred, Proj &&proj = Proj())
```

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Note

Complexity: At most $2 * (last - first)$ swaps. Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns *subrange_t<FwdIter>*. The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =
hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter>>::type hpx::ranges::partition(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
last,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Reorders the elements in the range [first, last) in such a way that all elements for which the predicate *pred* returns true precede the elements for which the predicate *pred* returns false. Relative order of the elements is not preserved.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *sequenced_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition* algorithm invoked with an execution policy object of type *parallel_policy* or *parallel_task_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Note

Complexity: At most $2 * (last - first)$ swaps. Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

Returns

The *partition* algorithm returns a `hpx::future<subrange_t<FwdIter>>` if the execution policy is of type *parallel_task_policy* and returns *subrange_t<FwdIter>* otherwise. The *partition* algorithm returns a subrange starting with an iterator to the first element of the second group and finishing with an iterator equal to last.

hpx::ranges::stable_partition

Defined in header `hpx/algorithm.hpp`⁷⁶⁰.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::partition`
- `hpx::ranges::partition_copy`

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
```

⁷⁶⁰ <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::stable_partition(Rng &&rng, Pred &&pred, Proj
&&proj = Proj())
```

Permutes the elements in the range `[first, last)` such that there exists an iterator `i` such that for every iterator `j` in the range `[first, i)` `INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator `k` in the range `[i, last)`, `INVOKE(f, INVOKE(proj, *k)) == false`

The invocations of `f` in the parallel `stable_partition` algorithm invoked without an execution policy object executes in sequential order in the calling thread.

Note

Complexity: At most $(last - first) * \log(last - first)$ swaps, but only linear number of swaps if there is enough extra memory Exactly *last - first* applications of the predicate and projection.

Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an bidirectional iterator
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of `partition` requires `Pred` to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type `Type` must be such that an object of type `BidIter` can be dereferenced and then implicitly converted to `Type`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate `f` is invoked.

Returns

The `stable_partition` algorithm returns an iterator `i` such that for every iterator `j` in the range `[first, i)`, `f(*j) != false` `INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator `k` in the range `[i, last)`, `f(*k) == false` `INVOKE(f, INVOKE(proj, *k)) == false`. The relative order of the elements in both groups is preserved.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
```

The invocations of f in the parallel *stable_partition* algorithm invoked with an execution policy object of type *sequenced_policy* executes in sequential order in the calling thread.

Note

Template Parameters

- ## Parameters

- ```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

### Returns

The *stable\_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range `[first, i)`, `f(*j) != false` `INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator *k* in the range `[i, last)`, `f(*k) == false` `INVOKE(f, INVOKE(proj, *k)) == false`. The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel\_task\_policy* the algorithm returns a `future<>` referring to this iterator.

```
template<typename BidirIter, typename Sent, typename Pred, typename Proj = hpx::identity>
subrange_t<BidirIter> hpx::ranges::stable_partition(BidirIter first, Sent last, Pred &&pred, Proj &&proj =
 Proj())
```

Permutes the elements in the range `[first, last)` such that there exists an iterator *i* such that for every iterator *j* in the range `[first, i)` `INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator *k* in the range `[i, last)`, `INVOKE(f, INVOKE(proj, *k)) == false`

The invocations of *f* in the parallel *stable\_partition* algorithm invoked without an execution policy object executes in sequential order in the calling thread.

### Note

Complexity: At most  $(last - first) * \log(last - first)$  swaps, but only linear number of swaps if there is enough extra memory Exactly *last - first* applications of the predicate and projection.

### Template Parameters

- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *BidirIter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

### Returns

The *stable\_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range `[first, i)`, `f(*j) != false INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator *k* in the range `[i, last)`, `f(*k) == false INVOKE(f, INVOKE(proj, *k)) == false`. The relative order of the elements in both groups is preserved.

```
template<typename ExPolicy, typename BidirIter, typename Sent, typename Pred, typename Proj =
hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<BidirIter>>::type hpx::ranges::stable_partition(ExPolicy
&&pol-
icy,
BidirIter
first,
Sent
last,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Permutes the elements in the range `[first, last)` such that there exists an iterator *i* such that for every iterator *j* in the range `[first, i)` `INVOKE(f, INVOKE(proj, *j)) != false`, and for every iterator *k* in the range `[i, last)`, `INVOKE(f, INVOKE(proj, *k)) == false`

The invocations of *f* in the parallel *stable\_partition* algorithm invoked with an execution policy object of type *sequenced\_policy* executes in sequential order in the calling thread.

The invocations of *f* in the parallel *stable\_partition* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: At most  $(last - first) * \log(last - first)$  swaps, but only linear number of swaps if there is enough extra memory Exactly *last - first* applications of the predicate and projection.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the invocations of *f*.
- **BidirIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *BidirIter*.

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Unary predicate which returns true if the element should be ordered before other elements. Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). The signature of this predicate should be equivalent to:

```
bool fun(const Type &a);
```

The signature does not need to have `const&`. The type *Type* must be such that an object of type *BidirIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *f* is invoked.

#### Returns

The *stable\_partition* algorithm returns an iterator *i* such that for every iterator *j* in the range [first, *i*), `f(*j) != false` INVOKE(*f*, INVOKE(*proj*, \**j*)) != false, and for every iterator *k* in the range [*i*, last), `f(*k) == false` INVOKE(*f*, INVOKE(*proj*, \**k*)) == false. The relative order of the elements in both groups is preserved. If the execution policy is of type *parallel\_task\_policy* the algorithm returns a `future<>` referring to this iterator.

### `hpx::ranges::partition_copy`

Defined in header `hpx/algorithm.hpp`<sup>761</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::partition`
- `hpx::ranges::stable_partition`

```
template<typename Rng, typename OutIter2, typename OutIter3, typename Pred, typename Proj =
hpx::identity>
```

---

<sup>761</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```

partition_copy_result<std::ranges::iterator_t<Rng>, OutIter2, OutIter3> hpx::ranges::partition_copy(Rng
 &&rng,
 Out-
 Iter2
 dest_true,
 Out-
 Iter3
 dest_false,
 Pred
 &&pred,
 Proj
 &&proj
 =
 Proj())

```

Copies the elements in the range *rng*, to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest\_true*. The rest of the elements are copied to the range beginning at *dest\_false*. The order of the elements is preserved.

The assignments in the parallel *partition\_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than N assignments, exactly N applications of the predicate *pred*, where N = `std::distance(begin(rng), end(rng))`.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.

- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *partition\_copy* algorithm returns a `partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>>`. The *partition\_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

```
template<typename ExPolicy, typename Rng, typename FwdIter2, typename FwdIter3, typename Pred,
typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>>::type hpx::
```

Copies the elements in the range *rng*, to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest\_true*. The rest of the elements are copied to the range beginning at *dest\_false*. The order of the elements is preserved.

The assignments in the parallel *partition\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs not more than N assignments, exactly N applications of the predicate *pred*, where N = `std::distance(begin(rng), end(rng))`.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *partition\_copy* algorithm returns a `hpx::future<partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>>` if the execution policy is of type *parallel\_task\_policy* and returns `partition_copy_result<std::ranges::iterator_t<Rng>, FwdIter2, FwdIter3>` otherwise. The *partition\_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

```
template<typename InIter, typename Sent, typename OutIter2, typename OutIter3, typename Pred, typename
Proj = hpx::identity>
partition_copy_result<InIter, OutIter2, OutIter3> hpx::ranges::partition_copy(InIter first, Sent last, OutIter2
dest_true, OutIter3 dest_false,
Pred &&pred, Proj &&proj =
Proj())
```

Copies the elements in the range, defined by `[first, last)`, to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest\_true*. The rest of the elements are copied to the range beginning at *dest\_false*. The order of the elements is preserved.

The assignments in the parallel *partition\_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note**

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

**Template Parameters**

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by `[first, last)`. This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *partition\_copy* algorithm returns a *partition\_copy\_result*<*FwdIter*, *OutIter2*, *OutIter3*>. The *partition\_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename OutIter2, typename OutIter3,
typename Pred, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, partition_copy_result<FwdIter, OutIter2, OutIter3>>::type hpx::ranges::partiti
```

Copies the elements in the range, defined by [first, last), to two different ranges depending on the value returned by the predicate *pred*. The elements, that satisfy the predicate *pred* are copied to the range beginning at *dest\_true*. The rest of the elements are copied to the range beginning at *dest\_false*. The order of the elements is preserved.

The assignments in the parallel *partition\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *partition\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *f*.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **OutIter2** – The type of the iterator representing the destination range for the elements that satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **OutIter3** – The type of the iterator representing the destination range for the elements that don't satisfy the predicate *pred* (deduced). This iterator type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *partition\_copy* requires *Pred* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest\_true** – Refers to the beginning of the destination range for the elements that satisfy the predicate *pred*
- **dest\_false** – Refers to the beginning of the destination range for the elements that don't satisfy the predicate *pred*.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate for partitioning the source iterators. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *partition\_copy* algorithm returns a *hpx::future*<partition\_copy\_result<FwdIter, OutIter2, OutIter3>> if the execution policy is of type *parallel\_task\_policy* and returns *partition\_copy\_result*<FwdIter, OutIter2, OutIter3> otherwise. The *partition\_copy* algorithm returns the tuple of the source iterator *last*, the destination iterator to the end of the *dest\_true* range, and the destination iterator to the end of the *dest\_false* range.

## hpx::ranges::fill

Defined in header `hpx/algorithm.hpp`<sup>762</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fill_n`

```
template<typename ExPolicy, typename Rng, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
hpx::parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::fill(
```

Assigns the given value to the elements in the range [first, last).

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

### Returns

The *fill* algorithm returns a `hpx::future<void>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

<sup>762</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename Iter, typename Sent, typename T = typename
std::iterator_traits<Iter>::value_type>
hpx::parallel::util::detail::algorithm_result<ExPolicy, Iter>::type hpx::ranges::fill(ExPolicy &&policy, Iter
first, Sent last, T const
&value)
```

Assigns the given value to the elements in the range [first, last).

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **T** – The type of the value to be assigned (deduced).

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **value** – The value to be assigned.

#### Returns

The *fill* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

```
template<typename Rng, typename T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
std::ranges::iterator_t<Rng> hpx::ranges::fill(Rng &&rng, T const &value)
```

Assigns the given value to the elements in the range [first, last).

#### Note

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *fill* algorithm returns *void*.

```
template<typename Iter, typename Sent, typename T = typename std::iterator_traits<Iter>::value_type>
Iter hpx::ranges::fill(Iter first, Sent last, T const &value)
```

Assigns the given value to the elements in the range [first, last).

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **Iter** – The type of the source iterators used for the range (deduced).
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *fill* algorithm returns *void*.

**hpx::ranges::fill\_n**

Defined in header `hpx/algorithm.hpp`<sup>763</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fill`

```
template<typename ExPolicy, typename Rng, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

<sup>763</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::fill_n(ExPolicy
 &&pol-
 icy,
 Rng
 &&rng,
 T
 const
 &value)
```

Assigns the given value value to the first count elements in the range beginning at first if count > 0. Does nothing otherwise.

The comparisons in the parallel *fill\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

#### Returns

The *fill\_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

```
template<typename ExPolicy, typename FwdIter, typename Size, typename T = typename
std::iterator_traits<FwdIter>::value_type>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter>::type hpx::ranges::fill_n(ExPolicy &&policy,
 FwdIter first, Size
 count, T const
 &value)
```

Assigns the given value value to the first count elements in the range beginning at first if count > 0. Does nothing otherwise.

The comparisons in the parallel *fill\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *fill\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *count* assignments, for *count* > 0.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *fill\_n* algorithm returns a *hpx::future<void>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *difference\_type* otherwise (where *difference\_type* is defined by *void*).

```
template<typename Rng, typename T = typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::fill_n(Rng &&rng, T const &value)
```

Assigns the given value *value* to the first *count* elements in the range beginning at *first* if *count* > 0. Does nothing otherwise.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *fill\_n* algorithm returns an output iterator that compares equal to last.

```
template<typename FwdIter, typename Size, typename T = typename std::iterator_traits<FwdIter>::value_type>
FwdIter hpx::ranges::fill_n(Iterator first, Size count, T const &value)
```

Assigns the given value *value* to the first *count* elements in the range beginning at *first* if *count* > 0. Does nothing otherwise.

**Note**

Complexity: Performs exactly *count* assignments, for *count* > 0.

**Template Parameters**

- **Iterator** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **T** – The type of the value to be assigned (deduced).

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **value** – The value to be assigned.

**Returns**

The *fill\_n* algorithm returns an output iterator that compares equal to last.

**hpx::ranges::ends\_with**

Defined in header `hpx/algorithm.hpp`<sup>764</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred =
ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::ends_with(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends\_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note**

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

**Template Parameters**

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.

<sup>764</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **Iter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

#### Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *ends\_with* algorithm returns *bool*. The *ends\_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ranges::ends_with(ExPolicy &&policy,
 FwdIter1 first1, Sent1
 last1, FwdIter2 first2,
 Sent2 last2, Pred
 &&pred = Pred(), Proj1
 &&proj1 = Proj1(),
 Proj2 &&proj2 =
 Proj2())
```

Checks whether the second range defined by [first1, last1) matches the suffix of the first range defined by [first2, last2)

The assignments in the parallel *ends\_with* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *ends\_with* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear: at most  $\min(N1, N2)$  applications of the predicate and both projections.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

**Returns**

The *ends\_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *ends\_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
```

```
bool hpx::ranges::ends_with(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 = Proj1(),
 Proj2 &&proj2 = Proj2())
```

Checks whether the second range *rng2* matches the suffix of the first range *rng1*.

The assignments in the parallel *ends\_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

#### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

#### Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *ends\_with* algorithm returns *bool*. The *ends\_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ranges::ends_with(ExPolicy &&policy,
 Rng1 &&rng1,
 Rng2 &&rng2, Pred
 &&pred = Pred(),
 Proj1 &&proj1 =
 Proj1(), Proj2
 &&proj2 = Proj2())
```

Checks whether the second range *rng2* matches the suffix of the first range *rng1*.

The assignments in the parallel *ends\_with* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *ends\_with* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

**Returns**

The *ends\_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *ends\_with* algorithm returns a boolean with the value true if the second range matches the suffix of the first range, false otherwise.

## hpx::ranges::swap\_ranges

Defined in header `hpx/algorithm.hpp`<sup>765</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename Sent1, typename InIter2, typename Sent2>
swap_ranges_result<InIter1, InIter2> hpx::ranges::swap_ranges(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2)
```

Exchanges elements between range [first1, last1) and another range starting at first2.

The swap operations in the parallel *swap\_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Linear in the distance between *first1* and *last1*

### Template Parameters

- **InIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for InIter2.

### Parameters

- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

### Returns

The *swap\_ranges* algorithm returns *swap\_ranges\_result<InIter1, InIter2>*. The *swap\_ranges* algorithm returns *in\_in\_result* with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
```

<sup>765</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

`parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<FwdIter1, FwdIter2>>::type` `hpx::ranges::swap_ranges(ExPolicy, FwdIter1, FwdIter2, FwdIter1, FwdIter2)`

Exchanges elements between range `[first1, last1)` and another range starting at `first2`.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The swap operations in the parallel `swap_ranges` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in the distance between `first1` and `last1`

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the first range of iterators to swap (deduced).
- **Sent1** – The type of the first sentinel (deduced). This sentinel type must be a sentinel for `FwdIter1`.
- **FwdIter2** – The type of the second range of iterators to swap (deduced).
- **Sent2** – The type of the second sentinel (deduced). This sentinel type must be a sentinel for `FwdIter2`.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements for the first range.
- **last1** – Refers to sentinel value denoting the end of the sequence of elements for the first range.
- **first2** – Refers to the beginning of the sequence of elements for the second range.
- **last2** – Refers to sentinel value denoting the end of the sequence of elements for the second range.

#### Returns

The `swap_ranges` algorithm returns a `hpx::future<swap_ranges_result<FwdIter1, FwdIter2>>` if the execution policy is of type `parallel_task_policy` and returns `FwdIter2` otherwise. The `swap_ranges` algorithm returns `in_in_result` with the first element as the iterator to the element

past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename Rng1, typename Rng2>
swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>> hpx::ranges::swap_ranges(Rng1
&&rng1,
Rng2
&&rng2)
```

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap\_ranges* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Linear in the distance between *first1* and *last1*

#### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

#### Parameters

- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

#### Returns

The *swap\_ranges* algorithm returns *swap\_ranges\_result*< std::ranges::iterator\_t<*Rng1*>, std::ranges::iterator\_t<*Rng1*>>. The *swap\_ranges* algorithm returns in *in\_result* with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
parallel::util::detail::algorithm_result<ExPolicy, swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>>> hpx::parallel::ranges::swap_ranges(ExPolicy, Rng1, Rng2)
```

Exchanges elements between range [first1, last1) and another range starting at *first2*.

The swap operations in the parallel *swap\_ranges* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The swap operations in the parallel *swap\_ranges* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear in the distance between *first1* and *last1*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements of the first range.
- **rng2** – Refers to the sequence of elements of the second range.

**Returns**

The *swap\_ranges* algorithm returns a `hpx::future<swap_ranges_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng1>>>` if the execution policy is of type *parallel\_task\_policy* and returns *swap\_ranges\_result< std::ranges::iterator\_t<Rng1>, std::ranges::iterator\_t<Rng1>>*. otherwise. The *swap\_ranges* algorithm returns *in\_in\_result* with the first element as the iterator to the element past the last element exchanged in range beginning with *first1* and the second element as the iterator to the element past the last element exchanged in the range beginning with *first2*.

**hpx::ranges::make\_heap**

Defined in header `hpx/algorithm.hpp`<sup>766</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::make_heap(ExPolicy&&policy, Iter
first, Sent last, Comp
&&comp, Proj &&proj
= Proj{ })
```

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

<sup>766</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The `make_heap` algorithm returns a `hpx::future<Iter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::make_heap(ExPolicy
&&pol-
icy,
Rng
&&rng,
Comp
&&comp,
Proj
&&proj
=
Proj{})
```

Constructs a *max heap* in the range `[first, last)`.

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *make\_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::make_heap(ExPolicy &&policy, Iter
 first, Sent last, Proj
 &&proj = Proj{ })
```

Constructs a *max heap* in the range `[first, last)`.

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *make\_heap* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::make_heap(ExPolicy
 &&pol-
 icy,
 Rng
 &&rng,
 Proj
 &&proj
 =
 Proj{})
```

Constructs a *max heap* in the range [first, last).

The predicate operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *sequential\_execution\_policy* executes in sequential order in the calling thread.

The comparison operations in the parallel *make\_heap* algorithm invoked with an execution policy object of type *parallel\_execution\_policy* or *parallel\_task\_execution\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

**Returns**

The *make\_heap* algorithm returns a `hpx::future<Iter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename Iter, typename Sent, typename Comp, typename Proj = hpx::identity>
Iter hpx::ranges::make_heap(Iter first, Sent last, Comp &&comp, Proj &&proj = Proj{})
```

Constructs a *max heap* in the range `[first, last)`.

**Note**

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *make\_heap* algorithm returns *Iter*. It returns *last*.

```
template<typename Rng, typename Comp, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> hpx::ranges::make_heap(Rng &&rng, Comp &&comp, Proj &&proj = Proj{ })
```

Constructs a *max heap* in the range [first, last).

#### Note

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – Refers to the binary predicate which returns true if the first argument should be treated as less than the second. The signature of the function should be equivalent to

```
bool comp(const Type &a, const Type &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type* must be such that objects of types *RndIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *make\_heap* algorithm returns *Iter*. It returns *last*.

```
template<typename Iter, typename Sent, typename Proj = hpx::identity>
Iter hpx::ranges::make_heap(Iter first, Sent last, Proj &&proj = Proj{ })
```

Constructs a *max heap* in the range [first, last).

#### Note

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **Iter** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *make\_heap* algorithm returns *Iter*. It returns *last*.

```
template<typename Rng, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> hpx::ranges::make_heap(Rng &&rng, Proj &&proj = Proj{})
```

Constructs a *max heap* in the range [first, last).

#### Note

Complexity: at most  $(3*N)$  comparisons where  $N = \text{distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *make\_heap* algorithm returns *Iter*. It returns *last*.

### hpx::ranges::adjacent\_find

Defined in header `hpx/algorithm.hpp`<sup>767</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter, typename Sent, typename Proj = hpx::identity, typename Pred = detail::equal_to>
FwdIter hpx::ranges::adjacent_find(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Searches the range [first, last) for two consecutive identical elements.

<sup>767</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Exactly the smaller of  $(\text{result} - \text{first}) + 1$  and  $(\text{last} - \text{first}) - 1$  application of the predicate where *result* is the value returned

**Template Parameters**

- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *adjacent\_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Proj = hpx::identity, typename Pred = detail::equal_to>
```

```
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::adjacent_find(ExPolicy
&&policy,
FwdIter first,
Sent last, Pred
&&pred =
Pred(), Proj
&&proj =
Proj())
```

Searches the range  $[\text{first}, \text{last})$  for two consecutive identical elements. This version uses the given binary predicate *pred*

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent\_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

#### Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *adjacent\_find* algorithm returns a *hpx::future<InIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *InIter* otherwise. The *adjacent\_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename Rng, typename Proj = hpx::identity, typename Pred = detail::equal_to>
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::adjacent_find(Rng &&rng, Pred &&pred =
Pred(), Proj &&proj = Proj())
```

Searches the range *rng* for two consecutive identical elements.

#### Note

Complexity: Exactly the smaller of  $(\text{result} - \text{std::begin}(\text{rng})) + 1$  and  $(\text{std::begin}(\text{rng}) - \text{std::end}(\text{rng})) - 1$  applications of the predicate where *result* is the value returned

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use.

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *adjacent\_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename Pred = detail::equal_to>
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::adjac
```

Searches the range *rng* for two consecutive identical elements.

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *adjacent\_find* invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

This overload of *adjacent\_find* is available if the user decides to provide their algorithm their own binary predicate *pred*.

#### Note

Complexity: Exactly the smaller of  $(\text{result} - \text{std::begin}(\text{rng})) + 1$  and  $(\text{std::begin}(\text{rng}) - \text{std::end}(\text{rng})) - 1$  applications of the predicate where *result* is the value returned

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *adjacent\_find* algorithm returns a *hpx::future<InIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *InIter* otherwise. The *adjacent\_find* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

## hpx::ranges::inclusive\_scan

Defined in header `hpx/algorithm.hpp`<sup>768</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename Op = std::plus<typename
std::iterator_traits<InIter>::value_type>>
inclusive_scan_result<InIter, OutIter> hpx::ranges::inclusive_scan(InIter first, Sent last, OutIter dest, Op
&&op)
```

Assigns through each iterator  $i$  in  $[result, result + (last - first))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the  $i$ th input element in the  $i$ th sum.

### Note

Complexity:  $O(last - first)$  applications of the predicate  $op$ .

### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- $a1$  when  $N$  is 1
- `GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aK)`
  - `GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN)` where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

<sup>768</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

### Returns

The *inclusive\_scan* algorithm returns `util::in_out_result<InIter, OutIter>`. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Op =
std::plus<typename std::iterator_traits<FwdIter1>::value_type>>
parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<FwdIter1, FwdIter2>>::type hpx::ranges::inclusive_scan
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- $a_1$  when  $N$  is 1
- `GENERALIZED_NONCOMMUTATIVE_SUM(op,  $a_1, \dots, a_K$ )`
  - `GENERALIZED_NONCOMMUTATIVE_SUM(+,  $a_M, \dots, a_N$ )` where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

### Returns

The *inclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `util::in_out_result<FwdIter1, FwdIter2>` otherwise. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename Op = std::plus<typename
hpx::traits::range_traits<Rng>::value_type>>
inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::inclusive_scan(Rng &&rng, O dest, Op
&&op)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *ith* input element in the *ith* sum.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(+, a1, ..., aN) is defined as:

- a1 when N is 1
- GENERALIZED\_NONCOMMUTATIVE\_SUM(+, a1, ..., aK)
  - GENERALIZED\_NONCOMMUTATIVE\_SUM(+, aM, ..., aN) where  $1 < K+1 = M \leq N$ .

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

#### Returns

The *inclusive\_scan* algorithm returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>`. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename Op = std::plus<typename
hpx::traits::range_traits<Rng>::value_type>>
```

`parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::inclusive`

Assigns through each iterator  $i$  in  $[\text{result}, \text{result} + (\text{last} - \text{first}))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the  $i$ th input element in the  $i$ th sum.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate  $op$ .

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(+, a1, ..., aN)` is defined as:

- $a1$  when  $N$  is 1
- `GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK)`
  - `GENERALIZED_NONCOMMUTATIVE_SUM(+, aM, ..., aN)` where  $1 < K+1 = M \leq N$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

### Returns

The *inclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied

```
template<typename InIter, typename Sent, typename OutIter, typename Op, typename T = typename
std::iterator_traits<InIter>::value_type>
inclusive_scan_result<InIter, OutIter> hpx::ranges::inclusive_scan(InIter first, Sent last, OutIter dest, Op
&&op, T init)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- *a1* when *N* is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.

- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

#### Returns

The *inclusive\_scan* algorithm returns `util::in_out_result<InIter, OutIter>`. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Op, typename
T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<FwdIter1, FwdIter2>>::type hpx::ranges::inclusive_scan
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aK*), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *aM*, ..., *aN*)) where  $1 < K+1 = M \leq N$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

### Returns

The *inclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<InIter, OutIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `util::in_out_result<InIter, OutIter>` otherwise. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename Op, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::inclusive_scan(Rng &&rng, O dest, Op
&&op, T init)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- *a1* when *N* is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

### Returns

The *inclusive\_scan* algorithm returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>`. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename Op, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, inclusive_scan_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::inclusive
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, init, *first, ..., *(first + (i - result)))`.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

The difference between *exclusive\_scan* and *inclusive\_scan* is that *inclusive\_scan* includes the *i*th input element in the *i*th sum. If *op* is not mathematically associative, the behavior of *inclusive\_scan* may be non-deterministic.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicate *op*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aK), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, aM, ..., aN)) where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Op** – The type of the binary function object used for the reduction operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **init** – The initial value for the generalized sum.

### Returns

The *inclusive\_scan* algorithm returns a `hpx::future<util::in_out_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `util::in_out_result<std::ranges::iterator_t<Rng>, O>` otherwise. The *inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied

## hpx::ranges::reverse

Defined in header `hpx/algorithm.hpp`<sup>769</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::reverse_copy`

```
template<typename Iter, typename Sent>
```

```
Iter hpx::ranges::reverse(Iter first, Sent sent)
```

Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Linear in the distance between *first* and *last*.

### Template Parameters

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

### Returns

The *reverse* algorithm returns a *Iter*. It returns *last*.

```
template<typename Rng>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::reverse(Rng &&rng)
```

Uses *rng* as the source range, as if using `util::begin(rng)` as *first* and `ranges::end(rng)` as *last*. Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Linear in the distance between *first* and *last*.

---

<sup>769</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Template Parameters**

**Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

**Parameters**

**rng** – Refers to the sequence of elements the algorithm will be applied to.

**Returns**

The *reverse* algorithm returns a `hpx::traits::range_iterator<Rng>::type`. It returns *last*.

```
template<typename ExPolicy, typename Iter, typename Sent>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::reverse(ExPolicy &&policy, Iter
 first, Sent sent)
```

Reverses the order of the elements in the range [first, last). Behaves as if applying `std::iter_swap` to every pair of iterators `first+i`, `(last-i) - 1` for each non-negative `i < (last-first)/2`.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Linear in the distance between *first* and *last*.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *Iter*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

**Returns**

The *reverse* algorithm returns a `hpx::future<Iter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. It returns *last*.

```
template<typename ExPolicy, typename Rng>
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::reverse(ExPolicy
 &&pol-
 icy, Rng
 &&rng)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Reverses the order of the elements in the range  $[first, last)$ . Behaves as if applying `std::iter_swap` to every pair of iterators  $first+i$ ,  $(last-i) - 1$  for each non-negative  $i < (last-first)/2$ .

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in the distance between *first* and *last*.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

#### Returns

The *reverse* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `hpx::future<std::ranges::iterator_t<Rng>>` otherwise. It returns *last*.

### `hpx::ranges::reverse_copy`

Defined in header `hpx/algorithm.hpp`<sup>770</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::reverse`

template<typename **Iter**, typename **Sent**, typename **OutIter**>

`reverse_copy_result<Iter, OutIter> hpx::ranges::reverse_copy(Iter first, Sent last, OutIter result)`

Copies the elements from the range  $[first, last)$  to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment  $*(result + (last - first) - 1 - i) = *(first + i)$  once for each non-negative  $i < (last - first)$ . If the source and destination ranges (that is,  $[first, last)$  and  $[result, result+(last-first))$  respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse\_copy* algorithm execute in sequential order in the calling thread.

<sup>770</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

**Returns**

The *reverse\_copy* algorithm returns a *reverse\_copy\_result<Iter, OutIter>*. The *reverse\_copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename OutIter>
reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter> hpx::ranges::reverse_copy(Rng &&rng, OutIter
 result)
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range [first, last) to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment  $*(result + (last - first) - 1 - i) = *(first + i)$  once for each non-negative  $i < (last - first)$ . If the source and destination ranges (that is, [first, last) and [result, result+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse\_copy* algorithm execute in sequential order in the calling thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **result** – Refers to the begin of the destination range.

#### Returns

The *reverse\_copy* algorithm returns a *ranges::reverse\_copy\_result*<std::ranges::iterator\_t<Rng>, OutIter>. The *reverse\_copy* algorithm returns an object equal to {last, result + N} where N = last - first

```
template<typename ExPolicy, typename Iter, typename Sent, typename FwdIter>
```

```
parallel::util::detail::algorithm_result<ExPolicy, reverse_copy_result<Iter, FwdIter>>::type hpx::ranges::reverse_copy(ExPolicy
&&pol-
icy,
Iter
first,
Sent
last,
FwdIter
re-
sult)
```

Copies the elements from the range [first, last) to another range beginning at result in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment  $*(result + (last - first) - 1 - i) = *(first + i)$  once for each non-negative  $i < (last - first)$ . If the source and destination ranges (that is, [first, last) and [result, result+(last-first)) respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for Iter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **result** – Refers to the begin of the destination range.

#### Returns

The *reverse\_copy* algorithm returns a `hpx::future<reverse_copy_result<Iter, FwdIter> >` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *reverse\_copy\_result<Iter, FwdIter>* otherwise. The *reverse\_copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename OutIter>
parallel::util::detail::algorithm_result<ExPolicy, reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>>>::type hpx::ranges::r
```

Uses *rng* as the source range, as if using *util::begin(rng)* as *first* and *ranges::end(rng)* as *last*. Copies the elements from the range  $[first, last)$  to another range beginning at *result* in such a way that the elements in the new range are in reverse order. Behaves as if by executing the assignment  $*(result + (last - first) - 1 - i) = *(first + i)$  once for each non-negative  $i < (last - first)$ . If the source and destination ranges (that is,  $[first, last)$  and  $[result, result + (last - first))$  respectively) overlap, the behavior is undefined.

The assignments in the parallel *reverse\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *reverse\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a bidirectional iterator.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **result** – Refers to the begin of the destination range.

**Returns**

The *reverse\_copy* algorithm returns a `hpx::future<ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::reverse_copy_result<std::ranges::iterator_t<Rng>, OutIter>` otherwise. The *reverse\_copy* algorithm returns an object equal to {last, result + N} where  $N = \text{last} - \text{first}$

**hpx::ranges::uninitialized\_default\_construct**

Defined in header `hpx/algorithm.hpp`<sup>771</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_default_construct_n`

template<typename **FwdIter**, typename **Sent**>

*FwdIter* **hpx::ranges::uninitialized\_default\_construct**(*FwdIter* first, *Sent* last)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

**Returns**

The *uninitialized\_default\_construct* algorithm returns a *FwdIter*. The *uninitialized\_default\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Sent**>

<sup>771</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

*hpx::parallel::util::detail::algorithm\_result\_t<ExPolicy, FwdIter>* *hpx::ranges::uninitialized\_default\_construct*(*ExPolicy* &&policy, *FwdIter* first, *Sent* last)

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

#### Returns

The *uninitialized\_default\_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_default\_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename Rng>
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::uninitialized_default_construct(Rng
 &&rng)
```

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

**Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

#### Parameters

**rng** – Refers to the range to which will be default constructed.

#### Returns

The *uninitialized\_default\_construct* algorithm returns a *returns* *hpx::traits::range\_traits<Rng>::iterator\_type*. The *uninitialized\_default\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename Rng>
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::unini
```

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_default\_construct* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.

- **rng** – Refers to the range to which the value will be default constructed

#### Returns

The *uninitialized\_default\_construct* algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *typename hpx::traits::range\_traits<Rng>::iterator\_type* otherwise. The *uninitialized\_default\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

### hpx::ranges::uninitialized\_default\_construct\_n

Defined in header `hpx/algorithm.hpp`<sup>772</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::uninitialized\_default\_construct*

template<typename **FwdIter**, typename **Size**>

*FwdIter* **hpx::ranges::uninitialized\_default\_construct\_n**(*FwdIter* first, *Size* count)

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range [first, first + count) by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_default\_construct\_n* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

#### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

#### Returns

The *uninitialized\_default\_construct\_n* algorithm returns a *FwdIter*. The *uninitialized\_default\_construct\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

template<typename **ExPolicy**, typename **FwdIter**, typename **Size**>

<sup>772</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

*parallel::util::detail::algorithm\_result<ExPolicy, FwdIter>::type* *hpx::ranges::uninitialized\_default\_construct\_n*(*ExPolicy* &&policy, *FwdIter* first, *Size* count)

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range *[first, first + count)* by default-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_default\_construct\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_default\_construct\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

#### Returns

The *uninitialized\_default\_construct\_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_default\_construct\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

## hpx::ranges::stable\_sort

Defined in header `hpx/algorithm.hpp`<sup>773</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
RandomIt hpx::ranges::stable_sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj =
 Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, \*(i + n)), INVOKE(proj, \*i)) == false.

*comp* has to induce a strict weak ordering on the values.

The assignments in the parallel *stable\_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

### Template Parameters

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *RandomIt*.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *stable\_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

<sup>773</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename
Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type hpx::ranges::stable_sort(ExPolicy
&&policy,
RandomIt first,
Sent last, Comp
&&comp =
Comp(), Proj
&&proj =
Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, \*(i + n)), INVOKE(proj, \*i)) == false.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument

of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *stable\_sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> hpx::ranges::stable_sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj
= Proj())
```

Sorts the elements in the range [first, last) in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i + n* is a valid iterator pointing to an element of the sequence, and *INVOKE(comp, INVOKE(proj, \*(i + n)), INVOKE(proj, \*i)) == false*.

*comp* has to induce a strict weak ordering on the values.

The assignments in the parallel *stable\_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the *INVOKE* operation applied to an object of type *Comp*, when contextually converted to *bool*, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *stable\_sort* algorithm returns *std::ranges::iterator\_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```

parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::stable_sort(ExPolicy
 &&pol-
 icy,
 Rng
 &&rng,
 Comp
 &&comp
 =
 Comp(),
 Proj
 &&proj
 =
 Proj())

```

Sorts the elements in the range `[first, last)` in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

`comp` has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – `comp` is a callable object. The return value of the `INVOKE` operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

**Returns**

The *stable\_sort* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::ranges::iterator_t<Rng>` otherwise. It returns *last*.

**hpx::ranges::sort**

Defined in header `hpx/algorithm.hpp`<sup>774</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
RandomIt hpx::ranges::sort(RandomIt first, Sent last, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range `[first, last)` in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

*comp* has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note**

Complexity:  $O(N \log(N))$ , where  $N = \text{detail::distance}(\text{first}, \text{last})$  comparisons.

**Template Parameters**

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `RandomIt`.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – *comp* is a callable object. The return value of the `INVOKE` operation applied to an object of type *Comp*, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

<sup>774</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Returns**

The *sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename
Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type hpx::ranges::sort(ExPolicy &&policy,
 RandomIt first, Sent last,
 Comp &&comp = Comp(),
 Proj &&proj = Proj())
```

Sorts the elements in the range [first, last) in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object comp (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(comp, INVOKE(proj, \*(i + n)), INVOKE(proj, \*i)) == false.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity:  $O(N \log(N))$ , where  $N = \text{detail::distance}(\text{first}, \text{last})$  comparisons.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *RandomIt*.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to bool, yields true if the first argument

of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.

- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp, typename Proj>
```

```
std::ranges::iterator_t<Rng> hpx::ranges::sort(Rng &&rng, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using *operator<()*).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i + n* is a valid iterator pointing to an element of the sequence, and *INVOKE(comp, INVOKE(proj, \*(i + n)), INVOKE(proj, \*i)) == false*.

*comp* has to induce a strict weak ordering on the values.

The assignments in the parallel *sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$  comparisons.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the *INVOKE* operation applied to an object of type *Comp*, when contextually converted to *bool*, yields *true* if the first argument of the call is less than the second, and *false* otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *sort* algorithm returns *std::ranges::iterator\_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::sort(ExPolicy
 &&policy,
 Rng &&rng,
 Comp
 &&comp =
 Comp(), Proj
 &&proj =
 Proj())
```

Sorts the elements in the range *rng* in ascending order. The order of equal elements is not guaranteed to be preserved. The function uses the given comparison function object *comp* (defaults to using operator<()).

A sequence is sorted with respect to a comparator *comp* and a projection *proj* if for every iterator *i* pointing to the sequence and every non-negative integer *n* such that *i* + *n* is a valid iterator pointing to an element of the sequence, and INVOKE(*comp*, INVOKE(*proj*, \*(*i* + *n*)), INVOKE(*proj*, \**i*)) == false.

*comp* has to induce a strict weak ordering on the values.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{begin}(\text{rng}), \text{end}(\text{rng}))$  comparisons.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **comp** – *comp* is a callable object. The return value of the INVOKE operation applied to an object of type *Comp*, when contextually converted to *bool*, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that *comp* will not apply any non-constant function through the dereferenced iterator.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

#### Returns

The *sort* algorithm returns a *hpx::future<std::ranges::iterator\_t<Rng>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *std::ranges::iterator\_t<Rng>* otherwise. It returns *last*.

## hpx::ranges::partial\_sort\_copy

Defined in header `hpx/algorithm.hpp`<sup>775</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent1, typename RandIter, typename Sent2, typename Comp =
ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
partial_sort_copy_result<InIter, RandIter> hpx::ranges::partial_sort_copy(InIter first, Sent1 last, RandIter
r_first, Sent2 r_last, Comp
&&comp = Comp(), Proj1
&&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Sorts some of the elements in the range `[first, last)` in ascending order, storing the result in the range `[r_first, r_last)`. At most `r_last - r_first` of the elements are placed sorted to the range `[r_first, r_first + n)` where `n` is the number of elements to sort (`n = min(last - first, r_last - r_first)`).

The assignments in the parallel *partial\_sort\_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity:  $O(N \log(\min(D, N)))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  and  $D = \text{std::distance}(\text{r\_first}, \text{r\_last})$  comparisons.

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **RandIter** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent2** – The type of the destination sentinel (deduced). This sentinel type must be a sentinel for `RandIter`.
- **Comp** – The type of the function/object to use (deduced). `Comp` defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the sentinel value denoting the end of the sequence of elements the algorithm will be applied to.

<sup>775</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **r\_first** – Refers to the beginning of the destination range.
- **r\_last** – Refers to the sentinel denoting the end of the destination range.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate `comp` is invoked.

**Returns**

The *partial\_sort\_copy* algorithm returns a *partial\_sort\_copy\_result*<*InIter*, *RandIter*>. The algorithm returns {last, result\_first + N}.

```
template<typename ExPolicy, typename FwdIter, typename Sent1, typename RandIter, typename Sent2,
typename Comp = ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result_t<ExPolicy, partial_sort_copy_result<FwdIter, RandIter>> hpx::ranges::partial_sort_co
```

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r\_first, r\_last). At most `r_last - r_first` of the elements are placed sorted to the range [r\_first, r\_first + n) where n is the number of elements to sort (`n = min(last - first, r_last - r_first)`).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity:  $O(N \log(\min(D, N)))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  and  $D = \text{std::distance}(\text{r\_first}, \text{r\_last})$  comparisons.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **RandIter** – The type of the destination iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent2** – The type of the destination sentinel (deduced). This sentinel type must be a sentinel for RandIter.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the sentinel value denoting the end of the sequence of elements the algorithm will be applied to.
- **r\_first** – Refers to the beginning of the destination range.
- **r\_last** – Refers to the sentinel denoting the end of the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate *comp* is invoked.

**Returns**

The *partial\_sort\_copy* algorithm returns a `hpx::future<partial_sort_copy_result<FwdIter, RandIter>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *partial\_sort\_copy\_result<FwdIter, RandIter>* otherwise. The algorithm returns  $\{\text{last}, \text{result\_first} + N\}$ .

```

template<typename Rng1, typename Rng2, typename Comp = ranges::less, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
partial_sort_copy_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>> hpx::ranges::partial_sort_copy(Rng1
&&rng1,
Rng2
&&rng2,
Comp
&&comp,
=
Comp(
Proj1
&&proj1,
=
Proj1(
Proj2
&&proj2,
=
Proj2(

```

Sorts some of the elements in the range [first, last) in ascending order, storing the result in the range [r\_first, r\_last). At most r\_last - r\_first of the elements are placed sorted to the range [r\_first, r\_first + n) where n is the number of elements to sort (n = min(last - first, r\_last - r\_first)).

The assignments in the parallel *partial\_sort\_copy* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity:  $O(N \log(\min(D, N)))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  and  $D = \text{std::distance}(\text{r\_first}, \text{r\_last})$  comparisons.

#### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of a random iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to *detail::less*.
- **Proj1** – The type of an optional projection function for the input range. This defaults to *hpx::identity*.
- **Proj2** – The type of an optional projection function for the output range. This defaults to *hpx::identity*.

#### Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument

of the call is less than the second, and false otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.

- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate `comp` is invoked.

#### Returns

The `partial_sort_copy` algorithm returns `partial_sort_copy_result<range_iterator_t<Rng1>, range_iterator_t<Rng2>>`. The algorithm returns `{last, result_first + N}`.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Comp = ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result_t<ExPolicy, partial_sort_copy_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>
```

Sorts some of the elements in the range `[first, last)` in ascending order, storing the result in the range `[r_first, r_last)`. At most `r_last - r_first` of the elements are placed sorted to the range `[r_first, r_first + n)` where `n` is the number of elements to sort (`n = min(last - first, r_last - r_first)`).

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(\min(D, N)))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  and  $D = \text{std::distance}(\text{r\_first}, \text{r\_last})$  comparisons.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes

the assignments.

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of a random iterator.
- **Comp** – The type of the function/function object to use (deduced). `Comp` defaults to `detail::less`.
- **Proj1** – The type of an optional projection function for the input range. This defaults to `hpx::identity`.
- **Proj2** – The type of an optional projection function for the output range. This defaults to `hpx::identity`.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. This defaults to `detail::less`.
- **proj1** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation after the actual predicate `comp` is invoked.

#### Returns

The `partial_sort_copy` algorithm returns a `hpx::future<partial_sort_copy_result<range_iterator_t<Rng1>, range_iterator_t<Rng2>>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `partial_sort_copy_result<range_iterator_t<Rng1>, range_iterator_t<Rng2>>` otherwise. The algorithm returns `{last, result_first + N}`.

### hpx::ranges::adjacent\_difference

Defined in header `hpx/algorithm.hpp`<sup>776</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename FwdIter1, typename FwdIter2, typename Sent>
FwdIter2 hpx::ranges::adjacent_difference(FwdIter1 first, Sent last, FwdIter2 dest)
```

Searches the range `[first, last)` for two consecutive identical elements.

#### Note

Complexity: Exactly the smaller of  $(\text{result} - \text{first}) + 1$  and  $(\text{last} - \text{first}) - 1$  application of the predicate where `result` is the value returned

<sup>776</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Template Parameters**

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename Rng, typename FwdIter2>
FwdIter2 hpx::ranges::adjacent_difference(Rng &&rng, FwdIter2 dest)
 Searches the rng for two consecutive identical elements.
```

**Note**

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

**Template Parameters**

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy
 &&pol-
 icy,
 FwdIter1
 first,
 Sent
 last,
 FwdIter2
 dest)
```

Searches the range `[first, last)` for two consecutive identical elements.

**Note**

Complexity: Exactly the smaller of  $(\text{result} - \text{first}) + 1$  and  $(\text{last} - \text{first}) - 1$  application of the predicate where *result* is the value returned

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename Rng, typename FwdIter2>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy
 &&pol-
 icy,
 Rng
 &&rng,
 FwdIter2
 dest)
```

Searches the *rng* for two consecutive identical elements.

**Note**

Complexity: Exactly the smaller of  $(\text{result} - \text{first}) + 1$  and  $(\text{last} - \text{first}) - 1$  application of the predicate where *result* is the value returned

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

#### Returns

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename FwdIter1, typename Sent, typename FwdIter2, typename Op>
FwdIter2 hpx::ranges::adjacent_difference(FwdIter1 first, Sent last, FwdIter2 dest, Op &&op)
```

Searches the range [first, last) for two consecutive identical elements.

#### Note

Complexity: Exactly the smaller of (result - first) + 1 and (last - first) - 1 application of the predicate where *result* is the value returned

#### Template Parameters

- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *CopyConstructible*.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type *iterator\_traits<InputIt>::value\_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename Rng, typename FwdIter2, typename Op>
FwdIter2 hpx::ranges::adjacent_difference(Rng &&rng, FwdIter2 dest, Op &&op)
```

Searches the *rng* for two consecutive identical elements.

### Template Parameters

- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *Copy-Constructible*.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type *iterator\_traits<InputIt>::value\_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

### Returns

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename Op>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy
 &&pol-
 icy,
 FwdIter1
 first,
 Sent
 last,
 FwdIter2
 dest,
 Op
 &&op)
```

Searches the range [first, last) for two consecutive identical elements.

**Note**

Complexity: Exactly the smaller of  $(\text{result} - \text{first}) + 1$  and  $(\text{last} - \text{first}) - 1$  application of the predicate where *result* is the value returned

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *Copy-Constructible*.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type *iterator\_traits<InputIt>::value\_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

**Returns**

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements. If no such elements are found, *last* is returned.

```
template<typename ExPolicy, typename Rng, typename FwdIter2, typename Op>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter2> hpx::ranges::adjacent_difference(ExPolicy
 &&pol-
 icy,
 Rng
 &&rng,
 FwdIter2
 dest,
 Op
 &&op)
```

Searches the *rng* for two consecutive identical elements.

#### Note

Complexity: Exactly the smaller of  $(\text{result} - \text{first}) + 1$  and  $(\text{last} - \text{first}) - 1$  application of the predicate where *result* is the value returned

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter2** – The type of the source iterators used for the range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Op** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *adjacent\_difference* requires *Op* to meet the requirements of *Copy-Constructible*.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – Binary operation function object that will be applied. The signature of the function should be equivalent to the following:

```
Ret fun(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`. The types *Type1* and *Type2* must be such that an object of type *iterator\_traits<InputIt>::value\_type* can be implicitly converted to both of them. The type *Ret* must be such that an object of type *OutputIt* can be dereferenced and assigned a value of type *Ret*.

#### Returns

The *adjacent\_difference* algorithm returns an iterator to the first of the identical elements.

### hpx::ranges::lexicographical\_compare

Defined in header `hpx/algorithm.hpp`<sup>777</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter1, typename Sent1, typename InIter2, typename Sent2, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity, typename Pred = hpx::parallel::detail::less>
bool hpx::ranges::lexicographical_compare(InIter1 first1, Sent1 last1, InIter2 first2, Sent2 last2, Pred
&&pred = Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 =
Proj2())
```

<sup>777</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Checks if the first range [first1, last1) is lexicographically less than the second range [first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(\text{first1}, \text{last})$  and  $N2 = \text{std::distance}(\text{first2}, \text{last2})$ .

#### Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

#### Template Parameters

- **InIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter1.
- **InIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for FwdIter1. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for FwdIter2. This defaults to `hpx::identity`

#### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *lexicographically\_compare* algorithm returns *bool*. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity, typename Pred = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::lexicographical_compare(ExPolicy
 &&pol-
 icy,
 FwdIter1
 first1,
 Sent1
 last1,
 FwdIter2
 first2,
 Sent2
 last2,
 Pred
 &&pred
 =
 Pred(),
 Proj1
 &&proj1
 =
 Proj1(),
 Proj2
 &&proj2
 =
 Proj2())
```

Checks if the first range [first1, last1) is lexicographically less than the second range [first2, last2). uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(\text{first1}, \text{last})$  and  $N2 = \text{std::distance}(\text{first2}, \text{last2})$ .

**Note**

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter1.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter2.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for FwdIter1. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for FwdIter2. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.

- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *lexicographically\_compare* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```
template<typename Rng1, typename Rng2, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity,
typename Pred = hpx::parallel::detail::less>
bool hpx::ranges::lexicographical_compare(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks if the first range rng1 is lexicographically less than the second range rng2. uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(\text{std::begin}(\text{rng1}), \text{std::end}(\text{rng1}))$  and  $N2 = \text{std::distance}(\text{std::begin}(\text{rng2}), \text{std::end}(\text{rng2}))$ .

#### Note

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

#### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for elements of the second range. This defaults to `hpx::identity`

#### Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *lexicographically\_compare* algorithm returns *bool*. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Proj1 = hpx::identity, typename Proj2
= hpx::identity, typename Pred = hpx::parallel::detail::less>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::lexicographical_compare(ExPolicy
&&pol-
icy,
Rng1
&&rng1,
Rng2
&&rng2,
Pred
&&pred
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Checks if the first range *rng1* is lexicographically less than the second range *rng2*. uses a provided predicate to compare elements.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *lexicographical\_compare* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $2 * \min(N1, N2)$  applications of the comparison operation, where  $N1 = \text{std::distance}(\text{std::begin}(\text{rng1}), \text{std::end}(\text{rng1}))$  and  $N2 = \text{std::distance}(\text{std::begin}(\text{rng2}), \text{std::end}(\text{rng2}))$ .

**Note**

Lexicographical comparison is an operation with the following properties

- Two ranges are compared element by element
- The first mismatching element defines which range is lexicographically *less* or *greater* than the other
- If one range is a prefix of another, the shorter range is lexicographically *less* than the other
- If two ranges have equivalent elements and are of the same length, then the ranges are lexicographically *equal*
- An empty range is lexicographically *less* than any non-empty range
- Two empty ranges are lexicographically *equal*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *lexicographical\_compare* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for elements of the second range. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Refers to the comparison function that the first and second ranges will be applied to
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *lexicographically\_compare* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *lexicographically\_compare* algorithm returns true if the first range is lexicographically less, otherwise it returns false. range [first2, last2), it returns false.

### hpx::ranges::mismatch

Defined in header [hpx/algorithm.hpp](#)<sup>778</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Pred = equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, mismatch_result<Iter1, Iter2>>::type hpx::ranges::mismatch(ExPolicy
&&pol-
icy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Returns true if the range [first1, last1) is mismatch to the range [first2, last2), and false otherwise.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

<sup>778</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate  $f$ . If  $\text{FwdIter1}$  and  $\text{FwdIter2}$  meet the requirements of *RandomAccessIterator* and  $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$  then no applications of the predicate  $f$  are made.

#### Note

The two ranges are considered mismatch if, for every iterator  $i$  in the range  $[\text{first1}, \text{last1})$ ,  $*i$  mismatches  $*(\text{first2} + (i - \text{first1}))$ . This overload of *mismatch* uses operator `==` to determine if two elements are mismatch.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *mismatch* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *mismatch* algorithm returns true if the elements in the two ranges are mismatch, otherwise it returns false. If the length of the range [first1, last1) does not mismatch the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, mismatch_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typen
```

Returns `std::pair` with iterators to the first two non-equivalent elements.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *mismatch* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most *last1 - first1* applications of the predicate *f*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *mismatch* algorithm returns a `hpx::future<std::pair<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `std::pair<FwdIter1, FwdIter2>` otherwise. The *mismatch* algorithm returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2, last2).

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred = equal_to,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
mismatch_result<Iter1, Iter2> hpx::ranges::mismatch(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred
&&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Returns true if the range [first1, last1) is mismatch to the range [first2, last2), and false otherwise.

#### Note

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate *f*. If *FwdIter1* and *FwdIter2* meet the requirements of *RandomAccessIterator* and  $(\text{last1} - \text{first1}) \neq (\text{last2} - \text{first2})$  then no applications of the predicate *f* are made.

**Note**

The two ranges are considered mismatch if, for every iterator *i* in the range `[first1,last1)`, *\*i* mismatches `*(first2 + (i - first1))`. This overload of `mismatch` uses `operator==` to determine if two elements are mismatch.

**Template Parameters**

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `mismatch` requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

**Parameters**

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

**Returns**

The `mismatch` algorithm returns *bool*. The `mismatch` algorithm returns true if the elements in the two ranges are mismatch, otherwise it returns false. If the length of the range `[first1, last1)` does not mismatch the length of the range `[first2, last2)`, it returns false.

```
template<typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 = hpx::identity, typename
Proj2 = hpx::identity>
mismatch_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::iterator_type> hp
```

Returns `std::pair` with iterators to the first two non-equivalent elements.

#### Note

Complexity: At most *last1* - *first1* applications of the predicate *f*.

#### Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *mismatch* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

#### Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as mismatch. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *mismatch* algorithm returns `std::pair<FwdIter1, FwdIter2>`. The *mismatch* algorithm returns the first mismatching pair of elements from two ranges: one defined by [first1, last1) and another defined by [first2, last2).

## hpx::ranges::min\_element

Defined in header `hpx/algorithm.hpp`<sup>779</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::max_element`
- `hpx::ranges::minmax_element`

```
template<typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
FwdIter hpx::ranges::min_element(FwdIter first, Sent last, F &&f = F(), Proj &&proj = Proj())
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min\_element* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

<sup>779</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *min\_element* algorithm returns *FwdIter*. The *min\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> hpx::ranges::min_element(Rng &&rng, F &&f = F(), Proj &&proj = Proj())
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min\_element* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *min\_element* algorithm returns a *hpx::traits::range\_iterator<Rng>::type* otherwise. The *min\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less,
typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::min_element(ExPolicy
&&policy,
FwdIter first,
Sent last, F &&f
= F(), Proj
&&proj = Proj())
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *min\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *min\_element* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *min\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename Rng, typename F = hpx::parallel::detail::less, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::min_element(ExPolicy
 &&pol-
 icy,
 Rng
 &&rng,
 F
 &&f
 =
 F(),
 Proj
 &&proj
 =
 Proj())
```

Finds the smallest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *min\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *min\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – The binary predicate which returns true if the the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *min\_element* algorithm returns a `hpx::future<hpx::traits::range_iterator<Rng>::type>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *min\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

## hpx::ranges::max\_element

Defined in header `hpx/algorithm.hpp`<sup>780</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::min_element`
- `hpx::ranges::minmax_element`

```
template<typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
FwdIter hpx::ranges::max_element(FwdIter first, Sent last, F &&f = F(), Proj &&proj = Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max\_element* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

<sup>780</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *max\_element* algorithm returns a *FwdIter*. The *max\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> hpx::ranges::max_element(Rng &&rng, F &&f = F(), Proj &&proj = Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max\_element* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *max\_element* algorithm returns a `hpx::traits::range_iterator<Rng>::type` otherwise. The *max\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less,
 typename Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::max_element(ExPolicy
 &&policy,
 FwdIter first,
 Sent last, F &&f
 = F(), Proj
 &&proj = Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Exactly  $\max(N-1, 0)$  comparisons, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **f** – The binary predicate which returns true if the This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *max\_element* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *max\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

```
template<typename ExPolicy, typename Rng, typename F = hpx::parallel::detail::less, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::max_element(ExPolicy
 &&pol-
 icy,
 Rng
 &&rng,
 F
 &&f
 =
 F(),
 Proj
 &&proj
 =
 Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *max\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Exactly *max*(N-1, 0) comparisons, where N = `std::distance(first, last)`.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *max\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the This argument is optional and defaults to `std::less`. the left argument is less than the right element. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *max\_element* algorithm returns a `hpx::future<hpx::traits::range_iterator<Rng>::type>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *max\_element* algorithm returns the iterator to the smallest element in the range [first, last). If several elements in the range are equivalent to the smallest element, returns the iterator to the first such element. Returns last if the range is empty.

### hpx::ranges::minmax\_element

Defined in header `hpx/algorithm.hpp`<sup>781</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::min_element`
- `hpx::ranges::max_element`

```
template<typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less, typename Proj =
hpx::identity>
minmax_element_result<FwdIter> hpx::ranges::minmax_element(FwdIter first, Sent last, F &&f = F(), Proj
&&proj = Proj())
```

Finds the greatest element in the range [first, last) using the given comparison function *f*.

The assignments in the parallel *minmax\_element* algorithm execute in sequential order in the calling thread.

<sup>781</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: At most  $\max(\text{floor}(3/2*(N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *minmax\_element* algorithm returns a *minmax\_element\_result*<*FwdIter*, *FwdIter*>. The *minmax\_element* algorithm returns a *min\_max\_result* consisting of an iterator to the smallest element as the min element and an iterator to the greatest element as the max element. Returns *minmax\_element\_result*{*first*, *first*} if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename Rng, typename F = hpx::parallel::detail::less, typename Proj = hpx::identity>
minmax_element_result<std::ranges::iterator_t<Rng>> hpx::ranges::minmax_element(Rng &&rng, F &&f =
 F(), Proj &&proj =
 Proj())
```

Finds the greatest element in the range [*first*, *last*) using the given comparison function *f*.

The assignments in the parallel *minmax\_element* algorithm execute in sequential order in the calling thread.

**Note**

Complexity: At most  $\max(\text{floor}(3/2*(N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced).
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *minmax\_element* algorithm returns a *minmax\_element\_result*<*hpx::traits::range\_iterator*<*Rng*>::type, *hpx::traits::range\_iterator*<*Rng*>::type> The *minmax\_element* algorithm returns a *min\_max\_result* consisting of an range iterator to the smallest element as the min element and an range iterator to the greatest element as the max element. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename F = hpx::parallel::detail::less,
typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, minmax_element_result<FwdIter>> hpx::ranges::minmax_element(ExPo
&&p
icy,
FwdI
first,
Sent
last,
F
&&f
=
F()
Proj
&&p
=
Proj(
```

Finds the greatest element in the range `[first, last)` using the given comparison function *f*.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $\max(\text{floor}(3/2 * (N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterator used (deduced). The iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to *std::less*. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *minmax\_element* algorithm returns a *minmax\_element\_result<FwdIter, FwdIter>* The *min-max\_element* algorithm returns a *min\_max\_result* consisting of an iterator to the smallest element as the min element and an iterator to the greatest element as the max element. Returns

`minmax_element_result{first, first}` if the range is empty. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

```
template<typename ExPolicy, typename Rng, typename F = hpx::parallel::detail::less, typename Proj =
hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, minmax_element_result<std::ranges::iterator_t<Rng>>> hpx::ranges::min
```

Finds the greatest element in the range `[first, last)` using the given comparison function `f`.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparisons in the parallel *minmax\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $\max(\text{floor}(3/2 * (N-1)), 0)$  applications of the predicate, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **F** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *minmax\_element* requires *F* to meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.

- **f** – The binary predicate which returns true if the the left argument is less than the right element. This argument is optional and defaults to `std::less`. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *minmax\_element* algorithm returns a *minmax\_element\_result*<*hpx::traits::range\_iterator*<*Rng*>::type, *hpx::traits::range\_iterator*<*Rng*>::type>. The *minmax\_element* algorithm returns a *min\_max\_result* consisting of an range iterator to the smallest element as the min element and an range iterator to the greatest element as the max element. If several elements are equivalent to the smallest element, the iterator to the first such element is returned. If several elements are equivalent to the largest element, the iterator to the last such element is returned.

## hpx::ranges::uninitialized\_value\_construct

Defined in header `hpx/algorithm.hpp`<sup>782</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::uninitialized\_value\_construct\_n*

template<typename **FwdIter**, typename **Sent**>

*FwdIter* **hpx::ranges::uninitialized\_value\_construct**(*FwdIter* first, *Sent* last)

Constructs objects of type *typename iterator\_traits*<*ForwardIt*>::value\_type in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

### Parameters

<sup>782</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

### Returns

The *uninitialized\_value\_construct* algorithm returns a returns *FwdIter*. The *uninitialized\_value\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Sent>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_value_construct(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
last)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

**Returns**

The *uninitialized\_value\_construct* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *uninitialized\_value\_construct* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename Rng>
```

```
hpx::traits::range_traits<Rng>::iterator_type hpx::ranges::uninitialized_value_construct(Rng &&rng)
```

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

**Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

**rng** – Refers to the range to which will be value constructed.

**Returns**

The *uninitialized\_value\_construct* algorithm returns a *hpx::traits::range\_traits<Rng>::iterator\_type*. The *uninitialized\_value\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

```
template<typename ExPolicy, typename Rng>
```

```
parallel::util::detail::algorithm_result<ExPolicy, typename hpx::traits::range_traits<Rng>::iterator_type>::type hpx::ranges::unini
```

Constructs objects of type *typename iterator\_traits<ForwardIt>::value\_type* in the uninitialized storage designated by the range by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_value\_construct* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range to which the value will be value constructed

**Returns**

The *uninitialized\_value\_construct* algorithm returns a `hpx::future<typename hpx::traits::range_traits<Rng>::iterator_type>`, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *typename hpx::traits::range\_traits<Rng>::iterator\_type* otherwise. The *uninitialized\_value\_construct* algorithm returns the output iterator to the element in the range, one past the last element constructed.

**`hpx::ranges::uninitialized_value_construct_n`**

Defined in header `hpx/algorithm.hpp`<sup>783</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_value_construct`

template<typename **FwdIter**, typename **Size**>

*FwdIter* `hpx::ranges::uninitialized_value_construct_n`(*FwdIter* first, *Size* count)

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range [first, first + count) by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct\_n* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note**

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

**Template Parameters**

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

**Parameters**

<sup>783</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

**Returns**

The *uninitialized\_value\_construct\_n* algorithm returns a *FwdIter*. The *uninitialized\_value\_construct\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

```
template<typename ExPolicy, typename FwdIter, typename Size>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, FwdIter> hpx::ranges::uninitialized_value_construct_n(ExPolicy
&&pol-
icy,
FwdIter
first,
Size
count)
```

Constructs objects of type `typename iterator_traits<ForwardIt>::value_type` in the uninitialized storage designated by the range `[first, first + count)` by value-initialization. If an exception is thrown during the initialization, the function has no effects.

The assignments in the parallel *uninitialized\_value\_construct\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_value\_construct\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.

**Returns**

The *uninitialized\_value\_construct\_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise.

The *uninitialized\_value\_construct\_n* algorithm returns the iterator to the element in the source range, one past the last element constructed.

## hpx::ranges::set\_union

Defined in header `hpx/algorithm.hpp`<sup>784</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<Iter1, Iter2, Iter3>>::type hpx::ranges::set_union(ExPolicy
&&pol
icy,
Iter1
first1,
Sent1
last1,
Iter2
first2,
Sent2
last2,
Iter3
dest,
Pred
&&op
=
Pred()
Proj1
&&pro
=
Proj1()
Proj2
&&pro
=
Proj2()
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), then all *m* elements will be copied from [*first1*, *last1*) to *dest*, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from [*first2*, *last2*) to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

<sup>784</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_union* algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. The *set\_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_union_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3>>
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges *[first1, last1)* and *[first2, last2)*. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, then all *m* elements will be copied from *[first1, last1)* to *dest*, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from *[first2, last2)* to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where  $N1$  is the length of the first sequence and  $N2$  is the length of the second sequence.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.

- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_union* algorithm returns a `hpx::future<ranges::set_union_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::set_union_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set\_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_union_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::set_union(Rng1
&&rng1,
Rng2
&&rng2,
Iter3
dest,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())
```

Constructs a sorted range beginning at *dest* consisting of all elements present in one or both sorted ranges [*first1*, *last1*) and [*first2*, *last2*). This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), then all *m* elements will be copied from [*first1*, *last1*) to *dest*, preserving order, and then exactly `std::max(n-m, 0)` elements will be copied from [*first2*, *last2*) to *dest*, also preserving order.

The resulting range cannot overlap with either of the input ranges.

### Note

Complexity: At most  $2 \cdot (N_1 + N_2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.

- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_union* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

#### Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

#### Returns

The *set\_union* algorithm returns `ranges::set_union_result<Iter1, Iter2, Iter3>`. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set\_union* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

### hpx::ranges::merge

Defined in header `hpx/algorithm.hpp`<sup>785</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::inplace_merge`

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Comp =
hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

---

<sup>785</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, hpx::ranges::merge_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<`

Merges two sorted ranges `[first1, last1)` and `[first2, last2)` into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$  applications of the comparison *comp* and the each projection.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form,

the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`

- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first range of elements the algorithm will be applied to.
- **rng2** – Refers to the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

#### Returns

The *merge* algorithm returns a `hpx::future<merge_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `merge_result<Iter1, Iter2, Iter3>` otherwise. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Comp = hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

`hpx::parallel::util::detail::algorithm_result<ExPolicy, hpx::ranges::merge_result<Iter1, Iter2, Iter3>>::type hpx::ranges::merge(Ex`

Merges two sorted ranges `[first1, last1)` and `[first2, last2)` into one sorted range beginning at `dest`. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *merge* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$  applications of the comparison *comp* and the each projection.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an random access iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.

- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an random access iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

#### Returns

The *merge* algorithm returns a `hpx::future<merge_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `merge_result<Iter1, Iter2, Iter3>` otherwise. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Comp = hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```

hpx::ranges::merge_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::merge(Rng1
&&rng1,
Rng2
&&rng2,
Iter3
dest,
Comp
&&comp
=
Comp(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())

```

Merges two sorted ranges [first1, last1) and [first2, last2) into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$  applications of the comparison *comp* and the each projection.

#### Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

#### Parameters

- **rng1** – Refers to the first range of elements the algorithm will be applied to.
- **rng2** – Refers to the second range of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

### Returns

The *merge* algorithm returns *merge\_result<Iter1, Iter2, Iter3>*. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Comp
= hpx::ranges::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::ranges::merge_result<Iter1, Iter2, Iter3> hpx::ranges::merge(Iter1 first1, Sent1 last1, Iter2 first2, Sent2
last2, Iter3 dest, Comp &&comp = Comp(),
Proj1 &&proj1 = Proj1(), Proj2 &&proj2 =
Proj2())
```

Merges two sorted ranges `[first1, last1)` and `[first2, last2)` into one sorted range beginning at *dest*. The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range. The destination range cannot overlap with either of the input ranges.

### Note

Complexity: Performs  $O(\text{std::distance}(\text{first1}, \text{last1}) + \text{std::distance}(\text{first2}, \text{last2}))$  applications of the comparison *comp* and the each projection.

### Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of a random access iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter1*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a random access iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of a sentinel for *Iter2*.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a random access iterator.

- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function to be used for elements of the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function to be used for elements of the second range. This defaults to `hpx::identity`

#### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter1* and *Iter2* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual comparison *comp* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual comparison *comp* is invoked.

#### Returns

The *merge* algorithm returns *merge\_result<Iter1, Iter2, Iter3>*. The *merge* algorithm returns the tuple of the source iterator *last1*, the source iterator *last2*, the destination iterator to the end of the *dest* range.

### hpx::ranges::inplace\_merge

Defined in header `hpx/algorithm.hpp`<sup>786</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::merge`

```
template<typename ExPolicy, typename Rng, typename Iter, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
```

<sup>786</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::inplace_merge(ExPolicy
 &&policy, Rng
 &&rng, Iter
 middle, Comp
 &&comp =
 Comp(), Proj
 &&proj = Proj())

```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

The assignments in the parallel *inplace\_merge* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *inplace\_merge* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first}, \text{last}))$  applications of the comparison *comp* and the each projection.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an random access iterator.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace\_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the range of elements the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *inplace\_merge* algorithm returns a `hpx::future<Iter>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. The *inplace\_merge* algorithm returns the source iterator *last*

```
template<typename ExPolicy, typename Iter, typename Sent, typename Comp = hpx::ranges::less, typename
Proj = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, Iter> hpx::ranges::inplace_merge(ExPolicy
 &&policy, Iter
 first, Iter middle,
 Sent last, Comp
 &&comp =
 Comp(), Proj
 &&proj = Proj())
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

The assignments in the parallel *inplace\_merge* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *inplace\_merge* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first}, \text{last}))$  applications of the comparison *comp* and the each projection.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter1*.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace\_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *inplace\_merge* algorithm returns a *hpx::future<Iter>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *Iter* otherwise. The *inplace\_merge* algorithm returns the source iterator *last*.

```
template<typename Rng, typename Iter, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
Iter hpx::ranges::inplace_merge(Rng &&rng, Iter middle, Comp &&comp = Comp(), Proj &&proj = Proj())
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

### Note

Complexity: Performs  $O(\text{std::distance}(\text{first}, \text{last}))$  applications of the comparison *comp* and the each projection.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace\_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*.

### Parameters

- **rng** – Refers to the range of elements the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *inplace\_merge* algorithm returns *Iter*. The *inplace\_merge* algorithm returns the source iterator *last*

```
template<typename Iter, typename Sent, typename Comp = hpx::ranges::less, typename Proj = hpx::identity>
Iter hpx::ranges::inplace_merge(Iter first, Iter middle, Sent last, Comp &&comp = Comp(), Proj &&proj =
 Proj())
```

Merges two consecutive sorted ranges [first, middle) and [middle, last) into one sorted range [first, last). The order of equivalent elements in the each of original two ranges is preserved. For equivalent elements in the original two ranges, the elements from the first range precede the elements from the second range.

#### Note

Complexity: Performs  $O(\text{std::distance}(\text{first}, \text{last}))$  applications of the comparison *comp* and the each projection.

#### Template Parameters

- **Iter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of a sentinel for *Iter1*.
- **Comp** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *inplace\_merge* requires *Comp* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **first** – Refers to the beginning of the first sorted range the algorithm will be applied to.
- **middle** – Refers to the end of the first sorted range and the beginning of the second sorted range the algorithm will be applied to.
- **last** – Refers to the end of the second sorted range the algorithm will be applied to.
- **comp** – *comp* is a callable object which returns true if the first argument is less than the second, and false otherwise. The signature of this comparison should be equivalent to:

```
bool comp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *Iter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *inplace\_merge* algorithm *Iter*. The *inplace\_merge* algorithm returns the source iterator *last*

**hpx::ranges::partial\_sort**

Defined in header `hpx/algorithm.hpp`<sup>787</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Comp = ranges::less, typename Proj = hpx::identity>
RandomIt hpx::ranges::partial_sort(RandomIt first, RandomIt middle, Sent last, Comp &&comp = Comp(),
 Proj &&proj = Proj())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The assignments in the parallel *partial\_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

**Note**

Complexity: Approximately (last - first) \* log(middle - first) comparisons.

**Template Parameters**

- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for RandomIt.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. Comp defaults to detail::less.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

<sup>787</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Returns**

The *partial\_sort* algorithm returns *RandomIt*. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Comp = ranges::less, typename
Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, RandomIt>::type hpx::ranges::partial_sort(ExPolicy
 &&policy,
 RandomIt first,
 RandomIt
 middle, Sent
 last, Comp
 &&comp =
 Comp(), Proj
 &&proj =
 Proj())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Approximately (last - first) \* log(middle - first) comparisons.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a random iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *RandomIt*.
- **Comp** – The type of the function/function object to use (deduced). *Comp* defaults to *detail::less*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. Comp defaults to detail::less.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *partial\_sort* algorithm returns a *hpx::future<RandomIt>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *RandomIt* otherwise. The algorithm returns an iterator pointing to the first element after the last element in the input sequence.

```
template<typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> hpx::ranges::partial_sort(Rng &&rng, std::ranges::iterator_t<Rng> middle,
 Comp &&comp = Comp(), Proj &&proj = Proj())
```

Places the first middle - first elements from the range [first, last) as sorted with respect to comp into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

The assignments in the parallel *partial\_sort* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Approximately (last - first) \* log(middle - first) comparisons.

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced). Comp defaults to detail::less.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.
- **comp** – comp is a callable object. The return value of the INVOKE operation applied to an object of type Comp, when contextually converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. It is assumed that comp will not apply any non-constant function through the dereferenced iterator. Comp defaults to detail::less.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate *comp* is invoked.

### Returns

The *partial\_sort* algorithm returns *std::ranges::iterator\_t<Rng>*. It returns *last*.

```
template<typename ExPolicy, typename Rng, typename Comp = ranges::less, typename Proj = hpx::identity>
```

```

parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::partial_sort(ExPolicy
 &&pol-
 icy,
 Rng
 &&rng,
 std::ranges::iterator,
 mid-
 dle,
 Comp
 &&comp
 =
 Comp(),
 Proj
 &&proj
 =
 Proj())

```

Sorts the elements in the range `[first, last)` in ascending order. The relative order of equal elements is preserved. The function uses the given comparison function object `comp` (defaults to using `operator<()`).

A sequence is sorted with respect to a comparator `comp` and a projection `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence, and `INVOKE(comp, INVOKE(proj, *(i + n)), INVOKE(proj, *i)) == false`.

The application of function objects in parallel algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity:  $O(N \log(N))$ , where  $N = \text{std::distance}(\text{first}, \text{last})$  comparisons.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Comp** – The type of the function/function object to use (deduced). `Comp` defaults to `detail::less`;
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **middle** – Refers to the middle of the sequence of elements the algorithm will be applied to.

- **comp** – `comp` is a callable object. The return value of the INVOKE operation applied to an object of type `Comp`, when contextually converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. It is assumed that `comp` will not apply any non-constant function through the dereferenced iterator. `Comp` defaults to `detail::less`.
- **proj** – Specifies the function (or function object) which will be invoked for each pair of elements as a projection operation before the actual predicate `comp` is invoked.

### Returns

The `partial_sort` algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `std::ranges::iterator_t<Rng>` otherwise. It returns `last`.

## hpx::ranges::transform\_inclusive\_scan

Defined in header `hpx/algorithm.hpp`<sup>788</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp>
transform_inclusive_scan_result<InIter, OutIter> hpx::ranges::transform_inclusive_scan(InIter first, Sent
 last, OutIter
 dest, BinOp
 &&binary_op,
 UnOp
 &&unary_op)
```

Assigns through each iterator `i` in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates `op` and `conv`.

### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- `a1` when `N` is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

<sup>788</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_inclusive\_scan* algorithm returns *transform\_inclusive\_scan\_result<InIter, OutIter>*. The *transform\_inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp,
typename UnOp>
```

`parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type hpx::ranges::transform`

Assigns through each iterator  $i$  in  $[\text{result}, \text{result} + (\text{last} - \text{first}))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM`( $\text{op}, \text{conv}(*\text{first}), \dots, \text{conv}*(\text{first} + (i - \text{result}))$ )).

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[\text{first}, \text{last})$  or  $[\text{result}, \text{result} + (\text{last} - \text{first}))$ .

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

**Note**

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates `op` and `conv`.

**Note**

`GENERALIZED_NONCOMMUTATIVE_SUM`( $\text{op}, a_1, \dots, a_N$ ) is defined as:

- $a_1$  when  $N$  is 1
- $\text{op}(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a_1, \dots, a_K), \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{op}, a_{K+1}, \dots, a_N))$  where  $1 < K+1 = M \leq N$ .

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter`.

- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

#### Returns

The *transform\_inclusive\_scan* algorithm returns a `hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *transform\_inclusive\_result<FwdIter1, FwdIter2>* otherwise. The *transform\_inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp>
transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::transform_inclusive_scan(Rng
 &&rng,
 O
 dest,
 BinOp
 &&bi-
 nary_op,
 UnOp
 &&unary_op)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(op, conv(\*first), ..., conv(\*(first + (i - result)))).

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[first, last)$  or  $[result, result + (last - first))$ .

The behavior of *transform\_inclusive\_scan* may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(last - first)$  applications of the predicates *op* and *conv*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aK*), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *aM*, ..., *aN*) where  $1 < K+1 = M \leq N$ ).

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by  $[first, last)$ . This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_inclusive\_scan* algorithm returns a *transform\_inclusive\_scan\_result*<`std::ranges::iterator_t<Rng>`, *O*>. The *transform\_inclusive\_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type hpx::rang
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(op, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of *transform\_inclusive\_scan* may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a_1$  when  $N$  is 1
- $op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a_1, \dots, a_K), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a_{K+1}, \dots, a_N))$  where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_inclusive\_scan* algorithm returns a `hpx::future<transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *transform\_inclusive\_scan\_result<std::ranges::iterator\_t<Rng>, O>* otherwise. The *transform\_inclusive\_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp, typename T =
typename std::iterator_traits<InIter>::value_type>
```

```
transform_inclusive_scan_result<InIter, OutIter> hpx::ranges::transform_inclusive_scan(InIter first, Sent
 last, OutIter
 dest, BinOp
 &&binary_op,
 UnOp
 &&unary_op, T
 init)
```

Assigns through each iterator  $i$  in  $[result, result + (last - first))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result))))`.

The reduce operations in the parallel `transform_inclusive_scan` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[first, last)$  or  $[result, result + (last - first))$ .

The behavior of `transform_inclusive_scan` may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(last - first)$  applications of the predicates `op` and `conv`.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$  when  $N$  is 1
- $op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, \dots, aK), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, aM, \dots, aN))$  where  $1 < K+1 = M \leq N$ .

#### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.

- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

#### Returns

The *transform\_inclusive\_scan* algorithm returns *transform\_inclusive\_scan\_result*<*InIter*, *OutIter*>. The *transform\_inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp,
typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_result<FwdIter1, FwdIter2>>::type hpx::ranges::transform
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, conv(\*first), ..., conv(\*(first + (i - result)))).

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform\_inclusive\_scan* may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aK*), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *aM*, ..., *aN*)) where  $1 < K+1 = M \leq N$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

### Returns

The *transform\_inclusive\_scan* algorithm returns a `hpx::future<transform_inclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *transform\_inclusive\_result<FwdIter1, FwdIter2>* otherwise. The *transform\_inclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::transform_inclusive_scan(Rng
&&rng,
O
dest,
BinOp
&&binary_op,
UnOp
&&unary_op,
T
init)
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, conv(\*first), ..., conv(\*(first + (i - result)))).

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform\_inclusive\_scan* may be non-deterministic for a non-associative predicate.

### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aK*), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *aM*, ..., *aN*)) where  $1 < K+1 = M \leq N$ .

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

#### Returns

The *transform\_inclusive\_scan* algorithm returns a *transform\_inclusive\_scan\_result* <std::ranges::iterator\_t<Rng>, O>. The *transform\_inclusive\_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T =
typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type hpx::rang
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, conv(\*first), ..., conv(\*(first + (i - result))))).

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_inclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform\_inclusive\_scan* may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aN) is defined as:

- a1 when N is 1
- op(GENERALIZED\_NONCOMMUTATIVE\_SUM(op, a1, ..., aK), GENERALIZED\_NONCOMMUTATIVE\_SUM(op, aM, ..., aN) where  $1 < K+1 = M \leq N$ ).

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

- **init** – The initial value for the generalized sum.

#### Returns

The *transform\_inclusive\_scan* algorithm returns a `hpx::future<transform_inclusive_scan_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *transform\_inclusive\_scan\_result<std::ranges::iterator\_t<Rng>, O>* otherwise. The *transform\_inclusive\_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

### hpx::ranges::search

Defined in header `hpx/algorithm.hpp`<sup>789</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::search\_n*

<sup>789</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename FwdIter, typename Sent, typename FwdIter2, typename Sent2, typename Pred =
hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
FwdIter hpx::ranges::search(FwdIter first, Sent last, FwdIter2 s_first, Sent2 s_last, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S$  = distance(s\_first, s\_last) and  $N$  = distance(first, last).

#### Template Parameters

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

### Returns

The *search* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename FwdIter2, typename Sent2,
 typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::search(ExPolicy &&policy,
 FwdIter first, Sent last,
 FwdIter2 s_first, Sent2
 s_last, Pred &&op =
 Pred(), Proj1 &&proj1 =
 Proj1(), Proj2 &&proj2 =
 Proj2())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: at most  $(S*N)$  comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{distance}(first, last)$ .

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel used for the first range (deduced). This iterator type must meet the requirements of an sentinel.

- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of type dereferenced *FwdIter2*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate is invoked.

### Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [*s\_first*, *s\_last*) in range [*first*, *last*). If the length of the subsequence [*s\_first*, *s\_last*) is greater than the length of the range [*first*, *last*), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity,
 typename Proj2 = hpx::identity>
```

```
std::ranges::iterator_t<Rng1> hpx::ranges::search(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{distance}(first, last)$ .

#### Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng2*.

#### Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

#### Returns

The *search* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s\_first, s\_last) in range [first, last). If the length of the subsequence [s\_first, s\_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```

template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng1>> hpx::ranges::search(ExPolicy
&&pol-
icy,
Rng1
&&rng1,
Rng2
&&rng2,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())

```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the *parallel\_search* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the *parallel\_search* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S$  = distance(s\_first, s\_last) and  $N$  = distance(first, last).

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng1*.

- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

#### Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence `[s_first, s_last)` in range `[first, last)`. If the length of the subsequence `[s_first, s_last)` is greater than the length of the range `[first, last)`, *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

### hpx::ranges::search\_n

Defined in header `hpx/algorithm.hpp`<sup>790</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::search*

```
template<typename FwdIter, typename FwdIter2, typename Sent2, typename Pred = hpx::ranges::equal_to,
 typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
FwdIter hpx::ranges::search_n(FwdIter first, std::size_t count, FwdIter2 s_first, Sent s_last, Pred &&op =
 Pred(), Proj1 &&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses a provided predicate to compare elements.

The comparison operations in the parallel *search\_n* algorithm execute in sequential order in the calling thread.

<sup>790</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: at most  $(S*N)$  comparisons where  $S = \text{distance}(s\_first, s\_last)$  and  $N = \text{count}$ .

**Template Parameters**

- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate *is* invoked.

**Returns**

The *search\_n* algorithm returns *FwdIter*. The *search\_n* algorithm returns an iterator to the beginning of the last subsequence  $[s\_first, s\_last)$  in range  $[first, first+count)$ . If the length of the

subsequence `[s_first, s_last)` is greater than the length of the range `[first, first+count)`, *first* is returned. Additionally, if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename ExPolicy, typename FwdIter, typename FwdIter2, typename Sent2, typename Pred =
 hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, FwdIter>::type hpx::ranges::search_n(ExPolicy
 &&policy,
 FwdIter first,
 std::size_t count,
 FwdIter2 s_first,
 Sent2 s_last, Pred
 &&op = Pred(),
 Proj1 &&proj1 =
 Proj1(), Proj2
 &&proj2 =
 Proj2())
```

Searches the range `[first, last)` for any elements in the range `[s_first, s_last)`. Uses a provided predicate to compare elements.

The comparison operations in the parallel *search\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S$  = distance(`s_first`, `s_last`) and  $N$  = count.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **FwdIter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source sentinel used for the second range (deduced). This iterator type must meet the requirements of an sentinel.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of type dereferenced *FwdIter2*.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **count** – Refers to the range of elements of the first range the algorithm will be applied to.
- **s\_first** – Refers to the beginning of the sequence of elements the algorithm will be searching for.
- **s\_last** – Refers to the end of the sequence of elements of the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter1* as a projection operation before the actual predicate is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of type dereferenced *FwdIter2* as a projection operation before the actual predicate is invoked.

### Returns

The *search\_n* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search\_n* algorithm returns an iterator to the beginning of the last subsequence [*s\_first*, *s\_last*) in range [*first*, *first*+*count*). If the length of the subsequence [*s\_first*, *s\_last*) is greater than the length of the range [*first*, *first*+*count*), *first* is returned. Additionally if the size of the subsequence is empty or no subsequence is found, *first* is also returned.

```
template<typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
```

```
std::ranges::iterator_t<Rng1> hpx::ranges::search_n(Rng1 &&rng1, std::size_t count, Rng2 &&rng2, Pred
&&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Searches the range [*first*, *last*) for any elements in the range [*s\_first*, *s\_last*). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: at most (*S*\**N*) comparisons where *S* = distance(*s\_first*, *s\_last*) and *N* = distance(*first*, *last*).

### Template Parameters

- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.
- **Proj2** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng2*.

#### Parameters

- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

#### Returns

The *search* algorithm returns a `hpx::future<FwdIter>` if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s\_first, s\_last) in range [first, last). If the length of the subsequence [s\_first, s\_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = hpx::ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
```

```

hpx::parallel::util::detail::algorithm_result<ExPolicy, std::ranges::iterator_t<Rng1>> hpx::ranges::search_n(ExPolicy
&&pol-
icy,
Rng1
&&rng1,
std::size_t
count,
Rng2
&&rng2,
Pred
&&op
=
Pred(),
Proj1
&&proj1
=
Proj1(),
Proj2
&&proj2
=
Proj2())

```

Searches the range [first, last) for any elements in the range [s\_first, s\_last). Uses a provided predicate to compare elements.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *search* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: at most ( $S \cdot N$ ) comparisons where  $S$  = distance(s\_first, s\_last) and  $N$  = distance(first, last).

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the examine range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the search range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *adjacent\_find* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function. This defaults to `hpx::identity` and is applied to the elements of *Rng1*.

- **Proj2** – The type of an optional projection function. This defaults to *hpx::identity* and is applied to the elements of *Rng2*.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the sequence of elements the algorithm will be examining.
- **count** – The number of elements to apply the algorithm on.
- **rng2** – Refers to the sequence of elements the algorithm will be searching for.
- **op** – Refers to the binary predicate which returns true if the elements should be treated as equal. the signature of the function should be equivalent to

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of *rng1* as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of *rng2* as a projection operation before the actual predicate *is* invoked.

#### Returns

The *search* algorithm returns a *hpx::future<FwdIter>* if the execution policy is of type *task\_execution\_policy* and returns *FwdIter* otherwise. The *search* algorithm returns an iterator to the beginning of the first subsequence [s\_first, s\_last) in range [first, last). If the length of the subsequence [s\_first, s\_last) is greater than the length of the range [first, last), *last* is returned. Additionally if the size of the subsequence is empty *first* is returned. If no subsequence is found, *last* is returned.

### hpx::ranges::set\_symmetric\_difference

Defined in header [hpx/algorithm.hpp](#)<sup>791</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Iter3, typename Pred = hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 =
hpx::identity>
```

<sup>791</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

`hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<Iter1, Iter2, Iter3>>::type hpx::ranges::set`

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges *[first1, last1)* and *[first2, last2)*, but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in *[first1, last1)* and *n* times in *[first2, last2)*, it will be copied to *dest* exactly  $\text{std::abs}(m-n)$  times. If  $m > n$ , then the last  $m-n$  of those elements are copied from *[first1, last1)*, otherwise the last  $n-m$  elements are copied from *[first2, last2)*. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $2 \cdot (N_1 + N_2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies

user-provided function objects.

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for Iter2.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

**Returns**

The `set_symmetric_difference` algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Iter3, typename Pred =
hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, set_symmetric_difference_result<std::ranges::iterator_t<Rng1>, std::ranges::itera
```

Constructs a sorted range beginning at `dest` consisting of all elements present in either of the sorted ranges `[first1, last1)` and `[first2, last2)`, but not in both of them are copied to the range beginning at `dest`. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate `f`.

If some element is found  $m$  times in `[first1, last1)` and  $n$  times in `[first2, last2)`, it will be copied to `dest` exactly  $\text{std::abs}(m-n)$  times. If  $m > n$ , then the last  $m-n$  of those elements are copied from `[first1, last1)`, otherwise the last  $n-m$  elements are copied from `[first2, last2)`. The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

The application of function objects in parallel algorithm invoked with a sequential execution policy object execute in sequential order in the calling thread (*sequenced\_policy*) or in a single new thread spawned from the current thread (for *sequenced\_task\_policy*).

The application of function objects in parallel algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: At most  $2 \cdot (N_1 + N_2 - 1)$  comparisons, where  $N_1$  is the length of the first sequence and  $N_2$  is

the length of the second sequence.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it applies user-provided function objects.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_symmetric\_difference* algorithm returns a `hpx::future<ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>` otherwise. where *Iter1* is `range_iterator_t<Rng1>` and *Iter2* is `range_iterator_t<Rng2>` The *set\_symmetric\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```

template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Iter3, typename Pred
= hpx::parallel::detail::less, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_symmetric_difference_result<Iter1, Iter2, Iter3> hpx::ranges::set_symmetric_difference(Iter1 first1,
 Sent1 last1,
 Iter2 first2,
 Sent2 last2,
 Iter3 dest,
 Pred &&op =
 Pred(), Proj1
 &&proj1 =
 Proj1(), Proj2
 &&proj2 =
 Proj2())

```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges [*first1*, *last1*) and [*first2*, *last2*), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [*first1*, *last1*) and *n* times in [*first2*, *last2*), it will be copied to *dest* exactly  $\text{std::abs}(m-n)$  times. If  $m > n$ , then the last  $m-n$  of those elements are copied from [*first1*, *last1*), otherwise the last  $n-m$  elements are copied from [*first2*, *last2*). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N_1 + N_2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

#### Template Parameters

- **Iter1** – The type of the source iterators used (deduced) representing the first sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for *Iter1*.
- **Iter2** – The type of the source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the end source iterators used (deduced) representing the second sequence. This iterator type must meet the requirements of an sentinel for *Iter2*.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::less<>*
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to *hpx::identity*

#### Parameters

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *Iter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

### Returns

The *set\_symmetric\_difference* algorithm returns *ranges::set\_symmetric\_difference\_result<Iter1, Iter2, Iter3>*. The *set\_symmetric\_difference* algorithm returns the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng1, typename Rng2, typename Iter3, typename Pred = hpx::parallel::detail::less, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
set_symmetric_difference_result<std::ranges::iterator_t<Rng1>, std::ranges::iterator_t<Rng2>, Iter3> hpx::ranges::set_symmetri
```

Constructs a sorted range beginning at *dest* consisting of all elements present in either of the sorted ranges [*first1*,

last1) and [first2, last2), but not in both of them are copied to the range beginning at *dest*. The resulting range is also sorted. This algorithm expects both input ranges to be sorted with the given binary predicate *f*.

If some element is found *m* times in [first1, last1) and *n* times in [first2, last2), it will be copied to *dest* exactly  $\text{std::abs}(m-n)$  times. If  $m > n$ , then the last  $m-n$  of those elements are copied from [first1, last1), otherwise the last  $n-m$  elements are copied from [first2, last2). The resulting range cannot overlap with either of the input ranges.

The resulting range cannot overlap with either of the input ranges.

#### Note

Complexity: At most  $2 \cdot (N1 + N2 - 1)$  comparisons, where *N1* is the length of the first sequence and *N2* is the length of the second sequence.

#### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Iter3** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *set\_symmetric\_difference* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::less<>`
- **Proj1** – The type of an optional projection function applied to the first sequence. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second sequence. This defaults to `hpx::identity`

#### Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The type *Type1* must be such that objects of type *InIter* can be dereferenced and then implicitly converted to *Type1*

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first sequence as a projection operation before the actual predicate *op* is invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second sequence as a projection operation before the actual predicate *op* is invoked.

**Returns**

The `set_symmetric_difference` algorithm returns `ranges::set_symmetric_difference_result<Iter1, Iter2, Iter3>`. where `Iter1` is `range_iterator_t<Rng1>` and `Iter2` is `range_iterator_t<Rng2>`. The `set_symmetric_difference` algorithm returns the output iterator to the element in the destination range, one past the last element copied.

**hpx::ranges::fold\_left**

Defined in header `hpx/algorithm.hpp`<sup>792</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right`
- `hpx::ranges::fold_right_last`
- `hpx::ranges::fold_left_with_iter`
- `hpx::ranges::fold_left_first_with_iter`

```
template<typename InIter, typename Sent, typename T, typename F>
auto hpx::ranges::fold_left(InIter first, Sent last, T init, F f)
```

Left-folds a range of elements using a binary operator.

**Note**

Complexity: Exactly N applications of the binary operator, where  $N = \text{std::distance}(\text{first}, \text{last})$ .

**Template Parameters**

- **InIter** – The type of the source begin iterator (deduced). This iterator must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

**Parameters**

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

**Returns**

The result of left-folding the range.

```
template<typename Rng, typename T, typename F>
```

<sup>792</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

auto *hpx::ranges::fold\_left*(*Rng* &&rng, *T* init, *F* f)

Left-folds a range of elements using a binary operator.

**Note**

Complexity: Exactly N applications of the binary operator, where N = std::distance(begin(rng), end(rng)).

**Template Parameters**

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

**Returns**

The result of left-folding the range.

***hpx::ranges::fold\_left\_first***

Defined in header *hpx/algorithm.hpp*<sup>793</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::fold\_left*
- *hpx::ranges::fold\_right*
- *hpx::ranges::fold\_right\_last*
- *hpx::ranges::fold\_left\_with\_iter*
- *hpx::ranges::fold\_left\_first\_with\_iter*

template<typename **InIter**, typename **Sent**, typename **F**>

auto *hpx::ranges::fold\_left\_first*(*InIter* first, *Sent* last, *F* f)

Left-folds a range using the first element as the initial value.

**Note**

Complexity: Exactly N-1 applications of the binary operator, where N = std::distance(first, last).

**Template Parameters**

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).

---

<sup>793</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **F** – The type of the binary function object.

#### Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

#### Returns

An optional containing the fold result, or `std::nullopt` if the range is empty.

```
template<typename Rng, typename F>
auto hpx::ranges::fold_left_first(Rng &&rng, F f)
```

Left-folds a range using the first element as the initial value.

#### Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

#### Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

#### Returns

An optional containing the fold result, or `std::nullopt` if the range is empty.

### hpx::ranges::fold\_right

Defined in header `hpx/algorithm.hpp`<sup>794</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fold_left`
- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right_last`
- `hpx::ranges::fold_left_with_iter`
- `hpx::ranges::fold_left_first_with_iter`

```
template<typename BidIter, typename Sent, typename T, typename F>
auto hpx::ranges::fold_right(BidIter first, Sent last, T init, F f)
```

Right-folds a range of elements using a binary operator.

#### Note

Complexity: Exactly N applications of the binary operator.

#### Template Parameters

<sup>794</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **BidIter** – The type of the source begin iterator (deduced). This iterator must meet the requirements of a bidirectional iterator.
- **Sent** – The type of the source sentinel (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

#### Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

#### Returns

The result of right-folding the range.

```
template<typename Rng, typename T, typename F>
auto hpx::ranges::fold_right(Rng &&rng, T init, F f)
```

Right-folds a range of elements using a binary operator.

#### Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

#### Parameters

- **rng** – Refers to the sequence of elements.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

#### Returns

The result of right-folding the range.

### **`hpx::ranges::fold_right_last`**

Defined in header `hpx/algorithm.hpp`<sup>795</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::ranges::fold_left`
- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right`
- `hpx::ranges::fold_left_with_iter`
- `hpx::ranges::fold_left_first_with_iter`

```
template<typename BidIter, typename Sent, typename F>
```

---

<sup>795</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

auto *hpx::ranges::fold\_right\_last*(*BidIter* first, *Sent* last, *F* f)

Right-folds a range using the last element as the initial value.

#### Template Parameters

- **BidIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

#### Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

#### Returns

An optional containing the fold result, or `std::nullopt` if the range is empty.

template<typename **Rng**, typename **F**>

auto *hpx::ranges::fold\_right\_last*(*Rng* &&rng, *F* f)

Right-folds a range using the last element as the initial value.

#### Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

#### Parameters

- **rng** – Refers to the sequence of elements.
- **f** – Binary function object that will be applied.

#### Returns

An optional containing the fold result, or `std::nullopt` if the range is empty.

## **hpx::ranges::fold\_left\_with\_iter**

Defined in header `hpx/algorithm.hpp`<sup>796</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ranges::fold\_left*
- *hpx::ranges::fold\_left\_first*
- *hpx::ranges::fold\_right*
- *hpx::ranges::fold\_right\_last*
- *hpx::ranges::fold\_left\_first\_with\_iter*

template<typename **InIter**, typename **Sent**, typename **T**, typename **F**>

<sup>796</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
auto hpx::ranges::fold_left_with_iter(InIter first, Sent last, T init, F f) ->
 fold_left_with_iter_result<InIter,
 std::decay_t<std::invoke_result_t<F&, T,
 std::iter_reference_t<InIter>>>>
```

Left-folds a range and returns both the result and the end iterator.

#### Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

#### Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

#### Returns

A `fold_left_with_iter_result` containing the end iterator and the fold result.

```
template<typename Rng, typename T, typename F>
auto hpx::ranges::fold_left_with_iter(Rng &&rng, T init, F f) ->
 fold_left_with_iter_result<std::ranges::iterator_t<Rng>,
 std::decay_t<std::invoke_result_t<F&, T,
 std::ranges::range_reference_t<Rng>>>>
```

Left-folds a range and returns both the result and the end iterator.

#### Template Parameters

- **Rng** – The type of the source range (deduced).
- **T** – The type of the initial value.
- **F** – The type of the binary function object.

#### Parameters

- **rng** – Refers to the sequence of elements.
- **init** – The initial value for the fold operation.
- **f** – Binary function object that will be applied.

#### Returns

A `fold_left_with_iter_result` containing the end iterator and the fold result.

## hpx::ranges::fold\_left\_first\_with\_iter

Defined in header `hpx/algorithm.hpp`<sup>797</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::fold_left`
- `hpx::ranges::fold_left_first`
- `hpx::ranges::fold_right`
- `hpx::ranges::fold_right_last`
- `hpx::ranges::fold_left_with_iter`

```
template<typename InIter, typename Sent, typename F>
auto hpx::ranges::fold_left_first_with_iter(InIter first, Sent last, F f) ->
 fold_left_first_with_iter_result<InIter,
 hpx::optional<std::decay_t<std::invoke_result_t<F&,
 std::iter_reference_t<InIter>,
 std::iter_reference_t<InIter>>>>>
```

Left-folds a range using the first element and returns both an optional result and the end iterator.

### Template Parameters

- **InIter** – The type of the source begin iterator (deduced).
- **Sent** – The type of the source sentinel (deduced).
- **F** – The type of the binary function object.

### Parameters

- **first** – Refers to the beginning of the sequence.
- **last** – Refers to the end of the sequence.
- **f** – Binary function object that will be applied.

### Returns

A `fold_left_first_with_iter_result` containing the end iterator and an optional with the fold result.

```
template<typename Rng, typename F>
auto hpx::ranges::fold_left_first_with_iter(Rng &&rng, F f) ->
 fold_left_first_with_iter_result<std::ranges::iterator_t<Rng>,
 hpx::optional<std::decay_t<std::invoke_result_t<F&,
 std::ranges::range_reference_t<Rng>,
 std::ranges::range_reference_t<Rng>>>>>
```

Left-folds a range using the first element and returns both an optional result and the end iterator.

### Template Parameters

- **Rng** – The type of the source range (deduced).
- **F** – The type of the binary function object.

### Parameters

- **rng** – Refers to the sequence of elements.

<sup>797</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **f** – Binary function object that will be applied.

#### Returns

A `fold_left_first_with_iter_result` containing the end iterator and an optional with the fold result.

### `hpx::ranges::starts_with`

Defined in header `hpx/algorithm.hpp`<sup>798</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred =
ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::starts_with(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&pred = Pred(), Proj1
&&proj1 = Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range defined by `[first1, last1)` matches the prefix of the first range defined by `[first2, last2)`

The assignments in the parallel `starts_with` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Linear: at most  $\min(N1, N2)$  applications of the predicate and both projections.

#### Template Parameters

- **Iter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter1`.
- **Iter2** – The type of the begin destination iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for `Iter2`.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function for the destination range. This defaults to `hpx::identity`

#### Parameters

- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.

<sup>798</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

### Returns

The *starts\_with* algorithm returns *bool*. The *starts\_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2,
typename Pred = ranges::equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::starts_with(ExPolicy &&policy,
 FwdIter1 first1, Sent1
 last1, FwdIter2 first2,
 Sent2 last2, Pred
 &&pred = Pred(),
 Proj1 &&proj1 =
 Proj1(), Proj2
 &&proj2 = Proj2())
```

Checks whether the second range defined by [first1, last1) matches the prefix of the first range defined by [first2, last2)

The assignments in the parallel *starts\_with* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts\_with* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used(deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter2** – The type of the begin destination iterators used deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the end destination iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter2.

- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the source range.
- **last1** – Sentinel value referring to the end of the source range.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Sentinel value referring to the end of the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *starts\_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *starts\_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename Proj1 = hpx::identity,
typename Proj2 = hpx::identity>
bool hpx::ranges::starts_with(Rng1 &&rng1, Rng2 &&rng2, Pred &&pred = Pred(), Proj1 &&proj1 =
 Proj1(), Proj2 &&proj2 = Proj2())
```

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts\_with* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

#### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.

- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

#### Parameters

- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *starts\_with* algorithm returns *bool*. The *starts\_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = ranges::equal_to, typename
Proj1 = hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result<ExPolicy, bool>::type hpx::ranges::starts_with(ExPolicy
&&policy, Rng1
&&rng1, Rng2
&&rng2, Pred
&&pred =
Pred(), Proj1
&&proj1 =
Proj1(), Proj2
&&proj2 =
Proj2())
```

Checks whether the second range *rng2* matches the prefix of the first range *rng1*.

The assignments in the parallel *starts\_with* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *starts\_with* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear: at most min(N1, N2) applications of the predicate and both projections.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The binary predicate that compares the projected elements.
- **Proj1** – The type of an optional projection function for the source range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function for the destination range. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the source range.
- **rng2** – Refers to the destination range.
- **pred** – Specifies the binary predicate function (or function object) which will be invoked for comparison of the elements in the in two ranges projected by proj1 and proj2 respectively.
- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements in the source range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements in the destination range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *starts\_with* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *starts\_with* algorithm returns a boolean with the value true if the second range matches the prefix of the first range, false otherwise.

### hpx::ranges::transform\_reduce

Defined in header [hpx/algorithm.hpp](#)<sup>799</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

#### Warning

doxygenfunction: Cannot find function “hpx::ranges::transform\_reduce” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

---

<sup>799</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

## hpx::ranges::remove

Defined in header `hpx/algorithm.hpp`<sup>800</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::remove_if`

```
template<typename Iter, typename Sent, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<Iter, Proj>::value_type>
```

```
subrange_t<Iter, Sent> hpx::ranges::remove(Iter first, Sent last, T const &value, Proj &&proj = Proj())
```

Removes all elements that are equal to *value* from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator==() and the projection *proj*.

### Template Parameters

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *remove* algorithm returns a `subrange_t<FwdIter, Sent>`. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
```

<sup>800</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::remove(Rng &&rng, T const &value, Proj &&proj =
 Proj())
```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator`==()` and the projection *proj*.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *remove* algorithm returns a *subrange\_t<std::ranges::iterator\_t<Rng>>*. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Proj = hpx::identity, typename T =
typename hpx::parallel::traits::projected<FwdIter, Proj>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::remove(ExPolicy
 &&pol-
 icy,
 FwdIter
 first,
 Sent
 last, T
 const
 &value,
 Proj
 &&proj
 =
 Proj())
```

Removes all elements that are equal to *value* from the range [first, last) and and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the operator `==()` and the projection *proj*.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *remove* algorithm returns a `hpx::future<subrange_t<FwdIter, Sent>>`. The *remove* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename Rng, typename Proj = hpx::identity, typename T = typename
hpx::parallel::traits::projected<std::ranges::iterator_t<Rng>, Proj>::value_type>
```

```

parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::remove(ExPolicy
&&pol-
icy,
Rng
&&rng,
T
const
&value,
Proj
&&proj
=
Proj())

```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator *==()* and the projection *proj*.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **T** – The type of the value to remove (deduced). This value type must meet the requirements of *CopyConstructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **value** – Specifies the value of elements to remove.
- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *remove* algorithm returns a *hpx::future< subrange\_t<std::ranges::iterator\_t<Rng>>>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *remove* algorithm returns the iterator to the new end of the range.

## hpx::ranges::remove\_if

Defined in header `hpx/algorithm.hpp`<sup>801</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::remove`

```
template<typename Iter, typename Sent, typename Pred, typename Proj = hpx::identity>
subrange_t<Iter, Sent> hpx::ranges::remove_if(Iter first, Sent sent, Pred &&pred, Proj &&proj = Proj())
```

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove\_if* algorithm execute in sequential order in the calling thread.

### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred* and the projection *proj*.

### Template Parameters

- **Iter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for `FwdIter`.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_if* requires *Pred* to meet the requirements of *CopyConstructible*..
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

<sup>801</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Returns**

The *remove\_if* algorithm returns a *subrange\_t<FwdIter, Sent>*. The *remove\_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename Rng, typename Pred, typename Proj = hpx::identity>
subrange_t<std::ranges::iterator_t<Rng>> hpx::ranges::remove_if(Rng &&rng, Pred &&pred, Proj &&proj =
 Proj())
```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove\_if* algorithm execute in sequential order in the calling thread.

**Note**

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator==() and the projection *proj*.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_if* requires *Pred* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *remove\_if* algorithm returns a *subrange\_t<std::ranges::iterator\_t<Rng>>*. The *remove\_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred, typename Proj =
 hpx::identity>
```

```

parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::remove_if(ExPolicy
&&pol-
icy,
FwdIter
first,
Sent
sent,
Pred
&&pred,
Proj
&&proj
=
Proj())

```

Removes all elements for which predicate *pred* returns true from the range [first, last) and returns a subrange [ret, last), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* applications of the predicate *pred* and the projection *proj*.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used for the This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the end iterators used (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_if* requires *Pred* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.

- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *remove\_if* algorithm returns a `hpx::future<subrange_t<FwdIter, Sent>>`. The *remove\_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

```
template<typename ExPolicy, typename Rng, typename Pred, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>>> hpx::ranges::remove_if(ExPolicy
&&pol-
icy,
Rng
&&rng,
Pred
&&pred,
Proj
&&proj
=
Proj())
```

Removes all elements that are equal to *value* from the range *rng* and and returns a subrange [ret, util::end(rng)), where ret is a past-the-end iterator for the new end of the range.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *remove\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

### Note

Complexity: Performs not more than *util::end(rng)*

- *util::begin(rng)* assignments, exactly *util::end(rng) - util::begin(rng)* applications of the operator`==()` and the projection *proj*.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *remove\_if* requires *Pred* to meet the requirements of *Copy-Constructible*.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is an unary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *remove\_if* algorithm returns a `hpx::future<subrange_t< std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter* otherwise. The *remove\_if* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange of the values all in valid but unspecified state.

### Warning

doxygenfunction: Cannot find function “hpx::ranges::find\_last\_if\_not” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

## hpx::ranges::unique

Defined in header `hpx/algorithm.hpp`<sup>810</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::unique_copy`

```
template<typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
subrange_t<FwdIter, Sent> hpx::ranges::unique(FwdIter first, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

### Template Parameters

<sup>809</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

<sup>810</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *unique* algorithm returns *subrange\_t<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
parallel::util::detail::algorithm_result<ExPolicy, subrange_t<FwdIter, Sent>>::type hpx::ranges::unique(ExPolicy
&&policy,
FwdIter
first,
Sent
last,
Pred
&&pred
=
Pred(),
Proj
&&proj
=
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range [first, last) and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *FwdIter*.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter* can be dereferenced and then implicitly converted to both *Type1* and *Type2*

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *unique* algorithm returns *subrange\_1<FwdIter, Sent>*. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>> hpx::ranges::unique(Rng &&rng, Pred
&&pred = Pred(),
Proj &&proj =
Proj())
```

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than *N* assignments, exactly *N* - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where *N* = `std::distance(begin(rng), end(rng))`.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *unique* algorithm returns `subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>`. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

```
template<typename ExPolicy, typename Rng, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

`parallel::util::detail::algorithm_result<ExPolicy, subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>> hpx::range`

Eliminates all but the first element from every consecutive group of equivalent elements from the range *rng* and returns a past-the-end iterator for the new logical end of the range.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred* and no more than twice as many applications of the projection *proj*, where N = `std::distance(begin(rng), end(rng))`.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *unique* algorithm returns a `hpx::future` `<subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `subrange_t<std::ranges::iterator_t<Rng>, std::ranges::iterator_t<Rng>>` otherwise. The *unique* algorithm returns an object {ret, last}, where ret is a past-the-end iterator for a new subrange.

## hpx::ranges::unique\_copy

Defined in header `hpx/algorithm.hpp`<sup>811</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::unique`

```
template<typename InIter, typename Sent, typename O, typename Pred = ranges::equal_to, typename Proj =
hpx::identity>
unique_copy_result<InIter, O> hpx::ranges::unique_copy(InIter first, Sent last, O dest, Pred &&pred = Pred(),
Proj &&proj = Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique\_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

### Note

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique\_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

<sup>811</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *InIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *unique\_copy* algorithm returns a `unique_copy_result<InIter, O>`. The *unique\_copy* algorithm returns an `in_out_result` with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename FwdIter, typename Sent, typename O, typename Pred =
 ranges::equal_to, typename Proj = hpx::identity>
parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<FwdIter, O>>::type hpx::ranges::unique_copy(ExPolicy
 &&pol-
 icy,
 FwdIter
 first,
 Sent
 last,
 O
 dest,
 Pred
 &&pred
 =
 Pred(),
 Proj
 &&proj
 =
 Proj())
```

Copies the elements from the range [first, last), to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs not more than *last - first* assignments, exactly *last - first - 1* applications of the predicate *pred* and no more than twice as many applications of the projection *proj*

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `FwdIter1`.
- **O** – The type of the iterator representing the destination range (deduced).
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique\_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The *unique\_copy* algorithm returns returns a `hpx::future< unique_copy_result<FwdIter, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `unique_copy_result<FwdIter, O>` otherwise. The *unique\_copy* algorithm returns an `in_out_result` with the source iterator to one past the last element and out containing the destination iterator to the end of the *dest* range.

```
template<typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj = hpx::identity>
```

```
unique_copy_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::unique_copy(Rng &&rng, O dest, Pred
&&pred = Pred(), Proj
&&proj = Proj())
```

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique\_copy* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = std::distance(begin(rng), end(rng)).

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique\_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to std::equal\_to<>
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is a binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *unique\_copy* algorithm returns *unique\_copy\_result*< std::ranges::iterator\_t<Rng>, O>. The *unique\_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

```
template<typename ExPolicy, typename Rng, typename O, typename Pred = ranges::equal_to, typename Proj =
hpx::identity>
```

`parallel::util::detail::algorithm_result<ExPolicy, unique_copy_result<std::ranges::iterator_t<Rng>, O>> hpx::ranges::unique_cop`

Copies the elements from the range *rng*, to another range beginning at *dest* in such a way that there are no consecutive equal elements. Only the first element of each group of equal elements is copied.

The assignments in the parallel *unique\_copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *unique\_copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs not more than N assignments, exactly N - 1 applications of the predicate *pred*, where N = `std::distance(begin(rng), end(rng))`.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Pred** – The type of the function/function object to use (deduced). Unlike its sequential form, the parallel overload of *unique\_copy* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

- **pred** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by the range *rng*. This is an binary predicate which returns *true* for the required elements. The signature of this predicate should be equivalent to:

```
bool pred(const Type &a, const Type &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

### Returns

The *unique\_copy* algorithm returns a `hpx::future<unique_copy_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *unique\_copy\_result< std::ranges::iterator\_t<Rng>, O>* otherwise. The *unique\_copy* algorithm returns the pair of the source iterator to *last*, and the destination iterator to the end of the *dest* range.

## hpx::ranges::copy

Defined in header `hpx/algorithm.hpp`<sup>812</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::copy\_n*
- *hpx::ranges::copy\_if*

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter>
parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_result<FwdIter1, FwdIter>>::type hpx::ranges::copy(ExPolicy
&&pol-
icy,
FwdIter1
iter,
Sent1
sent,
FwdIter
dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

<sup>812</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *copy* algorithm returns a `hpx::future<ranges::copy_result<FwdIter1, FwdIter> >` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::copy_result<FwdIter1, FwdIter>` otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter>
parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter>
```

Copies the elements in the range *rng* to another range beginning at *dest*.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

**Note**

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

**Template Parameters**

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *copy* algorithm returns a `hpx::future<ranges::copy_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::copy_result<iterator_t<Rng>, FwdIter2>` otherwise. The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter>
ranges::copy_result<FwdIter1, FwdIter> hpx::ranges::copy(FwdIter1 iter, Sent1 sent, FwdIter dest)
```

Copies the elements in the range, defined by [first, last), to another range beginning at *dest*.

**Note**

Complexity: Performs exactly *last - first* assignments.

**Template Parameters**

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for Iter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter>
ranges::copy_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter> hpx::ranges::copy(Rng
&&rng,
FwdIter
dest)
```

Copies the elements in the range *rng* to another range beginning at *dest*.

**Note**

Complexity: Performs exactly `std::distance(begin(rng), end(rng))` assignments.

**Template Parameters**

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

**Parameters**

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

**Returns**

The *copy* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

**hpx::ranges::copy\_n**

Defined in header `hpx/algorithm.hpp`<sup>813</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```

<sup>813</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Copies the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1`., to another range beginning at `dest`.

The assignments in the parallel `copy_n` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The assignments in the parallel `copy_n` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

#### Returns

The `copy_n` algorithm returns a `hpx::future<ranges::copy_n_result<FwdIter1, FwdIter2> >` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::copy_n_result<FwdIter1, FwdIter2>` otherwise. The `copy` algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Size, typename FwdIter2>
ranges::copy_n_result<FwdIter1, FwdIter2> hpx::ranges::copy_n(FwdIter1 first, Size count, FwdIter2 dest)
```

Copies the elements in the range `[first, first + count)`, starting from `first` and proceeding to `first + count - 1`., to another range beginning at `dest`.

#### Note

Complexity: Performs exactly *count* assignments, if *count* > 0, no assignments otherwise.

### Template Parameters

- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Size** – The type of the argument specifying the number of elements to apply  $f$  to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.

### Returns

The *copy* algorithm returns the pair of the input iterator forwarded to the first element after the last in the input sequence and the output iterator to the element in the destination range, one past the last element copied.

## hpx::ranges::copy\_if

Defined in header [hpx/algorithm.hpp](#)<sup>814</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::ranges::copy](#)
- [hpx::ranges::copy\\_n](#)

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter, typename Pred,
typename Proj = hpx::identity>
```

```
hpx::parallel::util::detail::algorithm_result<ExPolicy, ranges::copy_if_result<FwdIter1, FwdIter>>::type hpx::ranges::copy_if(E
```

Copies the elements in the range, defined by [first, last) to another range beginning at *dest*. The order of the elements that are not removed is preserved.

---

<sup>814</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for FwdIter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *copy\_if* algorithm returns a `hpx::future<ranges::copy_if_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `ranges::copy_if_result<iterator_t<Rng>, FwdIter2>` otherwise. The *copy\_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename FwdIter, typename Pred, typename Proj = hpx::identity>
```

*hpx::parallel::util::detail::algorithm\_result<ExPolicy, ranges::copy\_if\_result<typename hpx::traits::range\_traits<Rng>::iterator\_type, F*

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *copy\_if* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The `copy_if` algorithm returns a `hpx::future<ranges::copy_if_result<iterator_t<Rng>, FwdIter2>>` if the execution policy is of type `sequenced_task_policy` or `parallel_task_policy` and returns `ranges::copy_if_result<iterator_t<Rng>, FwdIter2>` otherwise. The `copy_if` algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename FwdIter1, typename Sent1, typename FwdIter, typename Pred, typename Proj =
hpx::identity>
ranges::copy_if_result<FwdIter1, FwdIter> hpx::ranges::copy_if(FwdIter1 iter, Sent1 sent, FwdIter dest, Pred
&&pred, Proj &&proj = Proj())
```

Copies the elements in the range, defined by [first, last) to another range beginning at *dest*. The order of the elements that are not removed is preserved.

**Template Parameters**

- **FwdIter1** – The type of the begin source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the end source iterators used (deduced). This iterator type must meet the requirements of an sentinel for FwdIter1.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

**Parameters**

- **iter** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **sent** – Refers to the end of the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

**Returns**

The `copy_if` algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename FwdIter, typename Pred, typename Proj = hpx::identity>
```

```

ranges::copy_if_result<typename hpx::traits::range_traits<Rng>::iterator_type, FwdIter> hpx::ranges::copy_if(Rng
&&rng,
FwdIter
dest,
Pred
&&pred,
Proj
&&proj
=
Proj())

```

Copies the elements in the range, defined by *rng* to another range beginning at *dest*. The order of the elements that are not removed is preserved.

#### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **Pred** – The type of an optional function/function object to use.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **pred** – The binary predicate which returns *true* if the elements should be treated as equal. The signature should be equivalent to the following:

```
bool pred(const Type1 &a, const Type1 &b);
```

The signature does not need to have *const &*, but the function must not modify the objects passed to it. The types *Type1* must be such that objects of type *FwdIter* can be dereferenced and then implicitly converted to *Type1*.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked.

#### Returns

The *copy\_if* algorithm returns the pair of the input iterator *last* and the output iterator to the element in the destination range, one past the last element copied.

### **hpx::ranges::equal**

Defined in header [hpx/algorithm.hpp](#)<sup>815</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```

template<typename ExPolicy, typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename
Pred = equal_to, typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>

```

<sup>815</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```

hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::equal(ExPolicy &&policy, Iter1
first1, Sent1 last1, Iter2 first2,
Sent2 last2, Pred &&op =
Pred(), Proj1 &&proj1 =
Proj1(), Proj2 &&proj2 =
Proj2())

```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most  $\min(\text{last1} - \text{first1}, \text{last2} - \text{first2})$  applications of the predicate *f*.

#### Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), *\*i* equals *\*(first2 + (i - first1))*. This overload of *equal* uses operator== to determine if two elements are equal.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.

- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

#### Returns

The *equal* algorithm returns a *hpx::future<bool>* if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range [first1, last1) does not equal the length of the range [first2, last2), it returns false.

```
template<typename ExPolicy, typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 =
hpx::identity, typename Proj2 = hpx::identity>
hpx::parallel::util::detail::algorithm_result_t<ExPolicy, bool> hpx::ranges::equal(ExPolicy &&policy, Rng1
&&rng1, Rng2 &&rng2,
Pred &&op = Pred(), Proj1
&&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The comparison operations in the parallel *equal* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: At most *last1 - first1* applications of the predicate *f*.

#### Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), *\*i* equals *\*(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *equal* algorithm returns a `hpx::future<bool>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *bool* otherwise. The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

```
template<typename Iter1, typename Sent1, typename Iter2, typename Sent2, typename Pred = equal_to,
typename Proj1 = hpx::identity, typename Proj2 = hpx::identity>
bool hpx::ranges::equal(Iter1 first1, Sent1 last1, Iter2 first2, Sent2 last2, Pred &&op = Pred(), Proj1 &&proj1
= Proj1(), Proj2 &&proj2 = Proj2())
```

Returns true if the range [first1, last1) is equal to the range [first2, last2), and false otherwise.

#### Note

Complexity: At most `min(last1 - first1, last2 - first2)` applications of the predicate *f*.

**Note**

The two ranges are considered equal if, for every iterator  $i$  in the range  $[first1, last1)$ ,  $*i$  equals  $*(first2 + (i - first1))$ . This overload of `equal` uses `operator==` to determine if two elements are equal.

**Template Parameters**

- **Iter1** – The type of the source iterators used for the first range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent1** – The type of the source iterators used for the end of the first range (deduced).
- **Iter2** – The type of the source iterators used for the second range (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent2** – The type of the source iterators used for the end of the second range (deduced).
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of `equal` requires `Pred` to meet the requirements of `CopyConstructible`. This defaults to `std::equal_to<>`
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to `hpx::identity`
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to `hpx::identity`

**Parameters**

- **first1** – Refers to the beginning of the sequence of elements of the first range the algorithm will be applied to.
- **last1** – Refers to the end of the sequence of elements of the first range the algorithm will be applied to.
- **first2** – Refers to the beginning of the sequence of elements of the second range the algorithm will be applied to.
- **last2** – Refers to the end of the sequence of elements of the second range the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const &`, but the function must not modify the objects passed to it. The types `Type1` and `Type2` must be such that objects of types `FwdIter1` and `FwdIter2` can be dereferenced and then implicitly converted to `Type1` and `Type2` respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

**Returns**

The `equal` algorithm returns true if the elements in the two ranges are equal, otherwise it returns false. If the length of the range  $[first1, last1)$  does not equal the length of the range  $[first2, last2)$ , it returns false.

```
template<typename Rng1, typename Rng2, typename Pred = equal_to, typename Proj1 = hpx::identity, typename
Proj2 = hpx::identity>
bool hpx::ranges::equal(Rng1 &&rng1, Rng2 &&rng2, Pred &&op = Pred(), Proj1 &&proj1 = Proj1(), Proj2
&&proj2 = Proj2())
```

Returns true if the range [first1, last1) is equal to the range starting at first2, and false otherwise.

#### Note

Complexity: At most *last1* - *first1* applications of the predicate *f*.

#### Note

The two ranges are considered equal if, for every iterator *i* in the range [first1,last1), *\*i* equals *\*(first2 + (i - first1))*. This overload of *equal* uses *operator==* to determine if two elements are equal.

### Template Parameters

- **Rng1** – The type of the first source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Rng2** – The type of the second source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.
- **Pred** – The type of an optional function/function object to use. Unlike its sequential form, the parallel overload of *equal* requires *Pred* to meet the requirements of *CopyConstructible*. This defaults to *std::equal\_to*<>
- **Proj1** – The type of an optional projection function applied to the first range. This defaults to *hpx::identity*
- **Proj2** – The type of an optional projection function applied to the second range. This defaults to *hpx::identity*

### Parameters

- **rng1** – Refers to the first sequence of elements the algorithm will be applied to.
- **rng2** – Refers to the second sequence of elements the algorithm will be applied to.
- **op** – The binary predicate which returns true if the elements should be treated as equal. The signature of the predicate function should be equivalent to the following:

```
bool pred(const Type1 &a, const Type2 &b);
```

The signature does not need to have *const* &, but the function must not modify the objects passed to it. The types *Type1* and *Type2* must be such that objects of types *FwdIter1* and *FwdIter2* can be dereferenced and then implicitly converted to *Type1* and *Type2* respectively

- **proj1** – Specifies the function (or function object) which will be invoked for each of the elements of the first range as a projection operation before the actual predicate *is* invoked.
- **proj2** – Specifies the function (or function object) which will be invoked for each of the elements of the second range as a projection operation before the actual predicate *is* invoked.

### Returns

The *equal* algorithm returns true if the elements in the two ranges are equal, otherwise it returns false.

## hpx::ranges::nth\_element

Defined in header `hpx/algorithm.hpp`<sup>816</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename RandomIt, typename Sent, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
```

```
RandomIt hpx::ranges::nth_element(RandomIt first, RandomIt nth, Sent last, Pred &&pred = Pred(), Proj &&proj = Proj())
```

`nth_element` is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by `nth` is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new `nth` element are less than or equal to the elements after the new `nth` element.

The comparison operations in the parallel `nth_element` algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Linear in `std::distance(first, last)` on average.  $O(N)$  applications of the predicate, and  $O(N \log N)$  swaps, where  $N = \text{last} - \text{first}$ .

### Template Parameters

- **RandomIt** – The type of the source begin, `nth`, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `RandomIt`.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type `randomIt` can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

<sup>816</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to `hpx::identity`.

#### Returns

The *nth\_element* algorithm returns *RandomIt*. The *nth\_element* algorithm returns an iterator equal to last.

```
template<typename ExPolicy, typename RandomIt, typename Sent, typename Pred = hpx::parallel::detail::less,
 typename Proj = hpx::identity>
parallel::util::detail::algorithm_result_t<ExPolicy, RandomIt> hpx::ranges::nth_element(ExPolicy &&policy,
 RandomIt first,
 RandomIt nth, Sent
 last, Pred &&pred =
 Pred(), Proj &&proj
 = Proj())
```

*nth\_element* is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth\_element* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *nth\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in `std::distance(first, last)` on average.  $O(N)$  applications of the predicate, and  $O(N \log N)$  swaps, where  $N = \text{last} - \text{first}$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **RandomIt** – The type of the source begin, *nth*, and end iterators used (deduced). This iterator type must meet the requirements of a random access iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *RandomIt*.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to *hpx::identity*

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point

- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to *Type*. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to `hpx::identity`.

### Returns

The *partition* algorithm returns a `hpx::future<RandomIt>` if the execution policy is of type *parallel\_task\_policy* and returns *RandomIt* otherwise. The *nth\_element* algorithm returns an iterator equal to last.

```
template<typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj = hpx::identity>
std::ranges::iterator_t<Rng> hpx::ranges::nth_element(Rng &&rng, std::ranges::iterator_t<Rng> nth, Pred
&&pred = Pred(), Proj &&proj = Proj())
```

*nth\_element* is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth\_element* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

### Note

Complexity: Linear in `std::distance(first, last)` on average.  $O(N)$  applications of the predicate, and  $O(N \log N)$  swaps, where  $N = \text{last} - \text{first}$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type *randomIt* can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to `hpx::identity`.

#### Returns

The *nth\_element* algorithm returns `std::ranges::iterator_t<Rng>`. The *nth\_element* algorithm returns an iterator equal to last.

```
template<typename ExPolicy, typename Rng, typename Pred = hpx::parallel::detail::less, typename Proj =
hpx::identity>
parallel::util::detail::algorithm_result_t<ExPolicy, std::ranges::iterator_t<Rng>> hpx::ranges::nth_element(ExPolicy
 &&pol-
 icy,
 Rng
 &&rng,
 std::ranges::iterator_t
 nth,
 Pred
 &&pred
 =
 Pred(),
 Proj
 &&proj
 =
 Proj())
```

*nth\_element* is a partial sorting algorithm that rearranges elements in `[first, last)` such that the element pointed at by *nth* is changed to whatever element would occur in that position if `[first, last)` were sorted and all of the elements before this new *nth* element are less than or equal to the elements after the new *nth* element.

The comparison operations in the parallel *nth\_element* invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *nth\_element* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Linear in `std::distance(first, last)` on average.  $O(N)$  applications of the predicate, and  $O(N \log N)$  swaps, where  $N = \text{last} - \text{first}$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of a random access iterator.
- **Pred** – Comparison function object which returns true if the first argument is less than the second.
- **Proj** – The type of an optional projection function. This defaults to `hpx::identity`

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **nth** – Refers to the iterator defining the sort partition point
- **pred** – Specifies the comparison function object which returns true if the first argument is less than (i.e. is ordered before) the second. The signature of this comparison function should be equivalent to:

```
bool cmp(const Type1 &a, const Type2 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type must be such that an object of type `randomIt` can be dereferenced and then implicitly converted to `Type`. This defaults to `std::less<>`.

- **proj** – Specifies the function (or function object) which will be invoked for each of the elements as a projection operation before the actual predicate *is* invoked. This defaults to `hpx::identity`.

#### Returns

The *partition* algorithm returns a `hpx::future<std::ranges::iterator_t<Rng>>` if the execution policy is of type `parallel_task_policy` and returns `std::ranges::iterator_t<Rng>` otherwise. The *nth\_element* algorithm returns an iterator equal to last.

### hpx::ranges::transform\_exclusive\_scan

Defined in header `hpx/algorithm.hpp`<sup>817</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InIter, typename Sent, typename OutIter, typename BinOp, typename UnOp, typename T =
typename std::iterator_traits<InIter>::value_type>
transform_exclusive_scan_result<InIter, OutIter> hpx::ranges::transform_exclusive_scan(InIter first, Sent
 last, OutIter
 dest, T init,
 BinOp
 &&binary_op,
 UnOp
 &&unary_op)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))`.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

<sup>817</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[first, last)$  or  $[result, result + (last - first))$ .

The behavior of `transform_exclusive_scan` may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(last - first)$  applications of the predicates *op* and *conv*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- *a1* when *N* is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

#### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for `InIter`.
- **OutIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an output iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

#### Parameters

- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have const&, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_exclusive\_scan* algorithm returns *transform\_exclusive\_scan\_result<InIter, OutIter>*. The *transform\_exclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename FwdIter1, typename Sent, typename FwdIter2, typename BinOp,
typename UnOp, typename T = typename std::iterator_traits<FwdIter1>::value_type>
parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_result<FwdIter1, FwdIter2>>::type hpx::ranges::transform
```

Assigns through each iterator *i* in [result, result + (last - first)) the value of GENERALIZED\_NONCOMMUTATIVE\_SUM(binary\_op, init, conv(\*first), ..., conv(\*(first + (i - result) - 1))).

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges [first,last) or [result,result + (last - first)).

The behavior of *transform\_exclusive\_scan* may be non-deterministic for a non-associative predicate.

### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

#### Note

GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aN*) is defined as:

- *a1* when *N* is 1
- *op*(GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *a1*, ..., *aK*), GENERALIZED\_NONCOMMUTATIVE\_SUM(*op*, *aM*, ..., *aN*)) where  $1 < K+1 = M \leq N$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an forward iterator.
- **Sent** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for **FwdIter**.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first** – Refers to the beginning of the sequence of elements the algorithm will be applied to.
- **last** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [*first*, *last*). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_exclusive\_scan* algorithm returns a `hpx::future<transform_exclusive_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *transform\_exclusive\_result<FwdIter1, FwdIter2>* otherwise. The *transform\_exclusive\_scan* algorithm returns an input iterator to the point denoted by the sentinel and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename Rng, typename O, typename BinOp, typename UnOp, typename T = typename
std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
transform_exclusive_scan_result<std::ranges::iterator_t<Rng>, O> hpx::ranges::transform_exclusive_scan(Rng
&&rng,
O
dest,
T
init,
BinOp
&&binary_op,
UnOp
&&unary_op)
```

Assigns through each iterator *i* in `[result, result + (last - first))` the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1))`.

The reduce operations in the parallel *transform\_exclusive\_scan* algorithm invoked without an execution policy object execute in sequential order in the calling thread.

Neither *conv* nor *op* shall invalidate iterators or sub-ranges, or modify elements in the ranges `[first,last)` or `[result,result + (last - first))`.

The behavior of *transform\_exclusive\_scan* may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates *op* and *conv*.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a_1$  when *N* is 1
- `op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK), GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN))` where  $1 < K+1 = M \leq N$ .

### Template Parameters

- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **O** – The type of the iterator representing the destination range (deduced).
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

### Parameters

- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

### Returns

The *transform\_exclusive\_scan* algorithm returns a *transform\_exclusive\_scan\_result*<`std::ranges::iterator_t<Rng>`, *O*>. The *transform\_exclusive\_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

```
template<typename ExPolicy, typename Rng, typename O, typename BinOp, typename UnOp, typename T =
typename std::iterator_traits<std::ranges::iterator_t<Rng>>::value_type>
```

`parallel::util::detail::algorithm_result<ExPolicy, transform_exclusive_scan_result<std::ranges::iterator_t<Rng>, O>>::type hpx::rang`

Assigns through each iterator  $i$  in  $[\text{result}, \text{result} + (\text{last} - \text{first}))$  the value of `GENERALIZED_NONCOMMUTATIVE_SUM(binary_op, init, conv(*first), ..., conv(*(first + (i - result) - 1)))`.

The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked with an execution policy object of type `sequenced_policy` execute in sequential order in the calling thread.

The reduce operations in the parallel `transform_exclusive_scan` algorithm invoked with an execution policy object of type `parallel_policy` or `parallel_task_policy` are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

Neither `conv` nor `op` shall invalidate iterators or sub-ranges, or modify elements in the ranges  $[\text{first}, \text{last})$  or  $[\text{result}, \text{result} + (\text{last} - \text{first}))$ .

The behavior of `transform_exclusive_scan` may be non-deterministic for a non-associative predicate.

#### Note

Complexity:  $O(\text{last} - \text{first})$  applications of the predicates `op` and `conv`.

#### Note

`GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN)` is defined as:

- $a1$  when  $N$  is 1
- $op(\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, a1, \dots, aK), \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(op, aM, \dots, aN))$  where  $1 < K+1 = M \leq N$ .

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

- **O** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of an forward iterator. This iterator type must meet the requirements of an forward iterator.
- **T** – The type of the value to be used as initial (and intermediate) values (deduced).
- **BinOp** – The type of the binary function object used for the reduction operation.
- **UnOp** – The type of the unary function object used for the conversion operation.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng** – Refers to the sequence of elements the algorithm will be applied to.
- **dest** – Refers to the beginning of the destination range.
- **init** – The initial value for the generalized sum.
- **binary\_op** – Specifies the function (or function object) which will be invoked for each of the values of the input sequence. This is a binary predicate. The signature of this predicate should be equivalent to:

```
Ret fun(const Type1 &a, const Type1 &b);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The types *Type1* and *Ret* must be such that an object of a type as given by the input sequence can be implicitly converted to any of those types.

- **unary\_op** – Specifies the function (or function object) which will be invoked for each of the elements in the sequence specified by [first, last). This is a unary predicate. The signature of this predicate should be equivalent to:

```
R fun(const Type &a);
```

The signature does not need to have `const&`, but the function must not modify the objects passed to it. The type *Type* must be such that an object of type *FwdIter1* can be dereferenced and then implicitly converted to *Type*. The type *R* must be such that an object of this type can be implicitly converted to *T*.

#### Returns

The *transform\_exclusive\_scan* algorithm returns a `hpx::future<transform_exclusive_scan_result<std::ranges::iterator_t<Rng>, O>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *transform\_exclusive\_scan\_result<std::ranges::iterator\_t<Rng>, O>* otherwise. The *transform\_exclusive\_scan* algorithm returns an input iterator to one past the end of the range and an output iterator to the element in the destination range, one past the last element copied.

### hpx::ranges::uninitialized\_move

Defined in header `hpx/algorithm.hpp`<sup>818</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ranges::uninitialized_move_n`

<sup>818</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

```
template<typename InIter, typename Sent1, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_move(InIter first1, Sent1 last1,
 FwdIter first2, Sent2
 last2)
```

Moves the elements in the range, defined by [first, last), to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in [first, last) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for InIter2.

#### Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

#### Returns

The *uninitialized\_move* algorithm returns an *in\_out\_result<InIter, FwdIter>*. The *uninitialized\_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename Sent1, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>>::type hpx::ranges::uninitial
```

Moves the elements in the range, defined by `[first, last)`, to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in `[first, last)` are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Sent1** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter*.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **last1** – Refers to sentinel value denoting the end of the sequence of elements the algorithm will be applied.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

#### Returns

The *uninitialized\_move* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `in_out_result<InIter, FwdIter>` otherwise. The *uninitialized\_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename Rng1, typename Rng2>
hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_type, typename hpx::traits::range_traits<Rng2>::it
```

Moves the elements in the range, defined by `[first, last)`, to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in `[first, last)` are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move* algorithm invoked without an execution policy object will execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

#### Template Parameters

- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

#### Parameters

- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

#### Returns

The *uninitialized\_move* algorithm returns an *in\_out\_result*<typename `hpx::traits::range_traits<Rng1>::iterator_type`, typename `hpx::traits::range_traits<Rng2>::iterator_type`>. The *uninitialized\_move* algorithm returns an input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename Rng1, typename Rng2>
parallel::util::detail::algorithm_result<ExPolicy, hpx::parallel::util::in_out_result<typename hpx::traits::range_traits<Rng1>::iterator_t
```

Moves the elements in the range, defined by `[first, last)`, to an uninitialized memory area beginning at *dest*. If an exception is thrown during the initialization, some objects in `[first, last)` are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_move* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *last - first* assignments.

### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **Rng1** – The type of the source range used (deduced). The iterators extracted from this range type must meet the requirements of an input iterator.
- **Rng2** – The type of the destination range used (deduced). The iterators extracted from this range type must meet the requirements of an forward iterator.

### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **rng1** – Refers to the range from which the elements will be moved from
- **rng2** – Refers to the range to which the elements will be moved to

### Returns

The *uninitialized\_move* algorithm returns a `hpx::future<in_out_result<InIter, FwdIter>>`, if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns `in_out_result< typename hpx::traits::range_traits<Rng1>::iterator_type , typename hpx::traits::range_traits<Rng2>::iterator_type>` otherwise. The *uninitialized\_move* algorithm returns the input iterator to one past the last element moved from and the output iterator to the element in the destination range, one past the last element moved.

## hpx::ranges::uninitialized\_move\_n

Defined in header `hpx/algorithm.hpp`<sup>819</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ranges::uninitialized\_move*

```
template<typename InIter, typename Size, typename FwdIter, typename Sent2>
hpx::parallel::util::in_out_result<InIter, FwdIter> hpx::ranges::uninitialized_move_n(InIter first1, Size
count, FwdIter first2,
Sent2 last2)
```

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

#### Note

Complexity: Performs exactly *count* movements, if count > 0, no move operations otherwise.

### Template Parameters

<sup>819</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/algorithm.hpp>

- **InIter** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for FwdIter.

#### Parameters

- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

#### Returns

The *uninitialized\_move\_n* algorithm returns *in\_out\_result<InIter, FwdIter>*. The *uninitialized\_move\_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

```
template<typename ExPolicy, typename FwdIter1, typename Size, typename FwdIter2, typename Sent2>
parallel::util::detail::algorithm_result<ExPolicy, parallel::util::in_out_result<FwdIter1, FwdIter2>>::type hpx::ranges::uninitial
```

Moves the elements in the range [first, first + count), starting from first and proceeding to first + count - 1., to another range beginning at dest. If an exception is thrown during the initialization, some objects in [first, first + count) are left in a valid but unspecified state.

The assignments in the parallel *uninitialized\_move\_n* algorithm invoked with an execution policy object of type *sequenced\_policy* execute in sequential order in the calling thread.

The assignments in the parallel *uninitialized\_move\_n* algorithm invoked with an execution policy object of type *parallel\_policy* or *parallel\_task\_policy* are permitted to execute in an unordered fashion in unspecified threads, and indeterminately sequenced within each thread.

#### Note

Complexity: Performs exactly *count* movements, if count > 0, no move operations otherwise.

#### Template Parameters

- **ExPolicy** – The type of the execution policy to use (deduced). It describes the manner in which the execution of the algorithm may be parallelized and the manner in which it executes the assignments.
- **FwdIter1** – The type of the source iterators used (deduced). This iterator type must meet the requirements of an input iterator.
- **Size** – The type of the argument specifying the number of elements to apply *f* to.
- **FwdIter2** – The type of the iterator representing the destination range (deduced). This iterator type must meet the requirements of a forward iterator.
- **Sent2** – The type of the source sentinel (deduced). This sentinel type must be a sentinel for *InIter2*.

#### Parameters

- **policy** – The execution policy to use for the scheduling of the iterations.
- **first1** – Refers to the beginning of the sequence of elements that will be moved from
- **count** – Refers to the number of elements starting at *first* the algorithm will be applied to.
- **first2** – Refers to the beginning of the destination range.
- **last2** – Refers to sentinel value denoting the end of the second range the algorithm will be applied to.

#### Returns

The *uninitialized\_move\_n* algorithm returns a `hpx::future<in_out_result<FwdIter1, FwdIter2>>` if the execution policy is of type *sequenced\_task\_policy* or *parallel\_task\_policy* and returns *FwdIter2* otherwise. The *uninitialized\_move\_n* algorithm returns the output iterator to the element in the destination range, one past the last element moved.

## asio

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### hpx/asio/asio\_util.hpp

Defined in header `hpx/asio/asio_util.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

## Functions

bool **get\_endpoint**(*std::string* const &addr, *std::uint16\_t* port, *asio::ip::tcp::endpoint* &ep, bool force\_ipv4 = false)

*std::string* **get\_endpoint\_name**(*asio::ip::tcp::endpoint* const &ep)

*asio::ip::tcp::endpoint* **resolve\_hostname**(*std::string* const &hostname, *std::uint16\_t* port, *asio::io\_context* &io\_service, bool force\_ipv4 = false)

The signature for an assertion handler.

### Functions

*assertion\_handler* **set\_assertion\_handler**(*assertion\_handler* handler)

Set the assertion handler to be used within a program. If the handler has been set already once, the call to this function will be ignored.

### Note

This function is not thread safe

---

<sup>821</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/source\\_location.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/source_location.hpp)

## async\_base

See *Public API* for a list of names and headers that are part of the public HPX API.

## hpx::post

Defined in header `hpx/future.hpp`<sup>822</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

### See also

*hpx::post (distributed)*

```
template<typename F, typename ...Ts>
```

```
bool hpx::post(F &&f, Ts&&... ts)
```

Runs the function `f` asynchronously (potentially in a separate thread which might be a part of a thread pool). This is done in a fire-and-forget manner, meaning there is no return value or way to synchronize with the function execution (it does not return an `hpx::future` that would hold the result of that function call).

`hpx::post` is particularly useful when synchronization mechanisms as heavyweight as futures are not desired, and instead, more lightweight mechanisms like latches or atomic variables are preferred. Essentially, the `post` function enables the launch of a new thread without the overhead of creating a future.

### Note

`hpx::post` is similar to `hpx::async` but does not return a future. This is why there is no way of finding out the result/failure of the execution of this function.

```
template<typename Action, typename ...Ts>
```

```
bool hpx::post(hpx::id_type const &id, Ts&&... vs)
```

```
template<typename Action, typename Client, typename Stub, typename Data, typename ...Ts>
```

```
bool hpx::post(components::client_base<Client, Stub, Data> const &c, Ts&&... vs)
```

```
template<typename Action, typename DistPolicy, typename ...Ts>
```

```
bool hpx::post(DistPolicy const &policy, Ts&&... vs)
```

```
template<typename Action, typename Continuation, typename ...Ts>
```

```
bool hpx::post(Continuation &&c, hpx::id_type const &gid, Ts&&... vs)
```

```
template<typename Action, typename Continuation, typename Client, typename Stub, typename Data,
typename ...Ts>
```

```
bool hpx::post(Continuation &&cont, components::client_base<Client, Stub, Data> const &c, Ts&&... vs)
```

```
template<typename Action, typename Continuation, typename DistPolicy, typename ...Ts>
```

```
bool hpx::post(Continuation &&c, DistPolicy const &policy, Ts&&... vs)
```

```
template<typename Action, typename Target, typename ...Ts>
```

<sup>822</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

bool **hpx::post**(*Action* &&action, *Target* &&target, *Ts*&&... ts)

The distributed implementation of **hpx::post** can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID.

#### Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

#### Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

#### Returns

true if the action was successfully posted, false otherwise.

## hpx::sync

Defined in header `hpx/future.hpp`<sup>823</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

#### See also

*hpx::sync (distributed)*

```
template<typename Action, typename F, typename ...Ts>
auto hpx::sync(F &&f, Ts&&... ts) -> decltype(detail::sync_action_dispatch<Action,
std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *sync* runs the function *f* synchronously and returns a **hpx::future** that will eventually hold the result of that function call.

```
template<typename Action, typename F, typename ...Ts>
auto hpx::sync(F &&f, Ts&&... ts) -> decltype(detail::sync_action_dispatch<Action,
std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *sync* runs the function *f* synchronously and returns a **hpx::future** that will eventually hold the result of that function call.

#### Warning

doxygenfunction: Unable to resolve function “hpx::sync” with arguments (Action&&, Target&&, Ts&&...) in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc. Potential matches:

```
- template<typename Action, typename F, typename ...Ts> auto sync(F &&f, Ts&&... ts) -
-> decltype(detail::sync_action_dispatch<Action, std::decay_t<F>>::call(std::forward
-><F>(f), std::forward<Ts>(ts)...))
- template<typename Action, typename Target, typename ...Ts> decltype(auto)
->sync(Action &&action, Target &&target, Ts&&... ts)
- template<typename F, typename ...Ts> decltype(auto) sync(F &&f, Ts&&... ts)
```

<sup>823</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

## hpx::async

Defined in header `hpx/future.hpp`<sup>824</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

### See also

*hpx::async (distributed)*

```
template<typename Action, typename F, typename ...Ts>
auto hpx::async(F &&f, Ts&&... ts) -> decltype(detail::async_action_dispatch<Action,
 std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a `hpx::future` that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being `hpx::launch::async` | `hpx::launch::deferred`. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the *async* flag is set (i.e. (policy & `hpx::launch::async`) != 0), then *async* executes the callable object *f* on a new thread of execution (with all thread-locals initialized) as if spawned by `hpx::thread`(`std::forward<F>(f)`, `std::forward<Ts>(ts)`...), except that if the function *f* returns a value or throws an exception, it is stored in the shared state accessible through the `hpx::future` that *async* returns to the caller.
- If the *deferred* flag is set (i.e. (policy & `hpx::launch::deferred`) != 0), then *async* converts *f* and *ts*... the same way as by `hpx::thread` constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the `hpx::future` that *async* returned to the caller will cause the copy of *f* to be invoked (as a rvalue) with the copies of *ts*... (also passed as rvalues) in the current thread (which does not have to be the thread that originally called `hpx::async`). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same `hpx::future` will return the result immediately.
- If neither `hpx::launch::async` nor `hpx::launch::deferred`, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the `hpx::launch::async` and `hpx::launch::deferred` flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to `hpx::async` synchronizes-with (as defined in `std::memory_order`) the call to *f*, and the completion of *f* is sequenced-before making the shared state ready. If the *async* policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If `std::decay<Function>::type` or each type in `std::decay<Ts>::type` is not constructible from its corresponding argument, the program is ill-formed.

### Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to *f*

### Returns

`hpx::future` referring to the shared state created by this call to `hpx::async`.

<sup>824</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

```
template<typename Action, typename F, typename ...Ts>
auto hpx::async(F &&f, Ts&&... ts) -> decltype(detail::async_action_dispatch<Action,
 std::decay_t<F>>::call(std::forward<F>(f), std::forward<Ts>(ts)...))
```

The function template *async* runs the function *f* asynchronously (potentially in a separate thread which might be a part of a thread pool) and returns a *hpx::future* that will eventually hold the result of that function call. If no policy is defined, *async* behaves as if it is called with policy being *hpx::launch::async* | *hpx::launch::deferred*. Otherwise, it calls a function *f* with arguments *ts* according to a specific launch policy.

- If the async flag is set (i.e. (policy & *hpx::launch::async*) != 0), then *async* executes the callable object *f* on a new thread of execution (with all thread-locals initialized) as if spawned by *hpx::thread*(std::forward<*F*>(f), std::forward<*Ts*>(ts)...), except that if the function *f* returns a value or throws an exception, it is stored in the shared state accessible through the *hpx::future* that *async* returns to the caller.
- If the deferred flag is set (i.e. (policy & *hpx::launch::deferred*) != 0), then *async* converts *f* and *ts...* the same way as by *hpx::thread* constructor, but does not spawn a new thread of execution. Instead, lazy evaluation is performed: the first call to a non-timed wait function on the *hpx::future* that *async* returned to the caller will cause the copy of *f* to be invoked (as a rvalue) with the copies of *ts...* (also passed as rvalues) in the current thread (which does not have to be the thread that originally called *hpx::async*). The result or exception is placed in the shared state associated with the future and only then it is made ready. All further accesses to the same *hpx::future* will return the result immediately.
- If neither *hpx::launch::async* nor *hpx::launch::deferred*, nor any implementation-defined policy flag is set in policy, the behavior is undefined.

If more than one flag is set, it is implementation-defined which policy is selected. For the default (both the *hpx::launch::async* and *hpx::launch::deferred* flags are set in policy), standard recommends (but doesn't require) utilizing available concurrency, and deferring any additional tasks.

In any case, the call to *hpx::async* synchronizes-with (as defined in std::memory\_order) the call to *f*, and the completion of *f* is sequenced-before making the shared state ready. If the *async* policy is chosen, the associated thread completion synchronizes-with the successful return from the first function that is waiting on the shared state, or with the return of the last function that releases the shared state, whichever comes first. If std::decay<Function>::type or each type in std::decay<*Ts*>::type is not constructible from its corresponding argument, the program is ill-formed.

#### Parameters

- **f** – Callable object to call
- **ts** – parameters to pass to *f*

#### Returns

*hpx::future* referring to the shared state created by this call to *hpx::async*.

#### Warning

doxygenfunction: Unable to resolve function “hpx::async” with arguments (Executor&&, hpx::sycl::experimental::sycl\_executor::queue\_function\_ptr\_t<*Ts...*>&&, *Ts*&&...) in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc. Potential matches:

```
- template<typename Action, typename F, typename ...Ts> auto async(F &&f, Ts&&... ts)
 ↳-> decltype(detail::async_action_dispatch<Action, std::decay_t<F>>
 ↳::call(std::forward<F>(f), std::forward<Ts>(ts)...))
- template<typename Action, typename Target, typename ...Ts> auto async(Action &&
 ↳action, Target &&target, Ts&&... ts)
- template<typename Executor, typename ...Ts> decltype(auto) async(Executor &&exec,
 ↳hpx::sycl::experimental::sycl_executor::queue_function_ptr_t<Ts...> &&f, Ts&&... ts)
- template<typename F, typename ...Ts> decltype(auto) async(F &&f, Ts&&... ts)
```

```
template<typename Action, typename Target, typename ...Ts>
auto hpx::async(Action &&action, Target &&target, Ts&&... ts)
```

The distributed implementation of `hpx::async` can be used by giving an action instance as argument instead of a function, and also by providing another argument with the locality ID or the target ID. The action executes asynchronously.

#### Template Parameters

- **Action** – The type of action instance
- **Target** – The type of target where the action should be executed
- **Ts** – The type of any additional arguments

#### Parameters

- **action** – The action instance to be executed
- **target** – The target where the action should be executed
- **ts** – Additional arguments

#### Returns

`hpx::future` referring to the shared state created by this call to `hpx::async`

## `hpx::launch`

Defined in header `hpx/future.hpp`<sup>825</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
struct launch : public hpx::detail::policy_holder<>
 Launch policies for hpx::async etc.
```

## `hpx::dataflow`

Defined in header `hpx/future.hpp`<sup>826</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

#### See also

`hpx::dataflow` (*distributed*)

**async\_combinators**

See [Public API](#) for a list of names and headers that are part of the public HPX API.

**hpx/async\_combinators/split\_future.hpp**

Defined in header `hpx/async_combinators/split_future.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

Top level HPX namespace.

**Functions**

```
template<typename ...Ts>
inline tuple<future<Ts>...> split_future(future<tuple<Ts...>> &&f)
```

The function *split\_future* is an operator allowing to split a given future of a sequence of values (any tuple, `std::pair`, or `std::array`) into an equivalent container of futures where each future represents one of the values from the original future. In some sense this function provides the inverse operation of *when\_all*.

**Note**

The following cases are special:

```
tuple<future<void> > split_future(future<tuple<> > && f);
array<future<void>, 1> split_future(future<array<T, 0> > && f);
```

here the returned futures are directly representing the futures which were passed to the function.

**Parameters**

**f** – [in] A future holding an arbitrary sequence of values stored in a tuple-like container. This facility supports `hpx::tuple<>`, `std::pair<T1, T2>`, and `std::array<T, N>`

**Returns**

Returns an equivalent container (same container type as passed as the argument) of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

```
template<typename T>
inline std::vector<future<T>> split_future(future<std::vector<T>> &&f, std::size_t size)
```

The function *split\_future* is an operator allowing to split a given future of a sequence of values (any `std::vector`) into a `std::vector` of futures where each future represents one of the values from the original `std::vector`. In some sense this function provides the inverse operation of *when\_all*.

**Parameters**

- **f** – [in] A future holding an arbitrary sequence of values stored in a `std::vector`.
- **size** – [in] The number of elements the vector will hold once the input future has become ready

**Returns**

Returns a `std::vector` of futures, where each future refers to the corresponding value in the input parameter. All the returned futures become ready once the input future has become ready. If the input future is exceptional, all output futures will be exceptional as well.

**hpx::when\_any**

Defined in header `hpx/future.hpp`<sup>827</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename InputIter, typename Container = vector<future<typename
std::iterator_traits<InputIter>::value_type>>>
future<when_any_result<Container>>> hpx::when_any(InputIter first, InputIter last)
```

function *when\_any* creates a future object that becomes when at least one element in a set of *future* and *shared\_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

**Parameters**

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *when\_any* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *when\_any* should wait.

**Returns**

Returns a `when_any_result` holding the same list of futures as has been passed to *when\_any* and an index pointing to a ready future.

- `future<when_any_result<Container<future<R>>>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
```

<sup>827</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

*future*<when\_any\_result<*Range*>> *hpx::when\_any*(*Range* &values)

function *when\_any* creates a future object that becomes when at least one element in a set of *future* and *shared\_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

#### Parameters

**values** – [in] A range holding an arbitrary amount of *futures* or *shared\_future* objects for which *when\_any* should wait.

#### Returns

Returns a *when\_any\_result* holding the same list of futures as has been passed to *when\_any* and an index pointing to a ready future.

- *future*<when\_any\_result<Container<future<R>>>>: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

template<typename ...T>

*future*<when\_any\_result<tuple<future<T>...>>> *hpx::when\_any*(T&&... futures)

function *when\_any* creates a future object that becomes when at least one element in a set of *future* and *shared\_future* objects becomes ready. It is a non-deterministic choice operator. It OR-composes all given future objects and returns a new future object representing the same list of futures after one future of that list finishes execution.

#### Parameters

**futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *when\_any* should wait.

#### Returns

Returns a *when\_any\_result* holding the same list of futures as has been passed to *when\_any* and an index pointing to a ready future.

- *future*<when\_any\_result<tuple<future<T0>, future<T1>...>>>: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- *future*<when\_any\_result<tuple<>>> if *when\_any* is called with zero arguments. The returned future will be initially ready.

## **hpx::when\_all**

Defined in header [hpx/future.hpp](#)<sup>828</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std::iterator\_traits*<*InputIter*>::value\_type>>>

*hpx::future*<*Container*> *hpx::when\_all*(*InputIter* first, *InputIter* last)

function *when\_all* creates a future object that becomes ready when all elements in a set of *future* and *shared\_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

---

<sup>828</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

**Note**

Calling this version of *when\_all* where `first == last`, returns a future with an empty container that is immediately ready. Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_all* will not throw an exception, but the futures held in the output collection may.

**Parameters**

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *when\_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *when\_all* should wait.

**Returns**

Returns a future holding the same list of futures as has been passed to *when\_all*.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
hpx::future<Range> hpx::when_all(Range &&values)
```

function *when\_all* creates a future object that becomes ready when all elements in a set of *future* and *shared\_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

**Note**

Calling this version of *when\_all* where the input container is empty, returns a future with an empty container that is immediately ready. Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_all* will not throw an exception, but the futures held in the output collection may.

**Parameters**

**values** – [in] A range holding an arbitrary amount of *future* or *shared\_future* objects for which *when\_all* should wait.

**Returns**

Returns a future holding the same list of futures as has been passed to *when\_all*.

- `future<Container<future<R>>>`: If the input cardinality is unknown at compile time and the futures are all have the same type.

```
template<typename ...T>
hpx::future<hpx::tuple<hpx::future<T>...>> hpx::when_all(T&&... futures)
```

function *when\_all* creates a future object that becomes ready when all elements in a set of *future* and *shared\_future* objects become ready. It is an operator allowing to join on the result of all given futures. It AND-composes all given future objects and returns a new future object representing the same list of futures after they finished executing.

**Note**

Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_all* will not throw an exception, but the futures held in the output collection may.

**Parameters**

**futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *when\_all* should wait.

**Returns**

Returns a future holding the same list of futures as has been passed to *when\_all*.

- `future<tuple<future<T0>, future<T1>, future<T2>...>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- `future<tuple<>>` if *when\_all* is called with zero arguments. The returned future will be initially ready.

**hpx::wait\_all**

Defined in header `hpx/future.hpp`<sup>829</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_all_nothrow`
- `hpx::wait_all_n`
- `hpx::wait_all_n_nothrow`

```
template<typename InputIter>
```

```
void hpx::wait_all(InputIter first, InputIter last)
```

The function *wait\_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function *wait\_all* returns after all futures have become ready. All input futures are still valid after *wait\_all* returns.

**Note**

The function *wait\_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait\_all\_nothrow* instead.

<sup>829</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

**Note**

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait\_all* returns and all inspection of the futures is complete.

**Parameters**

- **first** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_all* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or *shared\_future* objects for which *wait\_all* should wait.

```
template<typename R>
void hpx::wait_all(std::vector<future<R>> &&futures)
```

The function *wait\_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function *wait\_all* returns after all futures have become ready. All input futures are still valid after *wait\_all* returns.

**Note**

The function *wait\_all* will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use *wait\_all\_nothrow* instead.

**Note**

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait\_all* returns and all inspection of the futures is complete.

**Parameters**

- **futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_all* should wait.

```
template<typename R, std::size_t N>
void hpx::wait_all(std::array<future<R>, N> &&futures)
```

The function *wait\_all* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function *wait\_all* returns after all futures have become ready. All input futures are still valid after *wait\_all* returns.

**Note**

The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Note**

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until `wait_all` returns and all inspection of the futures is complete.

**Parameters**

**futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_all` should wait.

```
template<typename T>
void hpx::wait_all(hpx::future<T> const &f)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function `wait_all` returns after the future has become ready. The input future is still valid after `wait_all` returns.

**Note**

The function `wait_all` will rethrow any exceptions captured by the future while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters**

**f** – A *future* or *shared\_future* for which `wait_all` should wait.

```
template<typename ...T>
void hpx::wait_all(T&&... futures)
```

The function `wait_all` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

**Note**

The function `wait_all` returns after all futures have become ready. All input futures are still valid after `wait_all` returns.

**Note**

The function `wait_all` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_nothrow` instead.

**Parameters**

**futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_all* should wait.

**hpx::wait\_all\_nothrow**

Defined in header `hpx/future.hpp`<sup>830</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::wait\_all*
- *hpx::wait\_all\_n*
- *hpx::wait\_all\_n\_nothrow*

```
template<typename InputIter>
```

```
bool hpx::wait_all_nothrow(InputIter first, InputIter last)
```

The function *wait\_all\_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait\_all*. It differs from *wait\_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

**Note**

The function *wait\_all\_nothrow* returns after all futures have become ready. All input futures are still valid after *wait\_all\_nothrow* returns.

**Note**

Unlike *wait\_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

**Note**

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until *wait\_all* returns and all inspection of the futures is complete.

**Parameters**

- **first** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_all\_nothrow* should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of *future* or *shared\_future* objects for which *wait\_all\_nothrow* should wait.

**Returns**

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

```
template<typename R>
```

<sup>830</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

```
bool hpx::wait_all_nothrow(std::vector<future<R>> &&futures)
```

The function *wait\_all\_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait\_all*. It differs from *wait\_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

**Note**

The function *wait\_all\_nothrow* returns after all futures have become ready. All input futures are still valid after *wait\_all\_nothrow* returns.

**Note**

Unlike *wait\_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

**Parameters**

**futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_all\_nothrow* should wait.

**Returns**

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

```
template<typename R, std::size_t N>
```

```
bool hpx::wait_all_nothrow(std::array<future<R>, N> &&futures)
```

The function *wait\_all\_nothrow* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to *wait\_all*. It differs from *wait\_all* in that it will not rethrow any exceptions captured by the given futures while they became ready.

**Note**

The function *wait\_all\_nothrow* returns after all futures have become ready. All input futures are still valid after *wait\_all\_nothrow* returns.

**Note**

Unlike *wait\_all*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned *bool* to detect their presence.

**Parameters**

**futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_all\_nothrow* should wait.

**Returns**

Returns *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

```
template<typename T>
```

bool `hpx::wait_all_nothrow(hpx::future<T> const &f)`

The function `wait_all_nothrow` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to `wait_all`. It differs from `wait_all` in that it will not rethrow any exceptions captured by the given future while it became ready.

#### Note

The function `wait_all_nothrow` returns after the future has become ready. The input future is still valid after `wait_all_nothrow` returns.

#### Note

Unlike `wait_all`, this function will not rethrow any exception captured by the future while becoming ready. Any such exception is silently discarded; the caller can use the returned `bool` to detect its presence.

#### Parameters

**f** – A `future` or `shared_future` for which `wait_all_nothrow` should wait.

#### Returns

Returns `true` if the given future held an exception once it became ready, and `false` otherwise.

template<typename ...T>

bool `hpx::wait_all_nothrow(T&&... futures)`

The function `wait_all_nothrow` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to `wait_all`. It differs from `wait_all` in that it will not rethrow any exceptions captured by the given futures while they became ready.

#### Note

The function `wait_all_nothrow` returns after all futures have become ready. All input futures are still valid after `wait_all_nothrow` returns.

#### Note

Unlike `wait_all`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned `bool` to detect their presence.

#### Parameters

**futures** – An arbitrary number of `future` or `shared_future` objects, possibly holding different types for which `wait_all_nothrow` should wait.

#### Returns

Returns `true` if any of the given futures held an exception once it became ready, and `false` otherwise.

## hpx::wait\_all\_n

Defined in header `hpx/future.hpp`<sup>831</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::wait_all`
- `hpx::wait_all_nothrow`
- `hpx::wait_all_n_nothrow`

```
template<typename InputIter>
void hpx::wait_all_n(InputIter begin, std::size_t count)
```

The function `wait_all_n` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing.

### Note

The function `wait_all_n` returns after all futures have become ready. All input futures are still valid after `wait_all_n` returns.

### Note

The function `wait_all_n` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_all_n_nothrow` instead.

### Note

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until `wait_all` returns and all inspection of the futures is complete.

### Parameters

- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which `wait_all_n` should wait.
- **count** – The number of elements in the sequence starting at *first*.

### Returns

The function `wait_all_n` will return an iterator referring to the first element in the input sequence after the last processed element.

---

<sup>831</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

## hpx::wait\_all\_n\_nothrow

Defined in header `hpx/future.hpp`<sup>832</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_all`
- `hpx::wait_all_nothrow`
- `hpx::wait_all_n`

template<typename **InputIter**>

`std::pair<InputIter, bool> hpx::wait_all_n_nothrow(InputIter begin, std::size_t count)`

The function `wait_all_n_nothrow` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns after they finished executing, similar to `wait_all_n`. It differs from `wait_all_n` in that it will not rethrow any exceptions captured by the given futures while they became ready.

### Note

The function `wait_all_n_nothrow` returns after all futures have become ready. All input futures are still valid after `wait_all_n_nothrow` returns.

### Note

Unlike `wait_all_n`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call; the caller can use the returned `bool` to detect their presence.

### Note

The caller is responsible for keeping the *futures* container alive, unmoved, and unmodified until `wait_all` returns and all inspection of the futures is complete.

### Parameters

- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which `wait_all_n_nothrow` should wait.
- **count** – The number of elements in the sequence starting at *first*.

### Returns

The function `wait_all_n_nothrow` returns a pair consisting of an iterator referring to the first element in the input sequence after the last processed element, and a *bool* that is *true* if any of the given futures held an exception once it became ready, and *false* otherwise.

<sup>832</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

## hpx::when\_each

Defined in header `hpx/future.hpp`<sup>833</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename F, typename Future>
future<void> hpx::when_each(F &&f, std::vector<Future> &&futures)
```

The function *when\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

### Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

### Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_each* should wait.

### Returns

Returns a future representing the event of all input futures being ready.

```
template<typename F, typename Iterator>
future<Iterator> hpx::when_each(F &&f, Iterator begin, Iterator end)
```

The function *when\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

### Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

### Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *wait\_each* should wait.

<sup>833</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

**Returns**

Returns a future representing the event of all input futures being ready.

```
template<typename F, typename ...Ts>
future<void> hpx::when_each(F &&f, Ts&&... futures)
```

The function *when\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns a new future object representing the event of all those futures having finished executing. It also calls the supplied callback for each of the futures which becomes ready.

**Note**

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

**Parameters**

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_each* should wait.

**Returns**

Returns a future representing the event of all input futures being ready.

**hpx::wait\_some**

Defined in header `hpx/future.hpp`<sup>834</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::wait\_some\_nothrow*
- *hpx::wait\_some\_n*
- *hpx::wait\_some\_n\_nothrow*

```
template<typename InputIter>
void hpx::wait_some(std::size_t n, InputIter first, InputIter last)
```

The function *wait\_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

**Note**

The function *wait\_some* returns after *n* futures have become ready. All input futures are still valid after *wait\_some* returns.

<sup>834</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

**Note**

The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

**Parameters**

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the function to return.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *when\_all* should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *when\_all* should wait.

```
template<typename R>
void hpx::wait_some(std::size_t n, std::vector<future<R>> &&futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

**Note**

The function `wait_some` returns after *n* futures have become ready. All input futures are still valid after `wait_some` returns.

**Note**

The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

**Parameters**

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A vector holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_some` should wait.

```
template<typename R, std::size_t N>
void hpx::wait_some(std::size_t n, std::array<future<R>, N> &&futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

**Note**

The function `wait_some` returns after *n* futures have become ready. All input futures are still valid after `wait_some` returns.

**Note**

The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

**Parameters**

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_some` should wait.

```
template<typename ...T>
void hpx::wait_some(std::size_t n, T&&... futures)
```

The function `wait_some` is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

**Note**

The function `wait_all` returns after *n* futures have become ready. All input futures are still valid after `wait_some` returns.

**Note**

The function `wait_some` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_some_nothrow` instead.

**Parameters**

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which `wait_some` should wait.

template<typename **F**, typename **Future**>

void `hpx::wait_each`(*F* &&*f*, *std::vector*<*Future*> &&*futures*)

The function *wait\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait\_each* returns after all futures have been become ready.

### Note

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

### Parameters

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **futures** – A vector holding an arbitrary amount of *future* or *shared\_future* objects for which *wait\_each* should wait.

<sup>837</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

<sup>838</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

```
template<typename F, typename Iterator>
void hpx::wait_each(F &&f, Iterator begin, Iterator end)
```

The function *wait\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait\_each* returns after all futures have been become ready.

**Note**

This function consumes the futures as they are passed on to the supplied function. The callback should take one or two parameters, namely either a *future* to be processed or a type that *std::size\_t* is implicitly convertible to as the first parameter and the *future* as the second parameter. The first parameter will correspond to the index of the current *future* in the collection.

**Parameters**

- **f** – The function which will be called for each of the input futures once the future has become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *wait\_each* should wait.
- **end** – The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *wait\_each* should wait.

```
template<typename F, typename ...T>
void hpx::wait_each(F &&f, T&&... futures)
```

The function *wait\_each* is an operator allowing to join on the results of all given futures. It AND-composes all future objects given and returns after they finished executing. Additionally, the supplied function is called for each of the passed futures as soon as the future has become ready. *wait\_each* returns after all futures have been become ready.

**Note**

This function consumes the futures as they are passed on to the supplied function. ## hpx::when\_some

Defined in header `hpx/future.hpp`<sup>842</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **InputIter**, typename **Container** = vector<*future*<typename *std::iterator\_traits<InputIter>::value\_type>>>*

*future*<when\_some\_result<Container>> **hpx::when\_some**(*std::size\_t* n, Iterator first, Iterator last)

The function *when\_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

### Note

The future returned by the function *when\_some* becomes ready when at least *n* argument futures have become ready.

### Note

Calling this version of *when\_some* where *first* == *last*, returns a future with an empty container that is immediately ready. Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_some* will not throw an exception, but the futures held in the output collection may.

### Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which *when\_all* should wait.

<sup>841</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

<sup>842</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which *when\_all* should wait.

#### Returns

Returns a *when\_some\_result* holding the same list of futures as has been passed to *when\_some* and indices pointing to ready futures.

- *future*<*when\_some\_result*<Container<*future*<R>>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename Range>
```

```
future<when_some_result<Range>> hpx::when_some(std::size_t n, Range &&futures)
```

The function *when\_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

#### Note

The future returned by the function *when\_some* becomes ready when at least *n* argument futures have become ready.

#### Note

Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_some* will not throw an exception, but the futures held in the output collection may.

#### Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] A container holding an arbitrary amount of *future* or *shared\_future* objects for which *when\_some* should wait.

#### Returns

Returns a *when\_some\_result* holding the same list of futures as has been passed to *when\_some* and indices pointing to ready futures.

- *future*<*when\_some\_result*<Container<*future*<R>>>>>: If the input cardinality is unknown at compile time and the futures are all of the same type. The order of the futures in the output container will be the same as given by the input iterator.

```
template<typename ...Ts>
```

```
future<when_some_result<tuple<future<T>...>>> hpx::when_some(std::size_t n, Ts&&... futures)
```

The function *when\_some* is an operator allowing to join on the result of all given futures. It AND-composes all future objects given and returns a new future object representing the same list of futures after *n* of them finished executing.

#### Note

The future returned by the function *when\_some* becomes ready when at least *n* argument futures have become ready.

#### Note

Each future and *shared\_future* is waited upon and then copied into the collection of the output (returned) future, maintaining the order of the futures in the input collection. The future returned by *when\_some* will not throw an exception, but the futures held in the output collection may.

#### Parameters

- **n** – [in] The number of futures out of the arguments which have to become ready in order for the returned future to get ready.
- **futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *when\_some* should wait.

#### Returns

Returns a *when\_some\_result* holding the same list of futures as has been passed to *when\_some* and an index pointing to a ready future..

- `future<when_some_result<tuple<future<T0>, future<T1>...>>>>`: If inputs are fixed in number and are of heterogeneous types. The inputs can be any arbitrary number of future objects.
- `future<when_some_result<tuple<>>>` if *when\_some* is called with zero arguments. The returned future will be initially ready.

## hpx::wait\_all\_for

Defined in header `hpx/future.hpp`<sup>843</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_all_for_nothrow`
- `hpx::wait_all_for_n`
- `hpx::wait_all_for_n_nothrow`

```
template<typename InputIter>
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, InputIter first, InputIter
 last)
```

The function *wait\_all\_for* is an operator allowing to join on the result of all given futures, similar to *wait\_all*. It differs from *wait\_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

<sup>843</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

**Note**

The function `wait_all_for` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

The function `wait_all_for` will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use `wait_all_for_nothrow` instead.

**Parameters**

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **first** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all_for` should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of `future` or `shared_future` objects for which `wait_all_for` should wait.

**Returns**

Returns `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise.

```
template<typename R>
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, std::vector<future<R>>
 const &futures)
```

The function `wait_all_for` is an operator allowing to join on the result of all given futures, similar to `wait_all`. It differs from `wait_all` in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

**Note**

The function `wait_all_for` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

The function `wait_all_for` will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use `wait_all_for_nothrow` instead.

**Note**

The function `wait_all_for` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmodified, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, `wait_all_for` may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

**Parameters**

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_all_for` should wait.

**Returns**

Returns `hpx::future_status::ready` if all the given futures have become ready before *timeout* has elapsed, and `hpx::future_status::timeout` otherwise.

```
template<typename R, std::size_t N>
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout,
 std::array<future<R>, N>
 const &futures)
```

The function `wait_all_for` is an operator allowing to join on the result of all given futures, similar to `wait_all`. It differs from `wait_all` in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

**Note**

The function `wait_all_for` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

The function `wait_all_for` will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use `wait_all_for_nothrow` instead.

**Note**

The function `wait_all_for` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

#### Note

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmodified, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, `wait_all_for` may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

#### Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_all_for` should wait.

#### Returns

Returns `hpx::future_status::ready` if all the given futures have become ready before *timeout* has elapsed, and `hpx::future_status::timeout` otherwise.

```
template<typename T>
```

```
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, hpx::future<T> const &f)
```

The function `wait_all_for` is an operator allowing to join on the result of the given future, similar to `wait_all`. It differs from `wait_all` in that it will not suspend indefinitely if the given future never becomes ready; instead it returns as soon as either the future has become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function `wait_all_for` returns after the future has become ready, or after the given timeout has expired, whichever comes first. The input future is still valid after `wait_all_for` returns, independently of the returned status.

#### Note

The function `wait_all_for` will rethrow any exceptions captured by the future while becoming ready, as long as the given future became ready before the timeout elapsed. If this behavior is undesirable, use `wait_all_for_nothrow` instead.

#### Parameters

- **timeout** – The maximum duration to wait for the given future to become ready.
- **f** – A *future* or *shared\_future* for which `wait_all_for` should wait.

#### Returns

Returns `hpx::future_status::ready` if the given future has become ready before *timeout* has elapsed, and `hpx::future_status::timeout` otherwise.

```
template<typename ...T>
```

```
hpx::future_status hpx::wait_all_for(hpx::chrono::steady_duration const &timeout, T const&... futures)
```

The function *wait\_all\_for* is an operator allowing to join on the result of all given futures, similar to *wait\_all*. It differs from *wait\_all* in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function *wait\_all\_for* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

#### Note

The function *wait\_all\_for* will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use *wait\_all\_for\_nothrow* instead.

#### Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_all\_for* should wait.

#### Returns

Returns *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise.

### hpx::wait\_all\_for\_nothrow

Defined in header `hpx/future.hpp`<sup>844</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::wait\_all\_for*
- *hpx::wait\_all\_for\_n*
- *hpx::wait\_all\_for\_n\_nothrow*

```
template<typename InputIter>
```

```
hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout,
 InputIter first, InputIter last)
```

The function *wait\_all\_for\_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait\_all\_for*. It differs from *wait\_all\_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

<sup>844</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

**Note**

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

Unlike `wait_all_for_nothrow`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

**Parameters**

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **first** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all_for_nothrow` should wait.
- **last** – The iterator pointing to the element after the last one of a sequence of `future` or `shared_future` objects for which `wait_all_for_nothrow` should wait.

**Returns**

Returns a `wait_all_for_nothrow_result` object whose `status` member is `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise; and whose `has_exceptional_results` member indicates whether any of the futures that became ready had captured an exception.

```
template<typename R>
```

```
hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout,
 std::vector<future<R>> const &futures)
```

The function `wait_all_for_nothrow` is an operator allowing to join on the result of all given futures, similar to `wait_all_for`. It differs from `wait_all_for` in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

**Note**

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

**Note**

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmodified, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, `wait_all_for` may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

**Parameters**

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_all_for_nothrow` should wait.

**Returns**

Returns a `wait_all_for_nothrow_result` object whose *status* member is `hpx::future_status::ready` if all the given futures have become ready before *timeout* has elapsed, and `hpx::future_status::timeout` otherwise; and whose *has\_exceptional\_results* member indicates whether any of the futures that became ready had captured an exception.

```
template<typename R, std::size_t N>
```

```
hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout,
 std::array<future<R>, N> const &futures)
```

The function `wait_all_for_nothrow` is an operator allowing to join on the result of all given futures, similar to `wait_all_for`. It differs from `wait_all_for` in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

**Note**

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

**Note**

The function `wait_all_for_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

**Note**

The caller is responsible for keeping the *futures* container itself (and, for the iterator-range overload, the underlying sequence) alive, unmoved, and unmodified until it is done inspecting the futures' state. If the timeout expires before all futures become ready, `wait_all_for` may leave asynchronous continuations attached to the not-yet-ready futures; destroying, moving, or reallocating the container before those futures settle results in undefined behavior.

**Parameters**

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – A vector or array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_all_for_nothrow` should wait.

**Returns**

Returns a `wait_all_for_nothrow_result` object whose *status* member is `hpx::future_status::ready` if all the given futures have become ready before *timeout* has elapsed, and `hpx::future_status::timeout` otherwise; and whose *has\_exceptional\_results* member indicates whether any of the futures that became ready had captured an exception.

```
template<typename T>
```

```
hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout,
 hpx::future<T> const &f)
```

The function `wait_all_for_nothrow` is an operator allowing to join on the result of the given future, similar to `wait_all_for`. It differs from `wait_all_for` in that it will not rethrow any exceptions captured by the given future while it became ready; instead it returns as soon as either the future has become ready, or the given timeout has elapsed, whichever happens first.

**Note**

The function `wait_all_for_nothrow` returns after the future has become ready, or after the given timeout has expired, whichever comes first. The input future is still valid after `wait_all_for_nothrow` returns, independently of the returned status.

**Note**

Unlike `wait_all_for`, this function will not rethrow any exceptions captured by the future while becoming ready. Any such exception is silently discarded.

**Parameters**

- **timeout** – The maximum duration to wait for the given future to become ready.

- **f** – A *future* or *shared\_future* for which *wait\_all\_for\_nothrow* should wait.

### Returns

Returns a *wait\_all\_for\_nothrow\_result* object whose *status* member is *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise; and whose *has\_exceptional\_results* member indicates whether any of the futures that became ready had captured an exception.

```
template<typename ...T>
```

```
hpx::wait_all_for_nothrow_result hpx::wait_all_for_nothrow(hpx::chrono::steady_duration const &timeout, T
 const&... futures)
```

The function *wait\_all\_for\_nothrow* is an operator allowing to join on the result of all given futures, similar to *wait\_all\_for*. It differs from *wait\_all\_for* in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

### Note

The function *wait\_all\_for\_nothrow* returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after *wait\_all\_for\_nothrow* returns, independently of the returned status, and can be inspected (e.g. using *is\_ready()*) to determine which of the given futures have become ready.

### Note

Unlike *wait\_all\_for*, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

### Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **futures** – An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which *wait\_all\_for\_nothrow* should wait.

### Returns

Returns a *wait\_all\_for\_nothrow\_result* object whose *status* member is *hpx::future\_status::ready* if all the given futures have become ready before *timeout* has elapsed, and *hpx::future\_status::timeout* otherwise; and whose *has\_exceptional\_results* member indicates whether any of the futures that became ready had captured an exception.

## hpx::wait\_all\_for\_n

Defined in header `hpx/future.hpp`<sup>845</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::wait\_all\_for*
- *hpx::wait\_all\_for\_nothrow*

<sup>845</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

- `hpx::wait_all_for_n_nothrow`

```
template<typename InputIter>
hpx::future_status hpx::wait_all_for_n(hpx::chrono::steady_duration const &timeout, InputIter begin,
 std::size_t count)
```

The function `wait_all_for_n` is an operator allowing to join on the result of all given futures, similar to `wait_all_n`. It differs from `wait_all_n` in that it will not suspend indefinitely if one or more of the given futures never become ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function `wait_all_for_n` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_n` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

#### Note

The function `wait_all_for_n` will rethrow any exceptions captured by the futures while becoming ready, as long as all the given futures became ready before the timeout elapsed. If this behavior is undesirable, use `wait_all_for_n_nothrow` instead.

#### Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **begin** – The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which `wait_all_for_n` should wait.
- **count** – The number of elements in the sequence starting at *first*.

#### Returns

Returns `hpx::future_status::ready` if all the given futures have become ready before *timeout* has elapsed, and `hpx::future_status::timeout` otherwise.

### `hpx::wait_all_for_n_nothrow`

Defined in header `hpx/future.hpp`<sup>846</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_all_for`
- `hpx::wait_all_for_nothrow`
- `hpx::wait_all_for_n`

```
template<typename InputIter>
```

<sup>846</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

`hpx::wait_all_for_nothrow_result` `hpx::wait_all_for_n_nothrow`(`hpx::chrono::steady_duration` const &timeout, `InputIter` begin, `std::size_t` count)

The function `wait_all_for_n_nothrow` is an operator allowing to join on the result of all given futures, similar to `wait_all_n`. It differs from `wait_all_for_n` in that it will not rethrow any exceptions captured by the given futures while they became ready; instead it returns as soon as either all futures have become ready, or the given timeout has elapsed, whichever happens first.

#### Note

The function `wait_all_for_n_nothrow` returns after all futures have become ready, or after the given timeout has expired, whichever comes first. All input futures are still valid after `wait_all_for_n_nothrow` returns, independently of the returned status, and can be inspected (e.g. using `is_ready()`) to determine which of the given futures have become ready.

#### Note

Unlike `wait_all_for_n`, this function will not rethrow any exceptions captured by the futures while becoming ready. Any such exceptions are not rethrown by this call.

#### Parameters

- **timeout** – The maximum duration to wait for all the given futures to become ready.
- **begin** – The iterator pointing to the first element of a sequence of `future` or `shared_future` objects for which `wait_all_for_n_nothrow` should wait.
- **count** – The number of elements in the sequence starting at *first*.

#### Returns

Returns a `wait_all_for_nothrow_result` object whose `status` member is `hpx::future_status::ready` if all the given futures have become ready before `timeout` has elapsed, and `hpx::future_status::timeout` otherwise; and whose `has_exceptional_results` member indicates whether any of the futures that became ready had captured an exception.

## `hpx::wait_any`

Defined in header `hpx/future.hpp`<sup>847</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::wait_any_nothrow`
- `hpx::wait_any_n`
- `hpx::wait_any_n_nothrow`

```
template<typename InputIter>
void hpx::wait_any(InputIter first, InputIter last)
```

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

<sup>847</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

**Note**

The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

**Note**

The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

**Parameters**

- **first** – [in] The iterator pointing to the first element of a sequence of *future* or *shared\_future* objects for which `wait_any` should wait.
- **last** – [in] The iterator pointing to the last element of a sequence of *future* or *shared\_future* objects for which `wait_any` should wait.

```
template<typename R>
void hpx::wait_any(std::vector<future<R>> &futures)
```

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

**Note**

The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

**Note**

The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

**Parameters**

**futures** – [in] A vector holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_any` should wait.

```
template<typename R, std::size_t N>
void hpx::wait_any(std::array<future<R>, N> &futures)
```

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

**Note**

The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

**Note**

The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

**Parameters**

**futures** – [in] An array holding an arbitrary amount of *future* or *shared\_future* objects for which `wait_any` should wait.

```
template<typename ...T>
void hpx::wait_any(T&&... futures)
```

The function `wait_any` is a non-deterministic choice operator. It OR-composes all future objects given and returns after one future of that list finishes execution.

**Note**

The function `wait_any` returns after at least one future has become ready. All input futures are still valid after `wait_any` returns.

**Note**

The function `wait_any` will rethrow any exceptions captured by the futures while becoming ready. If this behavior is undesirable, use `wait_any_nothrow` instead.

**Parameters**

**futures** – [in] An arbitrary number of *future* or *shared\_future* objects, possibly holding different types for which `wait_any` should wait.

**hpx::wait\_any\_nothrow**

Defined in header `hpx/future.hpp`<sup>848</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```

```
template<typename ...Params>
```

```
using queue_function_ptr_t = ::sycl::event
(::sycl::queue::*)(std::conditional_t<std::is_trivial_v<std::remove_reference_t<Params>>, std::decay_t<Params>, Params>...)
```

Default Implementation without the extra intel code\_location parameter. Removes the reference for trivial types to make the function matching easier (see `sycl_stream.cpp` test)

## Public Functions

```
template<typename sycl_device_selector>
```

```
inline explicit sycl_executor(sycl_device_selector const &selector)
```

Create a SYCL executor (based on a sycl queue)

```
~sycl_executor() = default
```

```
inline future_type get_future()
```

Get future for this command\_queue (NOTE will be more efficient if an event is provided &#8212; otherwise a dummy kernel must be submitted to get an event)

```
inline future_type get_future(::sycl::event event)
```

Get future for that becomes ready when the given event completes.

```
template<typename ...Params>
```

```
inline void post(queue_function_ptr_t<Params...> &&queue_member_function, Params&&... args)
```

Invoke queue member function given queue and parameters &#8212; do not use event to return a `hpx::future` (One way)

```
template<typename ...Params>
```

```
inline hpx::future<void> async_execute(queue_function_ptr_t<Params...> &&queue_member_function, Params&&... args)
```

Invoke queue member function given queue and parameters &#8212; `hpx::future` tied to the sycl event / (two way)

```
inline ::sycl::device get_device() const
```

Return the device used by the underlying SYCL queue.

```
inline ::sycl::context get_context() const
```

Return the context used by the underlying SYCL queue.

```
inline ::sycl::queue &get_queue()
```

Return the underlying queue for direct access.

## Protected Attributes

`::sycl::queue` **command\_queue**

## cache

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx/cache/local\_cache.hpp

Defined in header `hpx/cache/local_cache.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

namespace **cache**

```
template<typename Key, typename Entry, typename UpdatePolicy = std::less<Entry>, typename
InsertPolicy = policies::always<Entry>, typename CacheStorage = std::map<Key, Entry>,
typename Statistics = statistics::no_statistics>
class local_cache
```

*#include <hpx/cache/local\_cache.hpp>* The `local_cache` implements the basic functionality needed for a local (non-distributed) cache.

#### Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache, must model the `CacheEntry` concept
- **UpdatePolicy** – A (optional) type specifying a (binary) function object used to sort the cache entries based on their ‘age’. The ‘oldest’ entries (according to this sorting criteria) will be discarded first if the maximum capacity of the cache is reached. The default is `std::less<Entry>`. The function object will be invoked using 2 entry instances of the type `Entry`. This type must model the `UpdatePolicy` model.
- **InsertPolicy** – A (optional) type specifying a (unary) function object used to allow global decisions whether a particular entry should be added to the cache or not. The default is `policies::always`, imposing no global insert related criteria on the cache. The function object will be invoked using the entry instance to be inserted into the cache. This type must model the `InsertPolicy` model.
- **CacheStorage** – A (optional) container type used to store the cache items. The container must be an associative and STL compatible container. The default is a `std::map<Key, Entry>`.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the `CacheStatistics` concept. The default value is the type `statistics::no_statistics` which does not collect any numbers, but provides empty stubs allowing the code to compile.

## Public Types

```
using key_type = Key

using entry_type = Entry

using update_policy_type = UpdatePolicy

using insert_policy_type = InsertPolicy

using storage_type = CacheStorage

using statistics_type = Statistics

using value_type = typename entry_type::value_type

using size_type = typename storage_type::size_type

using storage_value_type = typename storage_type::value_type
```

## Public Functions

```
inline explicit local_cache(size_type max_size = 0, update_policy_type const &up =
 update_policy_type(), insert_policy_type const &ip =
 insert_policy_type())
```

Construct an instance of a *local\_cache*.

### Parameters

- **max\_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get\_size* function.
- **up** – [in] An instance of the *UpdatePolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *UpdatePolicy* template parameter.
- **ip** – [in] An instance of the *InsertPolicy* to use for this cache. The default is to use a default constructed instance of the type as defined by the *InsertPolicy* template parameter.

```
local_cache(local_cache const &other) = default
```

```
local_cache(local_cache &&other) = default
```

```
local_cache &operator=(local_cache const &other) = default
```

```
local_cache &operator=(local_cache &&other) = default
```

```
~local_cache() = default
```

inline constexpr *size\_type* **size**() const noexcept

Return current size of the cache.

**Returns**

The current size of this cache instance.

inline constexpr *size\_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

**Note**

The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get\_size*.

**Returns**

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline bool **reserve**(*size\_type* max\_size)

Change the maximum size this cache can grow to.

**Parameters**

**max\_size** – [in] The new maximum size this cache will be allowed to grow to.

**Returns**

This function returns *true* if successful. It returns *false* if the new *max\_size* is smaller than the current limit and the cache could not be shrunk to the new maximum size.

inline bool **holds\_key**(*key\_type* const &k) const

Check whether the cache currently holds an entry identified by the given key.

**Note**

This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

**Parameters**

**k** – [in] The key for the entry which should be looked up in the cache.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

inline bool **get\_entry**(*key\_type* const &k, *key\_type* &realkey, *entry\_type* &val)

Get a specific entry identified by the given key.

**Note**

The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

**Parameters**

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &k, entry_type &val)
```

Get a specific entry identified by the given key.

**Note**

The function will call the entry's *entry::touch* function if the value corresponding to the provided key is found in the cache.

**Parameters**

- **k** – [in] The key for the entry which should be retrieved from the cache.
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &k, value_type &val)
```

Get a specific entry identified by the given key.

**Note**

The function will call the entry's *entry::touch* function if the value corresponding to the provided is found in the cache.

**Parameters**

- **k** – [in] The key for the entry which should be retrieved from the cache
- **val** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding value.

**Returns**

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool insert(key_type const &k, value_type const &val)
```

Insert a new element into this cache.

**Note**

This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the newly constructed entry instance. If either of these functions returns false the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

**Parameters**

- **k** – [in] The key for the entry which should be added to the cache.
- **val** – [in] The value which should be added to the cache.

**Returns**

This function returns *true* if the entry has been successfully added to the cache, otherwise

it returns *false*.

```
inline bool insert(key_type const &k, value_type &&val)
```

```
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>,
entry_type>, int> = 0>
```

```
inline bool insert(key_type const &k, Entry_ &&e)
```

Insert a new entry into this cache.

#### Note

This function invokes both, the insert policy as provided to the constructor and the function *entry::insert* of the provided entry instance. If either of these functions returns *false* the key/value pair doesn't get inserted into the cache and the *insert* function will return *false*. Other reasons for this function to fail (return *false*) are a) the key/value pair is already held in the cache or b) inserting the new value into the cache maxed out its capacity and it was not possible to free any of the existing entries.

#### Parameters

- **k** – [in] The key for the entry which should be added to the cache.
- **e** – [in] The entry which should be added to the cache.

#### Returns

This function returns *true* if the entry has been successfully added to the cache, otherwise it returns *false*.

```
template<typename Value, std::enable_if_t<std::is_convertible_v<std::decay_t<Value>,
value_type>, int> = 0>
```

```
inline bool update(key_type const &k, Value &&val)
```

Update an existing element in this cache.

#### Note

The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

#### Note

The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

#### Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

#### Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename F, typename Value, typename =
std::enable_if_t<std::is_convertible_v<std::decay_t<Value>, value_type>>>
```

```
inline bool update_if(key_type const &k, Value &&val, F &&f)
```

Update an existing element in this cache.

#### Note

The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

#### Note

The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

#### Parameters

- **k** – [in] The key for the value which should be updated in the cache.
- **val** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

#### Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Entry_, std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
```

```
inline bool update(key_type const &k, Entry_ &&e)
```

Update an existing entry in this cache.

#### Note

The function will call the entry's *entry::touch* function if the indexed value is found in the cache.

#### Note

The difference to the other overload of the *insert* function is that this overload replaces the whole cache entry, while the other overload replaces the cached value only, leaving the cache entry properties untouched.

#### Parameters

- **k** – [in] The key for the entry which should be updated in the cache.
- **e** – [in] The entry which should be used as a replacement for the existing entry in the cache. Any existing entry is first removed and then this entry is added.

#### Returns

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func = policies::always<storage_value_type>>
inline size_type erase(Func &&ep = Func())
```

Remove stored entries from the cache for which the supplied function object returns true.

#### Parameters

**ep** – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*. Even then the entry might not be removed from the cache as its *entry::remove* function might return false.

#### Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get\_size* functions of the removed entries).

```
inline size_type erase()
```

Remove all stored entries from the cache.

#### Note

All entries are considered for removal, but in the end an entry might not be removed from the cache as its *entry::remove* function might return false. This function is very useful for instance in conjunction with an entry's *entry::remove* function enforcing additional criteria like entry expiration, etc.

#### Returns

This function returns the overall size of the removed entries (which is the sum of the values returned by the *entry::get\_size* functions of the removed entries).

```
inline void clear()
```

Clear the cache.

Unconditionally removes all stored entries from the cache.

```
inline constexpr statistics_type const &get_statistics() const noexcept
```

Allow to access the embedded statistics instance.

#### Returns

This function returns a reference to the statistics instance embedded inside this cache

```
inline statistics_type &get_statistics() noexcept
```

## Protected Functions

## hpx/cache/lru\_cache.hpp

Defined in header `hpx/cache/lru_cache.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

template<typename **Key**, typename **Entry**, typename **Statistics** = *statistics::no\_statistics*>

class **lru\_cache**

*#include <hpx/cache/lru\_cache.hpp>* The **lru\_cache** implements the basic functionality needed for a local (non-distributed) LRU cache.

### Template Parameters

- **Key** – The type of the keys to use to identify the entries stored in the cache
- **Entry** – The type of the items to be held in the cache.
- **Statistics** – A (optional) type allowing to collect some basic statistics about the operation of the cache instance. The type must conform to the *CacheStatistics* concept. The default value is the type *statistics::no\_statistics* which does not collect any numbers, but provides empty stubs allowing the code to compile.

### Public Types

using **key\_type** = *Key*

using **entry\_type** = *Entry*

using **statistics\_type** = *Statistics*

using **entry\_pair** = *std::pair<key\_type, entry\_type>*

using **storage\_type** = *std::list<entry\_pair>*

using **map\_type** = *std::map<Key, typename storage\_type::iterator>*

using **size\_type** = *std::size\_t*

## Public Functions

inline explicit **lru\_cache**(*size\_type* max\_size = 0)

Construct an instance of a *lru\_cache*.

### Parameters

**max\_size** – [in] The maximal size this cache is allowed to reach any time. The default is zero (no size limitation). The unit of this value is usually determined by the unit of the values returned by the entry's *get\_size* function.

**lru\_cache**(*lru\_cache* const &other) = default

**lru\_cache**(*lru\_cache* &&other) = default

*lru\_cache* &**operator=**(*lru\_cache* const &other) = default

*lru\_cache* &**operator=**(*lru\_cache* &&other) = default

**~lru\_cache**() = default

inline constexpr *size\_type* **size**() const noexcept

Return current size of the cache.

### Returns

The current size of this cache instance.

inline constexpr *size\_type* **capacity**() const noexcept

Access the maximum size the cache is allowed to grow to.

### Note

The unit of this value is usually determined by the unit of the return values of the entry's function *entry::get\_size*.

### Returns

The maximum size this cache instance is currently allowed to reach. If this number is zero the cache has no limitation with regard to a maximum size.

inline void **reserve**(*size\_type* max\_size)

Change the maximum size this cache can grow to.

### Parameters

**max\_size** – [in] The new maximum size this cache will be allowed to grow to.

inline bool **holds\_key**(*key\_type* const &key) const

Check whether the cache currently holds an entry identified by the given key.

### Note

This function does not call the entry's function *entry::touch*. It just checks if the cache contains an entry corresponding to the given key.

### Parameters

**key** – [in] The key for the entry which should be looked up in the cache.

### Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &key, key_type &realkey, entry_type &entry)
```

Get a specific entry identified by the given key.

#### Note

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

#### Parameters

- **key** – [in] The key for the entry which should be retrieved from the cache.
- **realkey[out]** – Return the full real key found in the cache
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

#### Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
inline bool get_entry(key_type const &key, entry_type const &entry)
```

Get a specific entry identified by the given key.

#### Note

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

#### Parameters

- **key** – [in] The key for the entry which should be retrieved from the cache.
- **entry** – [out] If the entry indexed by the key is found in the cache this value on successful return will be a copy of the corresponding entry.

#### Returns

This function returns *true* if the cache holds the referenced entry, otherwise it returns *false*.

```
template<typename Entry_, typename =
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>
inline bool insert(key_type const &key, Entry_ &&entry)
```

Insert a new entry into this cache.

#### Note

This function assumes that the entry is not in the cache already. Inserting an already existing entry is considered undefined behavior

#### Parameters

- **key** – [in] The key for the entry which should be added to the cache.
- **entry** – [in] The entry which should be added to the cache.

```
template<typename Entry_, typename =
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>>>
inline void update(key_type const &key, Entry_ &&entry)
```

Update an existing element in this cache.

**Note**

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

**Note**

The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

**Parameters**

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The entry which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.

```
template<typename F, typename Entry_,
std::enable_if_t<std::is_convertible_v<std::decay_t<Entry_>, entry_type>, int> = 0>
inline bool update_if(key_type const &key, Entry_ &entry, F &&f)
```

Update an existing element in this cache.

**Note**

The function will “touch” the entry and mark it as recently used if the key was found in the cache.

**Note**

The difference to the other overload of the *insert* function is that this overload replaces the cached value only, while the other overload replaces the whole cache entry, updating the cache entry properties.

**Parameters**

- **key** – [in] The key for the value which should be updated in the cache.
- **entry** – [in] The value which should be used as a replacement for the existing value in the cache. Any existing cache entry is not changed except for its value.
- **f** – [in] A callable taking two arguments, *k* and the key found in the cache (in that order). If *f* returns true, then the update will continue. If *f* returns false, then the update will not succeed.

**Returns**

This function returns *true* if the entry has been successfully updated, otherwise it returns *false*. If the entry currently is not held by the cache it is added and the return value reflects the outcome of the corresponding insert operation.

```
template<typename Func>
inline size_type erase(Func const &ep)
```

Remove stored entries from the cache for which the supplied function object returns true.

**Parameters**

- **ep** – [in] This parameter has to be a (unary) function object. It is invoked for each of the entries currently held in the cache. An entry is considered for removal from the cache whenever the value returned from this invocation is *true*.

**Returns**

This function returns the overall size of the removed entries (which is the sum of the values returned by the `entry::get_size` functions of the removed entries).

inline *size\_type* **erase**()

Remove all stored entries from the cache.

**Returns**

This function returns the overall size of the removed entries (which is the sum of the values returned by the `entry::get_size` functions of the removed entries).

inline *size\_type* **clear**()

Clear the cache.

Unconditionally removes all stored entries from the cache.

inline constexpr *statistics\_type* const &**get\_statistics**() const noexcept

Allow to access the embedded statistics instance.

**Returns**

This function returns a reference to the statistics instance embedded inside this cache

inline *statistics\_type* &**get\_statistics**() noexcept

**Private Types**

## hpx/cache/entries/lru\_entry.hpp

Defined in header `hpx/cache/entries/lru_entry.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **lru\_entry** : public *hpx::util::cache::entries::entry<Value>*

*#include <hpx/cache/entries/lru\_entry.hpp>* The *lru\_entry* type can be used to store arbitrary values in a cache. Using this type as the cache's entry type makes sure that the least recently used entries are discarded from the cache first.

### Note

The *lru\_entry* conforms to the *CacheEntry* concept.

### Note

This type can be used to model a 'most recently used' cache policy if it is used with a `std::greater` as the caches' *UpdatePolicy* (instead of the default `std::less`).

### Template Parameters

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

### Public Functions

inline **lru\_entry**()

Any cache entry has to be default constructible.

inline explicit **lru\_entry**(*Value* const &val)  
noexcept(*std::is\_nothrow\_constructible\_v<base\_type, Value const&>*)

Construct a new instance of a cache entry holding the given value.

inline explicit **lru\_entry**(*Value* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

```
inline bool touch()
```

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LRU entry we store the time of the last access which will be used to compare the age of an entry during the invocation of the *operator<()*.

#### Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

```
inline constexpr time_point const &get_access_time() const noexcept
```

Returns the last access time of the entry.

### Private Types

```
using base_type = entry<Value>
```

```
using time_point = std::chrono::steady_clock::time_point
```

### Private Members

```
time_point access_time_
```

### Friends

```
inline friend auto operator<(lru_entry const &lhs, lru_entry const &rhs)
```

Compare the 'age' of two entries. An entry is 'older' than another entry if it has been accessed less recently (LRU).

```
inline friend auto operator>(lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator<= (lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator>= (lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator== (lru_entry const &lhs, lru_entry const &rhs)
```

```
inline friend auto operator!= (lru_entry const &lhs, lru_entry const &rhs)
```

### hpx/cache/entries/size\_entry.hpp

Defined in header `hpx/cache/entries/size_entry.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
 namespace util
```

namespace **cache**

namespace **entries**

template<typename **Value**>

class **size\_entry** : public *hpx::util::cache::entries::entry<Value>*

*#include <hpx/cache/entries/size\_entry.hpp>* The **size\_entry** type can be used to store values in a cache which have a size associated (such as files, etc.). Using this type as the cache's entry type makes sure that the entries with the biggest size are discarded from the cache first.

#### Note

The **size\_entry** conforms to the CacheEntry concept.

#### Note

This type can be used to model a 'discard smallest first' cache policy if it is used with a `std::greater` as the caches' UpdatePolicy (instead of the default `std::less`).

#### Template Parameters

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

#### Public Functions

**size\_entry**() = default

Any cache entry has to be default constructible.

inline explicit **size\_entry**(*Value* const &val, *std::size\_t* size = 0)  
noexcept(*std::is\_nothrow\_constructible\_v<base\_type, Value*  
const&>)

Construct a new instance of a cache entry holding the given value.

inline explicit **size\_entry**(*Value* &&val, *std::size\_t* size = 0) noexcept

Construct a new instance of a cache entry holding the given value.

inline constexpr *std::size\_t* **get\_size**() const noexcept

Return the 'size' of this entry.

#### Private Types

using **base\_type** = *entry<Value>*

## Private Members

`std::size_t size_ = 0`

## Friends

inline friend auto **operator**<(*size\_entry* const &lhs, *size\_entry* const &rhs) noexcept

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has a bigger size.

inline friend auto **operator**>(*size\_entry* const &lhs, *size\_entry* const &rhs) noexcept

inline friend auto **operator**<=(*size\_entry* const &lhs, *size\_entry* const &rhs) noexcept

inline friend auto **operator**>=(*size\_entry* const &lhs, *size\_entry* const &rhs) noexcept

inline friend auto **operator**==(*size\_entry* const &lhs, *size\_entry* const &rhs) noexcept

inline friend auto **operator**!=(*size\_entry* const &lhs, *size\_entry* const &rhs) noexcept

## hpx/cache/entries/fifo\_entry.hpp

Defined in header `hpx/cache/entries/fifo_entry.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **fifo\_entry** : public *hpx::util::cache::entries::entry*<*Value*>

*#include* <*hpx/cache/entries/fifo\_entry.hpp*> The *fifo\_entry* type can be used to store arbitrary values in a cache. Using this type as the cache’s entry type makes sure that the least recently inserted entries are discarded from the cache first.

### Note

The *fifo\_entry* conforms to the *CacheEntry* concept.

### Note

This type can be used to model a ‘last in first out’ cache policy if it is used with a *std::greater* as the caches’ *UpdatePolicy* (instead of the default *std::less*).

### Template Parameters

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less\_than\_comparable.

### Public Functions

**fifo\_entry()** = default

Any cache entry has to be default constructible.

```
inline explicit fifo_entry(Value const &val)
 noexcept(std::is_nothrow_constructible_v<base_type, Value
 const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit fifo_entry(Value &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline constexpr bool insert()
```

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

#### Note

This function is part of the CacheEntry concept

### Returns

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

```
inline constexpr time_point const &get_creation_time() const noexcept
```

### Private Types

```
using base_type = entry<Value>
```

```
using time_point = std::chrono::steady_clock::time_point
```

### Private Members

```
time_point insertion_time_
```

## Friends

```
inline friend auto operator<(fiffo_entry const &lfs, fiffo_entry const &rfs)
```

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been created earlier (FIFO).

```
inline friend auto operator>(fiffo_entry const &lfs, fiffo_entry const &rfs)
```

```
inline friend auto operator<=(fiffo_entry const &lfs, fiffo_entry const &rfs)
```

```
inline friend auto operator>=(fiffo_entry const &lfs, fiffo_entry const &rfs)
```

```
inline friend auto operator==(fiffo_entry const &lfs, fiffo_entry const &rfs)
```

```
inline friend auto operator!=(fiffo_entry const &lfs, fiffo_entry const &rfs)
```

## hpx/cache/entries/entry.hpp

Defined in header hpx/cache/entries/entry.hpp.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
namespace util
```

```
namespace cache
```

```
namespace entries
```

```
template<typename Value>
```

```
class entry
```

```
#include <hpx/cache/entries/entry.hpp>
```

### Template Parameters

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and less\_than\_comparable.

Subclassed by `hpx::util::cache::entries::fiffo_entry< Value >`,  
`hpx::util::cache::entries::lfu_entry< Value >`, `hpx::util::cache::entries::lru_entry< Value >`,  
`hpx::util::cache::entries::size_entry< Value >`

## Public Types

```
using value_type = Value
```

## Public Functions

**entry()** = default

Any cache entry has to be default constructible.

inline explicit **entry**(*value\_type* const &val)  
noexcept(*std::is\_nothrow\_copy\_constructible\_v*<*value\_type*>)

Construct a new instance of a cache entry holding the given value.

inline explicit **entry**(*value\_type* &&val) noexcept

Construct a new instance of a cache entry holding the given value.

inline *value\_type* &**get**() noexcept

Get a reference to the stored data value.

### Note

This function is part of the CacheEntry concept

inline constexpr *value\_type* const &**get**() const noexcept

## Public Static Functions

static inline constexpr bool **touch**() noexcept

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

### Note

It is possible to change the entry in a way influencing the sort criteria mandated by the UpdatePolicy. In this case the function should return *true* to indicate this to the cache, forcing to reorder the cache entries.

### Note

This function is part of the CacheEntry concept

## Returns

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache's UpdatePolicy

static inline constexpr bool **insert**() noexcept

The function *insert* is called by a cache whenever it is about to be inserted into the cache.

### Note

This function is part of the CacheEntry concept

**Returns**

This function should return *true* if the entry should be added to the cache, otherwise it should return *false*.

static inline constexpr bool **remove**() noexcept

The function *remove* is called by a cache holding this instance whenever it is about to be removed from the cache.

**Note**

This function is part of the CacheEntry concept

**Returns**

The return value can be used to avoid removing this instance from the cache. If the value is *true* it is ok to remove the entry, otherwise it will stay in the cache.

static inline constexpr *std::size\_t* **get\_size**() noexcept

Return the ‘size’ of this entry. By default, the size of each entry is just one (1), which is sensible if the cache has a limit (capacity) measured in number of entries.

**Private Members**

*value\_type* **value\_**

**Friends**

friend auto **operator<=>**(*entry* const&, *entry* const&) = default

Forwarding operator<=> allowing to compare entries instead of the values.

**hpx/cache/entries/lfu\_entry.hpp**

Defined in header hpx/cache/entries/lfu\_entry.hpp.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **entries**

template<typename **Value**>

class **lfu\_entry** : public *hpx::util::cache::entries::entry*<*Value*>

*#include* <hpx/cache/entries/lfu\_entry.hpp> The *lfu\_entry* type can be used to store arbitrary values in a cache. Using this type as the cache’s entry type makes sure that the least frequently used entries are discarded from the cache first.

**Note**

The `lfu_entry` conforms to the `CacheEntry` concept.

**Note**

This type can be used to model a ‘most frequently used’ cache policy if it is used with a `std::greater` as the caches’ `UpdatePolicy` (instead of the default `std::less`).

**Template Parameters**

**Value** – The data type to be stored in a cache. It has to be default constructible, copy constructible and `less_than_comparable`.

**Public Functions**

`lfu_entry()` = default

Any cache entry has to be default constructible.

```
inline explicit lfu_entry(Value const &val)
 noexcept(std::is_nothrow_constructible_v<base_type, Value
 const&>)
```

Construct a new instance of a cache entry holding the given value.

```
inline explicit lfu_entry(Value &&val) noexcept
```

Construct a new instance of a cache entry holding the given value.

```
inline bool touch() noexcept
```

The function *touch* is called by a cache holding this instance whenever it has been requested (touched).

In the case of the LFU entry we store the reference count tracking the number of times this entry has been requested. This which will be used to compare the age of an entry during the invocation of the *operator<()*.

**Returns**

This function should return true if the cache needs to update its internal heap. Usually this is needed if the entry has been changed by *touch()* in a way influencing the sort order as mandated by the cache’s `UpdatePolicy`

```
inline constexpr unsigned long const &get_access_count() const noexcept
```

**Private Types**

```
using base_type = entry<Value>
```

## Private Members

unsigned long **ref\_count\_** = 0

## Friends

inline friend auto **operator<**(*lfu\_entry* const &lhs, *lfu\_entry* const &rhs)

Compare the ‘age’ of two entries. An entry is ‘older’ than another entry if it has been accessed less frequently (LFU).

inline friend auto **operator>**(*lfu\_entry* const &lhs, *lfu\_entry* const &rhs)

inline friend auto **operator<=**(*lfu\_entry* const &lhs, *lfu\_entry* const &rhs)

inline friend auto **operator>=**(*lfu\_entry* const &lhs, *lfu\_entry* const &rhs)

inline friend auto **operator==**(*lfu\_entry* const &lhs, *lfu\_entry* const &rhs)

inline friend auto **operator!=**(*lfu\_entry* const &lhs, *lfu\_entry* const &rhs)

## hpx/cache/statistics/no\_statistics.hpp

Defined in header `hpx/cache/statistics/no_statistics.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

namespace **cache**

namespace **statistics**

## Enums

enum class **method**

*Values:*

enumerator **get\_entry**

enumerator **insert\_entry**

enumerator **update\_entry**

enumerator **erase\_entry**

class **no\_statistics**

Subclassed by *hpx::util::cache::statistics::local\_statistics*

### Public Static Functions

static inline constexpr void **got\_hit**() noexcept

The function *got\_hit* will be called by a cache instance whenever an entry got touched.

static inline constexpr void **got\_miss**() noexcept

The function *got\_miss* will be called by a cache instance whenever a requested entry has not been found in the cache.

static inline constexpr void **got\_insertion**() noexcept

The function *got\_insertion* will be called by a cache instance whenever a new entry has been inserted.

static inline constexpr void **got\_eviction**() noexcept

The function *got\_eviction* will be called by a cache instance whenever an entry has been removed from the cache because a new inserted entry let the cache grow beyond its capacity.

static inline constexpr void **clear**() noexcept

Reset all statistics.

static inline constexpr *std::int64\_t* **get\_get\_entry\_count**(bool) noexcept

The function *get\_get\_entry\_count* returns the number of invocations of the *get\_entry()* API function of the cache.

static inline constexpr *std::int64\_t* **get\_insert\_entry\_count**(bool) noexcept

The function *get\_insert\_entry\_count* returns the number of invocations of the *insert\_entry()* API function of the cache.

static inline constexpr *std::int64\_t* **get\_update\_entry\_count**(bool) noexcept

The function *get\_update\_entry\_count* returns the number of invocations of the *update\_entry()* API function of the cache.

static inline constexpr *std::int64\_t* **get\_erase\_entry\_count**(bool) noexcept

The function *get\_erase\_entry\_count* returns the number of invocations of the *erase()* API function of the cache.

static inline constexpr *std::int64\_t* **get\_get\_entry\_time**(bool) noexcept

The function *get\_get\_entry\_time* returns the overall time spent executing of the *get\_entry()* API function of the cache.

static inline constexpr *std::int64\_t* **get\_insert\_entry\_time**(bool) noexcept

The function *get\_insert\_entry\_time* returns the overall time spent executing of the *insert\_entry()* API function of the cache.

static inline constexpr *std::int64\_t* **get\_update\_entry\_time**(bool) noexcept

The function *get\_update\_entry\_time* returns the overall time spent executing of the *update\_entry()* API function of the cache.

static inline constexpr *std::int64\_t* **get\_erase\_entry\_time**(bool) noexcept

The function *get\_erase\_entry\_time* returns the overall time spent executing of the *erase()* API function of the cache.

```
struct update_on_exit
 #include <no_statistics.hpp> Helper class to update timings and counts on function exit.
```

### Public Functions

```
inline constexpr update_on_exit(no_statistics const&, method) noexcept
~update_on_exit() = default
update_on_exit(update_on_exit const&) = delete
update_on_exit(update_on_exit&&) = delete
update_on_exit &operator=(update_on_exit const&) = delete
update_on_exit &operator=(update_on_exit&&) = delete
```

## hpx/cache/statistics/local\_statistics.hpp

Defined in header `hpx/cache/statistics/local_statistics.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace util
```

```
 namespace cache
```

```
 namespace statistics
```

```
 class local_statistics : public hpx::util::cache::statistics::no_statistics
```

### Public Functions

```
local_statistics() = default
inline constexpr std::size_t hits() const noexcept
inline constexpr std::size_t misses() const noexcept
inline constexpr std::size_t insertions() const noexcept
inline constexpr std::size_t evictions() const noexcept
inline std::size_t hits(bool const reset) noexcept
inline std::size_t misses(bool const reset) noexcept
inline std::size_t insertions(bool const reset) noexcept
```

```
inline std::size_t evictions(bool const reset) noexcept
```

```
inline void got_hit() noexcept
```

The function *got\_hit* will be called by a cache instance whenever an entry got touched.

```
inline void got_miss() noexcept
```

The function *got\_miss* will be called by a cache instance whenever a requested entry has not been found in the cache.

```
inline void got_insertion() noexcept
```

The function *got\_insertion* will be called by a cache instance whenever a new entry has been inserted.

```
inline void got_eviction() noexcept
```

The function *got\_eviction* will be called by a cache instance whenever an entry has been removed from the cache because a new inserted entry let the cache grow beyond its capacity.

```
inline void clear() noexcept
```

Reset all statistics.

### Private Members

```
std::size_t hits_ = 0
```

```
std::size_t misses_ = 0
```

```
std::size_t insertions_ = 0
```

```
std::size_t evictions_ = 0
```

### Private Static Functions

```
static inline std::size_t get_and_reset(std::size_t &value, bool const reset) noexcept
```

## checkpoint\_base

See [Public API](#) for a list of names and headers that are part of the public HPX API.

### hpx/checkpoint\_base/checkpoint\_data.hpp

Defined in header `hpx/checkpoint_base/checkpoint_data.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
 namespace util
```

## Functions

```
template<typename Container, typename ...Ts>
void save_checkpoint_data(Container &data, Ts&&... ts)
 save_checkpoint_data
```

Save\_checkpoint\_data takes any number of objects which a user may wish to store in the given container.

### Template Parameters

- **Container** – Container used to store the check-pointed data.
- **Ts** – Types of variables to checkpoint

### Parameters

- **data** – Container instance used to store the checkpoint data
- **ts** – Variable instances to be inserted into the checkpoint.

```
template<typename ...Ts>
std::size_t prepare_checkpoint_data(Ts const&... ts)
 prepare_checkpoint_data
```

prepare\_checkpoint\_data takes any number of objects which a user may wish to store in a subsequent save\_checkpoint\_data operation. The function will return the number of bytes necessary to store the data that will be produced.

### Template Parameters

**Ts** – Types of variables to checkpoint

### Parameters

**ts** – Variable instances to be inserted into the checkpoint.

```
template<typename Container, typename ...Ts>
void restore_checkpoint_data(Container const &cont, Ts&... ts)
 restore_checkpoint_data
```

restore\_checkpoint\_data takes any number of objects which a user may wish to restore from the given container. The sequence of objects has to correspond to the sequence of objects for the corresponding call to save\_checkpoint\_data that had used the given container instance.

### Template Parameters

- **Container** – Container used to restore the check-pointed data.
- **Ts** – Types of variables to restore

### Parameters

- **cont** – Container instance used to restore the checkpoint data
- **ts** – Variable instances to be restored from the container

```
struct checkpointing_tag

template<>

struct extra_data_helper<checkpointing_tag>
```

## Public Static Functions

static extra\_data\_id\_type **id**() noexcept

static inline constexpr void **reset**(*checkpointing\_tag\**) noexcept

## compute\_local

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## hpx/compute\_local/vector.hpp

Defined in header `hpx/compute_local/vector.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **compute**

## Functions

```

using const_reverse_iterator = std::reverse_iterator<const_iterator>

```

### Public Functions

```

inline explicit vector(Allocator const &alloc = Allocator())

inline vector(size_type count, T const &value, Allocator const &alloc = Allocator())

inline explicit vector(size_type count, Allocator const &alloc = Allocator())

template<typename InIter>
inline vector(InIter first, InIter last, Allocator const &alloc = Allocator())

inline vector(vector const &other)

inline vector(vector const &other, Allocator const &alloc)

inline vector(vector &&other) noexcept

inline vector(vector &&other, Allocator const &alloc)

inline vector(std::initializer_list<T> init, Allocator const &alloc)

inline ~vector()

inline vector &operator=(vector const &other)

inline vector &operator=(vector &&other) noexcept

inline void assign(size_type count, T const &value)

template<typename InIter>
inline void assign(InIter first, InIter last)

inline void assign(std::initializer_list<T> ilist)

inline allocator_type get_allocator() const noexcept
 Returns the allocator associated with the container.

inline reference at(size_type pos)

inline const_reference at(size_type pos) const

```

inline *reference* **operator[]**(*size\_type* pos)

inline *const\_reference* **operator[]**(*size\_type* pos) const

inline *reference* **front**()

Returns a reference to the first element in the container. Calling front on an empty container is undefined.

inline *const\_reference* **front**() const

Returns a reference to the first element in the container. Calling front on an empty container is undefined.

inline *reference* **back**()

Returns a reference to the last element in the container. Calling back on an empty container is undefined.

inline *const\_reference* **back**() const

Returns a reference to the last element in the container. Calling back on an empty container is undefined.

inline *pointer* **data**() noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data()*; *data()* + *size()*) is always a valid range, even if the container is empty (*data()* is not dereference-able in that case).

inline *const\_pointer* **data**() const noexcept

Returns pointer to the underlying array serving as element storage. The pointer is such that range [*data()*; *data()* + *size()*) is always a valid range, even if the container is empty (*data()* is not dereference-able in that case).

inline *T* \***device\_data**() const noexcept

Returns a raw pointer corresponding to the address of the data allocated on the device.

inline *std::size\_t* **size**() const noexcept

inline *std::size\_t* **capacity**() const noexcept

inline bool **empty**() const noexcept

Returns: *size()* == 0.

inline void **resize**(*size\_type*)

Effects: If *size* <= *size()*, equivalent to calling *pop\_back()* *size()*

- *size* times. If *size()* < *size*, appends *size* - *size()* default-inserted elements to the sequence.

Requires: *T* shall be MoveInsertable and DefaultInsertable into \*this.

Remarks: If an exception is thrown other than by the move constructor of a non-CopyInsertable *T* there are no effects.

inline void **resize**(*size\_type*, *T* const&)

Effects: If *size* <= *size()*, equivalent to calling *pop\_back()* *size()* - *size* times. If *size()* < *size*, appends *size* - *size()* copies of *val* to the sequence.

Requires: *T* shall be CopyInsertable into \*this.

Remarks: If an exception is thrown there are no effects.

inline *iterator* **begin**() noexcept

inline *iterator* **end**() noexcept

inline *const\_iterator* **cbegin**() const noexcept

inline *const\_iterator* **cend**() const noexcept

inline *const\_iterator* **begin**() const noexcept

inline *const\_iterator* **end**() const noexcept

inline *reverse\_iterator* **rbegin**() noexcept

inline *reverse\_iterator* **rend**() noexcept

inline *const\_reverse\_iterator* **crbegin**() const noexcept

inline *const\_reverse\_iterator* **crend**() const noexcept

inline *const\_reverse\_iterator* **rbegin**() const noexcept

inline *const\_reverse\_iterator* **rend**() const noexcept

inline void **swap**(*vector* &other) noexcept

Effects: Exchanges the contents and capacity() of \*this with that of x.

Complexity: Constant time.

inline void **clear**() noexcept

Effects: Erases all elements in the range [begin(),end()). Destroys all elements in 'a'. Invalidates all references, pointers, and iterators referring to the elements of a and may invalidate the past-the-end iterator.

Post: a.empty() returns true.

Complexity: Linear.

```

```
inline void initialize_pages(pointer p, size_t n) const
```

Touches every page of the allocation starting at *p* so that each page is physically bound to the NUMA domain assigned to it by *binding\_helper\_*. One first-touch task per NUMA domain is dispatched and the call blocks until all of them complete.

#### Parameters

- **p** – pointer to the start of the allocation to initialize.
- **n** – number of elements to initialize.

#### Pre

Must be called from an HPX thread. `init_mutex` serializes concurrent calls to this function and is intentionally held across `hpx::wait_all()` below, which is a suspension point that may resume the calling HPX thread on a different OS worker thread. `hpx::mutex` (unlike `std::mutex`) supports this safely, and `ignore_while_checking` silences the HPX lock-checking layer's warning about a lock spanning a suspension point.

```
inline std::string display_binding(pointer p, numa_binding_helper_ptr helper)
```

Builds a human-readable, page-by-page description of how the allocation starting at *p* is bound across NUMA domains, suitable for debug output. `init_mutex` is held only for the duration of this synchronous call; unlike *initialize\_pages()*, no suspension point is crossed while it is held.

#### Parameters

- **p** – pointer to the start of the allocation to describe.
- **helper** – binding helper describing the array layout used to compute per-page offsets.

#### Returns

a formatted string describing the domain binding of each page in the allocation.

```
template<typename Binder>
```

```
inline std::shared_ptr<Binder> get_binding_helper_cast() const
```

## hpx/compute\_local/host/block\_fork\_join\_executor.hpp

Defined in header `hpx/compute_local/host/block_fork_join_executor.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace execution
```

```
namespace experimental
```

```
class block_fork_join_executor
```

*#include <block\_fork\_join\_executor.hpp>* An executor with fork-join (blocking) semantics.

The *block\_fork\_join\_executor* creates on construction a set of worker threads that are kept alive for the duration of the executor. Copying the executor has reference semantics, i.e. copies of a *fork\_join\_executor* hold a reference to the worker threads of the original instance. Scheduling work through the executor concurrently from different threads is undefined behaviour.

The executor keeps a set of worker threads alive for the lifetime of the executor, meaning other work will not be executed while the executor is busy or waiting for work. The executor has a customizable delay after which it will yield to other work. Since starting and resuming the worker threads is a slow operation the executor should be reused whenever possible for multiple adjacent parallel algorithms or invocations of `bulk_(a)sync_execute`.

This behaviour is similar to the plain *fork\_join\_executor* except that the *block\_fork\_join\_executor* creates a hierarchy of *fork\_join\_executors*, one for each target used to initialize it.

### Public Functions

```
inline explicit block_fork_join_executor(threads::thread_priority const priority =
 threads::thread_priority::bound,
 threads::thread_stacksize const stacksize =
 threads::thread_stacksize::small_,
 fork_join_executor::loop_schedule const
 schedule =
 fork_join_executor::loop_schedule::static_,
 std::chrono::nanoseconds const yield_delay =
 std::chrono::milliseconds(1))
```

Construct a *block\_fork\_join\_executor*.

**Note**

This constructor will create one `fork_join_executor` for each numa domain

**Parameters**

- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be `nostack`.
- **schedule** – The loop schedule of the parallel regions.
- **yield\_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

```
inline explicit block_fork_join_executor(std::vector<compute::host::target> const
 &targets, threads::thread_priority const priority
 = threads::thread_priority::bound,
 threads::thread_stacksize const stacksize =
 threads::thread_stacksize::small,
 fork_join_executor::loop_schedule const
 schedule =
 fork_join_executor::loop_schedule::static_,
 std::chrono::nanoseconds const yield_delay =
 std::chrono::milliseconds(1))
```

Construct a *block\_fork\_join\_executor*.

**Note**

This constructor will create one `fork_join_executor` for each given target

**Parameters**

- **targets** – The list of targets to use for thread placement
- **priority** – The priority of the worker threads.
- **stacksize** – The stacksize of the worker threads. Must not be `nostack`.
- **schedule** – The loop schedule of the parallel regions.
- **yield\_delay** – The time after which the executor yields to other work if it has not received any new work for execution.

**Private Members**

## config

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## hpx/config.hpp

Defined in header `hpx/config.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## Defines

### HPX\_INITIAL\_IP\_PORT

This is the default ip/port number used by the parcel subsystem.

### HPX\_CONNECTING\_IP\_PORT

### HPX\_INITIAL\_IP\_ADDRESS

### HPX\_RUNTIME\_INSTANCE\_LIMIT

This defines the maximum number of possible runtime instances in one executable

**HPX\_PARCEL\_BOOTSTRAP**

This defines the type of the parcelport to be used during application bootstrap. This value can be changed at runtime by the configuration parameter:

```
hpx.parcel.bootstrap = ...
```

(or by setting the corresponding environment variable `HPX_PARCEL_BOOTSTRAP`).

**HPX\_PARCEL\_MAX\_CONNECTIONS**

This defines the number of outgoing (parcel-) connections kept alive (to all other localities). This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.max_connections = ...
```

(or by setting the corresponding environment variable `HPX_PARCEL_MAX_CONNECTIONS`).

**HPX\_PARCEL\_IPC\_DATA\_BUFFER\_CACHE\_SIZE**

This defines the number of outgoing ipc (parcel-) connections kept alive (to each of the other localities on the same node). This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.ipc.data_buffer_cache_size = ...
```

(or by setting the corresponding environment variable `HPX_PARCEL_IPC_DATA_BUFFER_CACHE_SIZE`).

**HPX\_PARCEL\_MPI\_MAX\_REQUESTS**

This defines the number of MPI requests in flight This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.mpi.max_requests = ...
```

(or by setting the corresponding environment variable `HPX_PARCEL_MPI_MAX_REQUESTS`).

**HPX\_HAVE\_PARCELPOR MPI\_BACKGROUND\_THREADS**

This defines the number of cores that perform background work for the MPI parcelport This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.mpi.background_threads = ...
```

(or by setting the corresponding environment variable `HPX_HAVE_PARCELPOR MPI_BACKGROUND_THREADS`).

**HPX\_PARCEL\_MAX\_CONNECTIONS\_PER\_LOCALITY**

This defines the number of outgoing (parcel-) connections kept alive (to each of the other localities). This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.max_connections_per_locality = ...
```

(or by setting the corresponding environment variable `HPX_PARCEL_MAX_CONNECTIONS_PER_LOCALITY`).

**HPX\_PARCEL\_MAX\_MESSAGE\_SIZE**

This defines the maximally allowed message size for messages transferred between localities. This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.max_message_size = ...
```

(or by setting the corresponding environment variable `HPX_PARCEL_MAX_MESSAGE_SIZE`).

**HPX\_PARCEL\_MAX\_OUTBOUND\_MESSAGE\_SIZE**

This defines the maximally allowed outbound message size for coalescing messages transferred between localities. This value can be changed at runtime by setting the configuration parameter:

```
hpx.parcel.max_outbound_message_size = ...
```

(or by setting the corresponding environment variable `HPX_PARCEL_MAX_OUTBOUND_MESSAGE_SIZE`).

**HPX\_PARCEL\_SERIALIZATION\_OVERHEAD****HPX\_AGAS\_LOCAL\_CACHE\_SIZE**

This defines the number of AGAS address translations kept in the local cache. This is just the initial size which may be adjusted depending on the load of the system (not implemented yet), etc. It must be a minimum of 3 for AGAS v3 bootstrapping.

This value can be changes at runtime by setting the configuration parameter:

```
hpx.agas.local_cache_size = ...
```

(or by setting the corresponding environment variable `HPX_AGAS_LOCAL_CACHE_SIZE`)

**HPX\_AGAS\_RPC\_TIMEOUT**

This defines the default AGAS RPC timeout in milliseconds.

This value can be changed at runtime by setting the configuration parameter:

```
hpx.agas.rpc_timeout = val
```

(or by setting the corresponding environment variable `HPX_AGAS_RPC_TIMEOUT`)

**HPX\_INITIAL\_AGAS\_MAX\_PENDING\_REFCNT\_REQUESTS****HPX\_GLOBALCREDIT\_INITIAL**

This defines the initial global reference count associated with any created object.

**HPX\_NUM\_IO\_POOL\_SIZE**

This defines the default number of OS-threads created for the different internal thread pools

**HPX\_NUM\_PARCEL\_POOL\_SIZE****HPX\_NUM\_TIMER\_POOL\_SIZE****HPX\_SPINLOCK\_DEADLOCK\_DETECTION\_LIMIT**

By default, enable minimal thread deadlock detection in debug builds only.

**HPX\_HAVE\_THREAD\_BACKTRACE\_DEPTH**

By default we capture only 20 levels of stack back trace on suspension.

By default we do not maintain stack back-traces on suspension. This is a pure debugging aid to be able to see in the debugger where a suspended thread got stuck.

namespace **hpx**

```
namespace threads
```

## Enums

enum class **thread\_schedule\_state** : *std::int8\_t*

The *thread\_schedule\_state* enumerator encodes the current state of a *thread* instance

### Task Lifecycle State Transitions:

```
stateDiagram-v2
 %% Creation Phase
 [*] --> Staged : task_staged
 [*] --> Pending : task_created
 [*] --> Suspended : task_created
 Staged --> Pending : task_created

 %% Execution Loop
 Pending --> Active : task_executing
 Active --> Pending : task_yielded

 %% Sleep / Wake Cycle
 Active --> Suspended : task_suspended
 Suspended --> Pending : task_resumed

 %% Termination Paths
 Active --> Terminated : task_completed
 Active --> Deleted : task_completed (Inline fast-path)
 Pending --> Terminated : task_completed (Aborted)
 Suspended --> Terminated : task_completed (Aborted)

 %% Cleanup (Destruction / Recycling)
 Terminated --> Deleted : task_deleted
 Deleted --> [*]
```

Values:

enumerator **unknown**

enumerator **active**

thread is currently active (running, has resources)

enumerator **pending**

thread is pending (ready to run, but no hardware resource available)

enumerator **suspended**

thread has been suspended (waiting for synchronization event, but still known and under control of the thread-manager)

enumerator **depleted**

thread has been depleted (deeply suspended, it is not known to the thread-manager)

enumerator **terminated**

thread has been stopped and may be garbage collected

enumerator **staged**

this is not a real thread state, but allows to reference staged task descriptions, which eventually will be converted into thread objects

enumerator **pending\_do\_not\_schedule**

this is not a real thread state, but allows to create a thread in pending state without scheduling it (internal, do not use)

enumerator **pending\_boost**

this is not a real thread state, but allows to suspend a thread in pending state without high priority rescheduling

enumerator **deleted**

thread has been stopped and was deleted

enum class **thread\_priority** : *std::int8\_t*

This enumeration lists all possible thread-priorities for HPX threads.

*Values:*

enumerator **unknown**

enumerator **default\_**

Will assign the priority of the task to the default (normal) priority.

enumerator **low**

Task goes onto a special low priority queue and will not be executed until all high/normal priority tasks are done, even if they are added after the low priority task.

enumerator **normal**

Task will be executed when it is taken from the normal priority queue, this is usually a first in-first-out ordering of tasks (depending on scheduler choice). This is the default priority.

enumerator **high\_recursive**

The task is a high priority task and any child tasks spawned by this task will be made high priority as well - unless they are specifically flagged as non default priority.

enumerator **boost**

Same as *thread\_priority\_high* except that the thread will fall back to *thread\_priority\_normal* if resumed after being suspended.

enumerator **high**

Task goes onto a special high priority queue and will be executed before normal/low priority tasks are taken (some schedulers modify the behavior slightly and the documentation for those should be consulted).

enumerator **bound**

Task goes onto a special high priority queue and will never be stolen by another thread after initial assignment. This should be used for thread placement tasks such as OpenMP type for loops.

enumerator **initially\_bound**

Task initially goes onto a special high priority queue and will never be stolen by another thread after initial assignment. If the thread is rescheduled later, it will use normal priority.

enum class **thread\_restart\_state** : *std::int8\_t*

The *thread\_restart\_state* enumerator encodes the reason why a thread is being restarted

*Values:*

enumerator **unknown**enumerator **signaled**

The thread has been signaled.

enumerator **timeout**

The thread has been reactivated after a timeout.

enumerator **terminate**

The thread needs to be terminated.

enumerator **abort**

The thread needs to be aborted.

enum class **thread\_stacksize** : *std::int8\_t*

A *thread\_stacksize* references any of the possible stack-sizes for HPX threads.

*Values:*

enumerator **unknown**enumerator **small\_**

use small stack size (the underscore is to work around 'small' being defined to char on Windows)

enumerator **medium**

use medium sized stack size

enumerator **large**

use large stack size

enumerator **huge**

use very large stack size

enumerator **nostack**

this thread does not suspend (does not need a stack)

enumerator **current**

use size of current thread's stack

enumerator **default\_**

use default stack size

enumerator **minimal**

use minimally stack size

enumerator **maximal**

use maximally stack size

enum class **thread\_schedule\_hint\_mode** : *std::int8\_t*

The type of hint given when creating new tasks.

*Values:*

enumerator **none**

A hint that leaves the choice of scheduling entirely up to the scheduler.

enumerator **thread**

A hint that tells the scheduler to prefer scheduling a task on the local thread number associated with this hint. Local thread numbers are indexed from zero. It is up to the scheduler to decide how to interpret thread numbers that are larger than the number of threads available to the scheduler. Typically, thread numbers will wrap around when too large.

enumerator **numa**

A hint that tells the scheduler to prefer scheduling a task on the NUMA domain associated with this hint. NUMA domains are indexed from zero. It is up to the scheduler to decide how to interpret NUMA domain indices that are larger than the number of available NUMA domains to the scheduler. Typically, indices will wrap around when too large.

enum class **thread\_placement\_hint** : *std::int8\_t*

The type of hint given to the scheduler related to thread placement

The type of hint given to the scheduler related running a thread as a child directly in the context of the parent thread

*Values:*

enumerator **none**

No hint is specified. The implementation is free to chose what placement methods to use.

enumerator **depth\_first**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core).

enumerator **breadth\_first**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores).

enumerator **depth\_first\_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a depth-first basis (i.e. consecutively scheduled threads are placed on the same core). Threads are being scheduled in reverse order.

enumerator **breadth\_first\_reverse**

A hint that tells the scheduler to prefer spreading thread placement on a breadth-first basis (i.e. consecutively scheduled threads are placed on the neighboring cores). Threads are being scheduled in reverse order.

enum class **thread\_sharing\_hint** : *std::int8\_t*

The type of hint given to the scheduler related to whether it is ok to share the invoked function object between threads

*Values:*

enumerator **none**

No hint is specified. The implementation is free to chose what sharing methods to use.

enumerator **do\_not\_share\_function**

A hint that tells the scheduler to avoid sharing the given function (object) between threads.

enumerator **do\_not\_combine\_tasks**

A hint that tells the scheduler to avoid combining tasks on the same thread. This is important for tasks that may synchronize between each other, which could lead to deadlocks if those tasks are combined running by the same thread.

enum class **thread\_execution\_hint** : *std::int8\_t*

*Values:*

enumerator **none**

No hint is specified. Always run the thread in its own execution environment.

enumerator **run\_as\_child**

Attempt to run the thread in the execution context of the parent thread.

## Functions

`std::ostream &operator<<(std::ostream &os, thread_schedule_state t)`

char const \***get\_thread\_state\_name**(*thread\_schedule\_state* state) noexcept

Returns the name of the given state.

Get the readable string representing the name of the given thread\_state constant.

### Parameters

**state** – this represents the thread state.

`std::ostream &operator<<(std::ostream &os, thread_priority t)`

char const \***get\_thread\_priority\_name**(*thread\_priority* priority) noexcept

Return the thread priority name.

Get the readable string representing the name of the given thread\_priority constant.

### Parameters

**priority** – this represents the thread priority.

`std::ostream &operator<<(std::ostream &os, thread_restart_state t)`

char const \***get\_thread\_state\_ex\_name**(*thread\_restart\_state* state) noexcept

Get the readable string representing the name of the given thread\_restart\_state constant.

char const \***get\_thread\_state\_name**(*thread\_state* state) noexcept

Get the readable string representing the name of the given thread\_state constant.

`std::ostream &operator<<(std::ostream &os, thread_stacksize t)`

char const \***get\_stack\_size\_enum\_name**(*thread\_stacksize* size) noexcept

Returns the stack size name.

Get the readable string representing the given stack size constant.

### Parameters

**size** – this represents the stack size

constexpr bool **do\_not\_share\_function**(*thread\_sharing\_hint* hint) noexcept

constexpr bool **do\_not\_combine\_tasks**(*thread\_sharing\_hint* hint) noexcept

constexpr *thread\_sharing\_hint* **operator|**(*thread\_sharing\_hint* lhs, *thread\_sharing\_hint* rhs) noexcept

constexpr bool **run\_as\_child**(*thread\_execution\_hint* hint) noexcept

## Variables

constexpr *thread\_execution\_hint* **default\_runs\_as\_child\_hint** = *thread\_execution\_hint::none*

Default value to use for runs-as-child mode (if *true*, then futures will attempt to execute associated threads directly if they have not started running).

struct **thread\_schedule\_hint**

*#include <thread\_enums.hpp>* A hint given to a scheduler to guide where a task should be scheduled.

A scheduler is free to ignore the hint, or modify the hint to suit the resources available to the scheduler.

## Public Functions

inline constexpr **thread\_schedule\_hint**() noexcept

Construct a default hint with mode *thread\_schedule\_hint\_mode::none*.

inline explicit constexpr **thread\_schedule\_hint**(*std::int16\_t* const thread\_hint,  
                                                   *thread\_placement\_hint* placement =  
                                                   *thread\_placement\_hint::none*,  
                                                   *thread\_execution\_hint* runs\_as\_child =  
                                                   *default\_runs\_as\_child\_hint*,  
                                                   *thread\_sharing\_hint* sharing =  
                                                   *thread\_sharing\_hint::none*) noexcept

Construct a hint with mode *thread\_schedule\_hint\_mode::thread* and the given hint as the local thread number.

inline constexpr **thread\_schedule\_hint**(*thread\_schedule\_hint\_mode* const mode, *std::int16\_t*  
                                                   const hint, *thread\_placement\_hint* placement =  
                                                   *thread\_placement\_hint::none*, *thread\_execution\_hint*  
                                                   runs\_as\_child = *default\_runs\_as\_child\_hint*,  
                                                   *thread\_sharing\_hint* sharing =  
                                                   *thread\_sharing\_hint::none*) noexcept

Construct a hint with the given mode and hint. The numerical hint is unused when the mode is *thread\_schedule\_hint\_mode::none*.

inline explicit constexpr **thread\_schedule\_hint**(*thread\_placement\_hint* placement) noexcept

Construct a hint with the given placement hint.

inline explicit constexpr **thread\_schedule\_hint**(*thread\_execution\_hint* runs\_as\_child) noexcept

Construct a hint with the given execution hint.

inline explicit constexpr **thread\_schedule\_hint**(*thread\_sharing\_hint* sharing) noexcept

Construct a hint with the given sharing hint.

inline constexpr *thread\_placement\_hint* **placement\_mode**() const noexcept

inline constexpr void **placement\_mode**(*thread\_placement\_hint* bits) noexcept

inline constexpr *thread\_sharing\_hint* **sharing\_mode**() const noexcept

inline constexpr void **sharing\_mode**(*thread\_sharing\_hint* bits) noexcept

inline constexpr *thread\_execution\_hint* **runs\_as\_child\_mode**() const noexcept

inline constexpr void **runs\_as\_child\_mode**(*thread\_execution\_hint* bits) noexcept

inline constexpr void **schedule\_hint**(*std::int16\_t* core) noexcept

## Public Members

*std::int16\_t* **hint** = -1

The hint associated with the mode. The interpretation of this hint depends on the given mode.

*thread\_schedule\_hint\_mode* **mode** = *thread\_schedule\_hint\_mode::none*

The mode of the scheduling hint.

*std::uint8\_t* **placement\_mode\_bits**

The mode of the desired thread placement.

*std::uint8\_t* **sharing\_mode\_bits**

The mode of the desired sharing hint.

*std::uint8\_t* **runs\_as\_child\_mode\_bits**

The thread will run as a child directly in the context of the current thread

## datastructures

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## hpx::ignore

Defined in header *hpx/tuple.hpp*<sup>851</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::tuple*
- *hpx::tuple\_size*
- *hpx::tuple\_element*
- *hpx::make\_tuple*
- *hpx::tie*
- *hpx::forward\_as\_tuple*
- *hpx::tuple\_cat*
- *hpx::get*

constexpr *hpx::detail::ignore\_type* **hpx::ignore** = { }

An object of unspecified type such that any value can be assigned to it with no effect. Intended for use with *hpx::tie* when unpacking a *hpx::tuple*, as a placeholder for the arguments that are not used. While the behavior of *hpx::ignore* outside of *hpx::tie* is not formally specified, some code guides recommend using *hpx::ignore* to avoid warnings from unused return values of `[[nodiscard]]` functions.

---

<sup>851</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/tuple.hpp)

## hpx::tuple

Defined in header `hpx/tuple.hpp`<sup>852</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ignore`
- `hpx::tuple_size`
- `hpx::tuple_element`
- `hpx::make_tuple`
- `hpx::tie`
- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

template<typename ...**Ts**>

class **tuple**

Class template `hpx::tuple` is a fixed-size collection of heterogeneous values. It is a generalization of `hpx::pair`. If `std::is_trivially_destructible<Ti>::value` is true for every  $T_i$  in  $T_s$ , the destructor of tuple is trivial.

**Param Ts...**

the types of the elements that the tuple stores.

## hpx::tuple\_size

Defined in header `hpx/tuple.hpp`<sup>853</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::ignore`
- `hpx::tuple`
- `hpx::tuple_element`
- `hpx::make_tuple`
- `hpx::tie`
- `hpx::forward_as_tuple`
- `hpx::tuple_cat`
- `hpx::get`

template<typename **T**, typename **Enable** = void>

<sup>852</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/tuple.hpp)

<sup>853</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/tuple.hpp)

**struct `tuple_size`**

Provides access to the number of elements in a tuple-like type as a compile-time constant expression.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like. The `Enable` parameter allows constraining partial specializations via SFINAE (mirroring [`hpx::tuple\_element`](#)).

**`hpx::tuple_element`**

Defined in header [`hpx/tuple.hpp`](#)<sup>854</sup>.

See [\*Public API\*](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [`hpx::ignore`](#)
- [`hpx::tuple`](#)
- [`hpx::tuple\_size`](#)
- [`hpx::make\_tuple`](#)
- [`hpx::tie`](#)
- [`hpx::forward\_as\_tuple`](#)
- [`hpx::tuple\_cat`](#)
- [`hpx::get`](#)

template<[`std::size\_t`](#) **I**, typename **T**, typename **Enable** = void>

**struct `tuple_element`**

Provides compile-time indexed access to the types of the elements of a tuple-like type.

The primary template is not defined. An explicit (full) or partial specialization is required to make a type tuple-like.

**`hpx::make_tuple`**

Defined in header [`hpx/tuple.hpp`](#)<sup>855</sup>.

See [\*Public API\*](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [`hpx::ignore`](#)

- [`hpx::tuple\_cat`](#)

---

<sup>854</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/tuple.hpp)

<sup>855</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/tuple.hpp)

- *hpx::get*

```
template<typename ...Ts>
constexpr tuple<util::decay_unwrap_t<Ts>...> hpx::make_tuple(Ts&&... ts)
```

Provides compile-time indexed access to the types of the elements of the tuple.

## *hpx::tie*

Defined in header *hpx/tuple.hpp*<sup>856</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ignore*
- *hpx::tuple*
- *hpx::tuple\_size*
- *hpx::tuple\_element*
- *hpx::make\_tuple*
- *hpx::forward\_as\_tuple*
- *hpx::tuple\_cat*
- *hpx::get*

```
template<typename ...Ts>
constexpr tuple<Ts&...> hpx::tie(Ts&... ts)
```

Creates a tuple of lvalue references to its arguments or instances of *hpx::ignore*.

### Parameters

**ts** – zero or more lvalue arguments to construct the tuple from.

### Returns

*hpx::tuple* object containing lvalue references.

## *hpx::forward\_as\_tuple*

Defined in header *hpx/tuple.hpp*<sup>857</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::ignore*
- *hpx::tuple*
- *hpx::tuple\_size*
- *hpx::tuple\_element*
- *hpx::make\_tuple*
- *hpx::tie*
- *hpx::tuple\_cat*

<sup>856</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/tuple.hpp)

<sup>857</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/tuple.hpp)

- *hpx::get*

```
template<typename ...Ts>
constexpr tuple<Ts&&...> hpx::forward_as_tuple(Ts&&... ts)
```

Constructs a tuple of references to the arguments in args suitable for forwarding as an argument to a function. The tuple has rvalue reference data members when rvalues are used as arguments, and otherwise has lvalue reference data members.

**Parameters**

**ts** – zero or more arguments to construct the tuple from

**Returns**

*hpx::tuple* object created as if by

```
hpx::tuple<Ts&&...>(HPX_FORWARD(Ts, ts)...)
```

## **hpx::tuple\_cat**

Defined in header `hpx/tuple.hpp`<sup>858</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::ignore*
- *hpx::tuple*
- *hpx::tuple\_size*
- *hpx::tuple\_element*
- *hpx::make\_tuple*
- *hpx::tie*
- *hpx::forward\_as\_tuple*
- *hpx::get*

```
template<typename ...Tuples>
constexpr auto hpx::tuple_cat(Tuples&&... tuples)
```

Constructs a tuple that is a concatenation of all tuples in `tuples`. The behavior is undefined if any type in `std::decay_t<Tuples>...` is not a specialization of *hpx::tuple*. However, an implementation may choose to support types (such as `std::array` and `std::pair`) that follow the tuple-like protocol.

**Parameters**

**tuples** – - zero or more tuples to concatenate

**Returns**

*hpx::tuple* object composed of all elements of all argument tuples constructed from *hpx::get*<Is>(HPX\_FORWARD(UTuple,t) for each individual element.

---

<sup>858</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/tuple.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/tuple.hpp)

## hpx::get

Defined in header `hpx/tuple.hpp`<sup>859</sup>.

<sup>864</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/any.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/any.hpp)

- `hpx::any_cast`
- `hpx::make_any_nonser`

```
template<typename T, typename ...Ts>
util::basic_any<void, void, void, std::false_type> hpx::make_unique_any_nonser(Ts&&... ts)
```

```
template<typename T, typename U, typename ...Ts>
util::basic_any<void, void, void, std::false_type> hpx::make_unique_any_nonser(std::initializer_list<U> il,
Ts&&... ts)
```

```
template<typename T>
util::basic_any<void, void, void, std::false_type> hpx::make_unique_any_nonser(T &&t)
```

## hpx::any

Defined in header `hpx/any.hpp`<sup>865</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::make_any`

```
using hpx::any = util::basic_any<serialization::input_archive, serialization::output_archive, char, std::true_type>
```

## hpx::make\_any

Defined in header `hpx/any.hpp`<sup>866</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::any`

```
template<typename T, typename Char>
util::basic_any<serialization::input_archive, serialization::output_archive, Char> hpx::make_any(T &&t)
 Constructs an any object containing an object of type T, passing the provided arguments to T's constructor.
 Equivalent to:
```

```
return std::any(std::in_place_type<T>, std::forward<Args>(args)...);
```

## debugging

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx/debugging/print.hpp

Defined in header `hpx/debugging/print.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### errors

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/errors/try\_catch\_exception\_ptr.hpp

Defined in header `hpx/errors/try_catch_exception_ptr.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

### hpx/errors/error.hpp

Defined in header `hpx/errors/error.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### Defines

#### HPX\_ERROR\_UNSCOPED\_ENUM\_DEPRECATION\_MSG

namespace **hpx**

### Enums

enum class **error** : `std::int16_t`

Possible error conditions.

This enumeration lists all possible error conditions which can be reported from any of the API functions.

*Values:*

enumerator **success**

The operation was successful.

enumerator **no\_success**

The operation did failed, but not in an unexpected manner.

enumerator **not\_implemented**

The operation is not implemented.

enumerator **out\_of\_memory**

The operation caused an out of memory condition.

enumerator **bad\_action\_code**

enumerator **bad\_component\_type**

The specified component type is not known or otherwise invalid.

enumerator **network\_error**

A generic network error occurred.

enumerator **version\_too\_new**

The version of the network representation for this object is too new.

enumerator **version\_too\_old**

The version of the network representation for this object is too old.

enumerator **version\_unknown**

The version of the network representation for this object is unknown.

enumerator **unknown\_component\_address**

enumerator **duplicate\_component\_address**

The given global id has already been registered.

enumerator **invalid\_status**

The operation was executed in an invalid status.

enumerator **bad\_parameter**

One of the supplied parameters is invalid.

enumerator **internal\_server\_error**

enumerator **service\_unavailable**

enumerator **bad\_request**

enumerator **repeated\_request**

enumerator **lock\_error**

enumerator **duplicate\_console**

There is more than one console locality.

enumerator **no\_registered\_console**

There is no registered console locality available.

enumerator **startup\_timed\_out**

enumerator **uninitialized\_value**

enumerator **bad\_response\_type**

enumerator **deadlock**

enumerator **assertion\_failure**

enumerator **null\_thread\_id**

Attempt to invoke an API function from a non-HPX thread.

enumerator **invalid\_data**

enumerator **yield\_aborted**

The yield operation was aborted.

enumerator **dynamic\_link\_failure**

enumerator **commandline\_option\_error**

One of the options given on the command line is erroneous.

enumerator **serialization\_error**

There was an error during serialization of this object.

enumerator **unhandled\_exception**

An unhandled exception has been caught.

enumerator **kernel\_error**

The OS kernel reported an error.

enumerator **broken\_task**

The task associated with this future object is not available anymore.

enumerator **task\_moved**

The task associated with this future object has been moved.

enumerator **task\_already\_started**

The task associated with this future object has already been started.

enumerator **future\_already\_retrieved**

The future object has already been retrieved.

enumerator **promise\_already\_satisfied**

The value for this future object has already been set.

enumerator **future\_does\_not\_support\_cancellation**

The future object does not support cancellation.

enumerator **future\_can\_not\_be\_cancelled**

The future can't be canceled at this time.

enumerator **no\_state**

The future object has no valid shared state.

enumerator **broken\_promise**

The promise has been deleted.

enumerator **thread\_resource\_error**

enumerator **future\_cancelled**

enumerator **thread\_cancelled**

enumerator **thread\_not\_interruptable**

enumerator **duplicate\_component\_id**

The component type has already been registered.

enumerator **unknown\_error**

An unknown error occurred.

enumerator **bad\_plugin\_type**

The specified plugin type is not known or otherwise invalid.

enumerator **filesystem\_error**

The specified file does not exist or other filesystem related error.

enumerator **bad\_function\_call**

equivalent of `std::bad_function_call`

enumerator **task\_canceled\_exception**

`parallel::task_canceled_exception`

enumerator **task\_block\_not\_active**

task\_region is not active

enumerator **out\_of\_range**

Equivalent to `std::out_of_range`.

enumerator **length\_error**

Equivalent to `std::length_error`.

enumerator **migration\_needs\_retry**

migration failed because of global race, retry

enumerator **stale\_state**

The queried state may be stale, e.g. because no state has been recorded yet or a preceding notification has not yet been delivered

enumerator **target\_fenced**

A dispatch was deliberately and correctly refused because the target had already latched a terminal lifecycle event; this is a final rejection, not a staleness signal, and should not be retried

enumerator **future\_wait\_timed\_out**

future wait timed out

enumerator **locality\_was\_disconnected**

the requested target locality was disconnected

enumerator **future\_uncompleted**

future was resumed while being empty

## Functions

```

## hpx::error\_code

Defined in header `hpx/system_error.hpp`<sup>867</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

---

<sup>867</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/system\\_error.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/system_error.hpp)

class **error\_code** : public *std::error\_code*

A *hpx::error\_code* represents an arbitrary error condition.

The class *hpx::error\_code* describes an object used to hold error code values, such as those originating from the operating system or other low-level application program interfaces.

#### Note

Class *hpx::error\_code* is an adjunct to error reporting by exception

## hpx/errors/macros.hpp

Defined in header `hpx/errors/macros.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## Defines

**HPX\_THROW\_EXCEPTION**(errcode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX\_THROW\_EXCEPTION* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the *hpx::error* code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
 // Throw a hpx::exception initialized from the given parameters.
 // Additionally associate with this exception some detailed
 // diagnostic information about the throw-site.
 HPX_THROW_EXCEPTION(hpx::error::no_success, "raise_exception",
 "simulated error");
}
```

### Example:

**HPX\_THROW\_EXCEPTION\_MODE**(errcode, mode, f, ...)

Throw a *hpx::exception* initialized from the given parameters.

The macro *HPX\_THROW\_EXCEPTION\_MODE* can be used to throw a *hpx::exception*. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the *hpx::error* code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error

message the new exception should encapsulate. The `throwmode` parameter allows to specify the type of the thrown exception.

```
void raise_exception() {
 // Throw a hpx::exception initialized from the given parameters.
 HPX_THROW_EXCEPTION_MODE(hpx::error::no_success,
 hpx::throwmode::lightweight, "raise_exception",
 "simulated error");
}
```

**Example:**

**HPX\_THROW\_BAD\_ALLOC(f)**

Throw a `hpx::bad_alloc_exception` initialized from the given parameters.

The macro `HPX_THROW_BAD_ALLOC` can be used to throw a `hpx::exception`. The purpose of this macro is to prepend the source file name and line number of the position where the exception is thrown to the error message. Moreover, this associates additional diagnostic information with the exception, such as file name and line number, locality id and thread id, and stack backtrace from the point where the exception was thrown.

The parameter `errcode` holds the `hpx::error` code the new exception should encapsulate. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

```
void raise_exception()
{
 // Throw a hpx::exception initialized from the given parameters.
 // Additionally associate with this exception some detailed
 // diagnostic information about the throw-site.
 HPX_THROW_BAD_ALLOC("raise_exception", "simulated error");
}
```

**Example:**

**HPX\_THROWS\_IF(ec, errcode, f, ...)**

Either throw a `hpx::exception` or initialize `hpx::error_code` from the given parameters.

The macro `HPX_THROWS_IF` can be used to either throw a `hpx::exception` or to initialize a `hpx::error_code` from the given parameters. If `&ec == &hpx::throws`, the semantics of this macro are equivalent to `HPX_THROW_EXCEPTION`. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

The parameter `errcode` holds the `hpx::error` code from which the new exception should be initialized. The parameter `f` is expected to hold the name of the function exception is thrown from and the parameter `msg` holds the error message the new exception should encapsulate.

**HPX\_THROWS\_BAD\_ALLOC\_IF(ec, f)**

Either throw a `hpx::bad_alloc_exception` or `hpx::error_code` to `out_of_memory`.

The macro `HPX_THROWS_BAD_ALLOC_IF` can be used to either throw a `hpx::bad_alloc_exception` or to initialize a `hpx::error_code` to `hpx::error::out_of_memory`. If `&ec == &hpx::throws`, the semantics of this macro are equivalent to `HPX_THROW_BAD_ALLOC`. If `&ec != &hpx::throws`, the `hpx::error_code` instance `ec` is initialized instead.

**HPX\_DEFINE\_ERROR\_INFO**(NAME, TYPE)

### hpx/errors/exception\_list.hpp

Defined in header `hpx/errors/exception_list.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

class **exception\_list** : public *hpx::exception*

*#include <exception\_list.hpp>* The class *exception\_list* is a container of *exception\_ptr* objects parallel algorithms may use to communicate uncaught exceptions encountered during parallel execution to the caller of the algorithm

The type `exception_list::const_iterator` fulfills the requirements of a forward iterator.

### Public Types

using **iterator** = `exception_list_type::const_iterator`  
 bidirectional iterator

### Public Functions

inline *std::size\_t* **size**() const noexcept

The number of *exception\_ptr* objects contained within the *exception\_list*.

#### Note

Complexity: Constant time.

inline `exception_list_type::const_iterator` **begin**() const noexcept

An iterator referring to the first *exception\_ptr* object contained within the *exception\_list*.

inline `exception_list_type::const_iterator` **end**() const noexcept

An iterator which is the past-the-end value for the *exception\_list*.

### hpx/errors/define\_error\_info.hpp

Defined in header `hpx/errors/define_error_info.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### HPX\_THROW\_EXCEPTION

Defined in header [hpx/exception.hpp](#)<sup>868</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *HPX\_THROW\_BAD\_ALLOC*
- *HPX\_THROWS\_IF*

#### Warning

doxygenfunction: Cannot find function “HPX\_THROW\_EXCEPTION” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

### HPX\_THROW\_BAD\_ALLOC

Defined in header [hpx/exception.hpp](#)<sup>869</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *HPX\_THROW\_EXCEPTION*
- *HPX\_THROWS\_IF*

#### Warning

doxygenfunction: Cannot find function “HPX\_THROW\_BAD\_ALLOC” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

### HPX\_THROWS\_IF

Defined in header [hpx/exception.hpp](#)<sup>870</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *HPX\_THROW\_EXCEPTION*
- *HPX\_THROW\_BAD\_ALLOC*

**Warning**

doxygenfunction: Cannot find function “HPX\_THROWS\_IF” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

**hpx/errors/exception\_fwd.hpp**

Defined in header `hpx/errors/exception_fwd.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

**Enums**

enum class **throwmode** : `std::uint8_t`

Encode error category for new *error\_code*.

*Values:*

enumerator **plain**

enumerator **rethrow**

enumerator **lightweight**

**Functions**

constexpr bool **operator&**(*throwmode* lhs, *throwmode* rhs) noexcept

**Variables**

*error\_code* **throws**

Predefined *error\_code* object used as “throw on error” tag.

The predefined *hpx::error\_code* object *hpx::throws* is supplied for use as a “throw on error” tag.

Functions that specify an argument in the form ‘*error\_code*& ec=throws’ (with appropriate namespace qualifiers), have the following error handling semantics:

If `&ec != &throws` and an error occurred: `ec.value()` returns the implementation specific error number for the particular error that occurred and `ec.category()` returns the `error_category` for `ec.value()`.

If `&ec != &throws` and an error did not occur, `ec.clear()`.

If an error occurs and `&ec == &throws`, the function throws an exception of type `hpx::exception` or of a type derived from it. The exception’s `get_errorcode()` member function returns a reference to a `hpx::error_code` object with the behavior as specified above.

## hpx::exception

Defined in header [hpx/exception.hpp](#)<sup>871</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

class **exception** : public *std::system\_error*

A *hpx::exception* is the main exception type used by HPX to report errors.

The *hpx::exception* type is the main exception type used by HPX to report errors. Any exceptions thrown by functions in the HPX library are either of this type or of a type derived from it. This implies that it is always safe to use this type only in catch statements guarding HPX library calls.

Subclassed by *hpx::bad\_alloc\_exception*, *hpx::cuda::experimental::cuda\_exception*, *hpx::exception\_list*, *hpx::experimental::task\_canceled\_exception*, *hpx::mpi::experimental::mpi\_exception*

## execution

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx/execution/traits/policy\_traits.hpp

Defined in header *hpx/execution/traits/policy\_traits.hpp*.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

### hpx/execution/traits/is\_execution\_policy.hpp

Defined in header *hpx/execution/traits/is\_execution\_policy.hpp*.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

 parallelization
 {
 i. The type is_sequenced_execution_policy can be used to detect non-parallel execution policies for the
 purpose of excluding function signatures from otherwise ambiguous overload resolution participation.
 }

```

- ii. If `T` is the type of the standard or implementation-defined execution policy, `is_sequenced_execution_policy<T>` shall be publicly derived from `integral_constant<bool, true>`, otherwise from `integral_constant<bool, false>`.

- iii. The behavior of a program that adds specializations for `is_sequenced_execution_policy` is undefined.

template<typename `T`>

struct **is\_async\_execution\_policy** : public `hpx::detail::is_async_execution_policy<std::decay_t<T>>`

`#include <is_execution_policy.hpp>` Extension: Detect whether given execution policy makes algorithms asynchronous

- i. The type `is_async_execution_policy` can be used to detect asynchronous execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.

- ii. If `T` is the type of the standard or implementation-defined execution policy, `is_async_execution_policy<T>` shall be publicly derived from `integral_constant<bool, true>`, otherwise from `integral_constant<bool, false>`.

- iii. The behavior of a program that adds specializations for `is_async_execution_policy` is undefined.

## **hpx::execution::experimental::persistent\_auto\_chunk\_size**

Defined in header `hpx/execution.hpp`<sup>872</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

struct **persistent\_auto\_chunk\_size**

Loop iterations are divided into pieces and then assigned to threads. The number of loop iterations combined is determined based on measurements of how long the execution of 1% of the overall number of iterations takes. This executor parameters type makes sure that as many loop iterations are combined as necessary to run for the amount of time specified.

## **hpx::execution::experimental::num\_cores**

Defined in header `hpx/execution.hpp`<sup>873</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

struct **num\_cores**

Control number of cores in executors which need a functionality for setting the number of cores to be used by an algorithm directly

---

<sup>872</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/execution.](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/execution.)

## hpx/execution/executors/adaptive\_static\_chunk\_size.hpp

Defined in header `hpx/execution/executors/adaptive_static_chunk_size.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace execution
```

```
 namespace experimental
```

```
 struct adaptive_static_chunk_size
```

*#include <adaptive\_static\_chunk\_size.hpp>* Loop iterations are divided into pieces of size *chunk\_size* and then assigned to threads. If *chunk\_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

### Note

This executor parameters type is equivalent to OpenMP's `STATIC` scheduling directive.

## Public Functions

**adaptive\_static\_chunk\_size**() = default

Construct a `adaptive_static_chunk_size` executor parameters object

### Note

By default the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

```
inline explicit constexpr adaptive_static_chunk_size(std::size_t const chunk_size)
 noexcept
```

Construct a `adaptive_static_chunk_size` executor parameters object

### Parameters

**chunk\_size** – [in] The optional chunk size to use as the number of loop iterations to run on a single thread.

## hpx::execution::experimental::static\_chunk\_size

Defined in header `hpx/execution.hpp`<sup>875</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

---

<sup>875</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/execution.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/execution.hpp)

struct **static\_chunk\_size**

Loop iterations are divided into pieces of size *chunk\_size* and then assigned to threads. If *chunk\_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

**Note**

This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

## hpx/execution/executors/rebind\_policy.hpp

Defined in header `hpx/execution/executors/rebind_policy.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Orthogonal customization points for rebinding an execution policy's executor and executor parameters independently of one another.

`hpx::execution::detail::execution_policy` is the CRTP base class that CRTP-based built-in execution policies derive from; not every built-in policy uses it (`thrust_task_policy` is one example that does not). It exposes a single, combined rebind operation: given a new Executor and a new Parameters type, it produces `Derived<Executor, Parameters>`, where `Derived` is the template `<typename, typename>` class the concrete policy is written as. `hpx::execution::experimental::rebind_executor_t` builds on top of that combined operation and is what `hpx::execution::detail::execution_policy` itself uses internally for `on()`, `with()`, and `query()`.

That combined operation requires every execution policy to be shaped exactly as `Derived<Executor, Parameters>`, which is awkward for a policy that needs to carry additional state, expose additional template parameters, or simply is not naturally expressed as a two-parameter class template. This header adds two smaller, independently specializable customization points, one per axis, so a policy can opt in to rebinding along either axis without being forced into that shape at all. This is purely additive: nothing here replaces or is called by the existing combined `rebind_executor_t`, `on()`, `with()`, or `query()` machinery.

namespace **hpx**

namespace **execution**

## hpx/execution/executors/default\_parameters.hpp

Defined in header `hpx/execution/executors/default_parameters.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **execution**

namespace **experimental**

struct **default\_parameters**

*#include <default\_parameters.hpp>* Loop iterations are divided into pieces of size *chunk\_size* and then assigned to threads. If *chunk\_size* is not specified, the iterations are evenly (if possible) divided contiguously among the threads.

**Note**

This executor parameters type is equivalent to OpenMP's STATIC scheduling directive.

## Public Functions

**default\_parameters()** = default

Construct a `default_parameters` executor parameters object

**Note**

By default, the number of loop iterations is determined from the number of available cores and the overall number of loop iterations to schedule.

## `hpx::execution::experimental::guided_chunk_size`

Defined in header `hpx/execution.hpp`<sup>876</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

struct **guided\_chunk\_size**

Iterations are dynamically assigned to threads in blocks as threads request those until no blocks remain to be assigned. Similar to `dynamic_chunk_size` except that the block size decreases each time a number of loop iterations is given to a thread. The size of the initial block is proportional to *number\_of\_iterations / number\_of\_cores*. Subsequent blocks are proportional to *number\_of\_iterations\_remaining / number\_of\_cores*. The optional chunk size parameter defines the minimum block size. The default chunk size is 1.

**Note**

This executor parameters type is equivalent to OpenMP's GUIDED scheduling directive.

*#include <execution\_parameters\_fwd.hpp>* Return the number of invocations of the given function *f* which should be combined into a single task

**Param params**

[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num\_tasks*.

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Param iteration\_duration**

[in] The time one of the tasks require to be executed.

**Param cores**

[in] The number of cores the number of chunks should be determined for.

**Param num\_tasks**

[in] The number of tasks the chunk size should be determined for

**Return**

The size of the chunks (number of iterations per chunk) that should be used for parallel execution.

## Public Functions

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &¶ms, Executor &&exec,
 hpx::chrono::steady_duration const &iteration_duration,
 std::size_t cores, std::size_t num_tasks) const
```

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &¶ms, Executor &&exec, std::size_t cores,
 std::size_t num_tasks) const
```

```
struct measure_iteration_t
```

*#include <execution\_parameters\_fwd.hpp>* Return the measured execution time for one iteration based on running the given function.

**Note**

The parameter *f* is expected to be a nullary function returning a `std::size_t` representing the number of iteration the function has already executed (i.e. which don't have to be scheduled anymore).

**Param params**

[in] The executor parameters object to use for determining the chunk size for the given number of tasks *num\_tasks*.

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Param f**

[in] The function which will be optionally scheduled using the given executor.

**Param num\_tasks**

[in] The number of tasks the chunk size should be determined for

**Return**

The execution time for one of the tasks.

**Public Functions**

```
template<typename Parameters, typename Executor, typename F>
inline decltype(auto) operator() (Parameters &¶ms, Executor &&exec, F &&f,
 std::size_t num_tasks) const
```

```
struct maximal_number_of_chunks_t
```

*#include <execution\_parameters\_fwd.hpp>* Return the largest reasonable number of chunks to create for a single algorithm invocation.

**Param params**

[in] The executor parameters object to use for determining the number of chunks for the given number of *cores*.

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Param cores**

[in] The number of cores the number of chunks should be determined for.

**Param num\_tasks**

[in] The number of tasks the chunk size should be determined for

**Public Functions**

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &¶ms, Executor &&exec, std::size_t cores,
 std::size_t num_tasks) const
```

```
struct reset_thread_distribution_t
```

*#include <execution\_parameters\_fwd.hpp>* Reset the internal round robin thread distribution scheme for the given executor.

**Note**

This calls `params.reset_thread_distribution(exec)` if it exists; otherwise it does nothing.

**Param params**

[in] The executor parameters object to use for resetting the thread distribution scheme.

**Param exec**

[in] The executor object to use.

**Public Functions**

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &¶ms, Executor &&exec) const
```

```
struct processing_units_count_t
```

*#include <execution\_parameters\_fwd.hpp>* Retrieve the number of (kernel-)threads used by the associated executor.

**Note**

This calls `params.processing_units_count(Executor&&)` if it exists; otherwise it forwards the request to the executor parameters object.

**Param params**

[in] The executor parameters object to use as a fallback if the executor does not expose

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Param iteration\_duration**

[in] The time one of the tasks require to be executed.

**Param num\_tasks**

[in] The number of tasks the number of cores should be determined for

**Return**

The number of cores to use

**Public Functions**

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &¶ms, Executor &&exec,
 hpx::chrono::steady_duration const &iteration_duration,

```

```
struct mark_partition_t
```

*#include <execution\_parameters\_fwd.hpp>* Mark custom point in parallel algorithm execution

### Note

This calls `params.mark_partition(exec, partition, args...)` if it exists; otherwise it does nothing.

### Param params

[in] The executor parameters object to use as a fallback if the executor does not expose

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Public Functions**

```
template<typename Parameters, typename Executor, typename ...Args>
inline decltype(auto) operator() (Parameters &¶ms, Executor &&exec, std::size_t
 partition, Args&&... args) const
```

```
struct collect_execution_parameters_t
```

```
#include <execution_parameters_fwd.hpp> Collect various parameters of the chunking for this
parallel algorithm execution
```

**Note**

This calls params.mark\_begin\_execution(exec) if it exists; otherwise it does nothing.

**Param params**

[in] The executor parameters object to use as a fallback if the executor does not expose

**Param exec**

[in] The executor object which will be used for scheduling of the loop iterations.

**Param num\_elements**

[in] The overall number of elements for the algorithm.

**Param num\_cores**

[in] The overall number of cores to utilize for the algorithm.

**Param num\_chunks**

[in] The overall number of chunks for the algorithm.

**Param chunk\_size**

[in] The size of the chunks created for the algorithm.

**Public Functions**

```
template<typename Parameters, typename Executor>
inline decltype(auto) operator() (Parameters &¶ms, Executor &&exec, std::size_t
 num_elements, std::size_t num_cores, std::size_t
 num_chunks, std::size_t chunk_size) const
```

```
template<>
```

```
struct is_scheduling_property<with_processing_units_count_t> : public std::true_type
```

**hpx::execution::experimental::dynamic\_chunk\_size**

Defined in header [hpx/execution.hpp](#)<sup>878</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

struct **dynamic\_chunk\_size**

Loop iterations are divided into pieces of size *chunk\_size* and then dynamically scheduled among the threads; when a thread finishes one chunk, it is dynamically assigned another. If *chunk\_size* is not specified, the default chunk size is 1.

**Note**

This executor parameters type is equivalent to OpenMP's DYNAMIC scheduling directive.

**hpx::execution::experimental::collect\_chunking\_parameters**

Defined in header [hpx/execution.hpp](#)<sup>879</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

struct **collect\_chunking\_parameters**

Collect various parameters used for running a parallel algorithm.

**hpx/execution/algorithms/future\_sender.hpp**

Defined in header [hpx/execution/algorithms/future\\_sender.hpp](#).

See [Public API](#) for a list of names and headers that are part of the public HPX API.

Implementation details for adapting HPX futures as P2300 senders.

Usage:

```
hpx::future<int> f = hpx::async([]{ return 42; });
auto result = hpx::execution::experimental::as_sender(std::move(f))
 | hpx::execution::experimental::then([](int x){ return x * 2; })
 | hpx::execution::experimental::sync_wait();
```

namespace **hpx**

namespace **execution**

namespace **experimental**

<sup>879</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/execution.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/execution.hpp)

## hpx/execution/algorithms/sender\_future.hpp

Defined in header `hpx/execution/algorithms/sender_future.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

Converts any P2300 `stdexec` sender into an `hpx::future<T>`.

Usage:

```
// Explicit T:
auto sender = stdexec::just(42) | stdexec::then([](int x){ return x; });
hpx::future<int> f =
 hpx::execution::experimental::as_future<int>(std::move(sender));
int val = f.get(); // == 42
```

namespace **hpx**

namespace **execution**

namespace **experimental**

### Variables

```
template<typename T>
constexpr as_future_t<T> as_future = {}

template<typename T>
struct as_future_t
```

### Public Functions

```
template<typename Sender, typename =
 std::enable_if_t<hpx::execution::experimental::is_sender_v<std::decay_t<Sender>>>>
inline constexpr hpx::future<T> operator() (Sender &&sender) const
```

## execution\_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**hpx/execution\_base/execution.hpp**

Defined in header `hpx/execution_base/execution.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

struct **sequenced\_execution\_tag**

*#include <execution.hpp>* Function invocations executed by a group of sequential execution agents execute in sequential order.

struct **parallel\_execution\_tag**

*#include <execution.hpp>* Function invocations executed by a group of parallel execution agents execute in unordered fashion. Any such invocations executing in the same thread are indeterminately sequenced with respect to each other.

**Note**

`parallel_execution_tag` is weaker than `sequenced_execution_tag`.

struct **unsequenced\_execution\_tag**

*#include <execution.hpp>* Function invocations executed by a group of vector execution agents are permitted to execute in unordered fashion when executed in different threads, and un-sequenced with respect to one another when executed in the same thread.

**Note**

`unsequenced_execution_tag` is weaker than `parallel_execution_tag`.

namespace **parallel**

namespace **execution**

**Variables**

constexpr struct `hpx::parallel::execution::sync_execute_t` **sync\_execute**

constexpr struct `hpx::parallel::execution::async_execute_t` **async\_execute**

constexpr struct `hpx::parallel::execution::then_execute_t` **then\_execute**

```
constexpr struct hpx::parallel::execution::post_t post
```

```
constexpr struct hpx::parallel::execution::bulk_sync_execute_t bulk_sync_execute
```

```
constexpr struct hpx::parallel::execution::bulk_async_execute_t bulk_async_execute
```

```
constexpr struct hpx::parallel::execution::bulk_then_execute_t bulk_then_execute
```

```
constexpr struct hpx::parallel::execution::async_invoke_t async_invoke
```

```
constexpr struct hpx::parallel::execution::sync_invoke_t sync_invoke
```

```
struct sync_execute_t
```

*#include <execution.hpp>* Customization point for synchronous execution agent creation.

This synchronously creates a single function invocation *f()* using the associated executor. The execution of the supplied function synchronizes with the caller

#### Note

It will call `exec.sync_execute(f, ts...)` if the executor exposes a corresponding member function. For two-way executors it will invoke `async_execute` and wait for the task's completion before returning.

#### Param *exec*

[in] The executor object to use for scheduling of the function *f*.

#### Param *f*

[in] The function which will be scheduled using the given executor.

#### Param *ts*

[in] Additional arguments to use to invoke *f*.

#### Return

*f(ts...)*'s result

### Public Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<typename Executor, typename F, typename...
Ts> HPX_DEPRECATED_V (2, 0,
"tag_invoke overloads for sync_execute are deprecated. " "Define a .
sync_execute() member function instead."
) decltype(auto) operator() (Executor &&exec
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Ts&&... ts) const
```

## Public Members

F &&f

```
F Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(sync_execute_t{},
std::forward< Executor >(exec), std::forward< F >(f),
std::forward< Ts >(ts)...)}
```

struct **async\_execute\_t**

*#include <execution.hpp>* Customization point for asynchronous execution agent creation.

This asynchronously creates a single function invocation *f()* using the associated executor.

### Note

Executors have to implement only `async_execute()`. All other functions will be emulated by this or other customization points in terms of this single basic primitive. However, some executors will naturally specialize all operations for maximum efficiency.

### Note

This is valid for one way executors (calls `make_ready_future(exec.sync_execute(f, ts...))` if it exists) and for two-way executors (calls `exec.async_execute(f, ts...)` if it exists).

### Param *exec*

[in] The executor object to use for scheduling of the function *f*.

### Param *f*

[in] The function which will be scheduled using the given executor.

### Param *ts*

[in] Additional arguments to use to invoke *f*.

### Return

*f(ts...)*'s result through a future

## Public Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<typename Executor, typename F, typename...
Ts> HPX_DEPRECATED_V(2, 0,
"tag_invoke overloads for async_execute are deprecated. " "Define an .
async_execute() member function instead.
") decltype(auto) operator()(Executor &&exec
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

## Public Members

F &&f

```
F Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(async_execute_t{}
std::forward< Executor >(exec), std::forward< F >(f),
std::forward< Ts >(ts)...)
```

struct **then\_execute\_t**

*#include <execution.hpp>* Customization point for execution agent creation depending on a given future.

This creates a single function invocation *f()* using the associated executor after the given future object has become ready.

### Note

This is valid for two-way executors (calls `exec.then_execute(f, predecessor, ts...)` if it exists) and for one way executors (calls `predecessor.then(bind(f, ts...))`).

### Param *exec*

[in] The executor object to use for scheduling of the function *f*.

### Param *f*

[in] The function which will be scheduled using the given executor.

### Param *predecessor*

[in] The future object the execution of the given function depends on.

### Param *ts*

[in] Additional arguments to use to invoke *f*.

### Return

*f(ts...)*'s result through a future

## Public Functions

```
template<typename Executor, typename F, typename Future, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Future &&predecessor, Ts&&...
ts) const
```

```
template<typename Executor, typename F, typename Future, typename...
Ts> HPX_DEPRECATED_V (2, 0,
"tag_invoke overloads for then_execute are deprecated. " "Define a .
then_execute() member function instead.
") decltype(auto) operator()(Executor &&exec
```

```
template<executor_any Executor, typename F, typename Future, typename ...Ts>

ts) const
```

## Public Members

**F &&f**

**F Future && predecessor**

```
F Future Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(then_execute,
std::forward< Executor >(exec), std::forward< F >(f),
std::forward< Future >(predecessor), std::forward< Ts >(ts)..
.)}
```

struct **post\_t**

*#include <execution.hpp>* Customization point for asynchronous fire & forget execution agent creation.

This asynchronously (fire & forget) creates a single function invocation *f*() using the associated executor.

### Note

This is valid for two-way executors (calls `exec.post(f, ts...)`, if available, otherwise it calls `exec.async_execute(f, ts...)` while discarding the returned future), and for non-blocking two-way executors (calls `exec.post(f, ts...)` if it exists).

**Param exec**

[in] The executor object to use for scheduling of the function *f*.

**Param f**

[in] The function which will be scheduled using the given executor.

**Param ts**

[in] Additional arguments to use to invoke *f*.

## Public Functions

```
template<typename Executor, typename F, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

```
template<typename Executor, typename F, typename...
Ts> HPX_DEPRECATED_V(2, 0,
"tag_invoke overloads for post are deprecated. " "Define a .
post() member function instead.
") decltype(auto) operator()(Executor &&exec
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, F &&f, Ts&&... ts) const
```

## Public Members

F &&f

```
F Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(post_t{}
std::forward< Executor >(exec), std::forward< F >(f),
std::forward< Ts >(ts)...)
```

struct **bulk\_sync\_execute\_t**

*#include <execution.hpp>* Bulk form of synchronous execution agent creation.

This synchronously creates a group of function invocations  $f(i)$  whose ordering is given by the `execution_category` associated with the executor. The function synchronizes the execution of all scheduled functions with the caller.

Here  $i$  takes on all values in the index space implied by `shape`. All exceptions thrown by invocations of  $f(i)$  are reported in a manner consistent with parallel algorithm execution through the returned future.

### Note

This is deliberately different from the `bulk_sync_execute` customization points specified in P0443. The `bulk_sync_execute` customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

### Note

This calls `exec.bulk_sync_execute(f, shape, ts...)` if it exists; otherwise it executes `sync_execute(f, shape, ts...)` as often as needed.

### Param `exec`

[in] The executor object to use for scheduling of the function  $f$ .

### Param `f`

[in] The function which will be scheduled using the given executor.

### Param `shape`

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to  $f$ .

### Param `ts`

[in] Additional arguments to use to invoke  $f$ .

### Return

The return type of `executor_type::bulk_sync_execute` if defined by `executor_type`. Otherwise, a vector holding the returned values of each invocation of  $f$  except when  $f$  returns void, which case void is returned.

## Public Functions

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
 const
```

```
template<typename Executor, typename F, typename Shape, typename...
Ts> HPX_DEPRECATED_V (2, 0,
 "tag_invoke overloads for bulk_sync_execute are deprecated. " "Define a .
 bulk_sync_execute() member function instead.
 ") decltype(auto) operator() (Executor &&exec
```

 const
```

## Public Members

**F &&f**

**F Shape const & shape**

```
F Shape const Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(bulk_sync_execute,
 std::forward< Executor >(exec),std::forward< F >(f), shape,
 std::forward< Ts >(ts)...)
```

struct **bulk\_async\_execute\_t**

*#include <execution.hpp>* Bulk form of asynchronous execution agent creation.

This asynchronously creates a group of function invocations  $f(i)$  whose ordering is given by the `execution_category` associated with the executor.

Here  $i$  takes on all values in the index space implied by `shape`. All exceptions thrown by invocations of  $f(i)$  are reported in a manner consistent with parallel algorithm execution through the returned future.

### Note

This is deliberately different from the `bulk_async_execute` customization points specified in P0443. The `bulk_async_execute` customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

**Note**

This calls `exec.bulk_async_execute(f, shape, ts...)` if it exists; otherwise it executes `async_execute(f, shape, ts...)` as often as needed.

**Param exec**

[in] The executor object to use for scheduling of the function *f*.

**Param f**

[in] The function which will be scheduled using the given executor.

**Param shape**

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to *f*.

**Param ts**

[in] Additional arguments to use to invoke *f*.

**Return**

The return type of `executor_type::bulk_async_execute` if defined by `executor_type`. Otherwise, a vector of futures holding the returned values of each invocation of *f*.

**Public Functions**

```
template<typename Executor, typename F, typename Shape, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, F &&f, Shape const &shape, Ts&&... ts)
 const
```

```

**F &&f**

**F Shape const & shape**

```
F Shape const Ts &&ts const {return hpx::functional::tag_invoke_ns::tag_invoke(bulk_async,
std::forward< Executor >(exec),std::forward< F >(f), shape,
std::forward< Ts >(ts)...)
```

struct **bulk\_then\_execute\_t**

*#include <execution.hpp>* Bulk form of execution agent creation depending on a given future.

This creates a group of function invocations  $f(i)$  whose ordering is given by the `execution_category` associated with the executor.

Here  $i$  takes on all values in the index space implied by `shape`. All exceptions thrown by invocations of  $f(i)$  are reported in a manner consistent with parallel algorithm execution through the returned future.

### Note

This is deliberately different from the `then_sync_execute` customization points specified in P0443. The `bulk_then_execute` customization point defined here is more generic and is used as the workhorse for implementing the specified APIs.

### Note

This calls `exec.bulk_then_execute(f, shape, pred, ts...)` if it exists; otherwise it executes `sync_execute(f, shape, pred.share(), ts...)` (if this executor is also an `OneWayExecutor`), or `async_execute(f, shape, pred.share(), ts...)` (if this executor is also a `TwoWayExecutor`) - as often as needed.

### Param **exec**

[in] The executor object to use for scheduling of the function  $f$ .

### Param **f**

[in] The function which will be scheduled using the given executor.

### Param **shape**

[in] The shape objects which defines the iteration boundaries for the arguments to be passed to  $f$ .

### Param **predecessor**

[in] The future object the execution of the given function depends on.

### Param **ts**

[in] Additional arguments to use to invoke  $f$ .

### Return

The return type of `executor_type::bulk_then_execute` if defined by `executor_type`. Otherwise, a vector holding the returned values of each invocation of  $f$ .

## Public Functions

```

## hpx/executors/std\_execution\_policy.hpp

Defined in header `hpx/executors/std_execution_policy.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

## hpx/executors/exception\_list.hpp

Defined in header `hpx/executors/exception_list.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace parallel
```

**hpx::execution::experimental::get\_parallel\_scheduler**

Defined in header `hpx/execution.hpp`<sup>880</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::execution::experimental::parallel_scheduler`
- `hpx::execution::experimental::parallel_scheduler_domain`

`parallel_scheduler` `hpx::execution::experimental::get_parallel_scheduler()`

Return a `parallel_scheduler` that schedules on the default HPX thread pool.

This is HPX's implementation of the P2079 `std::execution::get_parallel_scheduler()` entry point. Work started on the returned scheduler uses the same worker threads as the default pool rather than a separate system thread pool.

**Note**

For a named resource-partitioner pool, use the overload that takes `hpx::threads::thread_pool_base&`.

**Returns**

A scheduler bound to HPX's default thread pool.

`parallel_scheduler` `hpx::execution::experimental::get_parallel_scheduler(hpx::threads::thread_pool_base &pool)`

Return a `parallel_scheduler` that runs work on `pool`.

Look named pools up with `hpx::resource::get_thread_pool`. A misspelled or unknown name throws `hpx::exception`; it does not produce undefined behavior.

**Parameters**

**pool** – HPX thread pool that should execute scheduled work.

**Pre**

`pool` must outlive the returned scheduler and every operation started on it. The scheduler stores a non-owning pointer; it does not extend the pool's lifetime. This precondition is not enforced at runtime (caller responsibility). Debug builds assert that `pool` currently reports at least one OS thread.

**Returns**

A scheduler bound to `pool`.

<sup>880</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/execution.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/execution.hpp)

## hpx::execution::experimental::parallel\_scheduler

Defined in header [hpx/execution.hpp](#)<sup>881</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::execution::experimental::get\\_parallel\\_scheduler](#)
- [hpx::execution::experimental::parallel\\_scheduler\\_domain](#)

### class **parallel\_scheduler**

P2079 parallel scheduler.

A replaceable `std::execution` scheduler that schedules work on an HPX thread pool through a *parallel\_scheduler\_backend*. The default backend wraps HPX's [thread\\_pool\\_policy\\_scheduler](#) so callers can use *get\_parallel\_scheduler* without managing pools themselves.

Schedulers compare equal when they share the same backend instance (P2079 pointer equality). Forward-progress guarantee is `parallel`.

Obtain instances with *get\_parallel\_scheduler* (default pool) or *get\_parallel\_scheduler(pool)* (named resource-partitioner pool).

## hpx::execution::experimental::parallel\_scheduler\_domain

Defined in header [hpx/execution.hpp](#)<sup>882</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::execution::experimental::get\\_parallel\\_scheduler](#)
- [hpx::execution::experimental::parallel\\_scheduler](#)

struct **parallel\_scheduler\_domain** : public [hpx::execution::experimental::detail::sync\\_wait\\_domain](#)

Domain associated with [parallel\\_scheduler](#).

Implements P2079 sender transformations for bulk algorithms that complete on a [parallel\\_scheduler](#). Fast-path bulk work is forwarded to HPX's optimized `thread_pool_bulk_sender`; custom backends go through the virtual *parallel\_scheduler\_backend* interface.

## hpx/executors/current\_executor.hpp

Defined in header `hpx/executors/current_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **execution**

namespace **this\_thread**

### Functions

*hpx::execution::parallel\_executor* **get\_executor**(*error\_code* &ec = *throws*)

Returns a reference to the executor that was used to create the current thread.

#### Throws

If – &ec != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw a *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

namespace **threads**

### Functions

*hpx::execution::parallel\_executor* **get\_executor**(*thread\_id\_type* const &id, *error\_code* &ec = *throws*)

Returns a reference to the executor that was used to create the given thread.

#### Throws

If – &ec != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw a *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

### hpx/executors/execution\_policy\_annotation.hpp

Defined in header `hpx/executors/execution_policy_annotation.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace execution
```

```

```

```
template<typename Policy>
```

```
class restricted_policy_executor
```

#### Public Types

```
using execution_category = typename embedded_executor::execution_category
```

Associate the `parallel_execution_tag` executor tag type as a default with this executor.

```
using executor_parameters_type = typename
```

```
embedded_executor::executor_parameters_type
```

## Public Functions

```
inline explicit restricted_policy_executor(std::size_t first_thread = 0, std::size_t
 num_threads = 1, threads::thread_priority
 priority = threads::thread_priority::default_,
 threads::thread_stacksize stacksize =
 threads::thread_stacksize::default_,
 threads::thread_schedule_hint schedulehint =
 { }, [[maybe_unused]] std::size_t
 hierarchical_threshold =
 hierarchical_threshold_default_)
```

Create a new parallel executor.

```
inline restricted_policy_executor(restricted_policy_executor const &other) noexcept
 cept(std::is_nothrow_copy_constructible_v<embedded_executor>)

inline restricted_policy_executor(restricted_policy_executor &&other) noexcept

```

### hpx/executors/service\_executors.hpp

Defined in header `hpx/executors/service_executors.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace parallel
```

```
 namespace execution
```

### hpx/executors/fork\_join\_executor.hpp

Defined in header `hpx/executors/fork_join_executor.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### hpx/executors/thread\_pool\_continues\_on\_sender.hpp

Defined in header `hpx/executors/thread_pool_continues_on_sender.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

Domain-optimized `continues_on` sender for HPX thread pool schedulers.

When `stdexec::continues_on` is applied with an HPX `thread_pool_scheduler`, the generic `stdexec` implementation creates two operation states: one for the source sender and one for the scheduler hop (`schedule_from`). This double-state overhead adds ~1 us per task in microbenchmarks.

This header provides a custom sender that replaces the generic path by:

1. Connecting the source sender to a lightweight receiver that captures the downstream receiver and the scheduler.
2. On `set_value`: if we are already on the same HPX thread pool, forwarding inline; otherwise, posting a single HPX task to forward the values.

This eliminates the intermediate `__storage_for_t`, the second operation state, and the `run_loop` overhead.

```
namespace hpx
```

```
 namespace execution
```

```
 namespace experimental
```

## hpx/executors/annotating\_executor.hpp

Defined in header `hpx/executors/annotating_executor.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **execution**

namespace **experimental**

template<executor\_any **BaseExecutor**>

struct **annotating\_executor**

*#include* <annotating\_executor.hpp> An *annotating\_executor* wraps any other executor and adds the capability to add annotations to the launched threads.

### Public Functions

template<executor\_any **Executor**>

inline explicit constexpr **annotating\_executor**(*Executor* &&exec, char const \*annotation = nullptr)

template<executor\_any **Executor**>

inline explicit **annotating\_executor**(*Executor* &&exec, *std::string* annotation)

## hpx::execution::seq

Defined in header `hpx/execution.hpp`<sup>883</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::execution::par*
- *hpx::execution::par\_unseq*
- *hpx::execution::task*
- *hpx::execution::sequenced\_policy*

- `hpx::execution::parallel_task_policy`

using `hpx::execution::parallel_policy = detail::parallel_policy_shim<parallel_executor, hpx::traits::executor_parameters_type_t<parallel_executor>>`

The class `parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

## hpx::execution::parallel\_unsequenced\_policy

Defined in header `hpx/execution.hpp`<sup>889</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::execution::seq`
- `hpx::execution::par`
- `hpx::execution::par_unseq`
- `hpx::execution::task`
- `hpx::execution::sequenced_policy`
- `hpx::execution::parallel_policy`
- `hpx::execution::sequenced_task_policy`
- `hpx::execution::parallel_task_policy`

using `hpx::execution::parallel_unsequenced_policy = detail::parallel_unsequenced_policy_shim<parallel_executor, hpx::traits::executor_parameters_type_t<parallel_executor>>`

The class `parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

<sup>888</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/execution.](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/execution.hpp)

<sup>889</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/execution.](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/execution.hpp)

## hpx::execution::sequenced\_task\_policy

Defined in header `hpx/execution.hpp`<sup>890</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::execution::seq`
- `hpx::execution::par`
- `hpx::execution::par_unseq`
- `hpx::execution::task`
- `hpx::execution::sequenced_policy`
- `hpx::execution::parallel_policy`
- `hpx::execution::parallel_unsequenced_policy`
- `hpx::execution::parallel_task_policy`

using `hpx::execution::sequenced_task_policy = detail::sequenced_task_policy_shim<sequenced_executor, hpx::traits::executor_parameters_type_t<sequenced_executor>>`

Extension: The class `sequenced_task_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may not be parallelized (has to run sequentially).

The algorithm returns a future representing the result of the corresponding algorithm when invoked with the `sequenced_policy`.

## hpx::execution::parallel\_task\_policy

Defined in header `hpx/execution.hpp`<sup>891</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::execution::seq`
- `hpx::execution::par`
- `hpx::execution::par_unseq`
- `hpx::execution::task`
- `hpx::execution::sequenced_policy`
- `hpx::execution::parallel_policy`
- `hpx::execution::parallel_unsequenced_policy`
- `hpx::execution::sequenced_task_policy`

```

```
template<typename Policy>
```

```
struct parallel_policy_executor_base
```

*#include* <*parallel\_executor.hpp*> A *parallel\_executor* creates groups of parallel execution agents which execute in threads implicitly created by the executor. This executor prefers continuing with the creating thread first before executing newly created threads.

This executor conforms to the concepts of a *TwoWayExecutor*, and a *BulkTwoWayExecutor*

Subclassed by *hpx::execution::parallel\_policy\_executor*< *Policy*, *HierarchicalSpawning* >, *hpx::execution::parallel\_policy\_executor*< *Policy*, true >

## Public Types

using **execution\_category** = *std::conditional\_t<std::is\_same\_v<Policy, launch::sync\_policy>, sequenced\_execution\_tag, parallel\_execution\_tag>*

Associate the parallel\_execution\_tag executor tag type as a default with this executor, except if the given launch policy is sync.

using **executor\_parameters\_type** = *experimental::default\_parameters*

Associate the default\_parameters executor parameters type as a default with this executor.

## Public Functions

inline **parallel\_policy\_executor\_base**(*parallel\_policy\_executor\_base* const &rhs) noexcept

inline *parallel\_policy\_executor\_base* &**operator**=(*parallel\_policy\_executor\_base* const &rhs)  
noexcept

constexpr ~**parallel\_policy\_executor\_base**() = default

template<typename T>
```

```
void hpx::cref(T const&&) = delete
```

```
template<typename T>
```

```
constexpr reference_wrapper<T const> hpx::cref(reference_wrapper<T> val) noexcept
```

## **hpx::function\_ref**

Defined in header `hpx/functional.hpp`<sup>895</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Sig>
```

```
class function_ref
```

*function\_ref* class is a vocabulary type with reference semantics for passing entities to call.

An example use case that benefits from higher-order functions is `retry(n, f)` which attempts to call `f` up to `n` times synchronously until success. This example might model the real-world scenario of repeatedly querying a flaky web service.

```
using payload = std::optional< /* ... */ >;
// Repeatedly invokes `action` up to `times` repetitions.
// Immediately returns if `action` returns a valid `payload`.
// Returns `std::nullopt` otherwise.
payload retry(size_t times, /* ????? */ action);
```

The passed-in action should be a callable entity that takes no arguments and returns a payload. This can be done with function pointers, `hpx::function` or a template but it is much simpler with *function\_ref* as seen below:

```
payload retry(size_t times, function_ref<payload()> action);
```

<sup>894</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

<sup>895</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

## hpx::invoke\_fused

Defined in header [hpx/functional.hpp](#)<sup>896</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::invoke\\_fused\\_r](#)

template<typename **F**, typename **Tuple**>

```
constexpr detail::invoke_fused_result_t<F, Tuple> hpx::invoke_fused(F &&f, Tuple &&t) noexcept(
 noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{ },
 std::forward<F>(f),
 std::forward<Tuple>(t))))
```

Invokes the given callable object *f* with the content of the sequenced type *t* (tuples, pairs).

### Note

This function is similar to `std::apply` (C++17). The difference between [hpx::invoke](#) and [hpx::invoke\\_fused](#) is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes [hpx::invoke\\_fused](#) rather useful.

### Parameters

- **f** – Must be a callable object. If *f* is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to [hpx::get](#).

### Throws

[std::exception](#) – like objects thrown by call to object *f* with the arguments contained in the sequenceable type *t*.

### Returns

The result of the callable object when it's called with the content of the given sequenced type.

## hpx::invoke\_fused\_r

Defined in header [hpx/functional.hpp](#)<sup>897</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::invoke\\_fused](#)

template<typename **R**, typename **F**, typename **Tuple**>

```
constexpr R hpx::invoke_fused_r(F &&f, Tuple &&t) noexcept(
 noexcept(detail::invoke_fused_impl(detail::fused_index_pack_t<Tuple>{ },
 std::forward<F>(f), std::forward<Tuple>(t))))
```

Invokes the given callable object *f* with the content of the sequenced type *t* (tuples, pairs).

<sup>896</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

<sup>897</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

**Note**

This function is similar to `std::apply` (C++17). The difference between `hpx::invoke` and `hpx::invoke_fused` is that the later unpacks the tuples while the former cannot. Turning a tuple into a parameter pack is not a trivial operation which makes `hpx::invoke_fused` rather useful.

**Note**

The difference between `hpx::invoke_fused` and `hpx::invoke_fused_r` is that the later allows to specify the return type as well.

**Parameters**

- **f** – Must be a callable object. If `f` is a member function pointer, the first argument in the sequenced type will be treated as the callee (this object).
- **t** – A type whose contents are accessible through a call to `hpx::get`.

**Throws**

`std::exception` – like objects thrown by call to object `f` with the arguments contained in the sequenceable type `t`.

**Template Parameters**

**R** – The result type of the function when it's called with the content of the given sequenced type.

**Returns**

The result of the callable object when it's called with the content of the given sequenced type.

**hpx::bind**

Defined in header `hpx/functional.hpp`<sup>898</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

**hpx::move\_only\_function**

Defined in header [hpx/functional.hpp](#)<sup>905</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename Sig, bool Serializable = false>
```

```
class move_only_function
```

Class template [hpx::move\\_only\\_function](#) is a general-purpose polymorphic function wrapper. [hpx::move\\_only\\_function](#) objects can store and invoke any constructible (not required to be move constructible) Callable target [target](#); functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to member objects.

The stored callable object is called the target of [hpx::move\\_only\\_function](#). If an [hpx::move\\_only\\_function](#) contains no target, it is called empty. Unlike [hpx::function](#), invoking an empty [hpx::move\\_only\\_function](#) results in undefined behavior.

[hpx::move\\_only\\_function](#)s supports every possible combination of cv-qualifiers, ref-qualifiers, and noexcept-specifiers not including volatile provided in its template parameter. These qualifiers and specifier (if any) are added to its operator(). [hpx::move\\_only\\_function](#) satisfies the requirements of MoveConstructible and MoveAssignable, but does not satisfy CopyConstructible or CopyAssignable.

**hpx::function**

Defined in header [hpx/functional.hpp](#)<sup>906</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
template<typename Sig, bool Serializable = false>
```

```
class function
```

Class template [hpx::function](#) is a general-purpose polymorphic function wrapper. Instances of [hpx::function](#) can store, copy, and invoke any CopyConstructible Callable target [target](#); functions, lambda expressions, bind expressions, or other function objects, as well as pointers to member functions and pointers to data members. The stored callable object is called the target of [hpx::function](#). If an [hpx::function](#) contains no target, it is called

<sup>905</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

<sup>906</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

empty. Invoking the target of an empty `hpx::function` results in `hpx::error::bad_function_call` exception being thrown. `hpx::function` satisfies the requirements of CopyConstructible and CopyAssignable.

## hpx::bind\_back

Defined in header `hpx/functional.hpp`<sup>907</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

### Warning

doxygenfunction: Unable to resolve function “hpx::bind\_back” with arguments (F&&, Ts&&...) in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc. Potential matches:

```

**Template Parameters****F** – type of stored exit function**Parameters****f** – stored exit function**hpx::experimental::scope\_success**Defined in header `hpx/experimental/scope.hpp`.See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename F>
auto hpx::experimental::scope_success(F &&f)
```

The class template `scope_success` is a general-purpose scope guard intended to call its exit function when a scope is normally exited.

**Template Parameters****F** – type of stored exit function**Parameters****f** – stored exit function**hpx::is\_placeholder**Defined in header `hpx/functional.hpp`<sup>908</sup>.See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename T>
```

```
struct is_placeholder
```

If `T` is a standard, Boost, or HPX placeholder (`_1`, `_2`, `_3`, ...) then this template is derived from `std::integral_constant<int,1>`, `std::integral_constant<int,2>`, `std::integral_constant<int,3>`, respectively. Otherwise, it is derived from `std::integral_constant<int,0>`.

The template may be specialized for any user-defined `T` type: the specialization must satisfy *UnaryTypeTrait* with base characteristic of `std::integral_constant<int,N>` with `N>0` to indicate that `T` should be treated as `N`'th placeholder type. `hpx::bind` uses `hpx::is_placeholder` to detect placeholders for unbound arguments.

**hpx::is\_bind\_expression**Defined in header `hpx/functional.hpp`<sup>909</sup>.See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename T>
```

<sup>908</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

hpp

<sup>909</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

hpp

```
struct is_bind_expression : public std::is_bind_expression<T>
```

If *T* is the type produced by a call to `hpx::bind`, this template is derived from `std::true_type`. For any other type, this template is derived from `std::false_type`.

This template may be specialized for a user-defined type *T* to implement *UnaryTypeTrait* with base characteristic of `std::true_type` to indicate that *T* should be treated by `hpx::bind` as if it were the type of a bind subexpression: when a bind-generated function object is invoked, a bound argument of this type will be invoked as a function object and will be given all the unbound arguments passed to the bind-generated object.

Subclassed by `hpx::is_bind_expression< T const >`

## futures

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## hpx::promise

Defined in header `hpx/future.hpp`<sup>910</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
template<typename R>
```

```
class promise : public hpx::detail::promise_base<R>
```

The class template `hpx::promise` provides a facility to store a value or an exception that is later acquired asynchronously via a `hpx::future` object created by the `hpx::promise` object. Note that the `hpx::promise` object is meant to be used only once. Each promise is associated with a shared state, which contains some state information and a result which may be not yet evaluated, evaluated to a value (possibly void) or evaluated to an exception. A promise may do three things with the shared state:

- make ready: the promise stores the result or the exception in the shared state. Marks the state ready and unblocks any thread waiting on a future associated with the shared state.
- release: the promise gives up its reference to the shared state. If this was the last such reference, the shared state is destroyed. Unless this was a shared state created by `hpx::async` which is not yet ready, this operation does not block.
- abandon: the promise stores the exception of type `hpx::future_error` with error code `hpx::error::broken_promise`, makes the shared state ready, and then releases it. The promise is the “push” end of the promise-future communication channel: the operation that stores a value in the shared state synchronizes-with (as defined in `hpx::memory_order`) the successful return from any function that is waiting on the shared state (such as `hpx::future::get`). Concurrent access to the same shared state may conflict otherwise: for example multiple callers of `hpx::shared_future::get` must either all be read-only or provide external synchronization.

---

<sup>910</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

## hpx::future

Defined in header `hpx/future.hpp`<sup>911</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::shared_future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`
- `hpx::make_exceptional_future`

template<typename **R**>

class **future** : public `hpx::lcos::detail::future_base<future<R>, R>`

The class template `hpx::future` provides a mechanism to access the result of asynchronous operations:

- An asynchronous operation (created via `hpx::async`, `hpx::packaged_task`, or `hpx::promise`) can provide a `hpx::future` object to the creator of that asynchronous operation.
- The creator of the asynchronous operation can then use a variety of methods to query, wait for, or extract a value from the `hpx::future`. These methods may block if the asynchronous operation has not yet provided a value.
- When the asynchronous operation is ready to send a result to the creator, it can do so by modifying shared state (e.g. `hpx::promise::set_value`) that is linked to the creator's `hpx::future`. Note that `hpx::future` references shared state that is not shared with any other asynchronous return objects (as opposed to `hpx::shared_future`).

## hpx::shared\_future

Defined in header `hpx/future.hpp`<sup>912</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`

<sup>911</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

<sup>912</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

- *hpx::make\_exceptional\_future*

template<typename R>

class **shared\_future** : public *hpx::lcos::detail::future\_base*<*shared\_future*<R>, R>

The class template *hpx::shared\_future* provides a mechanism to access the result of asynchronous operations, similar to *hpx::future*, except that multiple threads are allowed to wait for the same shared state. Unlike *hpx::future*, which is only moveable (so only one instance can refer to any particular asynchronous result), *hpx::shared\_future* is copyable and multiple shared future objects may refer to the same shared state. Access to the same shared state from multiple threads is safe if each thread does it through its own copy of a *shared\_future* object.

## hpx::make\_future

Defined in header *hpx/future.hpp*<sup>913</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

<sup>913</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

## hpx::make\_shared\_future

Defined in header `hpx/future.hpp`<sup>914</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::future`
- `hpx::shared_future`
- `hpx::make_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`
- `hpx::make_exceptional_future`

template<typename R>

`hpx::shared_future<R> hpx::make_shared_future(hpx::future<R> &&f) noexcept`

Converts any future or *shared\_future* of type T to a corresponding *shared\_future* of type T.

template<typename R>

`hpx::shared_future<R> &hpx::make_shared_future(hpx::shared_future<R> &f) noexcept`

Converts any future or *shared\_future* of type T to a corresponding *shared\_future* of type T.

template<typename R>

`hpx::shared_future<R> &&hpx::make_shared_future(hpx::shared_future<R> &&f) noexcept`

Converts any future or *shared\_future* of type T to a corresponding *shared\_future* of type T.

template<typename R>

`hpx::shared_future<R> const &hpx::make_shared_future(hpx::shared_future<R> const &f) noexcept`

Converts any future or *shared\_future* of type T to a corresponding *shared\_future* of type T.

## hpx::make\_ready\_future

Defined in header `hpx/future.hpp`<sup>915</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::future`
- `hpx::shared_future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_at`
- `hpx::make_ready_future_after`

<sup>914</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

<sup>915</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

- *hpx::make\_exceptional\_future*

```
template<typename T, typename ...Ts>
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> hpx::make_ready_future(Ts&&...
ts)
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, `valid() == true` and `is_ready() == true`.

```
template<int DeductionGuard = 0, typename T>
future<hpx::util::decay_unwrap_t<T>> hpx::make_ready_future(T &&init)
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, `valid() == true` and `is_ready() == true`.

```
future<void> hpx::make_ready_future()
```

The function creates a shared state that is immediately ready and returns a future associated with that shared state. For the returned future, `valid() == true` and `is_ready() == true`.

## hpx::make\_ready\_future\_alloc

Defined in header `hpx/future.hpp`<sup>916</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::future*
- *hpx::shared\_future*
- *hpx::make\_future*
- *hpx::make\_shared\_future*
- *hpx::make\_ready\_future*
- *hpx::make\_ready\_future\_at*
- *hpx::make\_ready\_future\_after*
- *hpx::make\_exceptional\_future*

```
template<typename T, typename Allocator, typename ...Ts>
std::enable_if_t<std::is_constructible_v<T, Ts&&...> || std::is_void_v<T>, future<T>> hpx::make_ready_future_alloc(Allocator
const
&a,
Ts&&...
ts)
```

Creates a pre-initialized future object with allocator (extension)

```
template<int DeductionGuard = 0, typename Allocator, typename T>
future<hpx::util::decay_unwrap_t<T>> hpx::make_ready_future_alloc(Allocator const &a, T &&init)
```

```
template<typename Allocator>
inline future<void> hpx::make_ready_future_alloc(Allocator const &a)
```

---

<sup>916</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

## hpx::make\_ready\_future\_at

Defined in header `hpx/future.hpp`<sup>917</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::future`
- `hpx::shared_future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_after`
- `hpx::make_exceptional_future`

```
template<int DeductionGuard = 0, typename T>
future<hpx::util::decay_unwrap_t<T>> hpx::make_ready_future_at(hpx::chrono::steady_time_point const
&abs_time, T &&init)
```

Creates a pre-initialized future object which gets ready at a given point in time (extension)

```
inline future<void> hpx::make_ready_future_at(hpx::chrono::steady_time_point const &abs_time)
```

Creates a pre-initialized future object which gets ready at a given point in time (extension)

## hpx::make\_ready\_future\_after

Defined in header `hpx/future.hpp`<sup>918</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::future`
- `hpx::shared_future`
- `hpx::make_future`
- `hpx::make_shared_future`
- `hpx::make_ready_future`
- `hpx::make_ready_future_alloc`
- `hpx::make_ready_future_at`
- `hpx::make_exceptional_future`

```
template<int DeductionGuard = 0, typename T>
future<hpx::util::decay_unwrap_t<T>> hpx::make_ready_future_after(hpx::chrono::steady_duration const
&rel_time, T &&init)
```

Creates a pre-initialized future object which gets ready after a given point in time (extension)

<sup>917</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

<sup>918</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

inline *future*<void> **hpx::make\_ready\_future\_after**(*hpx::chrono::steady\_duration* const &rel\_time)  
Creates a pre-initialized future object which gets ready after a given point in time (extension)

### **hpx::make\_exceptional\_future**

Defined in header `hpx/future.hpp`<sup>919</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::future*
- *hpx::shared\_future*
- *hpx::make\_future*
- *hpx::make\_shared\_future*
- *hpx::make\_ready\_future*
- *hpx::make\_ready\_future\_alloc*
- *hpx::make\_ready\_future\_at*
- *hpx::make\_ready\_future\_after*

template<typename T>  
*future*<T> **hpx::make\_exceptional\_future**(*std::exception\_ptr* const &e)  
Creates a pre-initialized future object which holds the given error (extension)

template<typename T, typename E>  
*future*<T> **hpx::make\_exceptional\_future**(E e)  
Creates a pre-initialized future object which holds the given error (extension)

### **hpx/futures/future\_fwd.hpp**

Defined in header `hpx/futures/future_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

Top level HPX namespace.

namespace **lcos**

namespace **lcos**

---

<sup>919</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

## hpx::packaged\_task

Defined in header `hpx/future.hpp`<sup>920</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

template<typename **Sig**>

class **packaged\_task**

The class template `hpx::packaged_task` wraps any Callable<sup>2</sup> target (function, lambda expression, bind expression, or another function object) so that it can be invoked asynchronously. Its return value or exception thrown is stored in a shared state which can be accessed through `hpx::future` objects. Just like `hpx::function`, `hpx::packaged_task` is a polymorphic, allocator-aware container: the stored callable target may be allocated on heap or with a provided allocator.

## include\_local

See *Public API* for a list of names and headers that are part of the public HPX API.

## hpx::experimental::sandbox

Defined in header `hpx/experimental/sandbox.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

### Warning

doxygenfunction: Cannot find function “hpx::experimental::sandbox” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

## io\_service

See *Public API* for a list of names and headers that are part of the public HPX API.

## hpx/io\_service/io\_service\_pool.hpp

Defined in header `hpx/io_service/io_service_pool.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

class **io\_service\_pool**

*#include <io\_service\_pool.hpp>* A pool of io\_service objects.

<sup>920</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/future.hpp>

## Public Functions

explicit **io\_service\_pool**(*std::size\_t* pool\_size = 2, *threads::policies::callback\_notifier* const &notifier = *threads::policies::callback\_notifier*(), char const \*pool\_name = "", char const \*name\_postfix = "")

Construct the *io\_service* pool.

### Parameters

- **pool\_size** – [in] The number of threads to run to serve incoming requests
- **notifier** – [in]
- **pool\_name** – [in]
- **name\_postfix** – [in]

explicit **io\_service\_pool**(*threads::policies::callback\_notifier* const &notifier, char const \*pool\_name = "", char const \*name\_postfix = "")

Construct the *io\_service* pool.

### Parameters

- **notifier** – [in]
- **pool\_name** – [in]
- **name\_postfix** – [in]

**io\_service\_pool**(*io\_service\_pool* const&) = delete

**io\_service\_pool**(*io\_service\_pool*&&) = delete

*io\_service\_pool* &**operator**=(*io\_service\_pool* const&) = delete

*io\_service\_pool* &**operator**=(*io\_service\_pool*&&) = delete

**~io\_service\_pool**()

bool **run**(bool join\_threads = true, *std::shared\_ptr<barrier>* startup = {}) const

Run all *io\_service* objects in the pool. If *join\_threads* is true this will also wait for all threads to complete.

### Parameters

- **join\_threads** – [in] If true, wait for all pool threads to join before returning.
- **startup** – [in] Optional startup barrier used to synchronize pool worker thread startup with the caller. Its participant count must equal the number of pool worker threads plus one for the caller. The caller must call *startup->wait()* after invoking *run()*.

bool **run**(*std::size\_t* num\_threads, bool join\_threads = true, *std::shared\_ptr<barrier>* startup = {}) const

Run *num\_threads* *io\_service* objects in the pool. If *join\_threads* is true this will also wait for all threads to complete.

### Parameters

- **num\_threads** – [in] The number of worker threads to start.
- **join\_threads** – [in] If true, wait for all pool threads to join before returning.
- **startup** – [in] Optional startup barrier used to synchronize pool worker thread startup with the caller. Its participant count must equal *num\_threads* plus one for the caller. The caller must call *startup->wait()* after invoking *run()*.

void **stop**() const

Stop all *io\_service* objects in the pool.

void **join**() const

Join all *io\_service* threads in the pool.

```

void clear() const
 Clear all internal data structures.

void wait() const
 Wait for all work to be done.

bool stopped() const

::asio::io_context &get_io_service(int index = -1) const
 Get an io_service to use.

std::thread &get_os_thread_handle(std::size_t thread_num) const
 access underlying thread handle

std::size_t size() const noexcept
 Get number of threads associated with this I/O service.

void thread_run(std::size_t index, std::shared_ptr<barrier> startup = {}) const
 Activate the thread index for this thread pool.

char const *get_name() const noexcept
 Return name of this pool.

void init(std::size_t pool_size) const

```

### Private Members

```

detail::io_service_pool_base *pool_

```

## lcos\_local

See [Public API](#) for a list of names and headers that are part of the public HPX API.

### hpx::lcos::local::and\_gate

Defined in header `hpx/modules/lcos_local.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```

struct and_gate : public hpx::lcos::local::base_and_gate<hpx::no_mutex>

```

An AND-gate synchronization primitive that fires once all of its expected inputs have been received.

#### Note

This type is not thread-safe. It has to be protected from concurrent access by different threads by the code using instances of this type.

## hpx/lcos\_local/trigger.hpp

Defined in header `hpx/lcos_local/trigger.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace lcos
```

```
 namespace local
```

```
 template<typename Mutex = hpx::spinlock>
```

```
 struct base_trigger
```

### Public Functions

```
 inline base_trigger() noexcept
```

```
 inline base_trigger(base_trigger &&rhs) noexcept
```

```
 inline base_trigger &operator=(base_trigger &&rhs) noexcept
```

```
 inline hpx::future<void> get_future(std::size_t *generation_value = nullptr, error_code &ec
 = hpx::throws)
```

get a future allowing to wait for the trigger to fire

```
 inline bool set(error_code &ec = throws)
```

Trigger this object.

```
 inline void synchronize(std::size_t generation_value, char const *function_name =
 "trigger::synchronize", error_code &ec = throws)
```

Wait for the generational counter to reach the requested stage.

```
 inline std::size_t next_generation()
```

```
 inline std::size_t generation() const
```

### Protected Types

```
 using mutex_type = Mutex
```

### Protected Functions

```

```

## pack\_traversal

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/pack\_traversal/pack\_traversal\_async.hpp

Defined in header `hpx/pack_traversal/pack_traversal_async.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace util
```

## Functions

```
template<typename Visitor, typename ...T>
auto traverse_pack_async(Visitor &&visitor, T&&... pack) -> de-
 cltype(detail::apply_pack_transform_async(std::forward<Visitor>(visitor),
 std::forward<T>(pack)...))
```

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus, we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
struct my_async_visitor {
 // The synchronous overload is called for each object. It may
 // return false to suspend the current control. In that case the
 // overload below is called.
 template <typename T>
 bool operator()(async_traverse_visit_tag, T&& element)
 {
 return true;
 }

 // The asynchronous overload is called when the synchronous
 // overload returned false. In addition to the current visited
 // element, the overload is called with a continuation callable
 // object which resumes the traversal when called later.
 template <typename T, typename N>
 void operator()(async_traverse_detach_tag, T&& element, N&& next)
 {
 }

 // The overload is called when the traversal was finished. The
 // whole pack which was traversed asynchronously is passed.
 template <typename T>
 void operator()(async_traverse_complete_tag, T&& pack)
 {
 }
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

### Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally, the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.

### Returns

A `hpx::intrusive_ptr` that references an instance of the given visitor object.

```
template<typename Allocator, typename Visitor, typename ...T>
auto traverse_pack_async_allocator(Allocator const &alloc, Visitor &&visitor, T&&... pack) ->
 de-
 cltype(detail::apply_pack_transform_async_allocator(alloc,
 std::forward<Visitor>(visitor), std::forward<T>(pack)...))
```

Traverses the pack with the given visitor in an asynchronous way.

This function works in the same way as `traverse_pack`, however, we are able to suspend and continue the traversal at later time. Thus, we require a visitor callable object which provides three `operator()` overloads as depicted by the code sample below:

```
struct my_async_visitor {
 // The synchronous overload is called for each object. It may
 // return false to suspend the current control. In that case the
 // overload below is called.
 template <typename T>
 bool operator()(async_traverse_visit_tag, T&& element)
 {
 return true;
 }

 // The asynchronous overload is called when the synchronous
 // overload returned false. In addition to the current visited
 // element, this overload receives a continuation callable object
 // which resumes the traversal when called later. The continuation
 // may be stored and called later or dropped completely to abort
 // the traversal early.
 template <typename T, typename N>
 void operator()(async_traverse_detach_tag, T&& element, N&& next)
 {
 }

 // This overload is called when the traversal is finished. The
 // complete pack that was traversed asynchronously is passed.
 template <typename T>
 void operator()(async_traverse_complete_tag, T&& pack)
 {
 }
};
```

See `traverse_pack` for a detailed description about the traversal behavior and capabilities.

#### Parameters

- **visitor** – A visitor object which provides the three `operator()` overloads that were described above. Additionally, the visitor must be compatible for referencing it from a `hpx::intrusive_ptr`. The visitor should have a virtual destructor!
- **pack** – The arbitrary parameter pack which is traversed asynchronously. Nested objects inside containers and tuple like types are traversed recursively.
- **alloc** – Allocator instance to use to create the traversal frame.

#### Returns

A `hpx::intrusive_ptr` that references an instance of the given visitor object.

## hpx::functional::unwrap

Defined in header `hpx/unwrap.hpp`<sup>921</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_n`
- `hpx::unwrapping_all`

struct **unwrap**

A helper function object for functionally invoking `hpx::unwrap`. For more information please refer to its documentation.

## hpx::functional::unwrap\_n

Defined in header `hpx/unwrap.hpp`<sup>922</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_n`
- `hpx::unwrapping_all`

template<std::size\_t **Depth**>

struct **unwrap\_n**

A helper function object for functionally invoking `hpx::unwrap_n`. For more information please refer to its documentation.

<sup>921</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/unwrap.hpp)

<sup>922</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/unwrap.hpp)

## hpx::functional::unwrap\_all

Defined in header [hpx/unwrap.hpp](#)<sup>923</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::functional::unwrap](#)
- [hpx::functional::unwrap\\_n](#)
- [hpx::unwrap](#)
- [hpx::unwrap\\_n](#)
- [hpx::unwrap\\_all](#)
- [hpx::unwrapping](#)
- [hpx::unwrapping\\_n](#)
- [hpx::unwrapping\\_all](#)

struct **unwrap\_all**

A helper function object for functionally invoking [hpx::unwrap\\_all](#). For more information please refer to its documentation.

## hpx::unwrap

Defined in header [hpx/unwrap.hpp](#)<sup>924</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::functional::unwrap](#)
- [hpx::functional::unwrap\\_n](#)
- [hpx::functional::unwrap\\_all](#)
- [hpx::unwrap\\_n](#)
- [hpx::unwrap\\_all](#)
- [hpx::unwrapping](#)
- [hpx::unwrapping\\_n](#)
- [hpx::unwrapping\\_all](#)

template<typename ...**Args**>

auto [hpx::unwrap](#)(*Args*&&... args) ->

decltype([util::detail::unwrap\\_depth\\_impl](#)<1U>(*std::forward*<*Args*>(*args*)...))

A helper function for retrieving the actual result of any [hpx::future](#) like type which is wrapped in an arbitrary way.

---

<sup>923</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/unwrap.hpp)

<sup>924</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/unwrap.hpp)

Unwraps the given pack of arguments, so that any `hpx::future` object is replaced by its future result type in the argument pack:

- `hpx::future<int> -> int`
- `hpx::future<std::vector<float>> -> std::vector<float>`
- `std::vector<future<float>> -> std::vector<float>`

The function is capable of unwrapping `hpx::future` like objects that are wrapped inside any container or tuple like type, see `hpx::util::map_pack()` for a detailed description about which surrounding types are supported. Non `hpx::future` like types are permitted as arguments and passed through.

```
hpx::unwrap(hpx::make_ready_future(0));

// Multiple arguments hpx::tuple<int, int> i2 =
 hpx::unwrap(hpx::make_ready_future(1),
 hpx::make_ready_future(2));
```

#### Note

This function unwraps the given arguments until the first traversed nested `hpx::future` which corresponds to an unwrapping depth of one. See `hpx::unwrap_n()` for a function which unwraps the given arguments to a particular depth or `hpx::unwrap_all()` that unwraps all future like objects recursively which are contained in the arguments.

#### Parameters

**args** – the arguments that are unwrapped which may contain any arbitrary future or non-future type.

#### Throws

`std::exception` – like objects in case any of the given wrapped `hpx::future` objects were resolved through an exception. See `hpx::future::get()` for details.

#### Returns

Depending on the count of arguments this function returns a `hpx::tuple` containing the unwrapped arguments if multiple arguments are given. In case the function is called with a single argument, the argument is unwrapped and returned.

## hpx::unwrap\_n

Defined in header `hpx/unwrap.hpp`<sup>925</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_all`

<sup>925</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/unwrap.hpp)

- *hpx::unwrapping*
- *hpx::unwrapping\_n*
- *hpx::unwrapping\_all*

```
template<std::size_t Depth, typename ...Args>
```

```
auto hpx::unwrap_n(Args&&... args) ->
```

```
 decltype(util::detail::unwrap_depth_impl<Depth>(std::forward<Args>(args)...))
```

An alternative version of *hpx::unwrap()*, which unwraps the given arguments to a certain depth of *hpx::future* like objects.

See *unwrap* for a detailed description.

#### Template Parameters

**Depth** – The count of *hpx::future* like objects which are unwrapped maximally.

### **hpx::unwrap\_all**

Defined in header *hpx/unwrap.hpp*<sup>926</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::functional::unwrap*
- *hpx::functional::unwrap\_n*
- *hpx::functional::unwrap\_all*
- *hpx::unwrap*
- *hpx::unwrap\_n*
- *hpx::unwrapping*
- *hpx::unwrapping\_n*
- *hpx::unwrapping\_all*

```
template<typename ...Args>
```

```
auto hpx::unwrap_all(Args&&... args) ->
```

```
 decltype(util::detail::unwrap_depth_impl<0U>(std::forward<Args>(args)...))
```

An alternative version of *hpx::unwrap()*, which unwraps the given arguments recursively so that all contained *hpx::future* like objects are replaced by their actual value.

See *hpx::unwrap()* for a detailed description.

---

<sup>926</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/unwrap.hpp)

## hpx::unwrapping

Defined in header `hpx/unwrap.hpp`<sup>927</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping_n`
- `hpx::unwrapping_all`

template<typename T>

auto `hpx::unwrapping`(T &&callable) ->

`decltype(util::detail::functional_unwrap_depth_impl<1U>(std::forward<T>(callable)))`

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap()` function and then passes the result to the given callable object.

```
return left + right;
});

int i1 = callable(hpx::make_ready_future(1),
 hpx::make_ready_future(2));
```

See `hpx::unwrap()` for a detailed description.

### Parameters

**callable** – the callable object which is called with the result of the corresponding unwrap function.

## hpx::unwrapping\_n

Defined in header `hpx/unwrap.hpp`<sup>928</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`

<sup>927</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/unwrap.hpp)

<sup>928</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/unwrap.hpp)

- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_all`

```
template<std::size_t Depth, typename T>
auto hpx::unwrapping_n(T &&callable) -> de-
 cltype(util::detail::functional_unwrap_depth_impl<Depth>(std::forward<T>(callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_n()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

## `hpx::unwrapping_all`

Defined in header `hpx/unwrap.hpp`<sup>929</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::functional::unwrap`
- `hpx::functional::unwrap_n`
- `hpx::functional::unwrap_all`
- `hpx::unwrap`
- `hpx::unwrap_n`
- `hpx::unwrap_all`
- `hpx::unwrapping`
- `hpx::unwrapping_n`

```
template<typename T>
auto hpx::unwrapping_all(T &&callable) -> de-
 cltype(util::detail::functional_unwrap_depth_impl<0U>(std::forward<T>(callable)))
```

Returns a callable object which unwraps its arguments upon invocation using the `hpx::unwrap_all()` function and then passes the result to the given callable object.

See `hpx::unwrapping()` for a detailed description.

## `hpx/pack_traversal/pack_traversal.hpp`

Defined in header `hpx/pack_traversal/pack_traversal.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **util**

---

<sup>929</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/unwrap.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/unwrap.hpp)

## Functions

```
template<typename Mapper, typename...
T> < unspecified > map_pack (Mapper &&mapper, T &&... pack)
```

Maps the pack with the given mapper.

This function tries to visit all plain elements which may be wrapped in:

- homogeneous containers (`std::vector`, `std::list`)
- heterogeneous containers (`hpx::tuple`, `std::pair`, `std::array`) and re-assembles the pack with the result of the mapper. Mapping from one type to a different one is supported.

Elements that aren't accepted by the mapper are routed through and preserved through the hierarchy.

```
// Maps all integers to floats
map_pack([](int value) {
 return float(value);
},
1, hpx::make_tuple(2, std::vector<int>{3, 4}), 5);
```

### Throws

`std::exception` – like objects which are thrown by an invocation to the mapper.

### Parameters

- **mapper** – A callable object, which accept an arbitrary type and maps it to another type or the same one.
- **pack** – An arbitrary variadic pack which may contain any type.

### Returns

The mapped element or in case the pack contains multiple elements, the pack is wrapped into a `hpx::tuple`.

## preprocessor

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### hpx/preprocessor/expand.hpp

Defined in header `hpx/preprocessor/expand.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

## Defines

### HPX\_PP\_EXPAND(X)

The `HPX_PP_EXPAND` macro performs a double macro-expansion on its argument.

This macro can be used to produce a delayed preprocessor expansion.

Example:

```
#define MACRO(a, b, c) (a)(b)(c)
#define ARGS() (1, 2, 3)

HPX_PP_EXPAND(MACRO ARGS()) // expands to (1)(2)(3)
```

### Parameters

- **X** – Token to be expanded twice

## hpx/preprocessor/strip\_parens.hpp

Defined in header `hpx/preprocessor/strip_parens.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### Defines

#### HPX\_PP\_STRIP\_PARENS(X)

For any symbol **X**, this macro returns the same symbol from which potential outer parens have been removed. If no outer parens are found, this macros evaluates to **X** itself without error.

The original implementation of this macro is from Steven Watanbe as shown in <http://boost.2283326.n4.nabble.com/preprocessor-removing-parentheses-t2591973.html#a2591976>

```
HPX_PP_STRIP_PARENS(no_parens)
HPX_PP_STRIP_PARENS((with_parens))
```

#### Example Usage:

This produces the following output

```
no_parens
with_parens
```

### Parameters

- **X** – Symbol to strip parens from

## hpx/preprocessor/stringize.hpp

Defined in header `hpx/preprocessor/stringize.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### Defines

#### HPX\_PP\_STRINGIZE(X)

The *HPX\_PP\_STRINGIZE* macro stringizes its argument after it has been expanded.

The passed argument **X** will expand to "**X**". Note that the stringizing operator (#) prevents arguments from expanding. This macro circumvents this shortcoming.

### Parameters

- **X** – The text to be converted to a string literal

## hpx/preprocessor/cat.hpp

Defined in header `hpx/preprocessor/cat.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### Defines

#### **HPX\_PP\_CAT(A, B)**

Concatenates the tokens *A* and *B* into a single token. Evaluates to *AB*

##### **Parameters**

- **A** – First token
- **B** – Second token

## hpx/preprocessor/nargs.hpp

Defined in header `hpx/preprocessor/nargs.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### Defines

#### **HPX\_PP\_NARGS(...)**

Expands to the number of arguments passed in

Example Usage:

```
HPX_PP_NARGS(hpx, pp, nargs)
HPX_PP_NARGS(hpx, pp)
HPX_PP_NARGS(hpx)
```

Expands to:

```
3
2
1
```

##### **Parameters**

- ... – The variadic number of arguments

## resiliency

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/resiliency/resiliency\_cpos.hpp

Defined in header `hpx/resiliency/resiliency_cpos.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resiliency**

namespace **experimental**

## hpx/resiliency/async\_replay\_executor.hpp

Defined in header `hpx/resiliency/async_replay_executor.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resiliency**

namespace **experimental**

## Functions

```
template<typename Executor, typename Pred, typename F, typename ...Ts>
decltype(auto) hpx_invoke(async_replay_validate_t, Executor &&exec, std::size_t n, Pred
&&pred, F &&f, Ts&&... ts)
```

ADL hook for `async_replay_validate` CPO with executor.

Asynchronously launches *f* on *exec*, validating results with *pred*. Repeats on error up to *n* times (aborts on `abort_replay_exception`).

### Parameters

- **tag** – CPO tag (*async\_replay\_validate\_t*).
- **exec** – Executor to run *f* on.
- **n** – Maximum number of retry attempts.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the first valid result of *f*.

```
template<typename Executor, typename F, typename ...Ts>
decltype(auto) hpx_invoke(async_replay_t, Executor &&exec, std::size_t n, F &&f, Ts&&... ts)
```

ADL hook for `async_replay` CPO with executor.

Asynchronously launches *f* on *exec*, repeating on error up to *n* times (aborts on `abort_replay_exception`).

### Parameters

- **tag** – CPO tag (*async\_replay\_t*).
- **exec** – Executor to run *f* on.
- **n** – Maximum number of retry attempts.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the first successful result of *f*.

## hpx/resiliency/async\_replay.hpp

Defined in header `hpx/resiliency/async_replay.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
 namespace resiliency
```

```
 namespace experimental
```

## Functions

```
template<typename Pred, typename F, typename ...Ts>
hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> hpx_invoke(async_replay_validate_t,
 std::size_t n, Pred
 &&pred, F &&f,
 Ts&&... ts)
```

ADL hook for `async_replay_validate` CPO.

Asynchronously launches *f*, validating results with *pred*. Repeats on error up to *n* times (aborts on `abort_replay_exception`).

### Parameters

- **tag** – CPO tag (*async\_replay\_validate\_t*).
- **n** – Maximum number of retry attempts.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the first valid result of *f*.

```
template<typename F, typename ...Ts>
hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> hpx_invoke(async_replay_t,
 std::size_t n, F
 &&f, Ts&&... ts)
```

ADL hook for `async_replay` CPO.

Asynchronously launches *f*, repeating on error up to *n* times (aborts on `abort_replay_exception`).

### Parameters

- **tag** – CPO tag (*async\_replay\_t*).
- **n** – Maximum number of retry attempts.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the first successful result of *f*.

## hpx/resiliency/async\_replicate\_executor.hpp

Defined in header `hpx/resiliency/async_replicate_executor.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resiliency**

namespace **experimental**

## Functions

```
template<typename Executor, typename Vote, typename Pred, typename F, typename ...Ts>
decltype(auto) hpx_invoke(async_replicate_vote_validate_t, Executor &&exec, std::size_t n, Vote
&&vote, Pred &&pred, F &&f, Ts&&... ts)
```

ADL hook for `async_replicate_vote_validate` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, validates results with *pred*, then runs valid results through *vote*.

### Parameters

- **tag** – CPO tag (*async\_replicate\_vote\_validate\_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the voted-upon result.

```
template<typename Executor, typename Vote, typename F, typename ...Ts>
decltype(auto) hpx_invoke(async_replicate_vote_t, Executor &&exec, std::size_t n, Vote &&vote,
F &&f, Ts&&... ts)
```

ADL hook for `async_replicate_vote` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, runs valid results through *vote*. Validation uses the default exception check.

### Parameters

- **tag** – CPO tag (*async\_replicate\_vote\_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the voted-upon result.

```
template<typename Executor, typename Pred, typename F, typename ...Ts>
decltype(auto) hpx_invoke(async_replicate_validate_t, Executor &&exec, std::size_t n, Pred
&&pred, F &&f, Ts&&... ts)
```

ADL hook for `async_replicate_validate` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*, validates results with *pred*. Returns the first valid result.

### Parameters

- **tag** – CPO tag (*async\_replicate\_validate\_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

### Returns

future with the first valid result.

```
template<typename Executor, typename F, typename ...Ts>
```

decltype(auto) **hpx\_invoke**(*async\_replicate\_t*, *Executor* &&exec, *std::size\_t* n, *F* &&f, *Ts*&&... ts)

ADL hook for `async_replicate` CPO with executor.

Asynchronously launches *f* exactly *n* times on *exec*. Validates by checking for exceptions. Returns the first valid result.

**Parameters**

- **tag** – CPO tag (*async\_replicate\_t*).
- **exec** – Executor to run *f* on.
- **n** – Number of replicated invocations.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

**Returns**

future with the first non-throwing result.

## hpx/resiliency/async\_replicate.hpp

Defined in header `hpx/resiliency/async_replicate.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resiliency**

namespace **experimental**

## Functions

```
template<typename Vote, typename Pred, typename F, typename ...Ts>
hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> hpx_invoke(async_replicate_vote_validate_t,
 std::size_t n, Vote
 &&vote, Pred
 &&pred, F &&f,
 Ts&&... ts)
```

ADL hook for `async_replicate_vote_validate` CPO.

Asynchronously launches *f* exactly *n* times, validates results with *pred*, then runs valid results through *vote*.

**Parameters**

- **tag** – CPO tag (*async\_replicate\_vote\_validate\_t*).
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

**Returns**

future with the voted-upon result.

```
template<typename Vote, typename F, typename ...Ts>
hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> hpx_invoke(async_replicate_vote_t,
 std::size_t n, Vote
 &&vote, F &&f,
 Ts&&... ts)
```

ADL hook for `async_replicate_vote` CPO.

Asynchronously launches *f* exactly *n* times, runs valid results through *vote*. Validation uses the default exception check.

#### Parameters

- **tag** – CPO tag (*async\_replicate\_vote\_t*).
- **n** – Number of replicated invocations.
- **vote** – Voting function selecting among valid results.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

#### Returns

future with the voted-upon result.

```
template<typename Pred, typename F, typename ...Ts>
hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> hpx_invoke(async_replicate_validate_t,
 std::size_t n, Pred
 &&pred, F &&f,
 Ts&&... ts)
```

ADL hook for `async_replicate_validate` CPO.

Asynchronously launches *f* exactly *n* times, validates results with *pred*. Returns the first valid result.

#### Parameters

- **tag** – CPO tag (*async\_replicate\_validate\_t*).
- **n** – Number of replicated invocations.
- **pred** – Predicate validating each invocation result.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

#### Returns

future with the first valid result.

```
template<typename F, typename ...Ts>
hpx::future<hpx::util::detail::invoke_deferred_result_t<F, Ts...>> hpx_invoke(async_replicate_t,
 std::size_t n, F
 &&f, Ts&&... ts)
```

ADL hook for `async_replicate` CPO.

Asynchronously launches *f* exactly *n* times. Validates by checking for exceptions. Returns the first valid result.

#### Parameters

- **tag** – CPO tag (*async\_replicate\_t*).
- **n** – Number of replicated invocations.
- **f** – Callable to invoke asynchronously.
- **ts** – Arguments forwarded to *f*.

#### Returns

future with the first non-throwing result.

## hpx/resiliency/replicate\_executor.hpp

Defined in header `hpx/resiliency/replicate_executor.hpp`.

plugin registries.
```

## Public Functions

virtual `~plugin_registry_base()` = default

virtual bool `get_plugin_info(std::vector<std::string> &fillini)` = 0

Return the configuration information for any plugin implemented by this module

### Parameters

**fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all plugins implemented in this module.

### Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

inline virtual void `init(int*, char***, util::runtime_configuration&)`

## hpx/runtime\_configuration/runtime\_configuration.hpp

Defined in header `hpx/runtime_configuration/runtime_configuration.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```

bool **tolerate\_node\_faults**()

Check whether fault tolerance for node/locality faults is enabled via the “enable\_fault\_tolerance” configuration entry in the “hpx” section.

**Returns**

true if fault tolerance is enabled, false otherwise.

inline void **tolerate\_node\_faults**(bool const value) const

Set whether this runtime instance should tolerate node faults.

This controls whether the runtime is configured to continue operating in the presence of locality failures (e.g. forced or unexpected disconnection of remote localities) rather than treating such failures as fatal errors.

**Parameters**

**value** – Set to true to enable fault tolerance for node failures, or false to require all localities to remain connected for normal operation.

## HPX\_REGISTER\_COMPONENT\_MODULE

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### Warning

doxygenfunction: Cannot find function “HPX\_REGISTER\_COMPONENT\_MODULE” in doxygen xml output for project “hpx” from directory: ../hpx\_autodoc

## hpx/runtime\_configuration/component\_registry\_base.hpp

Defined in header `hpx/runtime_configuration/component_registry_base.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

struct **component\_registry\_base**

*#include <component\_registry\_base.hpp>* The `component_registry_base` has to be used as a base class for all component registries.

## Public Functions

virtual `~component_registry_base()` = default

virtual bool `get_component_info`(*std::vector*<*std::string*> &fillini, *std::string* const &filepath, bool is\_static = false) = 0

Return the ini-information for all contained components.

### Parameters

- **fillini** – [in, out] The module is expected to fill this vector with the ini-information (one line per vector element) for all components implemented in this module.
- **filepath** – [in]
- **is\_static** – [in]

### Returns

Returns *true* if the parameter *fillini* has been successfully initialized with the registry data of all implemented in this module.

virtual void `register_component_type()` = 0

Register the component type represented by this component.

## hpx::runtime\_mode

Defined in header `hpx/init.hpp`<sup>930</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

enum class `hpx::runtime_mode` : *std::int8\_t*

A HPX runtime can be executed in two different modes: console mode and worker mode.

*Values:*

enumerator **invalid**

enumerator **console**

The runtime is the console locality.

enumerator **worker**

The runtime is a worker locality.

enumerator **connect**

The runtime is a worker locality connecting late

enumerator **local**

The runtime is fully local.

enumerator **default\_**

The runtime mode will be determined based on the command line arguments

enumerator **last**

<sup>930</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/init\\_runtime/include/hpx/init.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/init_runtime/include/hpx/init.hpp)

## hpx::components::component\_commandline\_base

Defined in header `hpx/components.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

struct **component\_commandline\_base**

The `component_commandline_base` has to be used as a base class for all component command-line line handling registries.

Subclassed by `hpx::components::component_commandline`

## runtime\_local

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

## hpx/runtime\_local/component\_startup\_shutdown\_base.hpp

Defined in header `hpx/runtime_local/component_startup_shutdown_base.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **components**

struct **component\_startup\_shutdown\_base**

*#include <component\_startup\_shutdown\_base.hpp>* The `component_startup_shutdown_base` has to be used as a base class for all component startup/shutdown registries.

### Public Functions

virtual **~component\_startup\_shutdown\_base**() = default

virtual bool **get\_startup\_function**(*startup\_function\_type* &startup, bool &pre\_startup) = 0

Return any startup function for this component.

#### Parameters

- **startup** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre\_startup** – [in, out] Will be set to true if the returned startup function is executed during the first round of calls.

#### Returns

Returns *true* if the parameter *startup* has been successfully initialized with the startup function.

virtual bool **get\_shutdown\_function**(*shutdown\_function\_type* &shutdown, bool &pre\_shutdown) = 0

Return any startup function for this component.

#### Parameters

- **shutdown** – [in, out] The module is expected to fill this function object with a reference to a startup function. This function will be executed by the runtime system during system startup.
- **pre\_shutdown** – [in, out] Will be set to true if the returned shutdown function is executed during the first round of calls.

**Returns**

Returns *true* if the parameter *shutdown* has been successfully initialized with the shutdown function.

**hpx::get\_locality\_id**

Defined in header `hpx/runtime.hpp`<sup>931</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

`std::uint32_t hpx::get_locality_id(error_code &ec = throws)`

Return the number of the locality this function is being called from.

This function returns the id of the current locality.

**Note**

The returned value is zero based and its maximum value is smaller than the overall number of localities the current application is running on (as returned by `get_num_localities()`).

**Note**

As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of `hpx::exception`.

**Note**

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

**Parameters**

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

**hpx/runtime\_local/report\_error.hpp**

Defined in header `hpx/runtime_local/report_error.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

<sup>931</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

## Functions

void **report\_error**(*std::size\_t* num\_thread, *std::exception\_ptr* const &e)

The function `report_error` reports the given exception to the console.

void **report\_error**(*std::exception\_ptr* const &e)

The function `report_error` reports the given exception to the console.

### hpx/runtime\_local/get\_worker\_thread\_num.hpp

Defined in header `hpx/runtime_local/get_worker_thread_num.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### hpx/runtime\_local/termination\_detection.hpp

Defined in header `hpx/runtime_local/termination_detection.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **local**

## Functions

void **termination\_detection**()

Wait for all local HPX threads to complete execution.

This function blocks the calling thread until all HPX worker threads on the current locality have completed their work and become idle. It performs local termination detection by waiting for the thread manager to drain all pending tasks.

### Example:

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>

int hpx_main()
{
 // Launch some asynchronous work
 for (int i = 0; i < 100; ++i)
 {
 hpx::post([]{ /* do work */ });
 }

 // Wait for all local threads to complete
 hpx::local::termination_detection();

 return hpx::finalize();
}
```

**Note**

This function should be called from an HPX thread or after the HPX runtime has been initialized.

**Throws**

`hpx::exception` – if called when the runtime is not in a valid state (e.g., before initialization or after shutdown).

bool **termination\_detection**(`hpx::chrono::steady_duration` const &timeout)

Wait for all local HPX threads to complete with a timeout.

This function blocks the calling thread until either all HPX worker threads have completed their work, or the specified timeout duration has elapsed.

**See also**

termination\_detection()

**Example:**

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <chrono>

int hpx_main()
{
 // Launch some work
 hpx::post([]{ /* long running task */ });

 // Wait up to 5 seconds
 if (!hpx::local::termination_detection(std::chrono::seconds(5)))
 {
 std::cerr << "Warning: Work did not complete within timeout\n";
 // Implement fallback strategy
 }

 return hpx::finalize();
}
```

**Parameters**

**timeout** – Maximum duration to wait for termination. The function will return false if this duration elapses before all threads complete.

**Throws**

`hpx::exception` – if called when the runtime is not in a valid state.

**Returns**

true if all threads completed before the timeout, false if the timeout elapsed.

bool **termination\_detection**(`hpx::chrono::steady_time_point` const &deadline)

Wait for all local HPX threads to complete until a deadline.

This function blocks the calling thread until either all HPX worker threads have completed their work, or the specified deadline time point is reached.

**See also**

`termination_detection(std::chrono::duration<double>)`

**Example:**

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <chrono>

int hpx_main()
{
 auto deadline = std::chrono::steady_clock::now() +
 std::chrono::seconds(10);

 hpx::post([]{ /* work */ });

 if (!hpx::local::termination_detection(deadline))
 {
 std::cerr << "Deadline reached\n";
 }

 return hpx::finalize();
}
```

**Parameters**

**deadline** – Absolute time point when waiting should stop. The function will return false if this time is reached before all threads complete.

**Throws**

`hpx::exception` – if called when the runtime is not in a valid state.

**Returns**

true if all threads completed before the deadline, false if the deadline was reached.

bool **termination\_detection**(`hpx::stop_token` stop\_token, `hpx::chrono::steady_duration` const &timeout = `hpx::chrono::steady_duration((hpx::chrono::steady_clock::duration::max)())`)

Wait for all local HPX threads with cancellation support.

This function blocks the calling thread until all HPX worker threads have completed, the timeout elapses, or a stop is requested via the stop\_token. This enables cooperative cancellation of the wait operation.

**See also**

`termination_detection(std::chrono::duration<double>)`

**Example:**

```
#include <hpx/hpx_init.hpp>
#include <hpx/runtime_local/termination_detection.hpp>
#include <hpx/stop_token.hpp>
#include <chrono>
```

(continues on next page)

(continued from previous page)

```

int hpx_main()
{
 hpx::stop_source stop_src;

 // In shutdown handler
 hpx::thread shutdown_thread([&stop_src]() {
 hpx::this_thread::sleep_for(std::chrono::seconds(30));
 stop_src.request_stop();
 });

 hpx::post([]{ /* work */ });

 // Wait with cancellation support
 bool completed = hpx::local::termination_detection(
 stop_src.get_token(),
 std::chrono::minutes(1)
);

 if (!completed)
 {
 std::cerr << "Cancelled or timed out\n";
 }

 shutdown_thread.join();
 return hpx::finalize();
}

```

**Parameters**

- **stop\_token** – Token that can be used to request cancellation of the wait operation.
- **timeout** – Maximum duration to wait. Defaults to maximum duration (effectively infinite).

**Throws**

*hpx::exception* – if called when the runtime is not in a valid state.

**Returns**

true if all threads completed, false if timeout elapsed or stop was requested.

**hpx::get\_thread\_name**

Defined in header `hpx/runtime.hpp`<sup>932</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

`std::string hpx::get_thread_name()`

Return the name of the calling thread.

This function returns the name of the calling thread. This name uniquely identifies the thread in the context of HPX. If the function is called while no HPX runtime system is active, the result will be “<unknown>”.

<sup>932</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

## hpx::get\_locality\_name

Defined in header `hpx/runtime.hpp`<sup>933</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

`std::string hpx::get_locality_name()`

Return the name of the locality this function is called on.

This function returns the name for the locality on which this function is called.

### See also

`future<std::string> get_locality_name(hpx::id_type const& id)`

### Returns

This function returns the name for the locality on which the function is called. The name is retrieved from the underlying networking layer and may be different for different parcelports.

`future<std::string> hpx::get_locality_name(hpx::id_type const &id)`

Return the name of the referenced locality.

This function returns a future referring to the name for the locality of the given id.

### See also

`std::string get_locality_name()`

### Parameters

**id** – [in] The global id of the locality for which the name should be retrieved

### Returns

This function returns the name for the locality of the given id. The name is retrieved from the underlying networking layer and may be different for different parcel ports.

## hpx/runtime\_local/thread\_mapper.hpp

Defined in header `hpx/runtime_local/thread_mapper.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

## hpx/runtime\_local/thread\_hooks.hpp

Defined in header `hpx/runtime_local/thread_hooks.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

### Functions

*threads::policies::callback\_notifier::on\_startstop\_type* **get\_thread\_on\_start\_func()**

Retrieve the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *register\_thread\_on\_start\_func*).

#### Note

This function can be called before the HPX runtime is initialized.

#### Returns

The currently installed error handler function.

*threads::policies::callback\_notifier::on\_startstop\_type* **get\_thread\_on\_stop\_func()**

Retrieve the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *register\_thread\_on\_stop\_func*).

#### Note

This function can be called before the HPX runtime is initialized.

#### Returns

The currently installed error handler function.

*threads::policies::callback\_notifier::on\_error\_type* **get\_thread\_on\_error\_func()**

Retrieve the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *register\_thread\_on\_error\_func*).

#### Note

This function can be called before the HPX runtime is initialized.

#### Returns

The currently installed error handler function.

*threads::policies::callback\_notifier::on\_startstop\_type* **register\_thread\_on\_start\_func**(*threads::policies::callback\_notifier::*  
 &&f)

Set the currently installed start handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered start function chains into the previous one (see *get\_thread\_on\_start\_func*).

#### Note

This function can be called before the HPX runtime is initialized.

#### Parameters

**f** – The function to install as the new start handler.

#### Returns

The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

*threads::policies::callback\_notifier::on\_startstop\_type* **register\_thread\_on\_stop\_func**(*threads::policies::callback\_notifier::*  
 &&f)

Set the currently installed stop handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered stop function chains into the previous one (see *get\_thread\_on\_stop\_func*).

#### Note

This function can be called before the HPX runtime is initialized.

#### Parameters

**f** – The function to install as the new stop handler.

#### Returns

The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

*threads::policies::callback\_notifier::on\_error\_type* **register\_thread\_on\_error\_func**(*threads::policies::callback\_notifier::*  
 &&f)

Set the currently installed error handler function. This is a function that will be called by HPX for each newly created thread that is made known to the runtime. HPX stores exactly one such function reference, thus the caller needs to make sure any newly registered error function chains into the previous one (see *get\_thread\_on\_error\_func*).

#### Note

This function can be called before the HPX runtime is initialized.

#### Parameters

**f** – The function to install as the new error handler.

**Returns**

The previously registered function of this category. It is the user's responsibility to call that function if the callback is invoked by HPX.

**hpx::get\_initial\_num\_localities**

Defined in header [hpx/runtime.hpp](#)<sup>934</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::get\\_num\\_localities](#)

`std::uint32_t hpx::get_initial_num_localities()`

Return the number of localities which were registered at startup for the running application.

The function `get_initial_num_localities` returns the number of localities which were connected to the console at application startup.

**See also**

[hpx::find\\_all\\_localities](#), [hpx::get\\_num\\_localities](#)

**Note**

As long as *ec* is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of [hpx::exception](#).

**hpx::get\_num\_localities**

Defined in header [hpx/runtime.hpp](#)<sup>935</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::get\\_initial\\_num\\_localities](#)

`hpx::future<std::uint32_t> hpx::get_num_localities()`

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console. The returned future represents the actual result.

**See also**

[hpx::find\\_all\\_localities](#), [hpx::get\\_num\\_localities](#)

---

<sup>934</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

<sup>935</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

**Note**

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

`std::uint32_t hpx::get_num_localities(launch::sync_policy, error_code &ec = throws)`

Return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console.

**See also**

`hpx::find_all_localities`, `hpx::get_num_localities`

**Note**

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

**Note**

As long as `ec` is not pre-initialized to `hpx::throws` this function doesn't throw but returns the result code using the parameter `ec`. Otherwise, it throws an instance of `hpx::exception`.

**Parameters**

`ec` – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`std::uint32_t hpx::get_num_localities(hpx::launch::sync_policy, error_code &ec)`

Return the number of localities which are currently registered for the running application.

`hpx::future<std::uint32_t> hpx::get_num_localities(components::component_type t)`

Asynchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` asynchronously returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

**See also**

`hpx::find_all_localities`, `hpx::get_num_localities`

**Note**

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

**Parameters**

**t** – The component type for which the number of connected localities should be retrieved.

`std::uint32_t hpx::get_num_localities(launch::sync_policy, components::component_type t, error_code &ec = throws)`

Synchronously return the number of localities which are currently registered for the running application.

The function `get_num_localities` returns the number of localities currently connected to the console which support the creation of the given component type. The returned future represents the actual result.

**See also**

`hpx::find_all_localities`, `hpx::get_num_localities`

**Note**

This function will return meaningful results only if called from an HPX-thread. It will return 0 otherwise.

**Parameters**

- **t** – The component type for which the number of connected localities should be retrieved.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

`std::uint32_t hpx::get_num_localities(hpx::launch::sync_policy, components::component_type type, error_code &ec)`

**hpx::shutdown\_function\_type**

Defined in header `hpx/runtime.hpp`<sup>936</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::register_pre_shutdown_function`
- `hpx::register_shutdown_function`

using `hpx::shutdown_function_type = hpx::move_only_function<void()>`

The type of the function which is registered to be executed as a shutdown or pre-shutdown function.

---

<sup>936</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

## hpx::register\_pre\_shutdown\_function

Defined in header [hpx/runtime.hpp](#)<sup>937</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::shutdown\\_function\\_type](#)
- [hpx::register\\_shutdown\\_function](#)

void **hpx::register\_pre\_shutdown\_function**(*shutdown\_function\_type* f)

Add a function to be executed by a HPX thread during [hpx::finalize\(\)](#) but guaranteed before any shutdown function is executed (system-wide)

Any of the functions registered with *register\_pre\_shutdown\_function* are guaranteed to be executed by an HPX thread during the execution of [hpx::finalize\(\)](#) before any of the registered shutdown functions are executed (see: [hpx::register\\_shutdown\\_function\(\)](#)).

### See also

[hpx::register\\_shutdown\\_function\(\)](#)

### Note

If this function is called while the pre-shutdown functions are being executed, or after that point, it will raise an `invalid_status` exception.

### Parameters

**f** – [in] The function to be registered to run by an HPX thread as a pre-shutdown function.

## hpx::register\_shutdown\_function

Defined in header [hpx/runtime.hpp](#)<sup>938</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::shutdown\\_function\\_type](#)
- [hpx::register\\_pre\\_shutdown\\_function](#)

void **hpx::register\_shutdown\_function**(*shutdown\_function\_type* f)

Add a function to be executed by a HPX thread during [hpx::finalize\(\)](#) but guaranteed after any pre-shutdown function is executed (system-wide)

Any of the functions registered with *register\_shutdown\_function* are guaranteed to be executed by an HPX thread during the execution of [hpx::finalize\(\)](#) after any of the registered pre-shutdown functions are executed (see: [hpx::register\\_pre\\_shutdown\\_function\(\)](#)).

<sup>937</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

<sup>938</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

**See also**

`hpx::register_pre_shutdown_function()`

**Note**

If this function is called while the shutdown functions are being executed, or after that point, it will raise an `invalid_status` exception.

**Parameters**

**f** – [in] The function to be registered to run by an HPX thread as a shutdown function.

**`hpx::register_thread`**

Defined in header `hpx/runtime.hpp`<sup>939</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::unregister_thread`
- `hpx::get_os_thread_data`
- `hpx::enumerate_os_threads`
- `hpx::get_runtime_instance_number`
- `hpx::register_on_exit`
- `hpx::is_starting`
- `hpx::tolerate_node_faults`
- `hpx::is_running`
- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

bool **`hpx::register_thread`**(*runtime* \*rt, char const \*name, *error\_code* &ec = *throws*)

Register the current kernel thread with HPX, this should be done once for each external OS-thread intended to invoke HPX functionality. Calling this function more than once will return false.

---

<sup>939</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

## hpx::unregister\_thread

Defined in header `hpx/runtime.hpp`<sup>940</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::register_thread`
- `hpx::get_os_thread_data`
- `hpx::enumerate_os_threads`
- `hpx::get_runtime_instance_number`
- `hpx::register_on_exit`
- `hpx::is_starting`
- `hpx::tolerate_node_faults`
- `hpx::is_running`
- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

void `hpx::unregister_thread(runtime *rt)`

Unregister the thread from HPX, this should be done once in the end before the external thread exists.

## hpx::get\_os\_thread\_data

Defined in header `hpx/runtime.hpp`<sup>941</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::register_thread`
- `hpx::unregister_thread`
- `hpx::enumerate_os_threads`
- `hpx::get_runtime_instance_number`

- `hpx::tolerate_node_faults`
- `hpx::is_running`
- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`

<sup>940</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

<sup>941</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

- *hpx::get\_system\_uptime*

runtime\_local::os\_thread\_data **hpx::get\_os\_thread\_data**(*std::string* const &label)

Access data for a given OS thread that was previously registered by *register\_thread*. This function must be called from a thread that was previously registered with the runtime.

### **hpx::enumerate\_os\_threads**

Defined in header *hpx/runtime.hpp*<sup>942</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register\_thread*
- *hpx::unregister\_thread*
- *hpx::get\_os\_thread\_data*
- *hpx::get\_runtime\_instance\_number*
- *hpx::register\_on\_exit*
- *hpx::is\_starting*
- *hpx::tolerate\_node\_faults*
- *hpx::is\_running*
- *hpx::is\_stopped*
- *hpx::is\_stopped\_or\_shutting\_down*
- *hpx::get\_num\_worker\_threads*
- *hpx::get\_system\_uptime*

bool **hpx::enumerate\_os\_threads**(*hpx::function*<bool(os\_thread\_data const&)> const &f)

Enumerate all OS threads that have registered with the runtime.

### **hpx::get\_runtime\_instance\_number**

Defined in header *hpx/runtime.hpp*<sup>943</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register\_thread*
- *hpx::unregister\_thread*
- *hpx::get\_os\_thread\_data*
- *hpx::enumerate\_os\_threads*
- *hpx::register\_on\_exit*
- *hpx::is\_starting*
- *hpx::tolerate\_node\_faults*

---

<sup>942</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

<sup>943</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

- `hpx::is_running`
- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

`std::size_t hpx::get_runtime_instance_number()`

Return the runtime instance number associated with the runtime instance the current thread is running in.

## `hpx::register_on_exit`

Defined in header `hpx/runtime.hpp`<sup>944</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::register_thread`
- `hpx::unregister_thread`
- `hpx::get_os_thread_data`
- `hpx::enumerate_os_threads`
- `hpx::get_runtime_instance_number`
- `hpx::is_starting`
- `hpx::tolerate_node_faults`
- `hpx::is_running`
- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

`bool hpx::register_on_exit(hpx::function<void()> const&)`

Register a function to be called during system shutdown.

## `hpx::is_starting`

Defined in header `hpx/runtime.hpp`<sup>945</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::register_thread`
- `hpx::unregister_thread`
- `hpx::get_os_thread_data`

<sup>944</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

<sup>945</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

- *hpx::enumerate\_os\_threads*

- *hpx::register\_on\_exit*
- *hpx::tolerate\_node\_faults*
- *hpx::is\_running*
- *hpx::is\_stopped*
- *hpx::is\_stopped\_or\_shutting\_down*
- *hpx::get\_num\_worker\_threads*
- *hpx::get\_system\_uptime*

bool **hpx::is\_starting()**

Test whether the runtime system is currently being started.

This function returns whether the runtime system is currently being started or not, e.g. whether the current state of the runtime system is *hpx::state::startup*

#### Note

This function needs to be executed on a HPX-thread. It will return false otherwise.

### **hpx::tolerate\_node\_faults**

Defined in header *hpx/runtime.hpp*<sup>946</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::register\_thread*
- *hpx::unregister\_thread*
- *hpx::get\_os\_thread\_data*
- *hpx::enumerate\_os\_threads*
- *hpx::get\_runtime\_instance\_number*
- *hpx::register\_on\_exit*
- *hpx::is\_starting*
- *hpx::is\_running*
- *hpx::is\_stopped*
- *hpx::is\_stopped\_or\_shutting\_down*
- *hpx::get\_num\_worker\_threads*
- *hpx::get\_system\_uptime*

---

<sup>946</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

bool `hpx::tolerate_node_faults()`

Test if HPX runs in fault-tolerant mode.

This function returns whether the runtime system is running in fault-tolerant mode

## `hpx::is_running`

Defined in header `hpx/runtime.hpp`<sup>947</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::register_thread`
- `hpx::unregister_thread`
- `hpx::get_os_thread_data`
- `hpx::enumerate_os_threads`
- `hpx::get_runtime_instance_number`

- `hpx::tolerate_node_faults`
- `hpx::is_stopped`
- `hpx::is_stopped_or_shutting_down`
- `hpx::get_num_worker_threads`
- `hpx::get_system_uptime`

bool `hpx::is_running()`

Test whether the runtime system is currently running.

This function returns whether the runtime system is currently running or not, e.g. whether the current state of the runtime system is `hpx::state::running`

### Note

This function needs to be executed on a HPX-thread. It will return false otherwise.

## `hpx::is_stopped`

Defined in header `hpx/runtime.hpp`<sup>948</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::register_thread`

bool `hpx::is_stopped()`

Test whether the runtime system is currently stopped.

This function returns whether the runtime system is currently stopped or not, e.g. whether the current state of the runtime system is `hpx::state::stopped`

#### Note

This function needs to be executed on a HPX-thread. It will return false otherwise.

### `hpx::is_stopped_or_shutting_down`

Defined in header `hpx/runtime.hpp`<sup>949</sup>.

bool **hpx::is\_stopped\_or\_shutting\_down()**

Test whether the runtime system is currently being shut down.

This function returns whether the runtime system is currently being shut down or not, e.g. whether the current state of the runtime system is *hpx::state::stopped* or *hpx::state::shutdown*

#### Note

This function needs to be executed on a HPX-thread. It will return false otherwise.

## hpx::get\_num\_worker\_threads

Defined in header [hpx/runtime.hpp](#)<sup>950</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::is\_stopped\_or\_shutting\_down*
- *hpx::get\_system\_uptime*

*std::size\_t* **hpx::get\_num\_worker\_threads()**

Return the number of worker OS- threads used to execute HPX threads.

This function returns the number of OS-threads used to execute HPX threads. If the function is called while no HPX runtime system is active, it will return zero.

## hpx::get\_system\_uptime

Defined in header [hpx/runtime.hpp](#)<sup>951</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

- `hpx::get_num_worker_threads`

`std::uint64_t hpx::get_system_uptime()`

Return the system uptime measure on the thread executing this call.

This function returns the system uptime measured in nanoseconds for the thread executing this call. If the function is called while no HPX runtime system is active, it will return zero.

## `hpx/runtime_local/custom_exception_info.hpp`

Defined in header `hpx/runtime_local/custom_exception_info.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

### Functions

`std::string diagnostic_information(exception_info const &xi)`

Extract the diagnostic information embedded in the given exception and return a string holding a formatted message.

The function `hpx::diagnostic_information` can be used to extract all diagnostic information stored in the given exception instance as a formatted string. This simplifies debug output as it composes the diagnostics into one, easy to use function call. This includes the name of the source file and line number, the sequence number of the OS-thread and the HPX-thread id, the locality id and the stack backtrace of the point where the original exception was thrown.

#### See also

`hpx::get_error_locality_id()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,  
`hpx::get_error_os_thread()`, `hpx::get_error_thread_id()`, `hpx::get_error_thread_description()`,  
`hpx::get_error()`, `hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`,  
`hpx::get_error_config()`, `hpx::get_error_state()`

**Parameters**

**xi** – The parameter *e* will be inspected for all diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

**Throws**

*std::bad\_alloc* – (if any of the required allocation operations fail)

**Returns**

The formatted string holding all the available diagnostic information stored in the given exception instance.

*std::string* **default\_diagnostic\_information**(*std::exception\_ptr* const &*e*)

*std::uint32\_t* **get\_error\_locality\_id**(*hpx::exception\_info* const &*xi*) noexcept

Return the locality id where the exception was thrown.

The function *hpx::get\_error\_locality\_id* can be used to extract the diagnostic information element representing the locality id as stored in the given exception instance.

**See also**

*hpx::diagnostic\_information*(), *hpx::get\_error\_host\_name*(), *hpx::get\_error\_process\_id*(),  
*hpx::get\_error\_function\_name*(), *hpx::get\_error\_file\_name*(), *hpx::get\_error\_line\_number*(),  
*hpx::get\_error\_os\_thread*(), *hpx::get\_error\_thread\_id*(), *hpx::get\_error\_thread\_description*(),  
*hpx::get\_error*(), *hpx::get\_error\_backtrace*(), *hpx::get\_error\_env*(), *hpx::get\_error\_what*(),  
*hpx::get\_error\_config*(), *hpx::get\_error\_state*()

**Parameters**

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

**Throws**

nothing –

**Returns**

The locality id of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return *hpx::naming::invalid\_locality\_id*.

*std::string* **get\_error\_host\_name**(*hpx::exception\_info* const &*xi*)

Return the hostname of the locality where the exception was thrown.

The function *hpx::get\_error\_host\_name* can be used to extract the diagnostic information element representing the host name as stored in the given exception instance.

**See also**

*hpx::diagnostic\_information*() *hpx::get\_error\_process\_id*(), *hpx::get\_error\_function\_name*(),  
*hpx::get\_error\_file\_name*(), *hpx::get\_error\_line\_number*(), *hpx::get\_error\_os\_thread*(),  
*hpx::get\_error\_thread\_id*(), *hpx::get\_error\_thread\_description*(), *hpx::get\_error*()

```
hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(),
hpx::get_error_state()
```

### Parameters

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

### Throws

*std::bad\_alloc* – (if one of the required allocations fails)

### Returns

The hostname of the locality where the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

*std::int64\_t* **get\_error\_process\_id**(*hpx::exception\_info* const &xi) noexcept

Return the (operating system) process id of the locality where the exception was thrown.

The function *hpx::get\_error\_process\_id* can be used to extract the diagnostic information element representing the process id as stored in the given exception instance.

### See also

```
hpx::diagnostic_information(), hpx::get_error_host_name(), hpx::get_error_function_name(),
hpx::get_error_file_name(), hpx::get_error_line_number(), hpx::get_error_os_thread(),
hpx::get_error_thread_id(), hpx::get_error_thread_description(), hpx::get_error(),
hpx::get_error_backtrace(), hpx::get_error_env(), hpx::get_error_what(), hpx::get_error_config(),
hpx::get_error_state()
```

### Parameters

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

### Throws

nothing –

### Returns

The process id of the OS-process which threw the exception. If the exception instance does not hold this information, the function will return 0.

*std::string* **get\_error\_env**(*hpx::exception\_info* const &xi)

Return the environment of the OS-process at the point the exception was thrown.

The function *hpx::get\_error\_env* can be used to extract the diagnostic information element representing the environment of the OS-process collected at the point the exception was thrown.

**See also**

*hpx::diagnostic\_information(), hpx::get\_error\_host\_name(), hpx::get\_error\_process\_id(),  
 hpx::get\_error\_function\_name(), hpx::get\_error\_file\_name(), hpx::get\_error\_line\_number(),  
 hpx::get\_error\_os\_thread(), hpx::get\_error\_thread\_id(), hpx::get\_error\_thread\_description(),  
 hpx::get\_error(), hpx::get\_error\_backtrace(), hpx::get\_error\_what(), hpx::get\_error\_config(),  
 hpx::get\_error\_state()*

**Parameters**

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

**Throws**

*std::bad\_alloc* – (if one of the required allocations fails)

**Returns**

The environment from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

*std::string* **get\_error\_backtrace**(*hpx::exception\_info* const &xi)

Return the stack backtrace from the point the exception was thrown.

The function *hpx::get\_error\_backtrace* can be used to extract the diagnostic information element representing the stack backtrace collected at the point the exception was thrown.

**See also**

*hpx::diagnostic\_information(), hpx::get\_error\_host\_name(), hpx::get\_error\_process\_id(),  
 hpx::get\_error\_function\_name(), hpx::get\_error\_file\_name(), hpx::get\_error\_line\_number(),  
 hpx::get\_error\_os\_thread(), hpx::get\_error\_thread\_id(), hpx::get\_error\_thread\_description(),  
 hpx::get\_error(), hpx::get\_error\_env(), hpx::get\_error\_what(), hpx::get\_error\_config(),  
 hpx::get\_error\_state()*

**Parameters**

**xi** – The parameter *e* will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: *hpx::exception\_info*, *hpx::error\_code*, *std::exception*, or *std::exception\_ptr*.

**Throws**

*std::bad\_alloc* – (if one of the required allocations fails)

**Returns**

The stack back trace from the point the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

*std::size\_t* **get\_error\_os\_thread**(*hpx::exception\_info* const &xi) noexcept

Return the sequence number of the OS-thread used to execute HPX-threads from which the exception was thrown.

The function `hpx::get_error_os_thread` can be used to extract the diagnostic information element representing the sequence number of the OS-thread as stored in the given exception instance.

`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,  
`hpx::get_error_state()`

#### Parameters

**xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

#### Throws

nothing –

#### Returns

The sequence number of the OS-thread used to execute the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size(-1)`.

`std::size_t` **get\_error\_thread\_id**(`hpx::exception_info` const &xi) noexcept

Return the unique thread id of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_id` can be used to extract the diagnostic information element representing the HPX-thread id as stored in the given exception instance.

#### See also

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,

`hpx::get_error_backtrace()`, `hpx::get_error_env()`, `hpx::get_error_what()`, `hpx::get_error_config()`,  
`hpx::get_error_state()`

#### Parameters

**xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

#### Throws

nothing –

#### Returns

The unique thread id of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return `std::size_t(0)`.

`std::string get_error_thread_description(hpx::exception_info const &xi)`

Return any additionally available thread description of the HPX-thread from which the exception was thrown.

The function `hpx::get_error_thread_description` can be used to extract the diagnostic information element representing the additional thread description as stored in the given exception instance.

#### See also

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,

`hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_state()`, `hpx::get_error_what()`,  
`hpx::get_error_config()`

#### Parameters

**xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

#### Throws

`std::bad_alloc` – (if one of the required allocations fails)

#### Returns

Any additionally available thread description of the HPX-thread from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string get_error_config(hpx::exception_info const &xi)`

Return the HPX configuration information point from which the exception was thrown.

The function `hpx::get_error_config` can be used to extract the HPX configuration information element representing the full HPX configuration information as stored in the given exception instance.

#### See also

`hpx::diagnostic_information()`, `hpx::get_error_host_name()`, `hpx::get_error_process_id()`,  
`hpx::get_error_function_name()`, `hpx::get_error_file_name()`, `hpx::get_error_line_number()`,

`hpx::get_error_env()`, `hpx::get_error()`, `hpx::get_error_state()`, `hpx::get_error_what()`,  
`hpx::get_error_thread_description()`

#### Parameters

**xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

#### Throws

`std::bad_alloc` – (if one of the required allocations fails)

**Returns**

Any additionally available HPX configuration information the point from which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

`std::string get_error_state(hpx::exception_info const &xi)`

Return the HPX runtime state information at which the exception was thrown.

The function `hpx::get_error_state` can be used to extract the HPX runtime state information element representing the state the runtime system is currently in as stored in the given exception instance.

**Parameters**

**xi** – The parameter `e` will be inspected for the requested diagnostic information elements which have been stored at the point where the exception was thrown. This parameter can be one of the following types: `hpx::exception_info`, `hpx::error_code`, `std::exception`, or `std::exception_ptr`.

**Throws**

`std::bad_alloc` – (if one of the required allocations fails)

**Returns**

The point runtime state at the point at which the exception was thrown. If the exception instance does not hold this information, the function will return an empty string.

**hpx/runtime\_local/runtime\_local.hpp**

Defined in header `hpx/runtime_local/runtime_local.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

**Functions**

void **set\_error\_handlers**(`hpx::util::runtime_configuration` const &cfg)

class **runtime**

## Public Types

using **notification\_policy\_type** = *threads::policies::callback\_notifier*

Generate a new notification policy instance for the given thread name prefix

using **hpx\_main\_function\_type** = int()

The *hpx\_main\_function\_type* is the default function type usable as the main HPX thread function.

using **hpx\_errorsink\_function\_type** = void(*std::uint32\_t*, *std::string* const&)

## Public Functions

virtual *notification\_policy\_type* **get\_notification\_policy**(char const \*prefix,  
runtime\_local::os\_thread\_type type)

state **get\_state**() const

void **set\_state**(state s)

explicit **runtime**(*hpx::util::runtime\_configuration* rtcfg, bool initialize)

Construct a new HPX runtime instance.

virtual **~runtime**()

The destructor makes sure all HPX runtime services are properly shut down before exiting.

void **on\_exit**(*hpx::function*<void()> const &f)

Manage list of functions to call on exit.

void **starting**()

Manage runtime ‘stopped’ state.

void **stopping**()

Call all registered on\_exit functions.

bool **stopped**() const

This accessor returns whether the runtime instance has been stopped.

*hpx::util::runtime\_configuration* &**get\_config**()

access configuration information

*hpx::util::runtime\_configuration* const &**get\_config**() const

*std::size\_t* **get\_instance\_number**() const

*util::thread\_mapper* &**get\_thread\_mapper**() const

Return a reference to the internal PAPI thread manager.

*threads::topology* const &**get\_topology**() const

virtual int **run**(*hpx::function*<*hpx\_main\_function\_type*> const &func)

Run the HPX runtime system, use the given function for the main *thread* and block waiting for all threads to finish.

**Note**

The parameter *func* is optional. If no function is supplied, the runtime system will simply wait for the shutdown action without explicitly executing any main thread.

**Parameters**

**func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx\_main\_function\_type*. This parameter is optional and defaults to none main thread function, in which case all threads have to be scheduled explicitly.

**Returns**

This function will return the value as returned as the result of the invocation of the function object given by the parameter **func**.

virtual int **run**()

Run the HPX runtime system, initially use the given number of (OS) threads in the thread-manager and block waiting for all threads to finish.

**Returns**

This function will always return 0 (zero).

virtual void **rethrow\_exception**()

Rethrow any stored exception (to be called after *stop()*)

virtual int **start**(*hpx::function<hpx\_main\_function\_type>* const &func, bool blocking = false)

Start the runtime system.

**Parameters**

- **func** – [in] This is the main function of an HPX application. It will be scheduled for execution by the thread manager as soon as the runtime has been initialized. This function is expected to expose an interface as defined by the typedef *hpx\_main\_function\_type*.
- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally.

**Returns**

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter **func**. Otherwise, it will return zero.

virtual int **start**(bool blocking = false)

Start the runtime system.

**Parameters**

**blocking** – [in] This allows to control whether this call blocks until the runtime system has been stopped. If this parameter is *true* the function *runtime::start* will call *runtime::wait* internally .

**Returns**

If a blocking is a true, this function will return the value as returned as the result of the invocation of the function object given by the parameter **func**. Otherwise, it will return zero.

virtual int **wait**()

Wait for the shutdown action to be executed.

**Returns**

This function will return the value as returned as the result of the invocation of the function object given by the parameter **func**.

virtual void **stop**(bool blocking = true)

Initiate termination of the runtime system.

**Parameters**

**blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.

virtual int **suspend**()

Suspend the runtime system.

virtual int **resume**()

Resume the runtime system.

virtual int **finalize**(double)

virtual bool **is\_networking\_enabled**()

Return true if networking is enabled.

virtual *hpx::threads::threadmanager* &**get\_thread\_manager**()

Allow access to the thread manager instance used by the HPX runtime.

virtual *std::string* **here**() const

Returns a string of the locality endpoints (usable in debug output)

virtual bool **report\_error**(*std::size\_t* num\_thread, *std::exception\_ptr* const &e, bool terminate\_all = true)

Report a non-recoverable error to the runtime system.

**Parameters**

- **num\_thread** – [in] The number of the operating system thread the error has been detected in.
- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate\_all** – [in] signal whether all localities should be terminated

virtual bool **report\_error**(*std::exception\_ptr* const &e, bool terminate\_all = true)

Report a non-recoverable error to the runtime system.

**Note**

This function will retrieve the number of the current shepherd thread and forward to the `report_error` function above.

**Parameters**

- **e** – [in] This is an instance encapsulating an exception which lead to this function call.
- **terminate\_all** – [in] signal whether all localities should be terminated

virtual void **add\_pre\_startup\_function**(*startup\_function\_type* f)

Add a function to be executed inside a HPX thread before `hpx_main` but guaranteed to be executed before any startup function registered with `add_startup_function`.

**Note**

The difference to a startup function is that all pre-startup functions will be (system-wide) executed before any startup function.

**Parameters**

**f** – The function ‘f’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add\_startup\_function**(*startup\_function\_type* f)

Add a function to be executed inside a HPX thread before `hpx_main`

**Parameters**

**f** – The function ‘f’ will be called from inside a HPX thread before `hpx_main` is executed. This is very useful to set up the runtime environment of the application (install performance counters, etc.)

virtual void **add\_pre\_shutdown\_function**(*shutdown\_function\_type* f)

Add a function to be executed inside a HPX thread during `hpx::finalize`, but guaranteed before any of the shutdown functions is executed.

**Note**

The difference to a shutdown function is that all pre-shutdown functions will be (system-wide) executed before any shutdown function.

**Parameters**

**f** – The function ‘f’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual void **add\_shutdown\_function**(*shutdown\_function\_type* f)

Add a function to be executed inside a HPX thread during `hpx::finalize`

**Parameters**

**f** – The function ‘f’ will be called from inside a HPX thread while `hpx::finalize` is executed. This is very useful to tear down the runtime environment of the application (uninstall performance counters, etc.)

virtual *hpx::util::io\_service\_pool* \***get\_thread\_pool**(char const \*name)

Access one of the internal thread pools (io\_service instances) HPX is using to perform specific tasks. The three possible values for the argument `name` are “main\_pool”, “io\_pool”, “parcel\_pool”, and “timer\_pool”. For any other argument value the function will return zero.

virtual bool **register\_thread**(char const \*name, *std::size\_t* num = 0, bool service\_thread = true, *error\_code* &ec = *throws*)

Register an external OS-thread with HPX.

This function should be called from any OS-thread which is external to HPX (not created by HPX), but which needs to access HPX functionality, such as setting a value on a promise or similar.

‘main’, ‘io’, ‘timer’, ‘parcel’, ‘worker’

**Note**

The function will compose a thread name of the form ‘<name>-thread#<num>’ which is used to register the thread. It is the user’s responsibility to ensure that each (composed) thread name is unique. HPX internally uses the following names for the threads it creates, do not reuse those:

**Note**

This function should be called for each thread exactly once. It will fail if it is called more than once.

**Parameters**

- **name** – [in] The name to use for thread registration.
- **num** – [in] The sequence number to use for thread registration. The default for this parameter is zero.
- **service\_thread** – [in] The thread should be registered as a service thread. The default for this parameter is ‘true’. Any service threads will be pinned to cores not currently used by any of the HPX worker threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns**

This function will return whether the requested operation succeeded or not.

virtual bool **unregister\_thread()**

Unregister an external OS-thread with HPX.

This function will unregister any external OS-thread from HPX.

**Note**

This function should be called for each thread exactly once. It will fail if it is called more than once. It will fail as well if the thread has not been registered before (see *register\_thread*).

**Returns**

This function will return whether the requested operation succeeded or not.

virtual runtime\_local::os\_thread\_data **get\_os\_thread\_data**(*std::string* const &label) const

Access data for a given OS thread that was previously registered by *register\_thread*.

virtual bool **enumerate\_os\_threads**(*hpx::function*<bool(runtime\_local::os\_thread\_data const&)> const &f) const

Enumerate all OS threads that have registered with the runtime.

*notification\_policy\_type::on\_startstop\_type* **on\_start\_func**() const

*notification\_policy\_type::on\_startstop\_type* **on\_stop\_func**() const

*notification\_policy\_type::on\_error\_type* **on\_error\_func**() const

*notification\_policy\_type::on\_startstop\_type* **on\_start\_func**(*notification\_policy\_type::on\_startstop\_type*&&)

*notification\_policy\_type::on\_startstop\_type* **on\_stop\_func**(*notification\_policy\_type::on\_startstop\_type*&&)

*notification\_policy\_type::on\_error\_type* **on\_error\_func**(*notification\_policy\_type::on\_error\_type*&&)

virtual *std::uint32\_t* **get\_locality\_id**(*error\_code* &ec) const

virtual *std::size\_t* **get\_num\_worker\_threads**() const

virtual *std::uint32\_t* **get\_num\_localities**(*hpx::launch::sync\_policy*, *error\_code* &ec) const

virtual *std::uint32\_t* **get\_initial\_num\_localities**() const

```
virtual hpx::future<std::uint32_t> get_num_localities() const
virtual std::string get_locality_name() const
virtual std::uint32_t assign_cores(std::string const&, std::uint32_t)
virtual std::uint32_t assign_cores()
inline hpx::program_options::options_description const &get_app_options() const
inline void set_app_options(hpx::program_options::options_description const &app_options)
```

## Public Static Functions

```
static std::uint64_t get_system_uptime()
 Return the system uptime measure on the thread executing this call.
```

## Protected Types

```
using on_exit_type = std::vector<hpx::function<void()>>
```

## Protected Functions

```
explicit runtime(hpx::util::runtime_configuration rtcfg)
void set_notification_policies(notification_policy_type &¬ifier,
 threads::detail::network_background_callback_type const
 &network_background_callback)
void init()
 Common initialization for different constructors.
void init_global_data()
threads::thread_result_type run_helper(hpx::function<runtime::hpx_main_function_type> const
 &func, int &result, bool call_startup_functions, void
 (*handle_print_bind)(std::size_t) = nullptr)
void wait_helper(std::mutex &mtx, std::condition_variable &cond, bool &running)
```

## Protected Attributes

## Protected Static Attributes

```
static std::atomic<int> instance_number_counter_
```

## Private Functions

```
void stop_helper(bool blocking, std::condition_variable &cond, std::mutex &mtx) const
```

Helper function to stop the runtime.

### Parameters

- **blocking** – [in] This allows to control whether this call blocks until the runtime system has been fully stopped. If this parameter is *false* then this call will initiate the stop action but will return immediately. Use a second call to stop with this parameter set to *true* to wait for all internal work to be completed.
- **cond** –
- **mtx** –

```
void deinit_tss_helper(char const *context, std::size_t num) const

void init_tss_ex(char const *context, runtime_local::os_thread_type type, std::size_t
 local_thread_num, std::size_t global_thread_num, char const *pool_name, char
 const *postfix, bool service_thread, error_code &ec) const

void init_tss_helper(char const *context, runtime_local::os_thread_type type, std::size_t
 local_thread_num, std::size_t global_thread_num, char const *pool_name, char
 const *postfix, bool service_thread) const

void notify_finalize()

void wait_finalize()

void call_startup_functions(bool pre_startup)
```

### Private Members

std::list<startup_function_type> startup_functions_

std::list<shutdown_function_type> pre_shutdown_functions_

std::list<shutdown_function_type> shutdown_functions_

bool stop_called_

bool stop_done_

std::condition_variable wait_condition_

hpx::program_options::options_description app_options_
```

namespace **threads**

### Functions

```
char const *get_stack_size_name(std::ptrdiff_t size)
 Returns the stack size name.

 Get the readable string representing the given stack size constant.

Parameters
 size – this represents the stack size

std::ptrdiff_t get_default_stack_size()
 Returns the default stack size.

 Get the default stack size in bytes.
```

```
std::ptrdiff_t get_stack_size(thread_stacksize size)
```

Returns the stack size corresponding to the given stack size enumeration.

Get the stack size corresponding to the given stack size enumeration.

**Parameters**

**size** – this represents the stack size

namespace **util**

## Functions

```
bool retrieve_commandline_arguments(hpx::program_options::options_description const
 &app_options, hpx::program_options::variables_map
 &vm)
```

```
bool retrieve_commandline_arguments(std::string const &app_name,
 hpx::program_options::variables_map &vm)
```

## **hpx::startup\_function\_type**

Defined in header `hpx/runtime.hpp`<sup>952</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::register_pre_startup_function`
- `hpx::register_startup_function`

using `hpx::startup_function_type = hpx::move_only_function<void()>`

The type of the function which is registered to be executed as a startup or pre-startup function.

## **hpx::register\_pre\_startup\_function**

Defined in header `hpx/runtime.hpp`<sup>953</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::startup_function_type`
- `hpx::register_startup_function`

void `hpx::register_pre_startup_function`(*startup\_function\_type* f)

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed before any startup function is executed (system-wide).

Any of the functions registered with `register_pre_startup_function` are guaranteed to be executed by an HPX thread before any of the registered startup functions are executed (see `hpx::register_startup_function()`).

<sup>952</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

<sup>953</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

**See also**

[hpx::register\\_startup\\_function\(\)](#)

**Note**

If this function is called while the pre-startup functions are being executed or after that point, it will raise `aninvalid_status` exception.

**Parameters**

**f** – [in] The function to be registered to run by an HPX thread as a pre-startup function.

**`hpx::register_startup_function`**

Defined in header [hpx/runtime.hpp](#)<sup>954</sup>.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::startup\\_function\\_type](#)
- [hpx::register\\_pre\\_startup\\_function](#)

void **`hpx::register_startup_function`**(*startup\_function\_type* f)

Add a function to be executed by a HPX thread before `hpx_main` but guaranteed after any pre-startup function is executed (system-wide).

Any of the functions registered with *register\_startup\_function* are guaranteed to be executed by an HPX thread after any of the registered pre-startup functions are executed (see: [hpx::register\\_pre\\_startup\\_function\(\)](#)), but before *hpx\_main* is being called.

This function is one of the few API functions which can be called before the runtime system has been fully initialized. It will automatically stage the provided startup function to the runtime system during its initialization (if necessary).

**See also**

[hpx::register\\_pre\\_startup\\_function\(\)](#)

---

<sup>954</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

**Note**

If this function is called while the startup functions are being executed or after that point, it will raise an `invalid_status` exception.

**Parameters**

**f** – [in] The function to be registered to run by an HPX thread as a startup function.

**hpx/runtime\_local/get\_os\_thread\_count.hpp**

Defined in header `hpx/runtime_local/get_os_thread_count.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

**Functions**

`std::size_t` **get\_os\_thread\_count()**

Return the number of OS-threads running in the runtime instance the current HPX-thread is associated with.

`std::size_t` **get\_os\_thread\_count**(*threads::*executor const &exec)

Return the number of worker OS- threads used by the given executor to execute HPX threads.

This function returns the number of cores used to execute HPX threads for the given executor. If the function is called while no HPX runtime system is active, it will return zero. If the executor is not valid, this function will fall back to retrieving the number of OS threads used by HPX.

**Parameters**

**exec** – [in] The executor to be used.

namespace **threads**

**hpx/runtime\_local/thread\_pool\_helpers.hpp**

Defined in header `hpx/runtime_local/thread_pool_helpers.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **resource**

## Functions

`std::size_t get_num_thread_pools()`

Return the number of thread pools currently managed by the *resource\_partitioner*

`std::size_t get_num_threads()`

Return the number of threads in all thread pools currently managed by the *resource\_partitioner*

`std::size_t get_num_threads(std::string const &pool_name)`

Return the number of threads in the given thread pool currently managed by the *resource\_partitioner*

`std::size_t get_num_threads(std::size_t pool_index)`

Return the number of threads in the given thread pool currently managed by the *resource\_partitioner*

`std::size_t get_pool_index(std::string const &pool_name)`

Return the internal index of the pool given its name.

`std::string const &get_pool_name(std::size_t pool_index)`

Return the name of the pool given its internal index.

`threads::thread_pool_base &get_thread_pool(std::string const &pool_name)`

Return the name of the pool given its name.

`threads::thread_pool_base &get_thread_pool(std::size_t pool_index)`

Return the thread pool given its internal index.

`bool pool_exists(std::string const &pool_name)`

Return true if the pool with the given name exists.

`bool pool_exists(std::size_t pool_index)`

Return true if the pool with the given index exists.

namespace **threads**

## Functions

`std::int64_t get_thread_count(thread_schedule_state state = thread_schedule_state::unknown)`

The function *get\_thread\_count* returns the number of currently known threads.

### Note

If `state == unknown` this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

### Parameters

**state** – [in] This specifies the thread-state for which the number of threads should be retrieved.

`std::int64_t get_thread_count(thread_priority priority, thread_schedule_state state = thread_schedule_state::unknown)`

The function *get\_thread\_count* returns the number of currently known threads.

**Note**

If `state == unknown` this function will not only return the number of currently existing threads, but will add the number of registered task descriptions (which have not been converted into threads yet).

**Parameters**

- **priority** – [in] This specifies the thread-priority for which the number of threads should be retrieved.
- **state** – [in] This specifies the thread-state for which the number of threads should be retrieved.

`std::int64_t` **get\_idle\_core\_count()**

The function `get_idle_core_count` returns the number of currently idling threads (cores).

`mask_type` **get\_idle\_core\_mask()**

The function `get_idle_core_mask` returns a bit-mask representing the currently idling threads (cores).

`bool` **enumerate\_threads**(*hpx::function*<bool(thread\_id\_type)> const &*f*, *thread\_schedule\_state* *state* = *thread\_schedule\_state::unknown*)

The function `enumerate_threads` will invoke the given function *f* for each thread with a matching thread state.

**Parameters**

- **f** – [in] The function which should be called for each matching thread. Returning ‘false’ from this function will stop the enumeration process.
- **state** – [in] This specifies the thread-state for which the threads should be enumerated.

**serialization**

See [Public API](#) for a list of names and headers that are part of the public HPX API.

**hpx/serialization/base\_object.hpp**

Defined in header `hpx/serialization/base_object.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **serialization**

**Functions**

```
template<typename Base, typename Derived>
constexpr base_object_type<Derived, Base> base_object(Derived &d) noexcept
```

```
template<typename D, typename B>
output_archive &operator<<(output_archive &ar, base_object_type<D, B> t)
```

```
template<typename D, typename B>
```

**hpx/serialization/serialization\_chunk.hpp**

Defined in header `hpx/serialization/serialization_chunk.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **serialization**

**Enums**

enum class **chunk\_type** : `std::uint8_t`

*Values:*

enumerator **chunk\_type\_index**

enumerator **chunk\_type\_const\_pointer**

enumerator **chunk\_type\_pointer**

**Functions**

constexpr *serialization\_chunk* **create\_index\_chunk**(`std::size_t` index, `std::size_t` size) noexcept

constexpr *serialization\_chunk* **create\_const\_pointer\_chunk**(void const \*pos, `std::size_t` size) noexcept

Zero-copy chunk referring to immutable caller-owned memory (save path). Parcelports must treat this like `chunk_type_pointer` for transmission.

constexpr *serialization\_chunk* **create\_pointer\_chunk**(void \*pos, `std::size_t` size) noexcept

Zero-copy chunk referring to mutable memory (typically receive path).

constexpr *serialization\_chunk* **create\_pointer\_chunk**(void const \*pos, `std::size_t` size) noexcept

Backward-compatible overload for const storage; same as `create_const_pointer_chunk`.

constexpr *serialization\_chunk* **create\_pointer\_chunk**(`std::nullptr_t`, `std::size_t` size) noexcept

Create a mutable-pointer chunk with a null address.

union **chunk\_data**

### Public Members

*std::size\_t* **index\_**

void const \***cpos\_**

void \***pos\_**

struct **serialization\_chunk**

### Public Functions

inline constexpr void const \***data()** const noexcept

Active union member depends on *type\_*: use this for both pointer kinds (mutable storage is returned as void const\*).

inline constexpr void \***data()** noexcept

Mutable view; only valid for *chunk\_type\_pointer* chunks.

inline constexpr *std::size\_t* **size()** const noexcept

### Public Members

*chunk\_data* **data\_**

*std::size\_t* **size\_**

*chunk\_type* **type\_**

## synchronization

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx::spinlock

Defined in header `hpx/mutex.hpp`<sup>955</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

using `hpx::spinlock` = detail::spinlock<true>

`spinlock` is a type of lock that causes a thread attempting to obtain it to check for its availability while waiting in a loop continuously.

---

<sup>955</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/mutex.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/mutex.hpp)

## hpx::latch

Defined in header `hpx/latch.hpp`<sup>956</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

### class `latch`

Latches are a thread coordination mechanism that allow one or more threads to block until an operation is completed. An individual latch is a single-use object; once the operation has been completed, the latch cannot be reused.

Subclassed by `hpx::lcos::local::latch`

## hpx::no\_mutex

Defined in header `hpx/mutex.hpp`<sup>957</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

### struct `no_mutex`

`no_mutex` class can be used in cases where the shared data between multiple threads can be accessed simultaneously without causing inconsistencies.

## hpx::nostopstate

Defined in header `hpx/stop_token.hpp`<sup>958</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::stop_callback`
- `hpx::stop_source`
- `hpx::stop_token`
- `hpx::nostopstate_t`

`constexpr nostopstate_t hpx::nostopstate = {}`

This is a constant object instance of `hpx::nostopstate_t` for use in constructing an empty `hpx::stop_source`, as a placeholder value in the non-default constructor.

<sup>956</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/latch.hpp>

<sup>957</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/mutex.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/mutex.hpp)

<sup>958</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/stop\\_token.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/stop_token.hpp)

## hpx::stop\_callback

Defined in header `hpx/stop_token.hpp`<sup>959</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::nostopstate`
- `hpx::stop_source`
- `hpx::stop_token`
- `hpx::nostopstate_t`

template<typename **Callback**>

class **stop\_callback** : private `hpx::detail::stop_callback_base`

## hpx::stop\_source

Defined in header `hpx/stop_token.hpp`<sup>960</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::nostopstate`
- `hpx::stop_callback`
- `hpx::stop_token`
- `hpx::nostopstate_t`

class **stop\_source**

The `stop_source` class provides the means to issue a stop request, such as for `hpx::jthread` cancellation. A stop request made for one `stop_source` object is visible to all `stop_sources` and `hpx::stop_tokens` of the same associated stop-state; any `hpx::stop_callback(s)` registered for associated `hpx::stop_token(s)` will be invoked, and any `hpx::condition_variable_any` objects waiting on associated `hpx::stop_token(s)` will be awoken. Once a stop is requested, it cannot be withdrawn. Additional stop requests have no effect.

### Note

For the purposes of `hpx::jthread` cancellation the `stop_source` object should be retrieved from the `hpx::jthread` object using `get_stop_source()`; or stop should be requested directly from the `hpx::jthread` object using `request_stop()`. This will then use the same associated stop-state as that passed into the `hpx::jthread`'s invoked function argument (i.e., the function being executed on its thread). For other uses, however, a `stop_source` can be constructed separately using the default constructor, which creates new stop-state.

---

<sup>960</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/stop\\_token.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/stop_token.hpp)

## hpx::stop\_token

Defined in header `hpx/stop_token.hpp`<sup>961</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::nostopstate`
- `hpx::stop_callback`
- `hpx::stop_source`
- `hpx::nostopstate_t`

### class `stop_token`

The `stop_token` class provides the means to check if a stop request has been made or can be made, for its associated `hpx::stop_source` object. It is essentially a thread-safe “view” of the associated stop-state. The `stop_token` can also be passed to the constructor of `hpx::stop_callback`, such that the callback will be invoked if the `stop_token`’s associated `hpx::stop_source` is requested to stop. And `stop_token` can be passed to the interruptible waiting functions of `hpx::condition_variable_any`, to interrupt the condition variable’s wait if stop is requested.

#### Note

A `stop_token` object is not generally constructed independently, but rather retrieved from a `hpx::jthread` or `hpx::stop_source`. This makes it share the same associated stop-state as the `hpx::jthread` or `hpx::stop_source`.

## hpx::nostopstate\_t

Defined in header `hpx/stop_token.hpp`<sup>962</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::nostopstate`
- `hpx::stop_callback`
- `hpx::stop_source`
- `hpx::stop_token`

### struct `nostopstate_t`

Unit type intended for use as a placeholder in `hpx::stop_source` non-default constructor, that makes the constructed `hpx::stop_source` empty with no associated stop-state.

<sup>963</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/mutex.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/mutex.hpp)

<sup>964</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/mutex.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/mutex.hpp)

class **timed\_mutex** : private *hpx::mutex*

The **timed\_mutex** class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In a manner similar to *mutex*, **timed\_mutex** offers exclusive, non-recursive ownership semantics. In addition, **timed\_mutex** provides the ability to attempt to claim ownership of a **timed\_mutex** with a timeout via the member functions *try\_lock\_for()* and *try\_lock\_until()*. The **timed\_mutex** class satisfies all requirements of and

*hpx::timed\_mutex* is neither copyable nor movable.

## **hpx::recursive\_mutex**

Defined in header *hpx/mutex.hpp*<sup>965</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

using *hpx::recursive\_mutex* = detail::recursive\_mutex\_impl<>

## **hpx::shared\_mutex**

Defined in header *hpx/shared\_mutex.hpp*<sup>966</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

using *hpx::shared\_mutex* = detail::shared\_mutex<>

The *shared\_mutex* class is a synchronization primitive that can be used to protect shared data from being simultaneously accessed by multiple threads. In contrast to other mutex types which facilitate exclusive access, a *shared\_mutex* has two levels of access:

- *shared* - several threads can share ownership of the same mutex.
- *exclusive* - only one thread can own the mutex.

If one thread has acquired the exclusive lock (through *lock*, *try\_lock*), no other threads can acquire the lock (including the shared). If one thread has acquired the shared lock (through *lock\_shared*, *try\_lock\_shared*), no other thread can acquire the exclusive lock, but can acquire the shared lock. Only when the exclusive lock has not been acquired by any thread, the shared lock can be acquired by multiple threads. Within one thread, only one lock (shared or exclusive) can be acquired at the same time. Shared mutexes are especially useful when shared data can be safely read by any number of threads simultaneously, but a thread may only write the same data when no other thread is reading or writing at the same time. The *shared\_mutex* class satisfies all requirements of *SharedMutex* and *StandardLayoutType*.

## hpx::once\_flag

Defined in header `hpx/mutex.hpp`<sup>967</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::call_once`

### struct `once_flag`

The class `hpx::once_flag` is a helper structure for `hpx::call_once`. An object of type `hpx::once_flag` that is passed to multiple calls to `hpx::call_once` allows those calls to coordinate with each other such that only one of the calls will actually run to completion. `hpx::once_flag` is neither copyable nor movable.

## hpx::call\_once

Defined in header `hpx/mutex.hpp`<sup>968</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::once_flag`

template<typename **F**, typename ...**Args**>

void `hpx::call_once`(`once_flag` &flag, *F* &&*f*, *Args*&&... args)

Executes the Callable object *f* exactly once, even if called concurrently, from several threads.

In detail:

- If, by the time `call_once` is called, flag indicates that *f* was already called, `call_once` returns right away (such a call to `call_once` is known as passive).
- Otherwise, `call_once` invokes `std::forward<Callable>(f)` with the arguments `std::forward<Args>(args)...` (as if by `hpx::invoke`). Unlike the `hpx::thread` constructor or `hpx::async`, the arguments are not moved or copied because they don't need to be transferred to another thread of execution. (such a call to `call_once` is known as active).
  - If that invocation throws an exception, it is propagated to the caller of `call_once`, and the flag is not flipped so that another call will be attempted (such a call to `call_once` is known as exceptional).
  - If that invocation returns normally (such a call to `call_once` is known as returning), the flag is flipped, and all other calls to `call_once` with the same flag are guaranteed to be passive. All active calls on the same flag form a single total order consisting of zero or more exceptional calls, followed by one returning call. The end of each active call synchronizes-with the next active call in that order. The return from the returning call synchronizes-with the returns from all passive calls on the same flag: this means that all concurrent calls to `call_once` are guaranteed to observe any side-effects made by the active call, with no additional synchronization.

### Note

If concurrent calls to `call_once` pass different functions *f*, it is unspecified which *f* will be called. The selected function runs in the same thread as the `call_once` invocation it was passed to. Initialization of function-local

<sup>967</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/mutex.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/mutex.hpp)

<sup>968</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/mutex.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/mutex.hpp)

statics is guaranteed to occur only once even when called from multiple threads, and may be more efficient than the equivalent code using `hpx::call_once`. The POSIX equivalent of this function is `pthread_once`.

#### Parameters

- **flag** – an object, for which exactly one function gets executed
- **f** – Callable object to invoke
- **args** – arguments to pass to the function

#### Throws

`std::system_error` – if any condition prevents calls to `call_once` from executing as specified or any exception thrown by `f`

### `hpx::counting_semaphore`

Defined in header `hpx/semaphore.hpp`<sup>969</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<std::ptrdiff_t LeastMaxValue = PTRDIFF_MAX>
```

```
class counting_semaphore
```

A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Counting semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. Unlike `hpx::mutex` a `counting_semaphore` is not tied to threads of execution<sup>&#8212</sup>; acquiring a semaphore can occur on a different thread than releasing the semaphore, for example. All operations on `counting_semaphore` can be performed concurrently and without any relation to specific threads of execution, with the exception of the destructor which cannot be performed concurrently but can be performed on a different thread.

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count.

Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

Specializations of `hpx::counting_semaphore` are not `, , ,` or `.`

<sup>969</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/semaphore.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/semaphore.hpp)

**Note**

`counting_semaphore`'s `try_acquire()` can spuriously fail.

**Template Parameters**

**LeastMaxValue** – `counting_semaphore` allows more than one concurrent access to the same resource, for at least *LeastMaxValue* concurrent accessors. As its name indicates, the *LeastMaxValue* is the minimum max value, not the actual max value. Thus `max()` can yield a number larger than *LeastMaxValue*.

**hpx::condition\_variable**

Defined in header `hpx/condition_variable.hpp`<sup>970</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::condition_variable_any`
- `hpx::cv_status`

**class condition\_variable**

The `condition_variable` class is a synchronization primitive that can be used to block a thread, or multiple threads at the same time, until another thread both modifies a shared variable (the condition), and notifies the `condition_variable`.

The thread that intends to modify the shared variable has to

- acquire a `hpx::mutex` (typically via `std::lock_guard`)
- perform the modification while the lock is held
- execute `notify_one` or `notify_all` on the `condition_variable` (the lock does not need to be held for notification)

Even if the shared variable is atomic, it must be modified under the mutex in order to correctly publish the modification to the waiting thread. Any thread that intends to wait on `condition_variable` has to

- acquire a `std::unique_lock<hpx::mutex>`, on the same mutex as used to protect the shared variable
- either
  - check the condition, in case it was already updated and notified
  - execute `wait`, `await_for`, or `wait_until`. The wait operations atomically release the mutex and suspend the execution of the thread.
  - When the condition variable is notified, a timeout expires, or a spurious wakeup occurs, the thread is awakened, and the mutex is atomically reacquired. The thread should then check the condition and resume waiting if the wake-up was spurious. or
- use the predicated overload of `wait`, `wait_for`, and `wait_until`, which takes care of the three steps above.

`hpx::condition_variable` works only with `std::unique_lock<hpx::mutex>`. This restriction allows for maximal efficiency on some platforms. `hpx::condition_variable_any` provides a condition variable that works with any object, such as `std::shared_lock`.

<sup>970</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/condition\\_variable.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/condition_variable.hpp)

Condition variables permit concurrent invocation of the *wait*, *wait\_for*, *wait\_until*, *notify\_one* and *notify\_all* member functions.

The class `hpx::condition_variable` is *alt* is not `, , ,` or

### `hpx::condition_variable_any`

Defined in header `hpx/condition_variable.hpp`<sup>971</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::condition_variable`
- `hpx::cv_status`

class **`condition_variable_any`**

The `condition_variable_any` class is a generalization of `hpx::condition_variable`. Whereas `hpx::condition_variable` works only on `std::unique_lock<std::mutex>`, a `condition_variable_any` can operate on any lock that meets the requirements.

See `hpx::condition_variable` for the description of the semantics of condition variables. It is not `, , ,` or

### `hpx::cv_status`

Defined in header `hpx/condition_variable.hpp`<sup>972</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::condition_variable`
- `hpx::condition_variable_any`

enum class **`hpx::cv_status`**

The scoped enumeration `hpx::cv_status` describes whether a timed wait returned because of timeout or not. `hpx::cv_status` is used by the *wait\_for* and *wait\_until* member functions of `hpx::condition_variable` and `hpx::condition_variable_any`.

*Values:*

enumerator **`no_timeout`**

The condition variable was awakened with *notify\_all*, *notify\_one*, or spuriously

enumerator **`timeout`**

the condition variable was awakened by timeout expiration

enumerator **`error`**

there was an error

<sup>972</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/condition\\_variable.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/condition_variable.hpp)

## hpx::barrier

Defined in header `hpx/barrier.hpp`<sup>973</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename OnCompletion = detail::empty_oncompletion>
```

```
class barrier
```

A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier. [ Note: A barrier is useful for managing repeated tasks that are handled by multiple threads. - end note ] Each barrier phase consists of the following steps:

- The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
- When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the `CompletionFunction` template parameter, the completion step is run as part of the call to `arrive` or `arrive_and_drop` that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.
- When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run. The phase completion step that is executed at the end of each phase has the following effects:

- Invokes the completion function, equivalent to `completion()`.
- Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object's member functions other than `wait` are called while the completion step is in progress.

Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.

`CompletionFunction` shall meet the `Cpp17MoveConstructible` (Table 28) and `Cpp17Destructible` (Table 32) requirements. `std::is_nothrow_invocable_v<CompletionFunction&>` shall be true.

The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the `Cpp17DefaultConstructible` requirements (Table 27) and `completion()` has no effects.

`barrier::arrival_token` is an unspecified type, such that it meets the `Cpp17MoveConstructible` (Table 28), `Cpp17MoveAssignable` (Table 30), and `Cpp17Destructible` (Table 32) requirements.

<sup>973</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/barrier.hpp>

## hpx/synchronization/sliding\_semaphore.hpp

Defined in header `hpx/synchronization/sliding_semaphore.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

### Typedefs

using **sliding\_semaphore** = *sliding\_semaphore\_var*<>

template<typename **Mutex** = *hpx::spinlock*>

class **sliding\_semaphore\_var**

*#include <sliding\_semaphore.hpp>* A semaphore is a protected variable (an entity storing a value) or abstract data type (an entity grouping several variables that may or may not be numerical) which constitutes the classic method for restricting access to shared resources, such as shared memory, in a multiprogramming environment. Semaphores exist in many variants, though usually the term refers to a counting semaphore, since a binary semaphore is better known as a mutex. A counting semaphore is a counter for a set of available resources, rather than a locked/unlocked flag of a single resource. It was invented by Edsger Dijkstra. Semaphores are the classic solution to preventing race conditions in the dining philosophers problem, although they do not prevent resource deadlocks.

Sliding semaphores can be used for synchronizing multiple threads as well: one thread waiting for several other threads to touch (signal) the semaphore, or several threads waiting for one other thread to touch this semaphore. The difference to a counting semaphore is that a sliding semaphore will not limit the number of threads which are allowed to proceed, but will make sure that the difference between the (arbitrary) number passed to set and wait does not exceed a given threshold.

### Public Functions

**sliding\_semaphore\_var**(*sliding\_semaphore\_var* const&) = delete

*sliding\_semaphore\_var* &**operator**=(*sliding\_semaphore\_var* const&) = delete

**sliding\_semaphore\_var**(*sliding\_semaphore\_var*&&) = delete

*sliding\_semaphore\_var* &**operator**=(*sliding\_semaphore\_var*&&) = delete

inline explicit **sliding\_semaphore\_var**(*std::int64\_t* max\_difference, *std::int64\_t* lower\_limit = 0) noexcept

Construct a new sliding semaphore.

#### Parameters

- **max\_difference** – [in] The max difference between the upper limit (as set by *wait()*) and the lower limit (as set by *signal()*) which is allowed without suspending any thread calling *wait()*.
- **lower\_limit** – [in] The initial lower limit.

inline void **set\_max\_difference**(*std::int64\_t* max\_difference, *std::int64\_t* lower\_limit = 0) noexcept

Set/Change the difference that will cause the semaphore to trigger

#### Parameters

- **max\_difference** – [in] The max difference between the upper limit (as set by `wait()`) and the lower limit (as set by `signal()`) which is allowed without suspending any thread calling `wait()`.
- **lower\_limit** – [in] The initial lower limit.

inline void **wait**(`std::int64_t` upper\_limit)

Wait for the semaphore to be signaled.

**Parameters**

**upper\_limit** – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower\_limit which was set by `signal()` is larger than the max\_difference.

inline bool **try\_wait**(`std::int64_t` upper\_limit = 1)

Try to wait for the semaphore to be signaled.

**Parameters**

**upper\_limit** – [in] The new upper limit. The calling thread will be suspended if the difference between this value and the largest lower\_limit which was set by `signal()` is larger than the max\_difference.

**Returns**

The function returns true if the calling thread would not block if it was calling `wait()`.

inline void **signal**(`std::int64_t` lower\_limit)

Signal the semaphore.

**Parameters**

**lower\_limit** – [in] The new lower limit. This will update the current lower limit of this semaphore. It will also re-schedule all suspended threads for which their associated upper limit is not larger than the lower limit plus the max\_difference.

inline `std::int64_t` **signal\_all**()

## Private Types

## hpx::binary\_semaphore

Defined in header `hpx/semaphore.hpp`<sup>974</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

<sup>974</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/semaphore.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/semaphore.hpp)

### class `binary_semaphore`

A binary semaphore is a semaphore object that has only two states. `binary_semaphore` is an alias for specialization of `hpx::counting_semaphore` with *LeastMaxValue* being 1. HPX's implementation of `binary_semaphore` is more efficient than the default implementation of a counting semaphore with a unit resource count (`hpx::counting_semaphore`).

### `tag_invoke`

See *Public API* for a list of names and headers that are part of the public HPX API.

### `hpx::invoke`

Defined in header `hpx/functional.hpp`<sup>975</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename F, typename ...Ts>
constexpr util::invoke_result_t<F, Ts&&...> hpx::invoke(F &&f, Ts&&... vs)
 noexcept(noexcept(HPX_INVOKE(std::forward<F>(f),
 std::forward<Ts>(vs)...)...))
```

Invokes the given callable object f with the content of the argument pack vs

#### Note

This function is similar to `std::invoke` (C++17)

#### Parameters

- **f** – Requires to be a callable object. If f is a member function pointer, the first argument in the pack will be treated as the callee (this object).
- **vs** – An arbitrary pack of arguments

#### Throws

*std::exception* – like objects thrown by call to object f with the argument types vs.

#### Returns

The result of the callable object when it's called with the given argument types.

### `hpx::is_invocable`

Defined in header `hpx/type_traits.hpp`<sup>976</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::is_invocable_r`

```
template<typename F, typename ...Ts>
```

---

<sup>975</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

<sup>976</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/type\\_traits.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/type_traits.hpp)

struct **is\_invocable** : public *hpx::detail::is\_invocable\_impl*<*F*&&(*Ts*&&...)>

Determines whether *F* can be invoked with the arguments *Ts*... Formally, determines whether

```
INVOKE(std::declval<F>(), std::declval<Ts>()...)
```

is well-formed when treated as an unevaluated operand, where *INVOKE* is the operation defined in *Callable*.

*F*, *R* and all types in the parameter pack *Ts* shall each be a complete type, (possibly cv-qualified) void, or an array of unknown bound. Otherwise, the behavior is undefined. If an instantiation of a template above depends, directly or indirectly, on an incomplete type, and that instantiation could yield a different result if that type were hypothetically completed, the behavior is undefined.

## hpx::is\_invocable\_r

Defined in header *hpx/type\_traits.hpp*<sup>977</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::is\_invocable*

template<typename **R**, typename **F**, typename ...**Ts**>

struct **is\_invocable\_r** : public *hpx::detail::is\_invocable\_r\_impl*<*F*&&(*Ts*&&...), *R*>

Determines whether *F* can be invoked with the arguments *Ts*... to yield a result that is convertible to *R* and the implicit conversion does not bind a reference to a temporary object (since C++23). If *R* is cv void, the result can be any type. Formally, determines whether

```
INVOKE<R>(std::declval<F>(), std::declval<Ts>()...)
```

is well-formed when treated as an unevaluated operand, where *INVOKE* is the operation defined in *Callable*. Determines whether *F* can be invoked with the arguments *Ts*... Formally, determines whether

```
INVOKE(std::declval<F>(), std::declval<Ts>()...)
```

is well-formed when treated as an unevaluated operand, where *INVOKE* is the operation defined in *Callable*.

*F*, *R* and all types in the parameter pack *Ts* shall each be a complete type, (possibly cv-qualified) void, or an array of unknown bound. Otherwise, the behavior is undefined. If an instantiation of a template above depends, directly or indirectly, on an incomplete type, and that instantiation could yield a different result if that type were hypothetically completed, the behavior is undefined.

## thread\_pool\_util

See *Public API* for a list of names and headers that are part of the public HPX API.

<sup>977</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/type\\_traits.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/type_traits.hpp)

## hpx/thread\_pool\_util/thread\_pool\_suspension\_helpers.hpp

Defined in header `hpx/thread_pool_util/thread_pool_suspension_helpers.hpp`.

namespace **hpx**

namespace **threads**

### Functions

*hpx::future*<void> **resume\_processing\_unit**(*thread\_pool\_base* &pool, *std::size\_t* virt\_core)

Resumes the given processing unit. When the processing unit has been resumed the returned future will be ready.

#### Note

Can only be called from an HPX thread. Use `resume_processing_unit_cb` or to resume the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

#### Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **virt\_core** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.

#### Returns

A `future<void>` which is ready when the given processing unit has been resumed.

void **resume\_processing\_unit\_cb**(*thread\_pool\_base* &pool, *hpx::function*<void()> callback, *std::size\_t* virt\_core, *error\_code* &ec = *throws*)

Resumes the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been resumed.

#### Note

Requires that the pool has `threads::policies::enable_elasticity` set.

#### Parameters

- **pool** – [in] The thread pool to resume a processing unit on.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt\_core** – [in] The processing unit to resume.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

*hpx::future*<void> **suspend\_processing\_unit**(*thread\_pool\_base* &pool, *std::size\_t* virt\_core)

Suspends the given processing unit. When the processing unit has been suspended the returned future will be ready.

**Note**

Can only be called from an HPX thread. Use `suspend_processing_unit_cb` or `suspend_processing_unit` to suspend the processing unit from outside HPX. Requires that the pool has `threads::policies::enable_elasticity` set.

**Parameters**

- **pool** – [in] The thread pool to suspend a processing unit from.
- **virt\_core** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.

**Throws**

`hpx::exception` – if called from outside the HPX runtime.

**Returns**

A `future<void>` which is ready when the given processing unit has been suspended.

```
void suspend_processing_unit_cb(hpx::function<void()> callback, thread_pool_base &pool,
 std::size_t virt_core, error_code &ec = throws)
```

Suspends the given processing unit. Takes a callback as a parameter which will be called when the processing unit has been suspended.

**Note**

Requires that the pool has `threads::policies::enable_elasticity` set.

**Parameters**

- **pool** – [in] The thread pool to suspend a processing unit from.
- **callback** – [in] Callback which is called when the processing unit has been suspended.
- **virt\_core** – [in] The processing unit to suspend.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to `hpx::throws` the function will throw on error instead.

```
hpx::future<void> resume_pool(thread_pool_base &pool)
```

Resumes the thread pool. When the all OS threads on the thread pool have been resumed the returned future will be ready.

**Note**

Can only be called from an HPX thread. Use `resume_cb` or `resume_direct` to suspend the pool from outside HPX.

**Parameters**

**pool** – [in] The thread pool to resume.

**Throws**

`hpx::exception` – if called from outside the HPX runtime.

**Returns**

A `future<void>` which is ready when the thread pool has been resumed.

```
void resume_pool_cb(thread_pool_base &pool, hpx::function<void()> callback, error_code &ec =
 throws)
```

Resumes the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been resumed.

**Parameters**

- **pool** – [in] The thread pool to resume.
- **callback** – [in] called when the thread pool has been resumed.

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

*hpx::future*<void> **suspend\_pool**(*thread\_pool\_base* &pool)

Suspends the thread pool. When the all OS threads on the thread pool have been suspended the returned future will be ready.

#### Note

Can only be called from an HPX thread. Use `suspend_cb` or `suspend_direct` to suspend the pool from outside HPX. A thread pool cannot be suspended from an HPX thread running on the pool itself.

#### Parameters

**pool** – [in] The thread pool to suspend.

#### Throws

*hpx::exception* – if called from outside the HPX runtime.

#### Returns

A *future*<void> which is ready when the thread pool has been suspended.

void **suspend\_pool\_cb**(*thread\_pool\_base* &pool, *hpx::function*<void()> callback, *error\_code* &ec = *throws*)

Suspends the thread pool. Takes a callback as a parameter which will be called when all OS threads on the thread pool have been suspended.

#### Note

A thread pool cannot be suspended from an HPX thread running on the pool itself.

#### Parameters

- **pool** – [in] The thread pool to suspend.
- **callback** – [in] called when the thread pool has been suspended.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Throws

*hpx::exception* – if called from an HPX thread which is running on the pool itself.

## thread\_support

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### hpx/thread\_support/spinlock.hpp

Defined in header `hpx/thread_support/spinlock.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **util**

## hpx::unlock\_guard

Defined in header `hpx/mutex.hpp`<sup>978</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename Lock>
```

```
class unlock_guard
```

The class `unlock_guard` is a mutex wrapper that provides a convenient mechanism for releasing a mutex for the duration of a scoped block.

`unlock_guard` performs the opposite functionality of `lock_guard`.

When a `lock_guard` object is created, it attempts to take ownership of the mutex it is given. When control leaves the scope in which the `lock_guard` object was created, the `lock_guard` is destructed and the mutex is released. Accordingly, when an `unlock_guard` object is created, it attempts to release the ownership of the mutex it is given. So, when control leaves the scope in which the `unlock_guard` object was created, the `unlock_guard` is destructed and the mutex is owned again. In this way, the mutex is unlocked in the constructor and locked in the destructor, so that one can have an unlocked section within a locked one.

### Note

`unlock_guard` is non-copyable and non-movable.

### Template Parameters

**Lock** – The type of the lockable object managed by the `unlock_guard`.

## threading

See *Public API* for a list of names and headers that are part of the public HPX API.

## hpx::jthread

Defined in header `hpx/jthread.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
class jthread
```

The class `jthread` represents a single thread of execution. It has the same general behavior as `hpx::thread`, except that `jthread` automatically rejoins on destruction, and can be cancelled/stopped in certain situations. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, `hpx::terminate` is called. The top-level function may communicate its return value or an exception to the caller via `hpx::promise` or by modifying shared variables (which may require synchronization, see `hpx::mutex` and `hpx::atomic`). Unlike `hpx::thread`, the `jthread` logically holds an internal private member of type `hpx::stop_source`, which maintains a shared stop-state. The `jthread` constructor accepts a function that takes a `hpx::stop_token` as its first argument, which will be passed in by the `jthread` from its internal `stop_source`. This allows the function to check if stop has been requested during its execution, and return if it has. `hpx::jthread` objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may be not associated with any `jthread`.

<sup>978</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/mutex.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/mutex.hpp)

objects (after detach). No two `hpx::jthread` objects may represent the same thread of execution; `hpx::jthread` is not *CopyConstructible* or *CopyAssignable*, although it is *MoveConstructible* and *MoveAssignable*.

## `hpx::thread`

Defined in header `hpx/thread.hpp`<sup>979</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::this_thread::yield`
- `hpx::this_thread::get_id`
- `hpx::this_thread::sleep_for`
- `hpx::this_thread::sleep_until`

### class `thread`

The class `thread` represents a single thread of execution. Threads allow multiple functions to execute concurrently. Threads begin execution immediately upon construction of the associated thread object (pending any OS scheduling delays), starting at the top-level function provided as a constructor argument. The return value of the top-level function is ignored and if it terminates by throwing an exception, `hpx::terminate` is called. The top-level function may communicate its return value or an exception to the caller via `hpx::promise` or by modifying shared variables (which may require synchronization, see `hpx::mutex` and `hpx::atomic`). `hpx::thread` objects may also be in the state that does not represent any thread (after default construction, move from, detach, or join), and a thread of execution may not be associated with any thread objects (after detach). No two `hpx::thread` objects may represent the same thread of execution; `hpx::thread` is not *CopyConstructible* or *CopyAssignable*, although it is *MoveConstructible* and *MoveAssignable*.

## `hpx::this_thread::yield`

Defined in header `hpx/thread.hpp`<sup>980</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::thread`
- `hpx::this_thread::get_id`
- `hpx::this_thread::sleep_for`
- `hpx::this_thread::sleep_until`

void `hpx::this_thread::yield()` noexcept

Provides a hint to the implementation to reschedule the execution of threads, allowing other threads to run.

#### Note

The exact behavior of this function depends on the implementation, in particular on the mechanics of the OS scheduler in use and the state of the system. For example, a first-in-first-out realtime scheduler

---

<sup>979</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/thread.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/thread.hpp)

<sup>980</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/thread.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/thread.hpp)

(SCHED\_FIFO in Linux) would suspend the current thread and put it on the back of the queue of the same-priority threads that are ready to run (and if there are no other threads at the same priority, yield has no effect).

### hpx::this\_thread::get\_id

Defined in header `hpx/thread.hpp`<sup>981</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::thread`
- `hpx::this_thread::yield`
- `hpx::this_thread::sleep_for`
- `hpx::this_thread::sleep_until`

`thread::id` `hpx::this_thread::get_id()` noexcept

Returns the id of the current thread.

### hpx::this\_thread::sleep\_for

Defined in header `hpx/thread.hpp`<sup>982</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::thread`
- `hpx::this_thread::yield`
- `hpx::this_thread::get_id`
- `hpx::this_thread::sleep_until`

inline void `hpx::this_thread::sleep_for(hpx::chrono::steady_duration const &rel_time)`

Blocks the execution of the current thread for at least the specified *rel\_time*. This function may block for longer than *rel\_time* due to scheduling or resource contention delays.

It is recommended to use a steady clock to measure the duration. If an implementation uses a system clock instead, the wait time may also be sensitive to clock adjustments.

#### Parameters

**rel\_time** – time duration to sleep

<sup>981</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/thread.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/thread.hpp)

<sup>982</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/thread.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/thread.hpp)

## hpx::this\_thread::sleep\_until

Defined in header `hpx/thread.hpp`<sup>983</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::thread`
- `hpx::this_thread::yield`
- `hpx::this_thread::get_id`
- `hpx::this_thread::sleep_for`

void `hpx::this_thread::sleep_until`(`hpx::chrono::steady_time_point` const &`abs_time`)

Blocks the execution of the current thread until specified *abs\_time* has been reached.

It is recommended to use the clock tied to *abs\_time*, in which case adjustments of the clock may be taken into account. Thus, the duration of the block might be more or less than `abs_time - Clock::now()` at the time of the call, depending on the direction of the adjustment and whether it is honored by the implementation. The function also may block until after *abs\_time* has been reached due to process scheduling or resource contention delays.

### Parameters

**abs\_time** – absolute time to block until

## threading\_base

See *Public API* for a list of names and headers that are part of the public *HPX* API.

## hpx/threading\_base/thread\_data.hpp

Defined in header `hpx/threading_base/thread_data.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

### Functions

constexpr *thread\_data* \***get\_thread\_id\_data**(thread\_id\_ref\_type const &tid) noexcept

constexpr *thread\_data* \***get\_thread\_id\_data**(thread\_id\_type const &tid) noexcept

constexpr *tracing::region\_init\_data* **get\_region\_init\_data**(*thread\_data* const\*) noexcept

constexpr *tracing::fiber\_region\_init\_data* **get\_fiber\_region\_init\_data**(*thread\_data* const\*)  
noexcept

---

<sup>983</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/thread.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/thread.hpp)

```
class thread_data : public detail::thread_data_reference_counting
```

*#include <thread\_data.hpp>* A *thread* is the representation of a HPX thread. It's a first class object in HPX. In our implementation this is a user level thread running on top of one of the OS threads spawned by the *thread-manager*.

A *thread* encapsulates:

- A thread status word (see the functions *thread::get\_state* and *thread::set\_state*)
- A function to execute (the thread function)
- A frame (in this implementation this is a block of memory used as the threads stack)
- A block of registers (not implemented yet)

Generally, *threads* are not created or executed directly. All functionality related to the management of *threads* is implemented by the thread-manager.

## Public Types

```
using mutex_type = util::detail::spinlock_no_backoff
```

## Public Functions

```
thread_data(thread_data const&) = delete
```

```
thread_data(thread_data&&) = delete
```

```
thread_data &operator=(thread_data const&) = delete
```

```
thread_data &operator=(thread_data&&) = delete
```

```
inline thread_state get_state(std::memory_order const order = std::memory_order_acquire) const
noexcept
```

The *get\_state* function queries the state of this thread instance.

### Note

This function will seldom be used directly. Most of the time the state of a thread will be retrieved by using the function *threadmanager::get\_state*.

### Returns

This function returns the current state of this thread. It will return one of the values as defined by the *thread\_state* enumeration.

```
inline thread_state set_state(thread_schedule_state const state, thread_restart_state state_ex =
 thread_restart_state::unknown, std::memory_order const load_order
 = std::memory_order_acquire, std::memory_order const
 exchange_order = std::memory_order_acq_rel) const noexcept
```

The *set\_state* function changes the state of this thread instance.

### Note

This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the thread-manager. Moreover, changing the thread state using this function

does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status `threadmanager::set_state` should be used.

#### Parameters

- **state** – [in] The new state to be set for the thread.
- **state\_ex** – [in]
- **load\_order** – [in]
- **exchange\_order** – [in]

```
inline bool set_state_tagged(thread_schedule_state const newstate, thread_state const
 &prev_state, thread_state &new_tagged_state, std::memory_order
 const exchange_order = std::memory_order_acq_rel) const
 noexcept
```

```
inline bool restore_state(thread_state const new_state, thread_state const old_state,
 std::memory_order const load_order = std::memory_order_relaxed,
 std::memory_order const load_exchange =
 std::memory_order_acq_rel) const noexcept
```

The `restore_state` function changes the state of this thread instance depending on its current state. It will change the state atomically only if the current state is still the same as passed as the second parameter. Otherwise, it won't touch the thread state of this instance.

#### Note

This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the `threadmanager`. Moreover, changing the thread state using this function does not change its scheduling status. It only sets the thread's status word. To change the thread's scheduling status `threadmanager::set_state` should be used.

#### Parameters

- **new\_state** – [in] The new state to be set for the thread.
- **old\_state** – [in] The old state of the thread which still has to be the current state.
- **load\_order** – [in]
- **load\_exchange** – [in]

#### Returns

This function returns `true` if the state has been changed successfully

```
inline bool restore_state(thread_schedule_state const new_state, thread_restart_state const
 state_ex, thread_state old_state, std::memory_order const
 load_exchange = std::memory_order_acq_rel) const noexcept
```

```
char const *get_fiber_name() const noexcept
```

```
inline constexpr thread_priority get_priority() const noexcept
```

```
inline void set_priority(thread_priority const priority) noexcept
```

```
inline bool is_background() const noexcept
```

```
inline void set_is_background() noexcept
```

```
inline constexpr bool should_emit_lifecycle() const noexcept
```

True if this task's lifecycle events should be emitted.

On Tracy, reflects the 1/N sample decision made once at ctor and *rebind\_base*; the read is unlocked because no other code path ever writes *emit\_lifecycle\_* (unlike *state\_* bits, which are mutated concurrently by *interrupt()*). On other backends, always true (their hooks are constexpr no-ops).

#### Returns

*true* if lifecycle events should be emitted for this task.

inline bool **interruption\_requested**() const noexcept

inline bool **interruption\_enabled**() const noexcept

inline bool **set\_interruption\_enabled**(bool const enable) noexcept

template<typename **ThreadQueue**>

inline constexpr *ThreadQueue* &**get\_queue**() noexcept

inline coroutine\_type::result\_type **operator**() (*hpx::execution\_base::this\_thread::detail::agent\_storage* \*agent\_storage)

Execute the thread function.

#### Returns

This function returns the thread state the thread should be scheduled from this point on.

The thread manager will use the returned value to set the thread's scheduling status.

inline coroutine\_type::result\_type **invoke\_directly**()

Directly execute the thread function (inline)

#### Returns

This function returns the thread state the thread should be scheduled from this point on.

The thread manager will use the returned value to set the thread's scheduling status.

inline virtual thread\_id\_type **get\_thread\_id**() const

virtual void destroy() noexcept = 0
```

### Public Static Functions

```
static inline constexpr std::uint64_t get_component_id() noexcept
 Return the id of the component this thread is running in.

static inline constexpr threads::thread_description get_description() noexcept

static inline constexpr threads::thread_description set_description(threads::thread_description)
 noexcept

static inline constexpr threads::thread_description get_lco_description() noexcept

static inline constexpr threads::thread_description set_lco_description(threads::thread_description)
 noexcept

static char const *get_safe_description(threads::thread_description const &description, char
 const *fallback = "<unknown>") noexcept

static inline constexpr std::uint32_t get_parent_locality_id() noexcept
 Return the locality of the parent thread.

static inline constexpr thread_id_type get_parent_thread_id() noexcept
 Return the thread id of the parent thread.

static inline constexpr std::size_t get_parent_thread_phase() noexcept
 Return the phase of the parent thread.

static inline constexpr util::backtrace const *get_backtrace() noexcept

static inline constexpr util::backtrace const *set_backtrace(util::backtrace const*) noexcept
```

## Protected Functions

```
inline thread_restart_state set_state_ex(thread_restart_state const new_state,
 std::memory_order const load_order =
 std::memory_order_acquire, std::memory_order const
 load_exchange = std::memory_order_acq_rel) const
 noexcept
```

The `set_state` function changes the extended state of this thread instance.

### Note

This function will seldom be used directly. Most of the time the state of a thread will have to be changed using the threadmanager.

### Parameters

- **new\_state** – [in] The new extended state to be set for the thread.
- **load\_order** – [in]
- **load\_exchange** – [in]

```
void rebind_base(thread_init_data &init_data)
```

## Private Types

## hpx::annotated\_function

Defined in header `hpx/functional.hpp`<sup>984</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
template<typename F>
constexpr F &&hpx::annotated_function(F &&f, char const* = nullptr) noexcept
```

Returns a function annotated with the given annotation.

Annotating includes setting the thread description per thread id.

### Parameters

**f** – Function to annotate

```
template<typename F>
constexpr F &&hpx::annotated_function(F &&f, std::string const&) noexcept
```

## hpx/threading\_base/thread\_description.hpp

Defined in header `hpx/threading_base/thread_description.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
namespace threads
```

### Functions

```
std::ostream &operator<<(std::ostream&, thread_description const&)
```

```
std::string as_string(thread_description const &desc)
```

```
threads::thread_description get_thread_description(thread_id_type const &id, error_code &ec =
 throws)
```

The function `get_thread_description` is part of the thread related API allows to query the description of one of the threads known to the thread-manager.

---

<sup>984</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

**Note**

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise it throws an instance of *hpx::exception*.

**Parameters**

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns**

This function returns the description of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the string “<unknown>”.

```
threads::thread_description set_thread_description(thread_id_type const &id,
 threads::thread_description const &desc =
 threads::thread_description(), error_code &ec
 = throws)
```

```
threads::thread_description get_thread_lco_description(thread_id_type const &id, error_code
 &ec = throws)
```

```
threads::thread_description set_thread_lco_description(thread_id_type const &id,
 threads::thread_description const &desc
 = threads::thread_description(),
 error_code &ec = throws)
```

```
struct thread_description
```

**Public Types**

```
enum class data_type : std::uint8_t
```

Values:

```
enumerator description
```

```
enumerator address
```

**Public Functions**

```
thread_description() noexcept = default

```

## hpx/threading\_base/thread\_helpers.hpp

Defined in header `hpx/threading_base/thread_helpers.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
namespace this_thread
```

### Functions

```
threads::thread_restart_state suspend(threads::thread_schedule_state state, threads::thread_id_type
nextid, threads::thread_description const &description =
threads::thread_description("this_thread::suspend"),
hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

#### Note

Must be called from within a HPX-thread.

**Throws**

If `– &ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

```
inline threads::thread_restart_state suspend(threads::thread_schedule_state state =
 threads::thread_schedule_state::pending,
 threads::thread_description const &description =
 threads::thread_description("this_thread::suspend"),
 hpx::error_code &ec = hpx::throws)
```

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to the thread state passed as the parameter.

**Note**

Must be called from within a HPX-thread.

**Throws**

If `– &ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

```
threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
 threads::thread_id_type id, threads::thread_description const
 &description =
 threads::thread_description("this_thread::suspend"),
 hpx::error_code &ec = hpx::throws)
```

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to `suspended` and schedules a wakeup for this threads at the given time.

**Note**

Must be called from within a HPX-thread.

**Throws**

If `– &ec != &throws`, never throws, but will set `ec` to an appropriate value when an error occurs. Otherwise, this function will throw an `hpx::exception` with an error code of `hpx::error::yield_aborted` if it is signaled with `wait_aborted`. If called outside a HPX-thread, this function will throw an `hpx::exception` with an error code of `hpx::error::null_thread_id`. If this function is called while the thread-manager is not running, it will throw an `hpx::exception` with an error code of `hpx::error::invalid_status`.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_time_point const &abs_time,
 threads::thread_description const &description =
 threads::thread_description("this_thread::suspend"),
 hpx::error_code &ec = hpx::throws)
```

The function `suspend` will return control to the thread manager (suspends the current thread). It sets the new state of this thread to `suspended` and schedules a wakeup for this threads at the given time.

**Note**

Must be called from within a HPX-thread.

**Throws**

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,
 threads::thread_description const &description =
 threads::thread_description("this_thread::suspend"),
 hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

**Note**

Must be called from within a HPX-thread.

**Throws**

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

```
inline threads::thread_restart_state suspend(hpx::chrono::steady_duration const &rel_time,
 threads::thread_id_type const &id,
 threads::thread_description const &description =
 threads::thread_description("this_thread::suspend"),
 hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given duration.

**Note**

Must be called from within a HPX-thread.

**Throws**

If `– &ec != &throws`, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

```
inline threads::thread_restart_state suspend(std::uint64_t ms, threads::thread_description const
&description =
threads::thread_description("this_thread::suspend"),
hpx::error_code &ec = hpx::throws)
```

The function *suspend* will return control to the thread manager (suspends the current thread). It sets the new state of this thread to *suspended* and schedules a wakeup for this threads after the given time (specified in milliseconds).

#### Note

Must be called from within a HPX-thread.

#### Throws

If – &ec != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

```
threads::thread_pool_base *get_pool(hpx::error_code &ec = hpx::throws)
```

Returns a pointer to the pool that was used to run the current thread

#### Throws

If – &ec != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

namespace **threads**

## Functions

```
thread_state set_thread_state(thread_id_type const &id, thread_schedule_state state =
thread_schedule_state::pending, thread_restart_state stateex =
thread_restart_state::signaled, thread_priority priority =
thread_priority::normal, bool retry_on_active = true, hpx::error_code
&ec = hpx::throws)
```

Set the thread state of the *thread* referenced by the thread\_id *id*.

#### Note

If the thread referenced by the parameter *id* is in *thread\_state::active* state this function schedules a new thread which will set the state of the thread as soon as it is not active anymore. The function returns *thread\_state::active* in this case.

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

#### Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry\_on\_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Returns

This function returns the previous state of the thread referenced by the *id* parameter. It will return one of the values as defined by the *thread\_state* enumeration. If the thread is not known to the thread-manager the return value will be *thread\_state::unknown*.

```
thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_time_point
 const &abs_time, std::atomic<bool> *started,
 thread_schedule_state state = thread_schedule_state::pending,
 thread_restart_state stateex = thread_restart_state::timeout,
 thread_priority priority = thread_priority::normal, bool
 retry_on_active = true, hpx::error_code &ec = hpx::throws)
```

Set the thread state of the *thread* referenced by the thread\_id *id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (at the given time)

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

#### Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **abs\_time** – [in] Absolute point in time for the new thread to be run
- **started** – [in,out] A helper variable allowing to track the state of the timer helper thread
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry\_on\_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Returns

```
inline thread_id_ref_type set_thread_state(thread_id_type const &id,
 hpx::chrono::steady_time_point const &abs_time,
 thread_schedule_state state =
 thread_schedule_state::pending, thread_restart_state
 stateex = thread_restart_state::timeout, thread_priority
 priority = thread_priority::normal, bool retry_on_active
 = true, hpx::error_code &= throws)
```

```
inline thread_id_ref_type set_thread_state(thread_id_type const &id, hpx::chrono::steady_duration
 const &rel_time, thread_schedule_state state =
 thread_schedule_state::pending, thread_restart_state
 stateex = thread_restart_state::timeout, thread_priority
 priority = thread_priority::normal, bool retry_on_active
 = true, hpx::error_code &ec = hpx::throws)
```

Set the thread state of the *thread* referenced by the thread\_id *id*.

Set a timer to set the state of the given *thread* to the given new value after it expired (after the given duration)

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

#### Parameters

- **id** – [in] The thread id of the thread the state should be modified for.
- **rel\_time** – [in] Time duration after which the new thread should be run
- **state** – [in] The new state to be set for the thread referenced by the *id* parameter.
- **stateex** – [in] The new extended state to be set for the thread referenced by the *id* parameter.
- **priority** – [in]
- **retry\_on\_active** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Returns

```
thread_state get_thread_state(thread_id_type const &id, hpx::error_code &ec = hpx::throws)
noexcept
```

The function `get_thread_backtrace` is part of the thread related API allows to query the currently stored thread back trace (which is captured during thread suspension).

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*. The function `get_thread_state` is part of the thread related API. It queries the state of one of the threads known to the thread-manager.

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

#### Parameters

- **id** – [in] The thread id of the thread being queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.
- **id** – [in] The thread id of the thread the state should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns**

This function returns the currently captured stack back trace of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be the zero.

**Returns**

This function returns the thread state of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be *terminated*.

`std::size_t get_thread_phase(thread_id_type const &id, hpx::error_code &ec = hpx::throws)` noexcept

The function `get_thread_phase` is part of the thread related API. It queries the phase of one of the threads known to the thread-manager.

**Note**

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

**Parameters**

- **id** – [in] The thread id of the thread the phase should be modified for.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns**

This function returns the thread phase of the thread referenced by the *id* parameter. If the thread is not known to the thread-manager the return value will be ~0.

`bool get_thread_interruption_enabled(thread_id_type const &id, hpx::error_code &ec = hpx::throws)`

Returns whether the given thread can be interrupted at this point.

**Note**

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

**Parameters**

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns**

This function returns *true* if the given thread can be interrupted at this point in time. It will return *false* otherwise.

`bool set_thread_interruption_enabled(thread_id_type const &id, bool enable, hpx::error_code &ec = hpx::throws)`

Set whether the given thread can be interrupted at this point.

**Note**

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

**Parameters**

- **id** – [in] The thread id of the thread which should receive the new value.

- **enable** – [in] This value will determine the new interruption enabled status for the given thread.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns**

This function returns the previous value of whether the given thread could have been interrupted.

```
bool get_thread_interruption_requested(thread_id_type const &id, hpx::error_code &ec = hpx::throws)
```

Returns whether the given thread has been flagged for interruption.

**Note**

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

**Parameters**

- **id** – [in] The thread id of the thread which should be queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Returns**

This function returns *true* if the given thread was flagged for interruption. It will return *false* otherwise.

```
void interrupt_thread(thread_id_type const &id, bool flag, hpx::error_code &ec = hpx::throws)
```

Flag the given thread for interruption.

**Note**

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

**Parameters**

- **id** – [in] The thread id of the thread which should be interrupted.
- **flag** – [in] The flag encodes whether the thread should be interrupted (if it is *true*), or 'uninterrupted' (if it is *false*).
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
inline void interrupt_thread(thread_id_type const &id, hpx::error_code &ec = hpx::throws)
```

```
void interruption_point(thread_id_type const &id, hpx::error_code &ec = hpx::throws)
```

Interrupt the current thread at this point if it was canceled. This will throw a *thread\_interrupted* exception, which will cancel the thread.

**Note**

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

**Parameters**

- **id** – [in] The thread id of the thread which should be interrupted.

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

*threads::thread\_priority* **get\_thread\_priority**(thread\_id\_type const &id, *hpx::error\_code* &ec = *hpx::throws*) noexcept

Return priority of the given thread

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

#### Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

*std::ptrdiff\_t* **get\_stack\_size**(thread\_id\_type const &id, *hpx::error\_code* &ec = *hpx::throws*) noexcept

Return stack size of the given thread

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

#### Parameters

- **id** – [in] The thread id of the thread whose priority is queried.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

*threads::thread\_pool\_base* \***get\_pool**(thread\_id\_type const &id, *hpx::error\_code* &ec = *hpx::throws*)

Returns a pointer to the pool that was used to run the current thread

#### Throws

If – &ec != &throws, never throws, but will set *ec* to an appropriate value when an error occurs. Otherwise, this function will throw an *hpx::exception* with an error code of *hpx::error::yield\_aborted* if it is signaled with *wait\_aborted*. If called outside a HPX-thread, this function will throw an *hpx::exception* with an error code of *hpx::error::null\_thread\_id*. If this function is called while the thread-manager is not running, it will throw an *hpx::exception* with an error code of *hpx::error::invalid\_status*.

## hpx::get\_worker\_thread\_num

Defined in header *hpx/runtime.hpp*<sup>985</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::get\_local\_worker\_thread\_num*
- *hpx::get\_thread\_pool\_num*

<sup>985</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

`std::size_t hpx::get_worker_thread_num()` noexcept

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

#### Note

The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by `get_os_thread_count()`).

#### Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t hpx::get_worker_thread_num(error_code &ec)` noexcept

Return the number of the current OS-thread running in the runtime instance the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread which executes the current HPX-thread.

#### Note

The returned value is zero based and its maximum value is smaller than the overall number of OS-threads executed (as returned by `get_os_thread_count()`). It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

#### Note

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

#### Parameters

**ec** – [in,out] this represents the error status on exit (obsolete, ignored).

## hpx::get\_local\_worker\_thread\_num

Defined in header `hpx/runtime.hpp`<sup>986</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::get_worker_thread_num`
- `hpx::get_thread_pool_num`

`std::size_t hpx::get_local_worker_thread_num()` noexcept

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

<sup>986</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

**Note**

The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

**Note**

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t hpx::get_local_worker_thread_num(error_code &ec) noexcept`

Return the number of the current OS-thread running in the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the OS-thread on the current thread pool which executes the current HPX-thread.

**Note**

The returned value is zero based and its maximum value is smaller than the number of OS-threads executed on the current thread pool. It will return -1 if the current thread is not a known thread or if the runtime is not in running state.

**Note**

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

**Parameters**

**ec** – [in,out] this represents the error status on exit (obsolete, ignored).

**hpx::get\_thread\_pool\_num**

Defined in header `hpx/runtime.hpp`<sup>987</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::get_worker_thread_num`
- `hpx::get_local_worker_thread_num`

`std::size_t hpx::get_thread_pool_num() noexcept`

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

---

<sup>987</sup> <http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/full/include/include/hpx/runtime.hpp>

**Note**

The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

**Note**

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

`std::size_t hpx::get_thread_pool_num(error_code &ec) noexcept`

Return the number of the current thread pool the current HPX-thread is executed with.

This function returns the zero based index of the thread pool which executes the current HPX-thread.

**Note**

The returned value is zero based and its maximum value is smaller than the number of thread pools started by the runtime. It will return -1 if the current thread pool is not a known thread pool or if the runtime is not in running state.

**Note**

This function needs to be executed on a HPX-thread. It will fail otherwise (it will return -1).

**Parameters**

**ec** – [in,out] this represents the error status on exit (obsolete, ignored).

**hpx/threading\_base/register\_thread.hpp**

Defined in header `hpx/threading_base/register_thread.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

## Functions

```
template<typename F>
thread_function_type make_thread_function(F &&f)
```

```
template<typename F, typename ...Ts>
thread_function_type make_thread_function_nullary(F &&f, Ts&&... ts)
```

```
void register_thread(threads::thread_init_data &data, threads::thread_pool_base *pool,
 threads::thread_id_ref_type &id, error_code &ec = hpx::throws)
```

Create a new *thread* using the given data.

### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

### Parameters

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

### Throws

*invalid\_status* – if the runtime system has not been started yet.

### Returns

This function will return the internal id of the newly created HPX-thread.

```
threads::thread_id_ref_type register_thread(threads::thread_init_data &data,
 threads::thread_pool_base *pool, error_code &ec =
 hpx::throws)
```

```
void register_thread(threads::thread_init_data &data, threads::thread_id_ref_type &id, error_code
 &ec = throws)
```

Create a new *thread* using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

### Parameters

- **data** – [in] The data to use for creating the thread.
- **id** – [out] The id of the newly created thread (if applicable)
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

### Throws

*invalid\_status* – if the runtime system has not been started yet.

### Returns

This function will return the internal id of the newly created HPX-thread.

```
threads::thread_id_ref_type register_thread(threads::thread_init_data &data, error_code &ec =
 throws)
```

thread\_id\_ref\_type **register\_work**(*threads::thread\_init\_data* &data, *threads::thread\_pool\_base* \*pool, *error\_code* &ec = *hpx::throws*)

Create a new work item using the given data.

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

#### Parameters

- **data** – [in] The data to use for creating the thread.
- **pool** – [in] The thread pool to use for launching the work.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Throws

*invalid\_status* – if the runtime system has not been started yet.

thread\_id\_ref\_type **register\_work**(*threads::thread\_init\_data* &data, *error\_code* &ec = *throws*)

Create a new work item using the given data on the same thread pool as the calling thread, or on the default thread pool if not on an HPX thread.

#### Note

As long as *ec* is not pre-initialized to *hpx::throws* this function doesn't throw but returns the result code using the parameter *ec*. Otherwise, it throws an instance of *hpx::exception*.

#### Parameters

- **data** – [in] The data to use for creating the thread.
- **ec** – [in,out] This represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

#### Throws

*invalid\_status* – if the runtime system has not been started yet.

## hpx::scoped\_annotation

Defined in header `hpx/functional.hpp`<sup>988</sup>.

See *Public API* for a list of names and headers that are part of the public HPX API.

struct **scoped\_annotation**

*scoped\_annotation* associates a **name** with a section of code (scope). It can be used to visualize code execution in profiling tools like *Intel VTune*, *Apex Profiler*, etc. That allows analyzing performance to figure out which part(s) of code is (are) responsible for performance degradation, etc.

<sup>988</sup> [http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include\\_local/include/hpx/functional.hpp](http://github.com/TheHPXProject/hpx/blob/1cc54efbc253981179cd090d3aa978c556dd9148/libs/core/include_local/include/hpx/functional.hpp)

## hpx/threading\_base/thread\_pool\_base.hpp

Defined in header `hpx/threading_base/thread_pool_base.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **thread\_pool\_base**

*#include <thread\_pool\_base.hpp>* The base class used to manage a pool of OS threads.

## Public Functions

virtual void **suspend\_processing\_unit\_direct**(*std::size\_t* virt\_core, *error\_code* &ec = *throws*)  
 = 0

Suspends the given processing unit. Blocks until the processing unit has been suspended.

### Parameters

- **virt\_core** – [in] The processing unit on the pool to be suspended. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **resume\_processing\_unit\_direct**(*std::size\_t* virt\_core, *error\_code* &ec = *throws*)  
 = 0

Resumes the given processing unit. Blocks until the processing unit has been resumed.

### Parameters

- **virt\_core** – [in] The processing unit on the pool to be resumed. The processing units are indexed starting from 0.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **resume\_direct**(*error\_code* &ec = *throws*) = 0

Resumes the thread pool. Blocks until all OS threads on the thread pool have been resumed.

### Parameters

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

virtual void **suspend\_direct**(*error\_code* &ec = *throws*) = 0

Suspends the thread pool. Blocks until all OS threads on the thread pool have been suspended.

**Note**

A thread pool cannot be suspended from an HPX thread running on the pool itself.

**Parameters**

**ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

**Throws**

*hpx::exception* – if called from an HPX thread which is running on the pool itself.

**hpx/threading\_base/print.hpp**

Defined in header `hpx/threading_base/print.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**hpx/threading\_base/tracing\_sample\_rate.hpp**

Defined in header `hpx/threading_base/tracing_sample_rate.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**hpx/threading\_base/threading\_base\_fwd.hpp**

Defined in header `hpx/threading_base/threading_base_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

**Functions**

*thread\_data* \***get\_self\_id\_data**() noexcept

The function *get\_self\_id\_data* returns the data of the HPX thread id associated with the current thread (or nullptr if the current thread is not a HPX thread).

thread\_self &**get\_self**()

The function *get\_self* returns a reference to the (OS thread specific) self reference to the current HPX thread.

thread\_self \***get\_self\_ptr**() noexcept

The function *get\_self\_ptr* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

thread\_self\_impl\_type \***get\_ctx\_ptr**()

The function *get\_ctx\_ptr* returns a pointer to the internal data associated with each coroutine.

`thread_self *get_self_ptr_checked(error_code &ec = throws)`

The function *get\_self\_ptr\_checked* returns a pointer to the (OS thread specific) self reference to the current HPX thread.

`thread_id_type get_self_id()` noexcept

The function *get\_self\_id* returns the HPX thread id of the current thread (or zero if the current thread is not a HPX thread).

**HPX\_DEPRECATED\_V (2, 0, "hpx::threads::get\_outer\_self\_id is deprecated, use " "hpx::threads::get\_self\_id instead") inline thread\_id\_type get\_outer\_self\_id() noexcept**

The function *get\_outer\_self\_id* returns the HPX thread id of the current outer thread (or zero if the current thread is not a HPX thread). This now always returns the same as *get\_self\_id*, even for directly executed threads.

`thread_id_type get_parent_id()` noexcept

The function *get\_parent\_id* returns the HPX thread id of the current thread's parent (or zero if the current thread is not a HPX thread).

#### Note

This function will return a meaningful value only if the code was compiled with HPX\_HAVE\_THREAD\_PARENT\_REFERENCE being defined.

`std::size_t get_parent_phase()` noexcept

The function *get\_parent\_phase* returns the HPX phase of the current thread's parent (or zero if the current thread is not a HPX thread).

#### Note

This function will return a meaningful value only if the code was compiled with HPX\_HAVE\_THREAD\_PARENT\_REFERENCE being defined.

`std::ptrdiff_t get_self_stacksize()` noexcept

The function *get\_self\_stacksize* returns the stack size of the current thread (or zero if the current thread is not a HPX thread).

`thread_stacksize get_self_stacksize_enum()` noexcept

The function *get\_self\_stacksize\_enum* returns the stack size of the /.

`std::uint32_t get_parent_locality_id()` noexcept

The function *get\_parent\_locality\_id* returns the id of the locality of the current thread's parent (or zero if the current thread is not a HPX thread).

#### Note

This function will return a meaningful value only if the code was compiled with HPX\_HAVE\_THREAD\_PARENT\_REFERENCE being defined.

`std::uint64_t get_self_component_id()` noexcept

The function *get\_self\_component\_id* returns the lva of the component the current thread is acting on

**Note**

This function will return a meaningful value only if the code was compiled with `HPX_HAVE_THREAD_TARGET_ADDRESS` being defined.

namespace **policies**

namespace **tracing**

**threadmanager**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**hpx/threadmanager/threadmanager.hpp**

Defined in header `hpx/threadmanager/threadmanager.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **threads**

class **threadmanager**

*#include <threadmanager.hpp>* The *thread-manager* class is the central instance of management for all (non-depleted) threads

**Public Types**

using **notification\_policy\_type** = *threads::policies::callback\_notifier*

using **pool\_type** = *std::unique\_ptr<thread\_pool\_base>*

using **pool\_vector** = *std::vector<pool\_type>*

**Public Functions**

**threadmanager**(*hpx::util::runtime\_configuration* &rtcfg\_, *notification\_policy\_type* &notifier,  
detail::network\_background\_callback\_type network\_background\_callback =  
detail::network\_background\_callback\_type())

**threadmanager**(*threadmanager* const&) = delete

**threadmanager**(*threadmanager*&&) = delete

*threadmanager* &**operator**=(*threadmanager* const&) = delete

*threadmanager* &**operator**=(*threadmanager*&&) = delete

**~threadmanager**()

void **init**() const

void **create\_pools**()

void **print\_pools**(*std::ostream*&) const

FIXME move to private and add `&#8212;hpx:printpools` cmd line option.

*thread\_pool\_base* &**default\_pool**() const

*thread\_pool\_base* &**get\_pool**(*std::string* const &pool\_name) const

*thread\_pool\_base* &**get\_pool**(pool\_id\_type const &pool\_id) const

*thread\_pool\_base* &**get\_pool**(*std::size\_t* thread\_index) const

bool **pool\_exists**(*std::string* const &pool\_name) const

bool **pool\_exists**(*std::size\_t* pool\_index) const

thread\_id\_ref\_type **register\_work**(thread\_init\_data &data, *error\_code* &ec = *throws*) const

The function *register\_work* adds a new work item to the thread manager. It doesn't immediately create a new *thread*, it just adds the task parameters (function, initial state and description) to the internal management data structures. The thread itself will be created when the number of existing threads drops below the number of threads specified by the constructors *max\_count* parameter.

#### Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **ec** –

void **register\_thread**(thread\_init\_data &data, thread\_id\_ref\_type &id, *error\_code* &ec = *throws*) const

The function *register\_thread* adds a new work item to the thread manager. It creates a new *thread*, adds it to the internal management data structures, and schedules the new thread, if appropriate.

#### Parameters

- **data** – [in] The value of this parameter allows to specify a description of the thread to create. This information is used for logging purposes mainly, but might be useful for debugging as well. This parameter is optional and defaults to an empty string.
- **id** – [out] This parameter will hold the id of the created thread. This id is guaranteed to be validly initialized before the thread function is executed.
- **ec** –

bool **run**() const

Run the thread manager's work queue. This function instantiates the specified number of OS threads in each pool. All OS threads are started to execute the function *tfunc*.

#### Returns

The function returns *true* if the thread manager has been started successfully, otherwise it returns *false*.

void **stop**(bool blocking = true) const

Forcefully stop the thread-manager.

**Parameters**

**blocking** –

bool **is\_busy**() const

bool **is\_idle**() const

void **wait**() const

bool **wait\_for**(*hpx::chrono::steady\_duration* const &rel\_time) const

template<typename **StopToken**>

inline bool **wait\_for**(*StopToken* &&stop\_token, *hpx::chrono::steady\_duration* const &rel\_time)  
const

void **suspend**() const

void **resume**() const

*hpx::state* **status**() const

Return whether the thread manager is still running This returns the “minimal state”, i.e. the state of the least advanced thread pool

*std::int64\_t* **get\_thread\_count**(*thread\_schedule\_state* state = *thread\_schedule\_state::unknown*,  
*thread\_priority* priority = *thread\_priority::default\_*, *std::size\_t*  
num\_thread = static\_cast<*std::size\_t*>(-1), bool reset = false)  
const

return the number of HPX-threads with the given state

**Note**

This function locks the internal OS lock in the thread manager

*std::int64\_t* **get\_idle\_core\_count**() const

mask\_type **get\_idle\_core\_mask**() const

*std::int64\_t* **get\_background\_thread\_count**() const

bool **enumerate\_threads**(*hpx::function*<bool(*thread\_id\_type*)> const &f, *thread\_schedule\_state*  
state = *thread\_schedule\_state::unknown*) const

void **abort\_all\_suspended\_threads**() const

bool **cleanup\_terminated**(bool delete\_all) const

*std::size\_t* **get\_os\_thread\_count**() const

Return the number of OS threads running in this thread-manager.

This function will return correct results only if the thread-manager is running.

*std::thread* &**get\_os\_thread\_handle**(*std::size\_t* num\_thread) const

void **report\_error**(*std::size\_t* num\_thread, *std::exception\_ptr* const &e) const

API functions forwarding to notification policy.

This notifies the thread manager that the passed exception has been raised. The exception will be routed through the notifier and the scheduler (which will result in it being passed to the runtime object, which in turn will report it to the console, etc.).

mask\_type **get\_used\_processing\_units**() const

Returns the mask identifying all processing units used by this thread manager.

*hwloc\_bitmap\_ptr* **get\_pool\_numa\_bitmap**(*std::string* const &pool\_name) const

void **set\_scheduler\_mode**(*threads::policies::scheduler\_mode* mode,

## thrust

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx/thrust/algorithms.hpp

Defined in header `hpx/thrust/algorithms.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

```
namespace hpx
```

```
namespace thrust
```

## Functions

```
template<typename Tag, typename ThrustPolicy, typename ...Args>
decltype(auto) hpx_invoke(Tag tag, ThrustPolicy &&policy, Args&&... args)
```

ADL hook dispatching HPX algorithm CPOs to Thrust backends.

When a Thrust execution policy is passed to an HPX algorithm CPO, this hook maps the call to the corresponding Thrust implementation. Async policies wrap the result in a future.

### Template Parameters

- **Tag** – The algorithm CPO tag type.
- **ThrustPolicy** – A Thrust execution policy satisfying `is_thrust_execution_policy`.
- **Args** – Arguments forwarded to the Thrust algorithm.

### Parameters

- **tag** – The algorithm CPO tag instance.
- **policy** – Thrust execution policy controlling dispatch.

- **args** – Arguments forwarded to the mapped algorithm.

**Returns**

The algorithm result, or a future thereof for async policies.

**timed\_execution**

See *Public API* for a list of names and headers that are part of the public *HPX* API.

**hpx/timed\_execution/timed\_execution\_fwd.hpp**

Defined in header `hpx/timed_execution/timed_execution_fwd.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

namespace **hpx**

namespace **parallel**

namespace **execution**

**Variables**

constexpr struct `hpx::parallel::execution::post_at_t` **post\_at**

constexpr struct `hpx::parallel::execution::post_after_t` **post\_after**

constexpr struct `hpx::parallel::execution::sync_execute_after_t` **sync\_execute\_after**

struct **post\_at\_t**

*#include <timed\_execution\_fwd.hpp>* Customization point of asynchronous fire & forget execution agent creation supporting timed execution.

This asynchronously (fire & forget) creates a single function invocation `f()` using the associated executor at the given point in time.

**Note**

This calls `exec.post_at(abs_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::post()` on the underlying non-time-scheduled execution agent.

**Param exec**

[in] The executor object to use for scheduling of the function *f*.

**Param abs\_time**

[in] The point in time the given function should be scheduled at to run.

**Param f**

[in] The function which will be scheduled using the given executor.

**Param ts...**

[in] Additional arguments to use to invoke *f*.

**Public Functions**

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const
&abs_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const
&abs_time, F &&f, Ts&&... ts) const
```

**struct post\_after\_t**

*#include <timed\_execution\_fwd.hpp>* Customization point of asynchronous fire & forget execution agent creation supporting timed execution.

This asynchronously (fire & forget) creates a single function invocation *f*() using the associated executor at the given point in time.

**Note**

This calls `exec.post_after(rel_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::post()` on the underlying non-time-scheduled execution agent.

**Param exec**

[in] The executor object to use for scheduling of the function *f*.

**Param rel\_time**

[in] The duration of time after which the given function should be scheduled to run.

**Param f**

[in] The function which will be scheduled using the given executor.

**Param ts...**

[in] Additional arguments to use to invoke *f*.

**Public Functions**

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const
&rel_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const
&rel_time, F &&f, Ts&&... ts) const
```

struct **async\_execute\_at\_t**

*#include <timed\_execution\_fwd.hpp>* Customization point of asynchronous execution agent creation supporting timed execution.

This asynchronously creates a single function invocation *f()* using the associated executor at the given point in time.

**Note**

This calls `exec.async_execute_at(abs_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::async_execute()` on the underlying non-time-scheduled execution agent.

**Param exec**

[in] The executor object to use for scheduling of the function *f*.

**Param abs\_time**

[in] The point in time the given function should be scheduled at to run.

**Param f**

[in] The function which will be scheduled using the given executor.

**Param ts...**

[in] Additional arguments to use to invoke *f*.

**Return**

*f(ts...)*'s result through a future

## Public Functions

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, hpx::chrono::steady_time_point const
 &abs_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator()(Executor &&exec, hpx::chrono::steady_time_point const
 &abs_time, F &&f, Ts&&... ts) const
```

struct **async\_execute\_after\_t**

*#include <timed\_execution\_fwd.hpp>* Customization point of asynchronous execution agent creation supporting timed execution.

This asynchronously creates a single function invocation *f()* using the associated executor at the given point in time.

**Note**

This calls `exec.async_execute_after(rel_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::async_execute()` on the underlying non-time-scheduled execution agent.

**Param exec**

[in] The executor object to use for scheduling of the function *f*.

**Param rel\_time**

[in] The duration of time after which the given function should be scheduled to run.

**Param f**

[in] The function which will be scheduled using the given executor.

**Param ts...**

[in] Additional arguments to use to invoke *f*.

**Return**

*f*(*ts...*)'s result through a future

**Public Functions**

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const
 &rel_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_duration const
 &rel_time, F &&f, Ts&&... ts) const
```

struct **sync\_execute\_at\_t**

*#include <timed\_execution\_fwd.hpp>* Customization point of synchronous execution agent creation supporting timed execution.

This synchronously creates a single function invocation *f*() using the associated executor at the given point in time.

**Note**

This calls `exec.sync_execute_at(abs_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::sync_execute()` on the underlying non-time-scheduled execution agent.

**Param exec**

[in] The executor object to use for scheduling of the function *f*.

**Param abs\_time**

[in] The point in time the given function should be scheduled at to run.

**Param f**

[in] The function which will be scheduled using the given executor.

**Param ts...**

[in] Additional arguments to use to invoke *f*.

**Return**

*f*(*ts...*)'s result

**Public Functions**

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const
 &abs_time, F &&f, Ts&&... ts) const
```

```
template<executor_any Executor, typename F, typename ...Ts>
inline decltype(auto) operator() (Executor &&exec, hpx::chrono::steady_time_point const
 &abs_time, F &&f, Ts&&... ts) const
```

struct **sync\_execute\_after\_t**

*#include <timed\_execution\_fwd.hpp>* Customization point of synchronous execution agent creation supporting timed execution.

This synchronously creates a single function invocation *f()* using the associated executor at the given point in time.

#### Note

This calls `exec.sync_execute_after(rel_time, f, ts...)`, if available, otherwise it emulates timed scheduling by delaying calling `execution::sync_execute()` on the underlying non-time-scheduled execution agent.

#### Param *exec*

[in] The executor object to use for scheduling of the function *f*.

#### Param *rel\_time*

[in] The duration of time after which the given function should be scheduled to run.

#### Param *f*

[in] The function which will be scheduled using the given executor.

#### Param *ts...*

[in] Additional arguments to use to invoke *f*.

#### Return

*f(ts...)*'s result

## timing

See *Public API* for a list of names and headers that are part of the public *HPX* API.

### **hpx::chrono::high\_resolution\_clock**

Defined in header *hpx/chrono.hpp*<sup>989</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

struct **high\_resolution\_clock**

Class *hpx::chrono::high\_resolution\_clock* represents the clock with the smallest tick period provided by the implementation. It may be an alias of *std::chrono::system\_clock* or *std::chrono::steady\_clock*, or a third, independent clock. *hpx::chrono::high\_resolution\_clock* meets the requirements of *Trivial-Clock*.

### **hpx::chrono::high\_resolution\_timer**

Defined in header *hpx/chrono.hpp*<sup>990</sup>.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

class **high\_resolution\_timer**

*high\_resolution\_timer* is a timer object which measures the elapsed time

~**topology**()

```
inline std::size_t get_socket_number(std::size_t num_thread, [[maybe_unused]] error_code &ec
 = throws) const noexcept
```

Return the Socket number of the processing unit the given thread is running on.

**Parameters**

- **num\_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
inline std::size_t get_numa_node_number(std::size_t num_thread, [[maybe_unused]] error_code
 &ec = throws) const noexcept
```

Return the NUMA node number of the processing unit the given thread is running on.

**Parameters**

- **num\_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
inline std::size_t get_numa_distance(std::size_t node_a, std::size_t node_b) const noexcept
```

Return the hardware latency distance between two NUMA nodes. Values are sourced from hwloc's distance matrix when available; otherwise a standard default (10 = local, 20 = remote) is returned.

**Parameters**

- **node\_a** – [in] logical index of the first NUMA node
- **node\_b** – [in] logical index of the second NUMA node

```
mask_cref_type get_machine_affinity_mask(error_code &ec = throws) const noexcept
```

Return a bit mask where each set bit corresponds to a processing unit available to the application.

**Parameters**

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_type get_service_affinity_mask(mask_cref_type used_processing_units, error_code
 &ec = throws) const
```

Return a bit mask where each set bit corresponds to a processing unit available to the service threads in the application.

**Parameters**

- **used\_processing\_units** – [in] This is the mask of processing units which are not available for service threads.
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_cref_type get_socket_affinity_mask(std::size_t num_thread, error_code &ec = throws)
 const
```

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the socket it is running on.

**Parameters**

- **num\_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

```
mask_cref_type get_numa_node_affinity_mask(std::size_t num_thread, error_code &ec =
 throws) const
```

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the NUMA domain it is running on.

**Parameters**

- **num\_thread** – [in]

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask\_cref\_type **get\_core\_affinity\_mask**(*std::size\_t* num\_thread, *error\_code* &ec = *throws*)  
const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread inside the core it is running on.

**Parameters**

- **num\_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask\_cref\_type **get\_thread\_affinity\_mask**(*std::size\_t* num\_thread, *error\_code* &ec = *throws*)  
const

Return a bit mask where each set bit corresponds to a processing unit available to the given thread.

**Parameters**

- **num\_thread** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **set\_thread\_affinity\_mask**(mask\_cref\_type mask, *error\_code* &ec = *throws*) const

Use the given bit mask to set the affinity of the given thread. Each set bit corresponds to a processing unit the thread will be allowed to run on.

**Note**

Use this function on systems where the affinity must be set from inside the thread itself.

**Parameters**

- **mask** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

mask\_type **get\_thread\_affinity\_mask\_from\_lva**(void const \*lva, *error\_code* &ec = *throws*)  
const

Return a bit mask where each set bit corresponds to a processing unit co-located with the memory the given address is currently allocated on.

**Parameters**

- **lva** – [in]
- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

void **print\_affinity\_mask**(*std::ostream* &os, *std::size\_t* num\_thread, mask\_cref\_type m, *std::string* const &pool\_name) const

Prints the given mask *m* to os in a human-readable form.

bool **reduce\_thread\_priority**(*error\_code* &ec = *throws*) const

Reduce thread priority of the current thread.

**Parameters**

- **ec** – [in,out] this represents the error status on exit, if this is pre-initialized to *hpx::throws* the function will throw on error instead.

*std::size\_t* **get\_number\_of\_sockets**() const

Return the number of available NUMA domains.

*std::size\_t* **get\_number\_of\_numa\_nodes**() const  
Return the number of available NUMA domains.

*std::size\_t* **get\_number\_of\_cores**() const  
Return the number of available cores.

*std::size\_t* **get\_number\_of\_pus**() const noexcept  
Return the number of available hardware processing units.

*std::size\_t* **get\_number\_of\_numa\_node\_cores**(*std::size\_t* numa) const  
Return number of cores in given numa domain.

*std::size\_t* **get\_number\_of\_numa\_node\_pus**(*std::size\_t* numa) const  
Return number of processing units in a given numa domain.

*std::size\_t* **get\_number\_of\_socket\_pus**(*std::size\_t* socket) const  
Return number of processing units in a given socket.

*std::size\_t* **get\_number\_of\_core\_pus**(*std::size\_t* core) const  
Return number of processing units in given core.

*std::size\_t* **get\_number\_of\_socket\_cores**(*std::size\_t* socket) const  
Return number of cores units in given socket.

inline *std::size\_t* **get\_core\_number**(*std::size\_t* num\_thread, *error\_code*& = *throws*) const

*std::size\_t* **get\_pu\_number**(*std::size\_t* num\_core, *std::size\_t* num\_pu, *error\_code* &ec = *throws*) const

*std::size\_t* **get\_cache\_size**(mask\_cref\_type mask, int level) const  
Return the size of the cache associated with the given mask.

mask\_type **get\_cpubind\_mask**(*error\_code* &ec = *throws*) const

mask\_type **get\_cpubind\_mask**(*std::thread* &handle, *error\_code* &ec = *throws*) const

*hwloc\_bitmap\_ptr* **cpuset\_to\_nodeset**(mask\_cref\_type mask) const  
convert a cpu mask into a numa node mask in hwloc bitmap form

void **write\_to\_log**() const

void **\*allocate**(*std::size\_t* len) const  
This is equivalent to malloc(), except that it tries to allocate page-aligned memory from the OS.

void **\*allocate\_membind**(*std::size\_t* len, *hwloc\_bitmap\_ptr* const &bitmap, *hpx\_hwloc\_membind\_policy* policy, int flags) const  
allocate memory with binding to a numa node set as specified by the policy and flags (see hwloc docs)

*threads::mask\_type* **get\_area\_membind\_nodeset**(void const \*addr, *std::size\_t* len) const

bool **set\_area\_membind\_nodeset**(void const \*addr, *std::size\_t* len, void \*nodeset) const

int **get\_numa\_domain**(void const \*addr) const

void **deallocate**(void \*addr, *std::size\_t* len) const noexcept  
Free memory that was previously allocated by allocate.

```

void print_hwloc(std::ostream&) const

```

```
struct lock_context
```

*#include <tracing.hpp>* Context for annotating lock acquisitions and releases.

This struct is used to provide tracing annotations for synchronization primitives such as spinlocks and mutexes. It registers the creation, acquisition, and release of locks to the active tracing backend.

## Public Functions

```
explicit lock_context(char const *name = nullptr, void const *addr = nullptr) noexcept
```

Constructs a lock context.

### Parameters

- **name** – The name or description of the lock.
- **addr** – The memory address of the lock, used to track it uniquely.

```
explicit lock_context(char const *prefix, char const *suffix, void const *addr = nullptr) noexcept
```

Constructs a lock context with a dynamic name.

### Parameters

- **prefix** – The prefix for the lock name.
- **suffix** – The suffix for the lock name.
- **addr** – The memory address of the lock, used to track it uniquely.

```
bool before_lock() const noexcept
```

Called immediately before attempting to acquire the lock.

### Returns

true if the prepare event was recorded and `after_lock` should be called.

```
void after_lock() const noexcept
```

Called immediately after the lock is successfully acquired.

```
void after_try_lock(bool success) const noexcept
```

Called after a try-lock operation completes.

### Parameters

**success** – true if the lock was acquired, false if it failed.

```
void before_unlock() const noexcept
```

Called immediately before releasing the lock.

```
void after_unlock() const noexcept
 Called immediately after releasing the lock.
```

```
namespace util
```

```
namespace external_timer
```

## hpx/tracing/backends/apex.hpp

Defined in header `hpx/tracing/backends/apex.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```

```

```
typedef char const *annotation_handle
```

### Functions

```
inline constexpr annotation_handle create_annotation_handle(char const *name) noexcept
```

```
inline constexpr void set_thread_name(char const *name) noexcept
```

Set the OS thread name in the profiler timeline.

```
inline constexpr char const *rename_region(char const *name) noexcept
```

Rename the currently active region on this thread; returns the previous name, or the caller's input if no rename occurred.

```
constexpr void task_staged(char const*, void const* = nullptr) noexcept
```

```
constexpr void task_created(char const*, void const*, void const* = nullptr) noexcept
```

```
constexpr void task_executing(void const*, char const*, std::size_t) noexcept
```

```
constexpr void task_yielded(void const*, char const*) noexcept
```

```
constexpr void task_suspended(void const*, char const*, char const* = nullptr) noexcept
```

```
constexpr void task_resumed(void const*, char const*, char const* = nullptr) noexcept
```

```
constexpr void task_completed(void const*, char const*) noexcept
```

```
constexpr void task_deleted(void const*) noexcept
```

constexpr void **future\_fulfilled**(void const\*, char const\* = nullptr) noexcept

    Consumer-side signal: handle\_on\_completed fired (no-op stub for APEX).  
    Consumer-side signal: handle\_on\_completed fired (no-op stub for ITTNotify).  
    Consumer-side signal: handle\_on\_completed fired (no-op stub).

constexpr void **work\_stolen**(std::size\_t, std::size\_t, void const\*, char const\* = nullptr) noexcept  
    Signal emitted when a worker thread steals a task from another worker.

inline constexpr void **frame\_mark**(char const\* = nullptr) noexcept  
    Frame boundary marker (no-op stub for APEX).  
    Frame boundary marker.  
    Emit a frame/stage boundary marker in Tracy timeline.  
    Frame boundary marker (no-op stub).  
    **Parameters**  
        **name** – Optional name for the frame/stage.

inline constexpr void **os\_thread\_sleep**(std::size\_t num\_thread) noexcept  
    Point message emitted just before an OS worker thread suspends on its condition variable.  
    **Parameters**  
        **num\_thread** – Index of the worker thread entering sleep.

struct **lock\_context**

void **create\_counter**(*std::string* const &full\_name, *std::string* const &short\_name) noexcept

void **sample\_counter**(*std::string* const &name, *std::string* const &short\_name, double value) noexcept

inline void **send\_parcel**(*std::uint64\_t* tag\_msb, *std::uint64\_t* tag\_lsb, *std::uint64\_t* size, *std::uint64\_t* target\_locality\_id) noexcept

Parcel-send signal: parcel handed to parcelport (APEX shim).

Parcel-send signal: parcel handed to parcelport (no-op stub for ITTNotify).

Parcel-send signal: a parcel has been handed to the parcelport for transmission.

Parcel-send signal: parcel handed to parcelport (no-op stub).

**Parameters**

- **tag\_msb** – High 64 bits of the parcel id.
- **tag\_lsb** – Low 64 bits of the parcel id. Together with tag\_msb they form the full 128-bit id used to pair events across localities; lsb alone restarts per locality and would produce false matches.
- **size** – Wire size of the parcel in bytes.
- **target\_locality\_id** – Destination locality id, or `naming::invalid_locality_id` if unknown.

inline void **recv\_parcel**(*std::uint64\_t* tag\_msb, *std::uint64\_t* tag\_lsb, *std::uint64\_t* source\_locality\_id) noexcept

Parcel-receive signal: parcel arrived (APEX shim).

Parcel-receive signal: parcel arrived (no-op stub for ITTNotify).

Parcel-receive signal: a parcel has arrived and its header has been deserialized.

Parcel-receive signal: parcel arrived (no-op stub).

**Parameters**

- **tag\_msb** – High 64 bits of the parcel id.

- **tag\_lsb** – Low 64 bits of the parcel id.
- **source\_locality\_id** – Sending locality id, or `naming::invalid_locality_id` when the parcel has no source id yet (pre-AGAS handshake parcels).

```
inline void parcel_scheduled(std::uint64_t tag_msb, std::uint64_t tag_lsb, std::uint64_t
 source_locality_id, std::uint64_t source_thread_id) noexcept
```

Parcel-scheduled signal: action entered local scheduler (no-op stub for APEX).

Parcel-scheduled signal: action entered local scheduler (no-op stub for ITTNotify).

Parcel-scheduled signal: an action carried by a parcel has been placed onto the local scheduler. Fires for deferred receives (zero-copy or multi-parcel message), for AGAS-routed parcels, and for parcels the AGAS re-route chain delivered after a migration detection. Does not fire for the non-deferred path where `load_schedule` schedules inline.

Parcel-scheduled signal: action entered local scheduler (no-op stub).

**Parameters**

- **tag\_msb** – High 64 bits of the parcel id.
- **tag\_lsb** – Low 64 bits of the parcel id.
- **source\_locality\_id** – Sending locality id (see `recv_parcel`).
- **source\_thread\_id** – Parent HPX thread id captured on the sender; may be 0 when unavailable.

```
namespace hpx
```

```
 namespace util
```

### Functions

```
template<typename Iterator>
constexpr bool insert_checked(std::pair<Iterator, bool> const &r) noexcept
```

Helper function for writing predicates that test whether an `std::map` insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy `std::pair<Iterator, bool>` type.

#### Parameters

**r** – [in] The return value of a `std::map` insert operation.

#### Returns

This function returns **r.second**.

```
template<typename Iterator>
bool insert_checked(std::pair<Iterator, bool> const &r, Iterator &it)
```

Helper function for writing predicates that test whether an `std::map` insertion succeeded. This inline template function negates the need to explicitly write the sometimes lengthy `std::pair<Iterator, bool>` type.

#### Parameters

- **r** – [in] The return value of a `std::map` insert operation.
- **r** – [out] A reference to an `Iterator`, which is set to **r.first**.
- **it** – [out] on exit, will hold the iterator referring to the inserted element

#### Returns

This function returns **r.second**.

## hpx/util/sed\_transform.hpp

Defined in header `hpx/util/sed_transform.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace util
```

## Functions

bool **parse\_sed\_expression**(*std::string* const &input, *std::string* &search, *std::string* &replace)

Parse a sed command.

### Note

Currently, only supports search and replace syntax (s/search/replace/)

### Parameters

- **input** – [in] The content to parse.
- **search** – [out] If the parsing is successful, this string is set to the search expression.
- **replace** – [out] If the parsing is successful, this string is set to the replace expression.

### Returns

*true* if the parsing was successful, false otherwise.

struct **sed\_transform**

*#include <sed\_transform.hpp>* An unary function object which applies a sed command to its subject and returns the resulting string.

### Note

Currently, only supports search and replace syntax (s/search/replace/)

## Public Functions

**sed\_transform**(*std::string* const &search, *std::string* replace)

explicit **sed\_transform**(*std::string* const &expression)

*std::string* **operator()**(*std::string* const &input) const

inline explicit **operator bool**() const noexcept

inline bool **operator!**() const noexcept

## Private Members

*std::shared\_ptr*<command> **command\_**

## component\_storage

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx/components/component\_storage/migrate\_to\_storage.hpp

Defined in header `hpx/components/component_storage/migrate_to_storage.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **components**

## Functions

```
template<typename Component>
future<hpx::id_type> migrate_to_storage(hpx::id_type const &to_migrate, hpx::id_type const
&target_storage)
```

Migrate the component with the given id to the specified target storage

The function *migrate\_to\_storage*<*Component*> will migrate the component referenced by *to\_migrate* to the storage facility specified with *target\_storage*. It returns a future referring to the migrated component instance.

### Parameters

- **to\_migrate** – [in] The global id of the component to migrate.
- **target\_storage** – [in] The id of the storage facility to migrate this object to.

### Template Parameters

**The** – only template argument specifies the component type of the component to migrate to the given storage facility.

### Returns

A future representing the global id of the migrated component instance. This should be the same as *migrate\_to*.

```
template<typename Derived, typename Stub, typename Data>
inline Derived migrate_to_storage(client_base<Derived, Stub, Data> const &to_migrate,
hpx::components::component_storage const &target_storage)
```

Migrate the given component to the specified target storage

The function *migrate\_to\_storage* will migrate the component referenced by *to\_migrate* to the storage facility specified with *target\_storage*. It returns a future referring to the migrated component instance.

### Parameters

- **to\_migrate** – [in] The client side representation of the component to migrate.
- **target\_storage** – [in] The id of the storage facility to migrate this object to.

### Returns

A client side representation of representing of the migrated component instance. This should be the same as *migrate\_to*.

### hpx/components/component\_storage/migrate\_from\_storage.hpp

Defined in header `hpx/components/component_storage/migrate_from_storage.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace components
```

#### Functions

```
template<typename Component>
future<hpx::id_type> migrate_from_storage(hpx::id_type const &to_resurrect, hpx::id_type const
 &target = hpx::invalid_id)
```

Migrate the component with the given id from the specified target storage (resurrect the object)

The function `migrate_from_storage<Component>` will migrate the component referenced by `to_resurrect` from the storage facility specified where the object is currently stored on. It returns a future referring to the migrated component instance. The component instance is resurrected on the locality specified by `target_locality`.

##### Parameters

- **to\_resurrect** – [in] The global id of the component to migrate.
- **target** – [in] The optional locality to resurrect the object on. By default the object is resurrected on the locality it was located on last.

##### Template Parameters

**The** – only template argument specifies the component type of the component to migrate from the given storage facility.

##### Returns

A future representing the global id of the migrated component instance. This should be the same as `to_resurrect`.

### process

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

### hpx/components/process/process.hpp

Defined in header `hpx/components/process/process.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

```
namespace hpx
```

```
 namespace components
```

```
 namespace process
```

## Functions

```
template<typename ...Ts>
child execute(hpx::id_type const &id, Ts&&... ts)
```

```
HPX_PROCESS_EXPORT child launch_connecting_locality (std::string const &to_launch,
std::vector< std::string > const &outer_args={},
std::vector< std::string > const &outer_env={},
std::optional< std::uint64_t > spawn_id=nullopt)
```

Launch an executable as a new HPX locality that connects to the currently running (bootstrap) locality via TCP.

This function spawns `to_launch` as a child process configured to join the calling HPX runtime as an additional, connecting locality. It forces the TCP parcellport for bootstrapping, forwards AGAS server address/port information from the current runtime's configuration, lets the operating system pick an ephemeral parcel port for the new locality, and blocks the caller until the spawned locality signals that it has finished starting up (via a named latch derived from the executable name and, optionally, `spawn_id`).

### Note

The following environment variables are set (overriding any inherited values) before launching:

- `HPX_AGAS_SERVER_ADDRESS` / `HPX_AGAS_SERVER_PORT` ? taken from the current runtime's `hpx.agas.address` / `hpx.agas.port` configuration entries.
- `HPX_PARCEL_SERVER_ADDRESS` ? same address as the AGAS server.
- `HPX_PARCEL_SERVER_PORT` ? set to "0" so the OS assigns an ephemeral port.
- `HPX_ON_STARTUP_WAIT_ON_LATCH` ? the startup latch name described above, used to synchronize with the caller.

### Parameters

- **to\_launch** – Path to the executable to launch as the connecting locality.
- **outer\_args** – Additional command-line arguments appended after the mandatory HPX bootstrap arguments (`--hpx:ignore-batch-env`, `--hpx:ini=hpx.parcel.tcp.priority=1000`, `--hpx:ini=hpx.parcel.bootstrap=tcp`). Defaults to an empty list.
- **outer\_env** – Additional environment variable entries in "NAME=value" form (or just "NAME" to set an empty value) that are merged into (and override) the inherited environment before launching the child process. Defaults to an empty list.
- **spawn\_id** – Optional identifier used to disambiguate the startup latch name when multiple instances of the same executable are launched concurrently. When present, the latch name is "<exe-stem>/<spawn\_id>"; otherwise it is just "<exe-stem>".

### Throws

*hpx::exception* – (or a derived type) if the child process could not be started (`process::throw_on_error()` is used).

### Returns

A child object representing the launched connecting-locality process, once it has signaled startup completion.

## supervision\_dispatch

See *Public API* for a list of names and headers that are part of the public HPX API.

### hpx::supervision::testing::local\_snapshot\_peers

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

- `hpx::supervision::testing::stop_background_loops`

`std::vector<server::peer_snapshot> hpx::supervision::testing::local_snapshot_peers()`

Returns a snapshot of this locality's currently-joined, ready peers, as tracked by the local registry. Not part of the public dispatch API - exists so tests can inspect registry state directly.

### hpx::supervision::testing::set\_failure\_detection\_poll\_timeout\_for\_testing

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- `hpx::supervision::testing::local_snapshot_peers`
- `hpx::supervision::testing::last_join_locality`
- `hpx::supervision::testing::suspend_heartbeat_for_testing`
- `hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing`
- `hpx::supervision::testing::stop_background_loops`

void `hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing`(`hpx::chrono::steady_duration`  
const  
&timeout)

Overrides the timeout `failure_detection_loop()` passes to `await_terminal()` on each sweep. Must be called before `init()` starts the loop to take effect for that lifecycle; has no effect on a sweep already in flight. Not part of the public dispatch API - exists only to make failure-detection tests deterministic and fast instead of bound by the real 60s `default_discovery_timeout`.

#### Parameters

**timeout** – The new poll timeout.

### hpx::supervision::testing::last\_join\_locality

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::supervision::testing::local_snapshot_peers`
- `hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing`
- `hpx::supervision::testing::suspend_heartbeat_for_testing`
- `hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing`
- `hpx::supervision::testing::stop_background_loops`

`hpx::id_type hpx::supervision::testing::last_join_locality()`

Returns the locality most recently returned by `join()`, regardless of whether the `register_observers()` call that followed it went on to succeed or fail. Lets tests verify that a failed `join()` does not leak that locality's local supervision state (see `registry::register_observers()`'s catch block).

### hpx::supervision::testing::suspend\_heartbeat\_for\_testing

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::supervision::testing::local_snapshot_peers`
- `hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing`
- `hpx::supervision::testing::last_join_locality`
- `hpx::supervision::testing::failure_detection_sweep_in_flight_for_testing`
- `hpx::supervision::testing::stop_background_loops`

void `hpx::supervision::testing::suspend_heartbeat_for_testing()`

Stops this locality's own `heartbeat_loop()` without finalizing the dispatcher, simulating a hard crash (all lifecycle activity ceases, including the periodic event::running pulse) while staying joined in peers' registries. Idempotent; no-op if `init()` was never called or the loop is already stopped. Not part of the public dispatch API - exists only so failure-detection tests can deterministically simulate silence instead of relying on the absence of explicit calls, which no longer implies silence now that heartbeats are mirrored onto observers' local supervision state.

### hpx::supervision::testing::failure\_detection\_sweep\_in\_flight\_for\_testing

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::supervision::testing::local_snapshot_peers`
- `hpx::supervision::testing::set_failure_detection_poll_timeout_for_testing`
- `hpx::supervision::testing::last_join_locality`

- *hpx::supervision::testing::suspend\_heartbeat\_for\_testing*
- *hpx::supervision::testing::stop\_background\_loops*

bool **hpx::supervision::testing::failure\_detection\_sweep\_in\_flight\_for\_testing()**

Reports whether `failure_detection_loop()` currently has one or more *await\_terminal()* calls outstanding against unresponsive peers (i.e. a sweep is mid-flight). Returns false before *init()* is called, between sweeps, and after *finalize()*. Not part of the public dispatch API - exists only so tests can deterministically synchronize on a real in-flight sweep instead of sleeping and hoping the loop got there first.

## **hpx::supervision::testing::stop\_background\_loops**

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::supervision::testing::local\_snapshot\_peers*
- *hpx::supervision::testing::set\_failure\_detection\_poll\_timeout\_for\_testing*
- *hpx::supervision::testing::last\_join\_locality*
- *hpx::supervision::testing::suspend\_heartbeat\_for\_testing*
- *hpx::supervision::testing::failure\_detection\_sweep\_in\_flight\_for\_testing*

void **hpx::supervision::testing::stop\_background\_loops()**

Stops this locality's `failure_detection_loop()` and `heartbeat_loop()` background tasks (joining both) without otherwise finalizing the dispatcher: unlike *finalize()*, this never publishes `event::completed`, never unregisters the registry symbol name, and never resets the lifecycle state back to uninitialized, so the sentinel's last published event stays stale and peers' `failure_detection_loop()` still eventually times out and observes `target_fenced/rejected_fenced` against this locality. Lets a caller depart the HPX runtime cleanly (e.g. via *hpx::disconnect()*) afterwards without leaving either background `hpx::async` task still running - simulating a worker that dies mid-epoch without corrupting AGAS or hanging runtime shutdown, as opposed to a true crash (no call at all) or a fully graceful departure (*finalize()*). Idempotent; no-op if *init()* was never called or the loops are already stopped. Not part of the public dispatch API - exists only for examples/tests that need to simulate this exact scenario deterministically.

## **hpx::supervision::init**

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public HPX API.

See also:

- *hpx::supervision::finalize*
- *hpx::supervision::is\_initialized*

*hpx::shared\_future<registry>* **hpx::supervision::init**(*hpx::chrono::steady\_duration* const &discovery\_timeout = default\_discovery\_timeout)

Performs one-shot, idempotent initialization of the supervision-dispatch runtime for this locality. On the first successful call, this function atomically transitions the internal lifecycle state from *uninitialized* to *initializing*, after incrementing the internal epoch, then owns the entire startup sequence: it creates a local *registry* for `hpx::find_here()`, publishes `event::started` for this locality *before* the registry's symbol name is registered (so that no peer can discover and join a not-yet-started locality), registers that symbol name, and finally performs a single

*discover\_and\_join()* pass to join every currently reachable peer registry. On success the state transitions to *active*; if any step throws, all partial state is rolled back and the lifecycle reverts to *uninitialized* so that a subsequent call can retry from scratch.

Calling *init()* while already *active* is a no-op that resolves immediately without repeating any side effect. Calling it while another call is still *initializing* attaches the caller to the in-flight operation's outcome rather than racing it, so concurrent callers never create more than one registry. Calling it while *finalizing* is in progress is rejected; callers should wait for *finalize()* to complete before re-initializing.

#### Note

This function has no effect on any state that has not yet been created by a successful call - in particular, no symbol name is ever registered and no event is ever published unless this function (or a concurrent call it is attached to) actually runs the initialization sequence.

#### Parameters

**discovery\_timeout** – The maximum duration to wait, across all discovery candidates combined, for peer registry symbol names to resolve during the *discover\_and\_join()* step (see *discover\_peers()*).

#### Returns

A shared future that becomes ready, holding the *registry* owned by this *init()* cycle, once the supervision runtime has reached the *active* state, or that becomes exceptional if initialization fails.

```
registry hpx::supervision::init(hpx::launch::sync_policy policy, hpx::chrono::steady_duration const
 &discovery_timeout = default_discovery_timeout)
```

Performs one-shot, idempotent initialization of the supervision-dispatch runtime for this locality, blocking the calling thread until the operation completes. This is the synchronous counterpart of *init(hpx::chrono::steady\_duration const&)*: it carries out the exact same lifecycle transition and startup sequence (registry creation, *event::started* publication, symbol name registration, and a single *discover\_and\_join()* pass), but waits for the resulting future to become ready (or exceptional) before returning, rather than handing the future back to the caller.

#### Note

As with the asynchronous overload, no symbol name is registered and no event is published unless this call (or a concurrent call it attaches to) actually performs the initialization sequence.

#### Parameters

- **policy** – Tag selecting the blocking overload of *init()*.
- **discovery\_timeout** – The maximum duration to wait, across all discovery candidates combined, for peer registry symbol names to resolve during the *discover\_and\_join()* step (see *discover\_peers()*).

#### Throws

*hpx::exception* – if initialization could not complete (e.g. due to a concurrent *finalize()* still in progress). Calling this while already *active* is a no-op that returns immediately.

#### Returns

The *registry* owned by this *init()* cycle.

## hpx::supervision::finalize

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [`hpx::supervision::init`](#)
- [`hpx::supervision::is\_initialized`](#)

void **`hpx::supervision::finalize()`**

Performs one-shot, idempotent teardown of the supervision-dispatch runtime previously started by `init()`. On the first call observing the *active* state, this function atomically transitions the lifecycle to *finalizing*, publishes *event::completed* for the local locality at the current epoch, unregisters the registry's symbol name, and then releases ownership of the registry (relying on *client\_base*'s default lifetime management to destroy it once no other references remain) before resetting the lifecycle back to *uninitialized*, allowing a subsequent `init()` call to re-arm the runtime from scratch.

Calling `finalize()` when the runtime is *uninitialized*, still *initializing*, or already *finalizing* is a documented no-op: it resolves immediately without publishing any event, unregistering any symbol name, or otherwise touching component state.

### Note

Because `finalize()` is a no-op unless the runtime is currently *active*, it is always safe to call speculatively, e.g. during shutdown, without first checking `is_initialized()`.

## hpx::supervision::is\_initialized

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- [`hpx::supervision::init`](#)
- [`hpx::supervision::finalize`](#)

bool **`hpx::supervision::is_initialized()`** noexcept

Returns whether the supervision-dispatch runtime for this locality is currently *active*, i.e. has completed `init()` and has not yet been torn down by `finalize()`.

### Note

This function never blocks and performs a single atomic load; it is safe to call from any thread, including while `init()` or `finalize()` is concurrently in flight.

### Returns

*true* if the lifecycle state is *active*, *false* if it is *uninitialized*, *initializing*, or *finalizing*.

## hpx::supervision::registry

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

class **registry** : public *hpx::components::client\_base<registry, server::registry>*

A registry is a lightweight, self-supervising handle for pairing with peer localities. It mirrors a peer's lifecycle state locally via `join()`, and can itself be discovered by name in AGAS like other `supervision_dispatch` components.

## hpx::supervision::dispatch\_work

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::invoke\_fenced\_action*

## hpx::supervision::invoke\_fenced\_action

Defined in header `hpx/supervision_dispatch.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

See also:

- [hpx::supervision::dispatch\\_work](#)

```
template<typename Action, typename IdType, typename Epoch, typename ...Ts>
decltype(auto) hpx::supervision::invoke_fenced_action(Action act, IdType target, Epoch const epoch, Ts...
 ts)
```

Remote dispatch point that performs the authoritative admission re-check and invokes the wrapped action.

This is the function body that actually runs as the action on the *destination* locality (the target’s own locality, reached via `hpx::colocated` in `dispatch_work()`). It is invoked by `fenced_action` once the action has been dispatched.

The admission check performed here runs on the same locality/thread that owns the target’s *supervision\_manager* state, so there is no suspension point between this check and the actual invocation below. This is what closes the client-side/dispatch race: even if the client’s own (non-authoritative) *check\_admission()* in `dispatch_work()` returned admitted, the target may have latched a terminal event for this epoch in the meantime, and this re-check will catch it.

This re-check is authoritative only because a joining registry (see `components/supervision_dispatch/src/server/registry_server.cpp`) dual-publishes lifecycle mirrors for a joined peer onto that peer’s own locality, in addition to the joining registry’s local copy: `target` must resolve to that same peer locality for this guarantee to hold. Dispatching `target` against an unrelated third locality - one that never received the dual-published mirror for this target - remains out of contract; the re-check performed there consults a *supervision\_manager* state that was never seeded for `target` and so cannot detect fencing.

### Template Parameters

- **Action** – The wrapped HPX action type to invoke on admission.
- **IdType** – Type of the target identifier forwarded to `act` (this type is always `hpx::id_type`).
- **Epoch** – Type of the fencing epoch value (this type is always `std::uint64_t`).
- **Ts** – Types of the additional arguments forwarded to `act`.

### Parameters

- **act** – The action instance to invoke once admission succeeds.
- **target** – Identifier of the component instance being dispatched to; forwarded to `act` (the epoch is fencing metadata only and is not part of `act`’s argument list).

- **epoch** – The fencing epoch to check admission for.
- **ts** – Additional arguments forwarded to `act`.

**Throws**

`hpx::exception` – with `hpx::error::target_fenced` if the target has latched a terminal event for epoch since the client's own admission check, in which case the wrapped action is not invoked.

**Returns**

The result of invoking `act`, obtained via `hpx::sync` (run directly/locally, without an extra parcel hop, since this function already executes on the target's locality).

**`hpx::supervision::discover_peers`**

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::supervision::fan_out_join`
- `hpx::supervision::discover_and_join`

`std::vector<discovered_peer> hpx::supervision::discover_peers`(`chrono::steady_duration const &timeout = default_discovery_timeout`)

Performs a one-time discovery pull for `supervision_dispatch` peers: concurrently resolves the pinned registry name (see `register_name()`) of every remote locality (`hpx::find_remote_localities()`, which already excludes this locality), bounded by a single wait for `timeout` across all candidates.

Because constructing a registry client from a symbolic name (see `client_base`'s symbolic-name constructor) waits/resolves once the symbol is bound rather than failing fast on one that is not (yet) registered, localities that never called `register_name()` (e.g. because they have not run `init_supervision()` yet) would otherwise hang this call indefinitely. Instead, once `timeout` elapses, only the candidates whose registry client was resolved by then (checked via the non-blocking `is_ready()`) are returned; every other candidate is simply excluded as not currently participating in supervision - `discover_peers()` itself never fails or throws on their account.

**Parameters**

**timeout** – The maximum duration to wait, across all candidates combined, for their registry names to resolve.

**Returns**

The peers whose registry client was resolved within `timeout`, as `discovered_peer` values carrying the `hpx::id_type` locality it is pinned to.

**`hpx::supervision::fan_out_join`**

Defined in header `hpx/supervision_dispatch.hpp`.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- `hpx::supervision::discover_peers`
- `hpx::supervision::discover_and_join`

```
std::vector<discovered_peer> hpx::supervision::fan_out_join(registry const &local_registry,
 std::vector<discovered_peer> const &peers,
 chrono::steady_duration const &timeout =
 default_discovery_timeout)
```

Reactively fans out join() calls from *local\_registry* to every peer in *peers* (typically the result of a prior *discover\_peers()* call): for each entry, this calls *local\_registry.join(peer.locality)*.

This reuses *registry::join()*'s existing reservation/idempotency machinery unchanged (see *server::registry::reserve\_ownership()*) rather than duplicating any of it, so calling *fan\_out\_join()* more than once with (partially) overlapping peer lists - or racing with an inbound join() call from one of those same peers, e.g. because that peer is concurrently running its own *fan\_out\_join()* against this locality - is safe and never creates more than one registry entry per peer locality.

*fan\_out\_join()* itself is reactive only: it performs exactly one round of join() calls for the given *peers* and starts no background/polling activity of its own.

#### Parameters

- **local\_registry** – The registry to join every peer in *peers* to.
- **peers** – The peers to join, typically returned by a prior *discover\_peers()* call.
- **timeout** – The maximum duration to wait, across all peers combined, for their join() calls to settle. Peers whose join() has not settled (or failed) within this bound are silently dropped from the result, rather than hanging or throwing.

#### Returns

The *discovered\_peer* values (locality + join\_epoch) for peers whose join() calls settled successfully within *timeout*, in the same relative order as *peers* (with unsuccessful/ timed-out peers omitted, rather than left as gaps). Each returned *discovered\_peer::join\_epoch* is populated from the corresponding join() call, so callers can dispatch against {*peer.locality*, *peer.join\_epoch*} directly, without needing a separate join() call to obtain it.

## hpx::supervision::discover\_and\_join

Defined in header *hpx/supervision\_dispatch.hpp*.

See *Public API* for a list of names and headers that are part of the public *HPX* API.

See also:

- *hpx::supervision::discover\_peers*
- *hpx::supervision::fan\_out\_join*

```
std::vector<discovered_peer> hpx::supervision::discover_and_join(registry const &local_registry,
 chrono::steady_duration const
 &timeout =
 default_discovery_timeout)
```

Composes a single reactive discovery-and-join pass for *supervision\_dispatch* peers: performs exactly one *discover\_peers()* pull to resolve the pinned registry name of every remote locality (*hpx::find\_remote\_localities()* already excludes this locality, so no separate self-exclusion is needed here), then fans the resulting peer list out to *local\_registry* via a single *fan\_out\_join()* pass.

*discover\_and\_join()* introduces no state, polling thread, timer, or repeated broadcast of its own - it is a pure composition of *discover\_peers()* and *fan\_out\_join()*, each of which is itself bounded to a single round of resolution/join calls. Because *fan\_out\_join()* reuses *registry::join()*'s existing reservation/idempotency machinery unchanged (see *server::registry::reserve\_ownership()*), calling *discover\_and\_join()* more than once - whether to pick up newly started peers or purely by accident - is safe and never creates more than one registry entry per peer

locality; repeated invocations simply return the (stable) join epochs already owned for peers that were previously joined.

#### Parameters

- **local\_registry** – The registry to join every discovered peer to.
- **timeout** – The maximum duration to wait, across all discovery candidates combined, for their registry name to resolve (see [discover\\_peers\(\)](#)).

#### Returns

The `discovered_peer` value that `local_registry` created (or already had) for each peer discovered and successfully joined within `timeout`, in the same relative order as returned by [discover\\_peers\(\)](#).

### hpx/supervision\_dispatch/server/registry.hpp

Defined in header `hpx/supervision_dispatch/server/registry.hpp`.

See [Public API](#) for a list of names and headers that are part of the public HPX API.

namespace **hpx**

namespace **supervision**

Fenced action dispatch for the supervision subsystem.

This header provides the machinery to dispatch an HPX action to a target component while enforcing supervision “fencing” semantics: once a target has latched a terminal event for a given epoch, no further actions for that epoch may execute against it. Dispatch performs a cheap, non-authoritative admission check on the caller’s locality and an authoritative re-check on the target’s own locality (via `hpx::colocated`), immediately before invoking the wrapped action, closing the race between admission and invocation.

Types and functions implementing HPX’s supervision and fenced dispatch facilities.

#### Functions

inline bool **operator==**([joined\\_peer](#) const &lhs, [joined\\_peer](#) const &rhs) noexcept

inline bool **operator!=**([joined\\_peer](#) const &lhs, [joined\\_peer](#) const &rhs) noexcept

[std::ostream](#) &**operator<<**([std::ostream](#) &strm, [joined\\_peer](#) const &peer)

struct **joined\_peer**

*#include <registry.hpp>* Pairs the two values a caller obtains from a successful `registry::join()` and needs to perform a fenced dispatch.

#### See also

`dispatch_work()`

**See also**

*server::registry::join()*

**Public Members**

*hpx::id\_type* **target**

The real, colocatable destination for the wrapped action.

The peer's locality id (i.e. `peer_locality`, the value originally passed into `registry::join()`). Forwarded to `hpx::colocated()` and used as the destination of `hpx::sync(act, target, ts...)` inside `dispatch_work()`.

*std::uint64\_t* **join\_epoch** = 0

The epoch at which this peer was joined.

Recorded by `registry::join()` and used to identify which registry entry a later `registry::leave()` call refers to - so that a racing re-join of the same peer locality (which mints a fresh `join_epoch` of its own) cannot be mistaken for the join this *joined\_peer* was returned from.

namespace **server**

struct **peer\_snapshot**

*#include <registry.hpp>* Plain-data view of a single joined peer, safe to hand out to callers outside the registry (unlike `peer_entry`, does not expose the ready/evict\_pending bookkeeping used internally to coordinate concurrent `join()/evict_peer()` calls).

**Public Members**

*hpx::id\_type* **peer\_locality**

The peer locality this entry was joined against.

*std::uint64\_t* **join\_epoch**

The epoch at which `peer_locality` was joined.

class **registry** : public *hpx::components::component\_base<registry>*

## Public Functions

### registry()

*joined\_peer* **join**(*hpx::id\_type* const &peer\_locality)

Joins a peer locality and creates or reuses its local supervision state.

#### Parameters

**peer\_locality** – The peer locality to observe.

*std::vector<peer\_snapshot>* **snapshot\_peers**() const

Returns a point-in-time snapshot of all fully joined, non-evicting peers.

Intended for a future failure-detection poller (or other local consumers) that needs a stable, lock-safe list of peers to iterate over without reaching into `peers_` directly. Entries mid-join (`ready == false`) or already scheduled for eviction (`evict_pending == true`) are excluded, so a poller never observes a half-registered or torn-down peer.

#### Returns

A snapshot of every peer entry with `ready == true` and `evict_pending == false` at the time of the call.

void **leave**(*hpx::id\_type* const &peer\_locality, *std::uint64\_t* join\_epoch)

Removes a previously joined peer.

#### Parameters

- **peer\_locality** – The peer locality to leave.
- **join\_epoch** – Must match the join epoch currently recorded for `peer_locality` (i.e. the epoch returned by the corresponding `join()`). If `peer_locality` has since been re-joined (fresh epoch) or already evicted, this call is a no-op.

## Protected Functions

*std::tuple<hpx::id\_type, std::uint64\_t, bool>* **reserve\_ownership**(*hpx::id\_type* const &peer\_locality)

*std::pair<hpx::id\_type, hpx::id\_type>* **register\_observers**(*hpx::id\_type* const &peer\_locality, *std::uint64\_t* join\_epoch)

void **evict\_peer**(*hpx::id\_type* const &peer\_locality, *std::uint64\_t* join\_epoch, *hpx::id\_type* keep\_alive, bool preserve\_terminal\_state)

## Protected Static Functions

static void **cleanup\_peer**(*hpx::id\_type* const &peer\_locality, *hpx::id\_type* const &lifecycle\_observer, *hpx::id\_type* const &activity\_observer, bool preserve\_terminal\_state)

Unregisters a peer's observers and, unless `preserve_terminal_state` is set, removes its locally tracked supervision state.

Performs the actual peer teardown deferred by `evict_peer()`: unregisters `lifecycle_observer` and `activity_observer` on `peer_locality`, and removes `peer_locality`'s locally tracked supervision state unless `preserve_terminal_state` is true, in which case that state - which was last set to the peer's terminal event by `register_observers()`'s lifecycle callback - is left in place as a tombstone rather than reset to "unknown". This lets any admission check still in flight against `peer_locality` (e.g. `check_admission()`) keep observing the fenced/terminal

outcome after eviction has run, instead of racing against it. A subsequent *join()* re-seeding this locality with a fresh epoch naturally overwrites the tombstone. Kept separate from *evict\_peer()* because *evict\_peer()* only posts this work as a task (via *hpx::post()*) rather than performing it inline.

#### Parameters

- **peer\_locality** – The locality that owns the observers, and whose local supervision state is removed.
- **lifecycle\_observer** – The lifecycle observer id to unregister.
- **activity\_observer** – The activity observer id to unregister.
- **preserve\_terminal\_state** – If true, leave *peer\_locality*’s local supervision state in place instead of removing it.

### Private Members

mutable *hpx::spinlock* **mtx\_**

*hpx::lcos::local::detail::condition\_variable* **cond\_**

*std::map<hpx::id\_type, peer\_entry>* **peers\_**

struct **peer\_entry**

Internal bookkeeping for a single joined (or joining) peer.

Not exposed outside the registry; see *peer\_snapshot* for the plain-data subset safe to hand to external callers.

### Public Functions

inline explicit **peer\_entry**(*hpx::id\_type* const &peer\_locality)

### Public Members

*hpx::id\_type* const **peer\_locality**

The locality that owns this peer’s. Surfaced read-only via *peer\_snapshot::peer\_locality*.

*hpx::id\_type* **lifecycle\_observer**

The observer id registered on *peer\_locality* to receive this peer’s terminal lifecycle notification (drives *evict\_peer()* via *hpx::post()*).

*hpx::id\_type* **activity\_observer**

The observer id registered on *peer\_locality* to receive this peer’s activity notifications (used to keep *peer\_locality*’s local state current between terminal events).

*std::uint64\_t* **join\_epoch** = 0

The epoch at which this peer was joined, recorded by *join()* and used by *evict\_peer()* (instead of shadow) to identify and used by *evict\_peer()* to identify which entry a deferred eviction refers to.

bool **ready** = false

False while a *join()* call has reserved ownership of this peer's locality (i.e. is in the process of performing the remote observer registrations) but has not yet filled in the rest of the entry. Concurrent *join()* calls for the same peer wait on *cond\_* instead of racing to register duplicate observers.

bool **evict\_pending** = false

True once a terminal notification has been observed for this peer but eviction has not yet completed (deferred via *hpx::post()* to *evict\_peer()*). Ensures a terminal notification racing ahead of *join()* completion is deferred instead of dropped, and lets *snapshot\_peers()* exclude a peer that is already tearing down.

bool **evict\_preserve\_terminal\_state** = false

The *preserve\_terminal\_state* argument *evict\_peer()* was called with when it set *evict\_pending* above, remembered so that *join()*'s deferred *cleanup\_peer()* call (once the join in progress completes) preserves or drops *peer\_locality*'s local supervision state consistently with what the racing terminal notification requested.

## 2.10 Contributing to HPX

HPX development happens on Github. The following sections are a collection of useful information related to HPX development.

### 2.10.1 Contributing to HPX

The main source of information to understand the process of how to contribute to HPX can be found in [this document](#)<sup>991</sup>. This is a living document that is constantly updated with relevant information.

### 2.10.2 HPX governance model

The HPX project is a meritocratic, consensus-based community project. Anyone with an interest in the project can join the community, contribute to the project design and participate in the decision making process. [This document](#)<sup>992</sup> describes how that participation takes place and how to set about earning merit within the project community.

### 2.10.3 Release procedure for HPX

Below is a step by step procedure for making an HPX release. We aim to produce two releases per year: one in March-April, and one in September-October.

This is a living document and may not be totally current or accurate. It is an attempt to capture current practices in making an HPX release. Please update it as appropriate.

One way to use this procedure is to print a copy and check off the lines as they are completed to avoid confusion.

1. Notify developers that a release is imminent.

<sup>991</sup> <https://github.com/TheHPXProject/hpx/blob/master/.github/CONTRIBUTING.md>

<sup>992</sup> <http://hpx.dev/documents/governance/>

2. For minor and major releases: create and check out a new branch at an appropriate point on `master` with the name `release-major.minor.X`. `major` and `minor` should be the major and minor versions of the release. For patch releases: check out the corresponding `release-major.minor.X` branch.
3. Write release notes in `docs/sphinx/releases/whats_new_${VERSION}.rst`. Keep adding merged PRs and closed issues to this until just before the release is made. Use `tools/generate_pr_issue_list.sh` to generate the lists. Add the new release notes to the table of contents in `docs/sphinx/releases.rst`.
4. Build the docs, and proof-read them. Update any documentation that may have changed, and correct any typos. Pay special attention to:
  - `$HPX_SOURCE/README.rst`
    - Update grant information
  - `docs/sphinx/releases/whats_new_${VERSION}.rst`
  - `docs/sphinx/about_hpx/people.rst`
    - Update collaborators
    - Update grant information
5. This step does not apply to patch releases. For APEX:
  - Change the release branch to be the most current release tag available in the APEX `git_external` section in the main `CMakeLists.txt`. Please contact the maintainers of the respective packages to generate a new release to synchronize with the *HPX* release ([APEX<sup>993</sup>](#)).
6. Make sure `HPX_VERSION_MAJOR/MINOR/SUBMINOR` in `CMakeLists.txt` contain the correct values. Change them if needed.
7. Change version references in `CITATION.cff`. There are two occurrences. Change year in the copyright file under `/libs/core/version/src/version.cpp`.
8. This step does not apply to patch releases. Remove features which have been deprecated for at least 2 releases. This involves removing build options which enable those features from the main `CMakeLists.txt` and also deleting all related code and tests from the main source tree.

The general deprecation policy involves a three-step process we have to go through in order to introduce a breaking change:

  - a. First release cycle: add a build option that allows for explicitly disabling any old (now deprecated) code.
  - b. Second release cycle: turn this build option OFF by default.
  - c. Third release cycle: completely remove the old code.

The main `CMakeLists.txt` contains a comment indicating for which version the breaking change was introduced first. In the case of deprecated features which don't have a replacement yet, we keep them around in case (like `Vc` for example).
9. Update the minimum required versions if necessary (compilers, dependencies, etc.) in `prerequisites.rst`. Update latest tested versions.
10. Verify that the Jenkins setups for the release branch on Rostam are running and do not display any errors.
11. Repeat the following steps until satisfied with the release.
  1. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to `-rcN`, where `N` is the current iteration of this step. Start with `-rc1`.
  2. Create a pre-release on GitHub using the script `tools/roll_release.sh`. This script automatically tag with the corresponding release number. The script requires that you have the STE||AR Group signing key.

---

<sup>993</sup> <http://github.com/UO-OACISS/xpress-apex>

3. This step is not necessary for patch releases. Notify `hpx-users@stellar-group.org` of the availability of the release candidate. Ask users to test the candidate by checking out the release candidate tag.
4. Allow at least a week for testing of the release candidate.
  - Use `git merge` when possible, and fall back to `git cherry-pick` when needed. For patch releases `git cherry-pick` is most likely your only choice if there have been significant unrelated changes on master since the previous release.
  - Go back to the first step when enough patches have been added.
  - If there are no more patches, continue to make the final release.
12. Update any occurrences of the latest stable release to refer to the version about to be released. For example, `quickstart.rst` contains instructions to check out the latest stable tag. Make sure that refers to the new version.
13. Add a new entry to the RPM changelog (`cmake/package/rpm/Changelog.txt`) with the new version number and a link to the corresponding changelog.
14. Change `HPX_VERSION_TAG` in `CMakeLists.txt` to an empty string.
15. Add the release date to the caption of the current “What’s New” section in the docs, and change the value of `HPX_VERSION_DATE` in `CMakeLists.txt`.
16. Create a release on GitHub using the script `tools/roll_release.sh`. This script automatically tag the with the corresponding release number. The script requires that you have the STELLAR Group signing key.
17. Update the website ([hpx.dev](https://hpx.dev)<sup>994</sup>). You can login on wordpress through *this page* <<https://hpx.dev/wp-login.php>>. You can update the pages with the following:
  - Update links on the downloads page. Link to the release on GitHub.
  - Documentation links on the docs page (link to generated documentation on GitHub Pages). Follow the style of previous releases.
  - A new blog post announcing the release, which links to downloads and the “What’s New” section in the documentation (see previous releases for examples).
18. Merge release branch into master.
19. Post-release cleanup. Create a new pull request against master with the following changes:
  1. Modify the release procedure if necessary.
  2. Change `HPX_VERSION_TAG` in `CMakeLists.txt` back to `-trunk`.
  3. Increment `HPX_VERSION_MINOR` in `CMakeLists.txt`.
20. Update Vcpkg (<https://github.com/Microsoft/vcpkg>) to pull from latest release.
  - Update version number in `CONTROL`
  - Update tag and SHA512 to that of the new release
21. Update spack (<https://github.com/spack/spack>) with the latest HPX package.
  - Update version number in `hpx/package.py` and SHA256 to that of the new release
22. Announce the release on [hpx-users@stellar-group.org](mailto:hpx-users@stellar-group.org), [stellar@cct.lsu.edu](mailto:stellar@cct.lsu.edu), [allcct@cct.lsu.edu](mailto:allcct@cct.lsu.edu), [faculty@csc.lsu.edu](mailto:faculty@csc.lsu.edu), [faculty@ece.lsu.edu](mailto:faculty@ece.lsu.edu), the *HPX* Slack channel, the STELLAR-GROUP Discord channel, our list of external collaborators, [isocpp.org](http://isocpp.org), [reddit.com](http://reddit.com), HPC Wire, Inside HPC, Heise Online, and a CCT press release.
23. Beer and pizza.

---

<sup>994</sup> <https://hpx.dev>

## 2.10.4 Testing *HPX*

To ensure correctness of *HPX*, we ship a large variety of unit and regression tests. The tests are driven by the [CTest](#)<sup>995</sup> tool and are executed automatically on each commit to the [HPX Github](#)<sup>996</sup> repository. In addition, it is encouraged to run the test suite manually to ensure proper operation on your target system. If a test fails for your platform, we highly recommend submitting an issue on our [HPX Issues](#)<sup>997</sup> tracker with detailed information about the target system.

### Running tests manually

Running the tests manually is as easy as typing `make tests && make test`. This will build all tests and run them once the tests are built successfully. After the tests have been built, you can invoke separate tests with the help of the `ctest` command. You can list all available test targets using `make help | grep tests`. Please see the [CTest Documentation](#)<sup>998</sup> for further details.

### Running performance tests

We run performance tests on Piz Daint for each pull request using Jenkins. To run those performance tests locally or on Piz Daint, a script is provided under `tools/perftests_ci/local_run.sh` (to be run in the build directory specifying the *HPX* source directory as the argument to the script, default is `$HOME/projects/hpx_perftests_ci`).

### Adding new performance tests

To add a new performance test, you need to wrap the portion of code to benchmark with `hpx::util::perftests_report`, passing the test name, the executor name and the function to time (can be a lambda). This facility is used to output the time results in a json format (format needed to compare the results and plot them). To effectively print them at the end of your test, call `hpx::util::perftests_print_times`. To see an example of use, see `future_overhead_report.cpp`. Finally, you can add the test to the CI report editing the `hpx_targets` variable for the executable name and the `hpx_test_options` variable for the corresponding options to use for the run in the performance test script `.jenkins/cscs-perftests/launch_perftests.sh`. And then run the `tools/perftests_ci/local_run.sh` script to get a reference json run (use the name of the test) to be added in the `tools/perftests_ci/perftest/references/daint_default` directory.

### Issue tracker

If you stumble over a bug or missing feature in *HPX*, please submit an issue to our [HPX Issues](#)<sup>999</sup> page. For more information on how to submit support requests or other means of getting in contact with the developers, please see the [Support Website](#)<sup>1000</sup> page.

---

<sup>995</sup> <https://gitlab.kitware.com/cmake/community/wikis/doc/ctest/Testing-With-CTest>

<sup>996</sup> <https://github.com/TheHPXProject/hpx/>

<sup>997</sup> <https://github.com/TheHPXProject/hpx/issues>

<sup>998</sup> <https://www.cmake.org/cmake/help/latest/manual/ctest.1.html>

<sup>999</sup> <https://github.com/TheHPXProject/hpx/issues>

<sup>1000</sup> <https://stellar.cct.lsu.edu/support/>

## Continuous testing

In addition to manual testing, we run automated tests on various platforms. We also run tests on all pull requests using both [github](#)<sup>1001</sup>. You can see the dashboards [CDash HPX dashboard](#)<sup>1001</sup>.

### 2.10.5 Using docker for development

Although it can often be useful to set up a local development environment with system-provided or self-built dependencies, [Docker](#)<sup>1002</sup> provides a convenient alternative to quickly get all the dependencies needed to start development of *HPX*. Our testing setup on [github](#)<sup>1003</sup> uses a docker image to run all tests.

To get started you need to install [Docker](#)<sup>1003</sup> using whatever means is most convenient on your system. Once you have [Docker](#)<sup>1004</sup> installed, you can pull or directly run the docker image. The image is based on Debian and Clang, and can be found on [Docker Hub](#)<sup>1005</sup>. To start a container using the *HPX* build environment, run:

```
$ docker run --interactive --tty stellargroup/build_env:latest bash
```

You are now in an environment where all the *HPX* build and runtime dependencies are present. You can install additional packages according to your own needs. Please see the [Docker Documentation](#)<sup>1006</sup> for more information on using [Docker](#)<sup>1007</sup>.

#### Warning

All changes made within the container are lost when the container is closed. If you want files to persist (e.g., the *HPX* source tree) after closing the container, you can bind directories from the host system into the container (see [Docker Documentation \(Bind mounts\)](#)<sup>1008</sup>).

### 2.10.6 Documentation

This documentation is built using [Sphinx](#)<sup>1009</sup>, and an automatically generated API reference using [Doxygen](#)<sup>1010</sup> and [Breathe](#)<sup>1011</sup>.

We always welcome suggestions on how to improve our documentation, as well as pull requests with corrections and additions.

<sup>1001</sup> <https://cdash.rostam.cct.lsu.edu/index.php?project=HPX>

<sup>1002</sup> <https://www.docker.com>

<sup>1003</sup> <https://www.docker.com>

<sup>1004</sup> <https://www.docker.com>

<sup>1005</sup> [https://hub.docker.com/r/stellargroup/build\\_env/](https://hub.docker.com/r/stellargroup/build_env/)

<sup>1006</sup> <https://docs.docker.com/>

<sup>1007</sup> <https://www.docker.com>

<sup>1008</sup> <https://docs.docker.com/storage/bind-mounts/>

<sup>1009</sup> <http://www.sphinx-doc.org>

<sup>1010</sup> <https://www.doxygen.org>

<sup>1011</sup> <https://breathe.readthedocs.io/en/latest>

## Prerequisites

To build the *HPX* documentation, you need recent versions of the following packages:

- python3 (3.9 or later)
- sphinx 7.2 or later (Python package)
- sphinx-book-theme (Python package)
- breathe 4.36.0 or later (Python package)
- doxygen
- sphinxcontrib-bibtex
- sphinx-copybutton

If the [Python](https://www.python.org)<sup>1012</sup> dependencies are not available through your system package manager, you can install them using the Python package manager `pip`. We recommend using a virtual environment:

```
mkdir -p build
python3 -m venv build/.venv
source build/.venv/bin/activate
pip install \
 "sphinx>=7.2" "breathe>=4.36.0" \
 sphinx-book-theme sphinxcontrib-bibtex \
 sphinx-copybutton
```

You may need to set the following CMake variables to make sure CMake can find the required dependencies.

### **Doxygen\_ROOT:PATH**

Specifies where to look for the installation of the [Doxygen](https://www.doxygen.org)<sup>1013</sup> tool.

### **Sphinx\_ROOT:PATH**

Specifies where to look for the installation of the [Sphinx](http://www.sphinx-doc.org)<sup>1014</sup> tool.

### **Breathe\_APIDOC\_ROOT:PATH**

Specifies where to look for the installation of the [Breathe](https://breathe.readthedocs.io/en/latest)<sup>1015</sup> tool.

## Building documentation

Enable building of the documentation by setting `HPX_WITH_DOCUMENTATION=ON` during [CMake](https://www.cmake.org)<sup>1016</sup> configuration. To build the documentation, build the `docs` target using your build tool. The default output format is HTML documentation. You can choose alternative output formats (single-page HTML, PDF, and man) with the `HPX_WITH_DOCUMENTATION_OUTPUT_FORMATS` CMake option.

### Note

If you add new source files to the Sphinx documentation, you have to run CMake again to have the files included in the build.

---

<sup>1012</sup> <https://www.python.org>

<sup>1013</sup> <https://www.doxygen.org>

<sup>1014</sup> <http://www.sphinx-doc.org>

<sup>1015</sup> <https://breathe.readthedocs.io/en/latest>

<sup>1016</sup> <https://www.cmake.org>

## Style guide

The documentation is written using reStructuredText. These are the conventions used for formatting the documentation:

- Use, at most, 80 characters per line.
- Top-level headings use over- and underlines with =.
- Sub-headings use only underlines with characters in decreasing level of importance: =, - and ..
- Use sentence case in headings.
- Refer to common terminology using `:term: `Component``.
- Indent content of directives (`.. directive::`) by three spaces.
- For C++ code samples at the end of paragraphs, use `::` and indent the code sample by 4 spaces.
  - For other languages (or if you don't want a colon at the end of the paragraph), use `.. code-block:: language` and indent by three spaces as with other directives.
- Use `.. list-table::` to wrap tables with a lot of text in cells.

## API documentation

The source code is documented using Doxygen. If you add new API documentation either to existing or new source files, make sure that you add the documented source files to the `doxygen_dependencies` variable in `docs/CMakeLists.txt`.

## Adding new API documentation

When you add new public APIs to *HPX*, follow these guidelines to ensure the documentation is correctly generated and easy to use.

## Documenting headers

At the top of a new header file, include the standard Doxygen documentation block. For example, if the new feature is called *my\_new\_feature*, you should:

- List the name of the new file under `\file`.
- Specify the page name with `\page` (e.g., `hpx:my_new_feature`).
- Reference the existing header that will include your new file under `\headerfile`.

```
/// \file my_new_feature.hpp
/// \page hpx:my_new_feature
/// \headerfile hpx/existing_header_of_new_feature.hpp
```

## Adding to the public API reference

For the documentation to appear in the generated API reference, add your new API to `docs/sphinx/api/public_api.rst` under the appropriate table (usually “Functions”) for the relevant header (for example, `hpx/existing_header_of_new_feature.hpp`).

## Including examples

Do **not** inline examples in the API reference. If you want to provide an example of how to use the new API, there are two recommended options:

1. **Documentation page option** Edit an existing relevant manual page to explain the new functionality and include a code example. Use this option if you want to provide additional context about how the API works.
2. **Standalone examples option** Create a separate example under `docs/sphinx/examples/`. Examples in this directory are typically more comprehensive and executable, making them suitable for richer or more complex scenarios.

## 2.10.7 Module structure

This section explains the structure of an *HPX* module.

The tool `create_library_skeleton.py`<sup>1017</sup> can be used to generate a basic skeleton. To create a library skeleton, run the tool in the `libs` subdirectory with the module name as an argument:

```
$./create_library_skeleton <lib_name>
```

This creates a skeleton with the necessary files for an *HPX* module. It will not create any actual source files. The structure of this skeleton is as follows:

- `<lib_name>/`
  - `README.rst`
  - `CMakeLists.txt`
  - `cmake`
  - `docs/`
    - \* `index.rst`
  - `examples/`
    - \* `CMakeLists.txt`
  - `include/`
    - \* `hpx/`
      - `<lib_name>`
  - `src/`
    - \* `CMakeLists.txt`
  - `tests/`
    - \* `CMakeLists.txt`

---

<sup>1017</sup> [https://github.com/TheHPXProject/hpx/blob/master/libs/create\\_module\\_skeleton.py](https://github.com/TheHPXProject/hpx/blob/master/libs/create_module_skeleton.py)

```

* unit/
 · CMakeLists.txt
* regressions/
 · CMakeLists.txt
* performance/
 · CMakeLists.txt

```

A `README.rst` should be always included which explains the basic purpose of the library and a link to the generated documentation.

A main `CMakeLists.txt` is created in the root directory of the module. By default it contains a call to `add_hpx_module` which takes care of most of the boilerplate required for a module. You only need to fill in the source and header files in most cases.

`add_hpx_module` requires a module name. Optional flags are:

Optional single-value arguments are:

- `INSTALL_BINARIES`: Install the resulting library.

Optional multi-value arguments-are:

- `SOURCES`: List of source files.
- `HEADERS`: List of header files.
- `COMPAT_HEADERS`: List of compatibility header files.
- `DEPENDENCIES`: Libraries that this module depends on, such as other modules.
- `CMAKE_SUBDIRS`: List of subdirectories to add to the module.

The `include` directory should contain only headers that other libraries need. For each of those headers, an automatic header test to check for self containment will be generated. Private headers should be placed under the `src` directory. This allows for clear separation. The `cmake` subdirectory may include additional [CMake](https://www.cmake.org)<sup>1018</sup> scripts needed to generate the respective build configurations.

Compatibility headers (forwarding headers for headers whose location is changed when creating a module, if moving them from the main library) should be placed in an `include_compatibility` directory. This directory is not created by default.

Documentation is placed in the `docs` folder. A empty skeleton for the index is created, which is picked up by the main build system and will be part of the generated documentation. Each header inside the `include` directory will automatically be processed by Doxygen and included into the documentation.

Tests are placed in suitable subdirectories of `tests`.

When in doubt, consult existing modules for examples on how to structure the module.

---

<sup>1018</sup> <https://www.cmake.org>

## Finding circular dependencies

Our CI will perform a check to see if there are circular dependencies between modules. In cases where it's not clear what is causing the circular dependency, running the `cpp-dependencies`<sup>1019</sup> tool manually can be helpful. It can give you detailed information on exactly which files are causing the circular dependency. If you do not have the `cpp-dependencies` tool already installed, one way of obtaining it is by using our docker image. This way you will have exactly the same environment as on the CI. See *Using docker for development* for details on how to use the docker image.

To produce the graph produced by CI run the following command (HPX\_SOURCE is assumed to hold the path to the HPX source directory):

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --graph-cycles circular_dependencies.dot
```

This will produce a dot file in the current directory. You can inspect this manually with a text editor. You can also convert this to an image if you have `graphviz` installed:

```
$ dot circular_dependencies.dot -Tsvg -o circular_dependencies.svg
```

This produces an svg file in the current directory which shows the circular dependencies. Note that if there are no cycles the image will be empty.

You can use `cpp-dependencies` to print the include paths between two modules.

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest <from> <to>
```

prints all possible paths from the module `<from>` to the module `<to>`. For example, as most modules depend on `config`, the following should give you a long list of paths from `algorithms` to `config`:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest algorithms config
```

The following should report that it can't find a path between the two modules:

```
$ cpp-dependencies --dir $HPX_SOURCE/libs --shortest config algorithms
```

## 2.11 Releases

### 2.11.1 List of supported releases

**HPX V2.0.0 (TBD)**

**General changes**

**Breaking changes**

**Closed issues**

**Closed pull requests**

---

<sup>1019</sup> <https://github.com/tomtom-international/cpp-dependencies>

## HPX V1.11.0 (Jun 30, 2025)

This release is the last version of HPX that supports C++17. Future versions of HPX will require compilation using C++20 or above.

### General changes

- Added synchronous versions of all collective operations. Added global predefined communicator objects that are accessible through new APIs: `hpx::collectives::get_world_communicator()` refers to all localities and `hpx::collectives::get_local_communicator()` refers to all threads on the calling locality. We unified the interfaces of the different communicator objects.
- Added `hpx::experimental::run_on_all` allowing to run a given function (possibly concurrently) using a given execution policy.
- Added a helper object `hpx::runtime_manager` that simplifies the initialization of HPX without needing to modify the main function of the application.
- We improved the compatibility with various accelerator frameworks (SYCL, OneAPI).
- Applied build system changes that allow building HPX without any prerequisites. This requires to pass `-DHPX_WITH_FETCH_HWLOC=On` and `-DHPX_WITH_FETCH_BOOST=On` to the [CMake](https://cmake.org)<sup>1020</sup> configuration.
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- Added the `hpx::contains` and `hpx::contains_subrange` parallel algorithms.
- Adapted many of HPX' parallel algorithms to be usable with senders/receivers.

### Breaking changes

- We have moved most of the APIs that were defined in the namespace `hpx::parallel::execution` to the namespace `hpx::execution::experimental`. It was not possible to add compatibility facilities that will allow to continue using the old APIs, applications will have to be changed in order to continue functioning correctly.
- The CMake configuration parameter `HPX_WITH_RUN_MAIN_EVERYWHERE` is now deprecated and will be removed in the future. Use the preprocessor macro `HPX_HAVE_RUN_MAIN_EVERYWHERE` on a target-by-target case instead.
- Removed the dysfunctional `libfabric` `parcelport`.
- Removed features that were long deprecated (starting V1.8):
  - `hpx::flush`, `hpx::endl`, `hpx::async_flush`, `hpx::async_endl` - Various enumerator types are now only available as `class enum` requiring explicit scoped use of the enumerator values
  - Various non-conforming overloads of parallel algorithms
  - `hpx::for_loop` and friends (now only available as

`hpx::experimental::for_loop)`

- `hpx::parallel::induction` is now only available as `hpx::experimental::induction`
- `hpx::parallel::reduction` and friends are now only available as `hpx::experimental::reduction`
- `hpx::assertion::source_location` is now only available as `hpx::source_location`
- `hpx::lcos::split_future` is now only available as `hpx::split_future`
- `hpx::lcos::wait` and friends have been removed altogether

<sup>1020</sup> <https://www.cmake.org>

- `hpx::lcos::wait_any` and friends are now only available as `hpx::wait_any`
- `hpx::lcos::wait_some` and friends are now only available as `hpx::wait_some`
- `hpx::lcos::wait_each` and friends are now only available as `hpx::wait_each`
- `hpx::lcos::wait_all` and friends are now only available as `hpx::wait_all`
- `hpx::lcos::when_all` and friends are now only available as `hpx::when_all`
- `hpx::lcos::when_any` and friends are now only available as `hpx::when_any`
- `hpx::lcos::when_each` and friends are now only available as `hpx::when_each`
- `hpx::lcos::when_some` and friends are now only available as `hpx::when_some`
- `hpx::util::optional` and related facilities are now only available as `hpx::optional`
- `hpx::util::bind` and related facilities are now only available as `hpx::bind`
- `hpx::util::function` and friends are now only available as `hpx::function`
- `hpx::traits::is_bound_action` and related facilities are now only available as `hpx::is_bound_action`
- `hpx::traits::is_bind_expression` and related facilities are now only available as `hpx::is_bind_expression`
- `hpx::traits::is_placeholder` and related facilities are now only available as `hpx::is_placeholder`
- `hpx::lcos::future` and related facilities are now only available as `hpx::future`
- `hpx::memory::intrusive_ptr` is now only available as `hpx::intrusive_ptr`
- `hpx::lcos::local::barrier` is now only available as `hpx::barrier`
- `hpx::lcos::barrier` is now only available as `hpx::distributed::barrier`
- `hpx::lcos::local::cpp20_binary_semaphore` is now only available as `hpx::detail::binary_semaphore`

- PR #6503<sup>1155</sup> - Fix 2 tests on FreeBSD by initializing freebsd\_environ
- PR #6499<sup>1156</sup> - Fix crash in get\_executable\_filename on FreeBSD
- PR #6498<sup>1157</sup> - Avoid rewriting defines.hpp
- PR #6497<sup>1158</sup> - Contains and contains\_subrange parallel algorithm implementation GSOC 2024
- PR #6496<sup>1159</sup> - Prevent usage of CMake try\_run on crosscompiling
- PR #6494<sup>1160</sup> - Add unit test cases and fixes for the S/R versions of the parallel algorithms
- PR #6487<sup>1161</sup> - Fixing security vulnerabilities reported by MSVC security checks
- PR #6486<sup>1162</sup> - Create codeql.yml
- PR #6474<sup>1163</sup> - Remove remnants of libfabric parcelport
- PR #6473<sup>1164</sup> - Add documentation for distributed implementations of post, async, sync and dataflow
- PR #6471<sup>1165</sup> - Add distance.cpp test in CMake
- PR #6468<sup>1166</sup> - Small vector relocation
- PR #6448<sup>1167</sup> - Standardising Benchmarks, with support for nanobench as an option for its backend
- PR #6365<sup>1168</sup> - Release V1.10.0
- PR #6089<sup>1169</sup> - Implementing p2079

## 2.11.2 List of older releases

### HPX V1.10.0 (May 29, 2024)

#### General changes

- The HPX documentation has seen a major overhaul for this release. We finished documenting the public local HPX API, we have added migration guides from widely used parallelization platforms to HPX (OpenMP, TBB, and MPI).
- We have added facilities enabling optimizations for trivially-relocatable types (see P1144<sup>1170</sup> for more details).

<sup>1153</sup> <https://github.com/TheHPXProject/hpx/pull/6508>

<sup>1154</sup> <https://github.com/TheHPXProject/hpx/pull/6507>

<sup>1155</sup> <https://github.com/TheHPXProject/hpx/pull/6503>

<sup>1156</sup> <https://github.com/TheHPXProject/hpx/pull/6499>

<sup>1157</sup> <https://github.com/TheHPXProject/hpx/pull/6498>

<sup>1158</sup> <https://github.com/TheHPXProject/hpx/pull/6497>

<sup>1159</sup> <https://github.com/TheHPXProject/hpx/pull/6496>

<sup>1160</sup> <https://github.com/TheHPXProject/hpx/pull/6494>

<sup>1161</sup> <https://github.com/TheHPXProject/hpx/pull/6487>

<sup>1162</sup> <https://github.com/TheHPXProject/hpx/pull/6486>

<sup>1163</sup> <https://github.com/TheHPXProject/hpx/pull/6474>

<sup>1164</sup> <https://github.com/TheHPXProject/hpx/pull/6473>

<sup>1165</sup> <https://github.com/TheHPXProject/hpx/pull/6471>

<sup>1166</sup> <https://github.com/TheHPXProject/hpx/pull/6468>

<sup>1167</sup> <https://github.com/TheHPXProject/hpx/pull/6448>

<sup>1168</sup> <https://github.com/TheHPXProject/hpx/pull/6365>

<sup>1169</sup> <https://github.com/TheHPXProject/hpx/pull/6089>

<sup>1170</sup> <https://wg21.link/p1144>

- We have added (and use) the `scope_xxx` helper facilities as specified by the C++ library fundamentals TS v3 (see: [N4948](#)<sup>1171</sup>).
- We have added configuration options that allow to build HPX without pre-installing any prerequisites. Use `HPX_WITH_FETCH_HWLOC=On` to have [Portable Hardware Locality \(HWLOC\)](#)<sup>1172</sup> installed for you. Similarly, setting `HPX_WITH_FETCH_BOOST=On` during configuration time will install the necessary [Boost](#)<sup>1173</sup> libraries (currently V1.84.0).
- We have performed a lot of code cleanup and refactoring to improve the overall code quality and decrease compile times.
- The collective operations APIs have seen an unification, we have fixed issues and performance problems for the collectives.
- The HPX executors have seen a streamlining and some consistency changes. We have applied many performance improvements to the executor implementations that directly positively impact the performance of our parallel algorithms.
- We have added a new parcelport allowing to use Gasnet as a communication platform.
- We have added optimizations to various parcelports improving overall communication performance. This includes - amongst other things - send immediate optimizations and receiver-side zero-copy optimizations.
- Futures will now execute the associated task eagerly and inline on any wait operation if the task has not started running yet. This feature can be enabled using the `HPX_COROUTINES_WITH_THREAD_SCHEDULE_HINT_RUNS_AS_CHILD=On` configuration setting (which is *Off* by default).
- We have enabled using json files to supply configuration information through the command line. This feature can be enabled with the configuration option `HPX_COMMAND_LINE_HANDLING_WITH_JSON_CONFIGURATION_FILES=On`. This functionality depends on the external [JSON library](#)<sup>1174</sup>, which can be built at configuration time by supplying `HPX_WITH_FETCH_JSON=On` to [CMake](#)<sup>1175</sup>.
- We have applied many fixes to our CUDA, ROCm, and SYCL build environments.

## Breaking changes

- The [CMake](#)<sup>1176</sup> configuration keys `SOMELIB_ROOT` (e.g., `BOOST_ROOT`) have been renamed to `Somelib_ROOT` (e.g., `Boost_ROOT`) to avoid warnings when using newer versions of [CMake](#)<sup>1177</sup>. Please update your scripts accordingly. For now, the old variable names are re-assigned to the new names and unset in the [CMake](#)<sup>1178</sup> cache.

## HPX V1.9.1 (August 4, 2023)

### General changes

This point release fixes a couple of problems reported for the V1.9.0 release. Most importantly, we fixed various occasional hanging during startup and shutdown in distributed scenarios. We also added support for zero-copy serialization on the receiving side to the TCP, MPI, and LCI parcelports. Last but not least, we have added support for Visual Studio 2019 and gcc using MINGW on Windows, and also support for gcc V13 and clang V15.

HPX headers are now made consistently named the same as their standard library counterparts, e.g. `#include <thread>` now corresponds to `#include <hpx/thread.hpp>`. This significantly simplifies porting existing standards conforming codes to HPX.

A lot of work has been done to improve and optimize our network communication layers. Primary focus of this work was on the LCI parcelport, but we have also cleaned up and improved the MPI parcelport.

Additionally, we have continued working on our documentation. The main focus here was on completing the API documentation of the most important API functions. We have started adding migration guides for people interested in moving their codes away from other, commonplace parallelization frameworks like OpenMP.

## HPX V1.9.0 (May 2, 2023)

### General changes

- Added RISC-V 64bit support. HPX is now compatible with RISC-V architectures which have revolutionized the HPC world.
- LCI parcelport has been optimized to transfer parcels with fewer messages and use the HPX resource partitioner for its progress thread allocation. It should generally provide better performance than before. It also removes its dependency on the MPI library.
- HPX dependency on Boost was further relaxed by replacing headers from Boost.Range, Boost.Tokenizer and Boost.Lockfree.

<sup>1407</sup> <https://github.com/TheHPXProject/hpx/pull/6279>

<sup>1408</sup> <https://github.com/TheHPXProject/hpx/pull/6281>

<sup>1409</sup> <https://github.com/TheHPXProject/hpx/pull/6283>

- Improvements took place on our parallel algorithms implementation.
- Our Senders/Receivers (P2300) integration was extended:
  - Coroutines were integrated with senders/receivers.

`get_completion_signatures` now works with awaitable senders. - `with_awaitable_senders` allows the passed senders to retrieve the value i.e. senders are transparently awaitable from within a coroutine. - `when_all_vector` was added.

- `sync_wait` and `sync_wait_with_variant` sender consumers were added. The user can now initiate the execution of their asynchronous pipeline by blocking the current thread that executes the `main()` function until the result is retrieved.
- The combinators for futures (a.k.a. `async_combinators`) `when_*`, `wait_*`, `wait_*_nothrow` were turned into CPOs allowing for end-user customization. For more information on the `async_combinators` refer to the documentation, [https://hpx-docs.stellar-group.org/latest/html/libs/core/async\\_combinators/docs/index.html?highlight=combinators](https://hpx-docs.stellar-group.org/latest/html/libs/core/async_combinators/docs/index.html?highlight=combinators).
- The new datapar backend SVE allows `simd` and `par_simd` execution policies to exploit dataparallelism in the processors that have SVE vector registers like A64FX and Neoverse V1.
- The documentation for parallel algorithms, container algorithms was further improved. The Public API page was vastly enriched.
- Copy button shortcut was added at the top-right of code-blocks.
- Pragma directive that reports warnings as errors on MSVC was fixed.
- Command line argument `--hpx:loopback_network` was added to facilitate debugging with networks.
- We added an HPX-SYCL integration, allowing users to obtain HPX futures for SYCL events. This effectively enables the integration of arbitrary asynchronous SYCL operations into the HPX task graph. Bolted on top of this integration, we further added an HPX-SYCL executor for ease of use.

## Breaking changes

- Stopped supporting Clang V8, the minimal version supported is now Clang V10.
- Stopped supporting gcc V8, the minimal version supported is now gcc V9.
- Stopped supporting Visual Studio 2015, the minimal version supported is now Visual Studio 2019.
- `tag_policy_tag` et.al. were re-added after HPX V1.8.1 deprecation.
- `get_chunk_size` and `processing_units_count` API is now expecting the time for one iteration as an argument.
- The list of all the namespace changes can be found here: [HPX V1.9.0 Namespace changes](#).

## Closed issues

### HPX V1.8.1 (Aug 5, 2022)

This is a bugfix release with a few minor additions and resolved problems.

#### General changes

This patch release adds a number of small new features and fixes a handful of problems discovered since the last release, in particular:

- A lot of work has been done to improve vectorization support for our parallel algorithms. HPX now supports using EVE - the Expressive Vector Engine as a vectorization backend.
- Added a simple average power consumption performance counter.
- Added performance counters related to the use of zero-copy chunks in the networking layer.

<sup>1624</sup> <https://github.com/TheHPXProject/hpx/pull/5962>

<sup>1625</sup> <https://github.com/TheHPXProject/hpx/pull/5961>

<sup>1626</sup> <https://github.com/TheHPXProject/hpx/pull/5955>

<sup>1627</sup> <https://github.com/TheHPXProject/hpx/pull/5952>

<sup>1628</sup> <https://github.com/TheHPXProject/hpx/pull/5950>

<sup>1629</sup> <https://github.com/TheHPXProject/hpx/pull/5949>

<sup>1630</sup> <https://github.com/TheHPXProject/hpx/pull/5948>

<sup>1631</sup> <https://github.com/TheHPXProject/hpx/pull/5945>

<sup>1632</sup> <https://github.com/TheHPXProject/hpx/pull/5883>

<sup>1633</sup> <https://github.com/TheHPXProject/hpx/pull/5872>

<sup>1634</sup> <https://github.com/TheHPXProject/hpx/pull/5855>

- More work was done towards full compatibility with the sender/receivers proposal P2300.
- Fixing `sync_wait` to decay the result types
- Fixed collective operations to properly avoid overlapping consecutive operations on the same communicator.
- Simplified the implementation of our execution policies and added mapping functions between those.
- Fixed performance issues with our implementation of *small\_vector*.
- Serialization now works with buffers of unsigned characters.
- Fixing dangling reference in serialization of non-default constructible types
- Fixed static linking on Windows.
- Fixed support for M1/MacOS based architectures.
- Fixed support for gentoo/musl.
- Fixed *hpx::counting\_semaphore\_var*.
- Properly check start and end bounds for *hpx::for\_loop*
- A lot of changes and fixes to the documentation (see <https://hpx-docs.stellar-group.org>).

## Breaking changes

- No breaking changes have been introduced.

- PR #5879<sup>1699</sup> - New performance counters related to zero-copy chunks.

## HPX V1.8.0 (May 18, 2022)

With HPX parallel algorithms been fully adapted to C++20 the new release achieves full conformance with C++20 concurrency and parallelism facilities. HPX now supports all of the algorithms as specified by C++20. We have added support for vectorization to more of our algorithms. Much work has been done towards implementing P2300 (“std::execution”) and implementing the underlying senders/receivers facilities. Finally, The new release comes with a brand new documentation interface!

### General changes

- The new documentation can now be found on our webpage: <https://hpx-docs.stellar-group.org>. This includes a completely new and user-friendly interface environment along with restructuring of certain components. The content in the “Quick start”, “Manual” and “Examples” was improved, while the “Build system” page was adapted to include necessary information for newcomers.
- With the vectorization support available in modern hardware architectures HPX now provides new data-parallel vector execution policies `hpx::execution::simd` and `hpx::execution::par_simd` that enable significant speed-up of our parallel algorithm implementations. The following algorithms now support SIMD execution:
  - `copy`, `copy_n`
  - `generate`
  - `adjacent_difference`, `adjacent_find`
  - `all_of`, `any_of`, `none_of`
  - `equal`, `mismatch`,
  - `inner_product`
  - `count`, `count_if`
  - `fill`, `fill_n`

---

<sup>1691</sup> <https://github.com/TheHPXProject/hpx/pull/5897>

<sup>1692</sup> <https://github.com/TheHPXProject/hpx/pull/5896>

<sup>1693</sup> <https://github.com/TheHPXProject/hpx/pull/5895>

<sup>1694</sup> <https://github.com/TheHPXProject/hpx/pull/5894>

<sup>1695</sup> <https://github.com/TheHPXProject/hpx/pull/5890>

<sup>1696</sup> <https://github.com/TheHPXProject/hpx/pull/5889>

<sup>1697</sup> <https://github.com/TheHPXProject/hpx/pull/5888>

<sup>1698</sup> <https://github.com/TheHPXProject/hpx/pull/5887>

<sup>1699</sup> <https://github.com/TheHPXProject/hpx/pull/5879>

- `find`, `find_end`, `find_first_of`, `find_if`, `find_if_not`
  - `for_each`, `for_each_n`
  - `generate`, `generate_n`.
- Based on top of P2300 the HPX parallel algorithms now support the pipeline syntax towards an effort to unify their usage along with senders/receivers. The HPX parallel algorithms can now bind with senders/receivers using the pipeline operator.
- Several changes took place on the executors provided by HPX:
- The executors now support the `num_cores` options in order for the user to be able to specify the desired number of cores to be used in the corresponding execution.
- The `scheduler` executor was implemented on top of senders/receivers and can be used with all HPX facilities that schedule new work, such as parallel algorithms, `hpx::async`, `hpx::dataflow`, etc.
- The performance of `fork_join_executor` was improved.
- The following algorithms have been added/adapted to be C++20 conformant:
  - `min_element`
  - `max_element`
  - `minmax_element`
  - `starts_with`
  - `ends_with`
  - `swap_ranges`
  - `unique`
  - `unique_copy`
  - `rotate`
  - `rotate_copy`
  - `sort`
  - `shift_left`
  - `shift_right`
  - `stable_sort`
  - `partition`
  - `partition_copy`
  - `stable_partition`
  - `adjacent_difference`
  - `nth_element`
  - `partial_sort`
  - `partial_sort_copy`.
- `HPX_FORWARD`/`HPX_MOVE` macros were introduced that replaced the `std::move` and `std::forward` facilities that in the library code.
- Hangs on distributed barrier were fixed.
- The performance of `scan_partitioner` was improved.

- Support was added for `thread_priority` to the `parallel_execution_policy`
- Regarding senders/receivers and the P2300 proposal various actions took place. `stop_token` was adapted to the recent proposal version (`in_place_stop_token` was introduced). Also hint, annotation, priority and stacksize properties were added to the scheduler executor. Stop support was added to `when_all`. Support for completion signatures was added. The following schedulers and algorithms were added:
  - `get_completion_scheduler`
  - `any_sender` and `unique_any_sender`
  - split sender
  - `transform_mpi` sender
  - transfer sender
  - `let_error`, `let_stopped`
  - `get_env` and related environment queries
  - `schedule`, `set_value`, `set_error`, `set_done`, `start` and `connect` are now proper customization points as defined in P2300.
- Several namespaces were altered towards conformance with C++20. Compatibility layers have been added and the old versions will be removed in next releases. The namespace changes are the following:
  - `hpx::parallel::induction/reduction` were moved into namespace `hpx::experimental`
  - `for_loop` and friends were moved into namespace `hpx::experimental`.
  - `hpx::util::optional` and friends were moved into namespace `hpx`.
  - `hpx::lcos::barrier` has been moved into the `hpx::distributed` namespace and `hpx::lcos::local::cpp20_barrier` has been renamed to `barrier` and moved into the `hpx` namespace.
  - `hpx::lcos::latch` has been moved into the `hpx::distributed` namespace and `lcos::local::latch` has been moved into the `hpx` namespace. The `count_down_and_wait()` functionality of `latch` has been renamed to `arrive_and_wait()`.
  - `hpx::util::unique_function_nonsr` has been renamed to `hpx::move_only_function`.
  - `hpx::util::unique_function` has been renamed to `hpx::distributed::move_only_function`.
  - `hpx::util::function` has been renamed to `hpx::distributed::function`.
  - `hpx::util::function_nonsr` has been renamed to `hpx::function`.
  - `hpx::util::function_ref` have been moved to namespace `hpx`.
  - `hpx::lcos::split_future` changed namespace and is now used as `hpx::split_future`.
